The officer shall every three months, if required, take an account of the stock of all distillers and rectifiers, and, if any unfair increase shall be found, the same shall be forfeited and may be seized; and the person in whose stock such excess shall be found shall forfeit £50. Rectifiers are to mark the strength and quality of mixed spirits on the outside of the cask, and in default thereof, or if untrue marked, the same shall be forfeited, and also the casks, and may be seized; and the rectifier shall forfeit £50. 26 Geo. III. c. 73.

By 27 Geo. III. c. 31, made perpetual by 41 Geo. III. c. 97, it was enacted, that all spirits should be deemed and taken to be of the strength indicated by Clarke's hydrometer; but, by 43 Geo. III. c. 97, the lords of the treasury may discontinue the use of this hydrometer, and direct any other to be used in lieu of it. All British spirits of the third extraction, or which have been twice distilled from low wines, and had flavor communicated to them, shall be deemed 'British brandy;' if no flavor has been communicated to them, the same shall be deemed 'rectified British spirits.' If of the second extraction, or once distilled from low wines, the same shall be deemed 'raw British spirits.' And all British spirits distilled with juniper berries, caraway seeds, anise seeds, or other seeds, or ingredients used in the compounding of spirits, shall be deemed 'British compounds.' And all British spirits of a greater strength than one to two over hydrometer proof shall be deemed 'spirits of wine.' Officers shall take an account of the

stock of rectifiers and compounders every three months at least, and if any increase of quantity, under certain limitations, be found, the quantity in excess shall be forfeited, and may be seized; and such person shall forfeit £50.

And if any British spirits or compounds are sent out of a greater strength than one in five under hydrometer proof, the same shall be forfeited, and treble value, or £50 in the whole; and the same may be seized, with the casks and vessels containing it. 30 Geo. III. c. 37. The distiller shall weekly make entry of all wash by him used for the making of low wines and spirits within each week, on pain of £10; and within a week after shall pay off the duties, on pain of double duty. 19 Geo. III. c. 50. All permits for removing British spirits shall correspond with the request notes, and be delivered with such spirits to the buyer, on the forfeiture of the same to such buyer and double the price, including the duties: and such buyer may be admitted to prove that such spirits were delivered without a lawful permit; but no buyer shall be allowed to avail himself of such forfeiture unless complaint is made within fourteen days after the delivery of the spirits. 26 Geo. III. c. 73.

Retailers of distilled liquors, or such as sell the same in less quantity than two gallons, must take out a licence, for which they are to pay annually a sum corresponding to the rent of the premises which they occupy; if the rent of such retailer be £15, or upwards, £5. 2s.; at £20, and upwards, £5. 10s.; at £25, and upwards, £5. 18s. at £30, or upwards, £6. 6s.; at £40, or upwards, £6. 14s.; and at £50, or upwards, £7. 2s. This licence, which is to be renewed annually, on the penalty of £50, is to be granted only to those who keep taverns, victualling-houses, inns, coffee-houses, or ale-houses; who, within the limits of the office of excise in London, pay £10 a year rent, and parish rates, and in places where the occupiers are not rated £12 a year; and who, in other parts of the kingdom, pay to church and poor. They must first be licensed to sell ale in the places where they dwell.

By 16 Geo. II. c. 8, retailers of spirituous liquors, without licence, were subject to a penalty of £10; and by 24 Geo. II. c. 40, all liquors found in the custody of such persons, or within six calendar months after conviction, were to be seized. And by 13 Geo. III. c. 56; and 30 Geo. III. c. 38, such retailers are to forfeit £50, subject to mitigation so as not to be reduced below £5. Every person who shall retail less than two gallons shall enter his warehouses, shops, &c., and his spirituous liquors, on pain of £20 for every place, and 40s. for every gallon not entered; and also the liquors and casks. 9 Geo. II. c. 23; 30 Geo. III. c. 38. By 19 Geo. III. c. 69, every importer or dealer in spirituous liquors, shall cause to be painted on a conspicuous part of the house, shop, or cellar, &c., used by him, the words *Importer of, or Dealer in, Spirituous Liquors*, on pain of £50. Any importer or dealer buying of a person who has not these words over the door of his shop, &c., shall forfeit £100. Any person who hath not made entry of his liquors, and who hath these words over his door, shall forfeit £50. No spi-

rituous liquors shall be brought into a place of sale without previous notice to the officer of excise, and leaving with him a certificate, expressing that all the duties are paid, the quantity and quality, the name of the seller, &c., on pain of forfeiting £20, and also the liquor and casks. 9 Geo. II. c. 23. Retailers shall not increase the quantity of their liquors, on pain of 40s. a gallon; and the liquors so mixed with water, or any other liquors, shall be seized and forfeited. 9 Geo. II. c. 23. By 21 Geo. III. c. 55, the stock increased shall be forfeited, a quantity equal to the increased quantity shall be seized by the officer, and the person offending shall forfeit £20. The officer may at all times, by day or night, enter into warehouses, shops, or other places, to take an account of the quantity and quality; and if any retailer hinder the officer he shall forfeit £50. 9 Geo. II. c. 23. No licensed retailer shall have any share in a distillery or rectifying house, or be concerned in such trade, on pain of £200. 26 Geo. III. c. 73.

Hawkers of spirituous liquors in the streets, &c., are liable to a forfeiture of £10. 9 Geo. II. c. 23. 11 Geo. II. c. 26. Persons giving away spirituous liquors, or paying wages in them, shall be deemed retailers. 9 Geo. II. c. 23. Keepers of gaols, workhouses, &c., selling spirituous liquors, or knowingly suffering them to be sold, except such as are prescribed by a physician, surgeon, or apothecary, forfeit for the first offence £100, and for the second their office. Persons bringing any such liquors into any place of that kind may be apprehended, and on conviction committed to the house of correction, or prison, for any time not exceeding three months, unless they immediately pay a fine, not exceeding £20, nor less than £10. Debts for spirituous liquors cannot be recovered, unless they have been contracted, or the liquors delivered at one time to the value of 20s. or upwards: and distillers knowingly selling or delivering distilled liquors to unlicensed retailers, forfeit £10, and treble their value; and the retailer, convicting the distiller, is entitled to a share of the penalty, and is himself indemnified. Persons riotously rescuing offenders, or assaulting informers, and their aiders or abettors, are guilty of felony, and liable to seven years' transportation. 24 Geo. II. c. 40. If any person shall obstruct any officer in the execution of his duty, in relation to this act, he shall forfeit £200. 23 Geo. III. c. 81. No liquor exceeding one gallon shall be removed without a permit. 6 Geo. I. c. 21. British spirits made from corn are allowed on exportation as merchandise, a bounty or drawback of £3. 12s. per ton. 5 Geo. III. c. 5; 27 Geo. III. c. 13. And by 6 Geo. II. c. 17. for spirits drawn from British corn, a drawback was to be allowed at the port of shipping, of £4. 18s. per ton, in full of all drawbacks: and by 23 Geo. II. c. 9, there was to be an additional drawback of £24. 10s. a ton, on all British-made spirits exported; provided that they are not exported in casks containing less than 100 gallons, and in vessels of less burden than 100 tons, except to Africa and Newfoundland, whither they may be exported in any vessels not less than seventy tons. 6 Geo. III. c. 46. The 43 Geo. III. c. 69, which con-

solidates the duties, &c., of excise, continues all advances, bounties, and drawbacks, which are particularly directed to be made by any act or acts of parliament in force, on or immediately before the 5th of July, 1803, except so far as such allowances may be varied or repealed by the same act. By 39 and 40 Geo. III. c. 73, spirits distilled in England for exportation to Scotland, are exempted from the excise duties in England. And by 43 Geo. III. c. 69, for every gallon, English wine measure, of spirits, not exceeding in strength that of one to ten over hydrometer proof, and so in proportion for any higher degree of strength, made in England and thence imported into Scotland, payment is to be made by the importer before landing, of 4s.; and by c. 81, an additional duty of 2s.: for every such gallon manufactured in Scotland and brought from thence into England, 5s. 0½d.; and by c. 81, an additional duty of 2s. 5d. For every gallon of such spirits of greater strength than one to ten over hydrometer proof, and not exceeding £3 per cent. over and above one to ten over hydrometer proof, 7s. 5½d. and a surcharge. And all duties and drawbacks under these acts shall be proportionate to the actual quantity. No spirits shall be sent from Scotland to England, or from England to Scotland, by land, or in vessels of less than seventy tons burden, or in casks containing less than 100 gallons, on forfeiture of the same, together with casks or package. And if any distiller, rectifier, compounder, or dealer in spirits, or servant belonging to any such person, shall obstruct an officer in the execution of this act, he shall forfeit £200. Vide laws relating to distillation under GENEVA, WHISKEY, BRANDY, and RUM. See also HYDROMETER.

DISTINCT, *adj.* } Fr. *distinct*; Italian,
DISTINCTION, *n. s.* } Portug. and Span. *distinto*;
DISTINCTIVE, *adj.* } Lat. *distinctus*,
DISTINCTIVELY, *adv.* } from *distinguo*, *dis*, and
DISTINCTLY, *adv.* } Gr. *τιζω*, to mark or
DISTINCTNESS, *n. s.* } prick for distinction:
 marked out in any way; different in kind, degree, or number; separate: distinction is the act or art of discerning a difference, as well as the thing that notes it; and the honor or difference of state resulting. Distinctive is that which marks a difference, or having power to do so: distinctively and distinctly, clearly without confusion of differences. Distinctness, more intense or accurate distinction.

For tho things that ben withouten the soule ghyeth voicis, eithir pipe, eithir harpe, but tho ghyuen *distinctioun* of sownyngis hou schal it be knowun that is sungun eithir that that is trumpid?

Wiclif. 1 Cor. 13.

The mixture of those things by speech, which by nature are divided, is the mother of all error: to take away therefore that error, which confusion breedeth, *distinction* is requisite.

Hooker.

I did all my pilgrimage dilate,
 Whereof by parcels she had something heard,
 But not *distinctively*. *Shakespeare. Othello.*

This fierce abridgment
 Hath to it circumstantial branches, which
Distinction should be rich in. *Id. Cymbeline.*

Lawfulness cannot be handled without limitations and *distinctions*. *Bacon's Holy War.*

Credulous and vulgar auditors readily believe it, and the more judicious and *distinctive* heads do not reject it. *Broune.*

Heaven is high,
 High and remote; to see from thence *distinct*
 Each thing on earth. *Milton.*

Tempestuous fell
 His arrows from the fourfold-visaged four,
Distinct with eyes; and from the living wheels
Distinct alike with multitude of eyes. *Id.*

If by the church they mean the communion of saints only; though the persons of men be visible, yet because their *distinctive* cognizance is invisible, they can never see their guide; and therefore they can never know whether they go right or wrong.

Bp. Taylor.

The intention was, that the two armies, which marched out together, should afterwards be *distinct*.

Clarendon.

Maids, women, wives, without *distinction* fall;
 The sweeping deluge, love, comes on, and covers all. *Dryden.*

The object I could first *distinctly* view,
 Was tall straight trees, which on the waters flew. *Id.*

The membranes and humours of the eye are perfectly pellucid, and void of colour, for the clearness, and the *distinctness*, of vision. *Ray on Creation.*

Fatherhood and property are *distinct* titles, and began presently, upon Adam's death, to be in *distinct* persons. *Locke.*

This will puzzle all your logick and *distinctions* to answer it. *Denham's Sophy.*

On its sides it was bounded pretty *distinctly*, but on its ends very confusedly and indistinctly.

Newton's Opticks.

In story-telling, besides the marking *distinct* characters, and selecting pertinent circumstances, it is likewise necessary to leave off in time and end smartly. *Steele.*

For from the natal hour, *distinctive* names,
 One common right the great and lowly claims. *Pope's Odyssey.*

Some young men of *distinction* are found to travel through Europe, with no other intent, than that of understanding, and collecting pictures, &c.

Goldsmith.

There is too much reason to apprehend, that the custom of pleading for any client, without discrimination of right or wrong, must lessen the regard to those important *distinctions*, and deaden the moral sensibility of the heart. *Percival.*

The painter, on the other hand, can throw stronger illumination and *distinctness* on the principal moment or catastrophe of the action; besides the advantage he has in using a universal language which can be read in an instant of time. *Darwin.*

I used then to say, and I say so still, render the office of a bishop respectable by giving some civil *distinction* to its possessor, in order that his example may have more weight with both the laity and clergy.

Bp. Watson.

DISTINGUISH, *v. a. & v. n.* } Fr. *distinguer*;
DISTINGUISHABLE, *adj.* } Span. and Port.
DISTINGUISHED, *part. adj.* } *distinguer*; It.
DISTINGUISHER, *n. s.* } and Lat. *distincti-*
DISTINGUISHINGLY, *adv.* } *guere*. See *Dis-*
DISTINGUISHMENT, *n. s.* } *TINGENT*. To mark
 diversity; to specify; to know by some mark or

to judge; and hence to honor: as a neuter verb, to make distinction. Distinguishable is capable of being distinguished; honorable. Distinguishtly, accurately; or with some mark of honor. Distinguishment seems synonymous with distinction.

Rightly to *distinguish*, is, by conceit of the mind, to sever things different in nature, and to discern wherein they differ.

Hooker.

We have not yet been seen in any house,
Nor can we be *distinguish'd*, by our faces,
For man or master.

Shakspeare. *Taming of the Shrew.*

Let us admire the wisdom of God in this *distinguisher* of times, and visible deity, the sun.

Browne's *Vulgar Errors.*

Impenitent, they left a race behind
Like to themselves, *distinguishable* scarce
From Gentiles, but by circumcision vain.

Milton.

The acting of the soul, as it relates to perception and decision, to choice and pursuit, or aversion, is *distinguishable* to us.

Hale's *Origin of Mankind.*

Being dissolved in aqueous juices, it is by the eye *distinguishable* from the solvent body.

Boyle.

The not *distinguishing* where things should be *distinguish'd*, and the not confounding where things should be confounded, is the cause of all the mistakes in the world.

Selden.

If writers be just to the memory of Charles II., they cannot deny him to have been an exact knower of mankind, and a perfect *distinguisher* of their talents.

Dryden.

We are able, by our senses, to know and *distinguish* things; and to examine them so far as to apply them to our uses, and several ways to accommodate the exigencies of this life.

Locke.

St. Paul's Epistles contain nothing but points of Christian instruction, amongst which he seldom fails to enlarge on the great and *distinguishing* doctrines of our holy religion.

Id.

Can I be sure that in leaving all established opinions I am following the truth; and by what criterion shall I *distinguish* her, even if fortune should at last guide me on her footsteps?

Hume on *Human Understanding.*

The *distinguishing* part of our constitution is its liberty.

Burke.

Moses *distinguishes* the causes of the flood into those that belong to the heavens, and those that belong to the earth, the rains, and the abyss.

Burnet's *Theory.*

I would endeavour that my betters should seek me by the merit of something *distinguishable*, instead of my seeking them.

Swift.

Wit, I consider as a singular and unavoidable manner of doing or saying any thing peculiar and natural to one man only, by which his speech and actions are *distinguished* from those of other men.

Congreve.

Let us revolve that roll with strictest eye,
Where, safe from time, *distinguish'd* actions lie.

Prior.

To make corrections upon the searchers' reports, I considered whether any credit at all were to be given to their *distinguishments*.

Graunt's *Bills of Mortality.*

For sins committed, with many aggravations of guilt, the furnace of wrath will be seven times hotter, and burn with a *distinguish'd* fury.

Rogers.

Some call me a Tory, because the heads of that party have been *distinguishtly* favourable to me.

Pope.

Never on man did heavenly favour shine
With rays so strong, *distinguish'd*, and divine.

Id. *Odyssey.*

The question is, whether you *distinguish* me, because you have better sense than other people, or whether you seem to have better sense than other people, because you *distinguish* me.

Shenstone.

DISTORT', v. a. } Lat. *distortus*, from *dis*
DISTORTION, n. s. } and *torqueo*, *tortus*, to turn. To make crooked; twist; writhe; deform: often used figuratively.

Something must be *distorted* beside the intent of the divine inditer.

Peacham on *Poetry.*

With fear and pain

Distorted, all my nether shape thus grew

Transformed.

Milton.

Wrath and malice, envy and revenge, do darken and distort the understandings of men.

Tillotson.

By his *distortions* he reveals his pains;
He by his tears and by his sighs complains.

Prior.

In England we see people lulled asleep with solid and elaborate discourses of piety, who would be warmed and transported out of themselves by the bellows and *distortions* of enthusiasm.

Addison's *Spectator.*

Now mortal pangs *distort* his lovely form.

Smith.

Here cross-legged nobles in rich state shall dine,
There, in bright mail, *distorted* heroes shine.

Gay.

For gold, his sword the hireling russian draws;
For gold, the hireling judge *distorts* the laws.

Johnson. *Vanity of Human Wishes.*

We prove its use

Sovereign and most effectual to secure
A form, not now gymnastic as of yore,
From rickets and *distortion*, else our lot.

Cowper.

DISTRACT', v. a. & adj. } Fr. *distraire*;
DISTRACT'EDLY, adv. } Ital. *distrare*;
DISTRACT'EDNESS, n. s. } Span. *distraher*;
DISTRAC'TION, } from Lat. *dis*, di-
DISTRAC'TIVE, adj. } versely, and *tra-*
DISTRAUGHT', part. adj. } ho; Gr. *δρασσω*, to draw. To draw several ways at once: to perplex the mind; to harass: vex; make mad. Distract and distractedness are synonymous. Distractive is causing perplexity. Distracted is distracted.

While I suffer thy terrors I am *distracted*.

By sea, by sea.

—Most worthy Sir, you therein throw away
The absolute soldiership you have by land;
Distract your army, which doth most consist
Of war-marked footmen.

Shakspeare. *Antony and Cleopatra.*

Better I were *distract*,
So should my thoughts be severed from my griefs;
And woe, by wrong imagination, lose
The knowledge of themselves.

Id. *King Lear.*

Come, cousin, canst thou quake, and change thy colour,

Murder thy breath in middle of a word
And then again begin, and stop again,
As if thou wert *distracted* and mad with terror?

Id. *Richard III.*

Methought her eyes had crossed her tongue,
For she did speak in starts *distractedly*.

Id. *Twelfth Night.*

She was unable in strength of mind to bear the grief of his disease, and fell *distracted* of her wits.

Bacon.

The needle endeavours to conform unto the medicinal; but being *distracted*, driveth that way where the greater and powerfuller part of the earth is placed.

Browne's Vulgar Errors.

He had been a good military man in his days, but was then *distraught* of his wits. *Camd. Rem.*

It would burst forth; but I recover breath;
And sense *distract* to know well what I utter.

Milton's Agonistes.

The two armies lay quiet near each other without improving the confusion and *distract*ion which the king's forces were too much inclined to. *Clarendon.*

Idleness is but the devil's home for temptation, and for unprofitable *distracting* musings. *Barter.*

Never was known a night of such *distract*ion,
Noise so confused and dreadful! jostling crowd,
That run and knew not whither. *Dryd. Span. Fr.*

Oft grown unmindful through *distractive* cares,
I've stretched my arms, and touched him unawares.

Dryden.

If he cannot wholly avoid the eye of the observer, he hopes to *distract* it by a multiplicity of the object.

South.

You shall find a *distracted* man fancy himself a king, and with a right inference require suitable attendance, respect, and obedience. *Locke.*

So to mad Pentheus double Thebes appears,
And furies howl in his distemp'ored ears;
Orestes so, with like *distract*ion tost,
Is made to fly his mother's angry ghost. *Waller.*

What may we not hope from him in a time of quiet and tranquillity, since, during the late *distract*ions, he has done so much for the advantage of our trade?

Addison's Freeholder.

Commiserate all those who labour under a settled *distract*ion, and who are shut out from all the pleasures and advantages of human commerce.

Atterbury.

This quiet sail is as a noiseless wing
To waft me from *distract*ion; once I loved
Torn ocean's roar, but thy soft murmuring
Sounds sweet as if a sister's voice reproved,
That I with stern delights should e'er have been so moved.

Byron's Child Harold.

DISTRAIN' *v. a. & n.* } *Fr. distraindre;*
DISTRAIN' *tr, n. s.* } *Ital. and Lat. dis-*
DISTRAIN' *tr, n. s.* } *tingere; dis, exple-*
tive, and *stringo*, to gripe. To lay hold of by law. See the article.

Here's Beauford, that regards not God nor king,
Hath here *distrained* the Tower to his use.

Shakspeare.

The earl answered, I will not lend money to my superior, upon whom I cannot *distrain* for the debt.

Clarendon's Remains.

Blood, his rent to have regained
Upon the British diadem *distrained*. *Marvel.*

DISTRAIN, or **DISTREIN**, in law, is to attach, or seize on one's goods, for the satisfaction of a debt. It is the mode of levying a distress. See the following article.

DISTRESS' *v. a. & n. s.* } *Fr. détresse; It.*
DISTRESS' *ful, adj.* } *distrezza;* from

Lat. districtio, stringo; to press hard; hence, distress, because a person in distress is pressed by his affairs. To seize by law; to harass; crush by affliction; make unhappy.

We are troubled on every side, yet not *distrained*.
Bible. 2 Cor. iv. 8

O flesh they ben, and o flesh, as I gesse,
Hath but on herte in wele and in *distress*.

Chaucer. Cant. Tales.

He would first demand his debt; and, if he were not paid, he would straight go and take a *distress* of goods and cattle, where he could find them, to th value.

Spenser.

There can I sit alone, unseen of any,
And to the nightingale's complaining notes
Tune my *distresses*, and record my woes.

Shakspeare.

I often did beguile her of her tears,
When I did speak of some *distressful* stroke
That my youth suffered. *Id. Othello.*

They were not ashamed—to come to me for assessments and monthly payments for that estate which they had taken; and took *distresses* from me upon my most just denial. *Bp. Hall's Hard Measure.*

Quoth she, some say the soul's secure
Against *distress* and forfeiture.

Hudibras.

People in affliction or *distress* cannot be hated by generous minds. *Clarissa.*

The ewes still folded, with distended thighs,
Unmilked, lay bleating in *distressful* cries.

Pope's Odyssey.

And such is the fate of hapless lexicography, that not only darkness, but light, impedes and *distresses* it; things may be not only too little, but too much known, to be happily illustrated.

Johnson. Preface to Dictionary.

Ah! then and there was hurrying to and fro,
And gathering tears, and tremblings of distress,
And cheeks all pale, which but an hour ago
Blushed at the praise of their own loveliness.

Byron.

DISTRESS, **DISTRICTIO**, is the taking of a personal chattel out of the possession of the wrongdoer, into the custody of the party injured, to procure a satisfaction for the wrong committed. The term distress is also, in our law books, applied to the thing taken by this process, as well as to the process itself. The most usual injury for which a distress may be taken is that of non-payment of rents. See **RENT**.

It is held as a universal principle, that a distress may be taken for any kind of rent in arrear; the detaining of which beyond the day of payment is an injury to him that is entitled to receive it. Likewise, for neglecting to do suit to the lord's court, or other certain personal service, (Co. Litt. 46,) the lord may distress, of common right. Also, for amercements in a court-leet a distress may be had of common right; but not for amercements in a court-baron, without a special prescription to warrant it, (Brownl. 36.) Another injury for which distresses may be taken, is where a man finds beasts of a stranger wandering in his grounds, damage-feasant; that is, doing him hurt or damage, by treading down his grass, or the like; in which case the owner of the soil may distress them till satisfaction be made him for the injury sustained. Lastly, for several duties and penalties inflicted by special acts of parliament, as for assessments made by commissioners of sewers, stat. 7 Ann. c. 10, or for the relief of the poor, stat. 43 Eliz. c. 2, remedy by distress and sale is given: with regard to which

it may be observed, that such distresses are partly analogous to the ancient distress at common law, as being replevable and the like (4 Burr. 589); but more resembling the common law process of execution, by seizing and selling the goods of the debtor under a writ of *Fieri Facias*, which see.

By stat. 56 Geo. 3, c. 88, § 16, 17, tenants in Ireland having paid rent to their immediate landlord, if distrained by the superior landlord, may recover damages against their immediate landlord, and retain them out of the future accruing rent. By this act, as amended by 58 Geo. 3, c. 39, the powers of distress on corn, &c., growing (given in England by stat. 11 Geo. II., c. 19) are extended to Ireland; and other provisions are made for the recovery of tenements from absconding, overholding, and defaulting tenants.

With respect to the things which may be distrained, or taken in distress, it may be laid down as a general rule, that all chattels personal are liable to be distrained, unless particularly protected or exempted. Instead, therefore, of mentioning the things that are distrainable, it will be more easy to recount the things which are not so, with the reason of their particular exemptions. (Co. Litt. 47). Every thing which is distrained is presumed to be the property of the wrong-doer: it will follow, therefore, that such things, in which no man can have an absolute and valuable property, as dogs, cats, rabbits, and all animals *feræ naturæ*, cannot be distrained. But if deer, which are *feræ naturæ*, are kept in a private enclosure for the purpose of sale or profit, this circumstance reduces them to a kind of stock or merchandise, that they may be distrained for rent. Moreover, whatever is in the personal use or occupation of any man is, for the time, privileged and protected from any distress; as an axe with which a man is cutting wood, or a horse while a man is riding him. But horses drawing a cart, and also the cart, may be distrained for rent-arrere, if a man be not upon the cart (1 Vent. 36): and it hath been said, that if a horse, though a man be riding him, be taken damage-feasant, or trespassing in another's ground, the horse may be distrained and led away to the pound. (1 Sid. 440.) However, the authorities on this point being collected together in Hargr. Co. Litt. 47, the clear result of them is, that such a distress is illegal. Again, valuable things in the way of trade shall not be liable to distress; as a horse standing in a smith's shop to be shod, or in a common inn; or cloth at a tailor's house; or corn sent to a mill or market. All these are protected or privileged for the benefit of trade; and are supposed in common presumption not to belong to the owner of the house, but to his customers. But, generally speaking, whatever goods and chattels the landlord finds upon the premises, whither they, in fact, belong to the tenant or a stranger, are distrainable by him for rent; for otherwise a door would be open to infinite frauds upon the landlord; and the stranger has his remedy by action on the case against the tenant, if by the tenant's default the chattels are distrained, so that he cannot render them when called upon. With regard to a stranger's beasts

which are found on the tenant's land, the following distinctions are taken. If they are put in by consent of the owner of the beasts, they are distrainable immediately afterwards for rent-arrere by the landlord. (Cro. Eliz. 549.) So also if the stranger's cattle break the fences, and commit a trespass by coming on the land; they are distrainable immediately by the lessor for his tenant's rent, as a punishment to the owner of the beasts for the wrong committed through his negligence. (Co. Litt. 47.) But if the lands were not sufficiently fenced so as to keep out cattle, the landlord cannot, generally, distrain them, till they have been levant and couchant on the land; that is, have been long enough there to have lain down and rose up to feed; which, in general, is held to be one night at least; and then the law presumes, that the owner may have notice whither his cattle have strayed, and it is his own neglect not to have taken them away. There are also other things privileged by the ancient common law; as a man's tools and utensils of his trade, the axe of a carpenter, the books of a scholar, and the like; which are said to be privileged for the sake of the public, because the taking of them away would disable the owner from serving the commonwealth in his station. So, beasts of the plough, *averia caruæ*, and sheep, are privileged from distresses at common law (stat. 51 Hen. III. c. 4.): while dead goods, or other sort of beasts, which Bracton calls *catalla otiosa*, may be distrained. But, as beasts of the plough may be taken in execution for debt, so they may be for distresses by statute, which partake of the nature of executions. (4 Burr. 589). And, perhaps, the true reason, why these and the tools of a man's trade were privileged at the common law, was, because the distress was then merely intended to compel the payment of the rent, and not as a satisfaction for the non-payment; and, therefore, to deprive the party of the instruments and means of paying it, would counteract the very end of the distress (4 Burr. 588). Moreover, nothing shall be distrained for rent, which may not be rendered again in as good a plight as when it was distrained; for which reason milk, fruit, and the like, cannot be distrained; a distress at common law being only in the nature of a pledge or security, to be restored in the same plight when the debt is paid. So, anciently, sheaves or stacks of corn could not be distrained; because some damage must needs accrue in their removal; but a cart loaded with corn might; as that could be safely restored. But now by statute 2 W. & M. c. 5, corn in sheaves or cocks, or loose in the straw, or hay in barns or ricks, or otherwise, may be distrained, as well as other chattels. Lastly, things fixed to the freehold may not be distrained, as caldrons, windows, doors, and chimney pieces; for they savour of the realty. For this reason also corn growing could not be distrained; till the statute of 11 Geo. II., c. 19, empowered landlords to distrain corn, hops, grass, or other products of the earth, and to cut and gather them when ripe. The goods of a carrier are privileged, and cannot be distrained for rent, though the waggon containing them is put into the barn of a house, or on the road. (1 Salk. 249). But the goods of

a third person, found on the premises, may be distrained by the collector of the house and window tax, for arrears under 43 Geo. III. c. 161, though the goods are only borrowed and the person in arrear has other goods of his own on the premises sufficient to satisfy the arrears. 1 Maid. and Sel. Rep. 601.

ii. We enquire next *how* distresses may be taken, disposed of, or avoided. The law of distresses, says Elackstone, is greatly altered in late years. Formerly they were regarded as a mere pledge or security for payment of rent or other duties, or satisfaction for damage done. And so the law continues with regard to distresses of beasts taken damage-feasant, and for other causes, not altered by act of parliament; over which the distrainer has no other power than to retain them till satisfaction is made. But distresses for rent-arrears being found by the legislature to be the shortest and most effectual method of compelling the payment of such rent, many beneficial laws for this purpose have been made in the last century; which have much altered the common law, as laid down by our ancient writers. In discussing this part of the subject, it will be supposed that the distress is made for rent; and the differences between such distress, and that taken for other causes, will be specified. All distresses must be made by day, unless in the case of damage-feasant; an exception being made in this case, lest the beasts should escape before they are taken. (Co. Litt. 142). When a person intends to make a distress, he must, by himself or his bailiff, enter on the demised premises; formerly during the continuance of the lease, but now (stat. 8 Ann. c. 14), if the tenant holds over, the landlord may distrain within six months after the determination of the lease; provided his own title or interest, as well as the tenant's possession, continue at the time of the distress. If the lessor does not find sufficient distress on the premises, formerly he could not resort any where else; and therefore, knavish tenants made a practice to convey away their goods and stock, fraudulently, from the house or lands demised, in order to cheat their landlords. But now (stat. 8 Ann. c. 14. 11 Geo. II. c. 19), the landlord may distrain any goods of his tenant, carried clandestinely off the premises, wherever he finds them within thirty days after, unless they have been bona fide sold for a valuable consideration: and all persons privy to, or assisting in such fraudulent conveyance, forfeit double the value to the landlord. The landlord may also distrain the beasts of his tenant, feeding upon any commons or wastes, appendant or appurtenant to the demised premises. The landlord might not formerly break open a house, to make a distress, for that is a breach of the peace. But when he was in the house, it was held, that he might break open an inner door (Co. Litt. 16. Comberb. 17); and now (stat. 11 Geo. II. c. 19) he may, by the assistance of the peace officers of the parish, break open, in the day-time, any place whither the goods have been fraudulently removed, and locked up to prevent a distress; oath being first made, in case it be a dwelling-house, of a reasonable ground to suspect that such goods are concealed in it. Where a man is en-

titled to distrain for an entire duty, he ought to distrain for the whole at once; and not for part at one time, and part at another. (2 Lutw. 1532). But if he distrains for the whole, and there is not sufficient on the premises, or he happens to mistake in the value of the thing distrained, and so takes an insufficient distress, he may take a second distress to complete his remedy. (Cro. Eliz. 13. stat. 17; Car. II. c. 7: 4 Burr 590). Distresses must be proportioned to the thing distrained for. By the statute of Marlbridge, 52 Hen. III. c. 4, if any man takes a great or unreasonable distress, for rent-arrears, he shall be heavily amerced for the same. Or if (2 Inst. 107.) the landlord distrains two oxen for twelve-pence rent; the taking of both is an unreasonable distress; but if there were no other distress near the value to be found, he might reasonably have distrained one of them; but for homage, fealty, or suit and service, as also for parliamentary wages, it is said that no distress can be excessive. (Bro. Abr. tit. Assise. 291; Prerogative 98.) For as these distresses cannot be sold, the owner, upon making satisfaction, may have his chattels again. The remedy for excessive distresses is by a special action on the statute of Marlbridge; for an action of trespass is not maintainable upon this account, it being no injury at the common law.

iii. When the distress is taken, the next object of consideration is the *disposal* of it. For which purpose the things distrained must in the first place be carried to some pound, and there impounded by the taker. But in their way thither, they may be rescued by the owner, in case the distress was taken without cause, or contrary to law: as if no rent be due; if they were taken upon the highway, or the like; in these cases the tenant may lawfully make rescue. (Co. Litt. 160, 161). But if they be once impounded, even though taken without any cause, the owner may not break the pound and take them out; for they are then in custody of the law. (Co. Litt. 47). When impounded, the goods were formerly only in the nature of a pledge or security to compel the performance of satisfaction: and upon this account, it has been held (Cro. Jac. 148) that the distrainer is not at liberty to work or use a distrained beast. And thus the law still continues with regard to beasts taken damage-feasant, and distresses for suit or services; which must remain impounded, till the owner makes satisfaction; or contests the right of distraining by replevying the chattels. This kind of distress, though it puts the owner to inconvenience, and is therefore a punishment to him, yet, if he continues obstinate and will make no satisfaction or payment, it is no remedy at all to the distrainer. But for a debt due to the crown, unless paid within forty days, the distress was always saleable at common law. (Bro. Abr. tit. Distress. 71). And for an amercement at a court-leet, the lord may also sell the distress (8 Rep. 41); partly because, being the king's court of record, its process partakes of the royal prerogative (Bro. ubi. supra. 12 Mod. 330): but principally, because it is in the nature of an execution to levy a legal debt. And so in the several statute-distresses already mentioned, which are also in the nature of executions; the power of sale is

likewise usually given, to effectuate and complete the remedy. And in like manner, by several acts of parliament (2 W. & M. c. 5., 8 Ann. c. 14., 4 Geo. II. c. 28, 11 Geo. II. c. 19), in all cases of distress for rent, if the tenant or owner do not, within five days after the distress is taken, and notice of the cause thereof given to him, replevy the same with sufficient security, the distrainor, with the sheriff or constable, shall cause the same to be appraised by two sworn appraisers, and sell the same towards satisfaction of the rent and charges; rendering the overplus, if any, to the owner himself. And, by these means, a full and entire satisfaction may now be had for rent in arrear, by the mere act of the party himself, viz. by distress, the remedy given at common law, and sale consequent thereon, which is added by act of parliament. If any distress and sale shall be made, for rent in arrear and due, when none is really due, the owner shall recover double value, with full costs. 2 W. Sess. 1 c. 5.

The taking of a distress was formerly reckoned a hazardous proceeding, on account of the many particulars that attended it: for if any irregularity was committed, it vitiated the whole, and made the distrainers trespassers ab initio (1 Ventr. 37). But now, by the statute 11 Geo. II. c. 19, it is provided, that for any unlawful act done, the whole shall not be unlawful, or the parties trespassers ab initio; but that the party grieved shall only have an action for the real damage sustained; and not even that, if tender of amends is made before any action is brought. *Blackst. Comm. Book iii.*

DISTRESS, PERSONAL, is made by distraining a man's moveable goods, and seizing the seizure of his lands and tenements, from the teste, or date of the writ, for the defendant's contempt in not appearing to an action brought against him when he was summoned, or attached; and the issues so returned by the sheriffs, are forfeited to the king, and estreated into the exchequer.

DISTRESS, REAL, is made on immovable goods. It differs from an attachment in this, that it cannot be taken by any common person, without the compass of his own fee; except it be presently after the cattle, or other things are driven, or borne off the ground, on purpose to avoid distress.

Distress has been termed either finite or infinite. *Distress finite*, is that which is limited by law, in regard to the number of times it shall be made, in order to bring the party to a trial of the action. *Distress infinite*, is that which is without any limitation being made till the person appears. It is farther applied to jurors that do not appear: as, upon a certificate of assise, the process is venire facias, habere corpora, and distress infinite. It is also divided into grand distress and ordinary distress: of these the former extends to all the goods and chattels that the party has within the county. A person, of common right, may distrain for rents and all manner of services; and where a rent is reserved on a gift in tail, lease for life, or years, &c., though there be no clause of distress in the grant or lease, so as that he has the reversion: but on a feoffment made in fee, a distress may not be taken, unless it be expressly reserved in the deed.

DISTRIBUTE, *v. a.* Fr. *distribuer*; Ital. *distribuer*; and Span. *distribuir*; Lat. *distribuo*; *adj.* *buere*; Lat. *distributive*, *adv.* *buere*; *dis*, diversely, and *tribuo*, to bestow. To divide among several; to deal forth; dispense. Distributer is, he who deals out; and distribution, the act of distributing; hence charity. Distributive, that which assigns the due portions of things. Distributively, proportionally; singly; particularly.

She did distribute her goods to all them that were nearest of kindred. *Judith xvi. 24.*

The king sent over a great store of gentlemen and warlike people, amongst whom he distributed the land. *Spenser.*

Although we cannot be free from all sin collectively, in such sort that no part thereof shall be found inherent in us; yet, distributively at the least, all great and grievous actual offences, as they offer themselves one by one, both may and ought to be by all means avoided. *Hooker.*

The spoil got on the Antiates
Was not distributed. *Shakspeare. Coriolanus.**
Of great riches there is no real use, except it be in the distribution. *Bacon's Essays.*

If Justice will take all, and nothing give,
Justice methinks is not distributive. *Dryden.*

Observe the distributive justice of the authors, which is constantly applied to the punishment of virtue, and the reward of vice, directly opposite to the rules of their best critics. *Swift.*

There were judges and distributors of justice appointed for the several parts of his dominions. *Addison on Italy.*

Let us govern our charitable distributions by this pattern of nature, and maintain a mutual circulation of benefits and returns. *Atterbury.*

As an integral whole is distinguished into its several parts by division, so the word *distribution* is most properly used, when we distinguish a universal whole into its several kinds of species. *Watts.*

There remains yet to be considered the distribution of words into their proper classes, or that part of lexicography which is strictly critical. *Johnson.*

The Latin language, long the vehicle used in distributing knowledge among the different nations of Europe, is daily more and more neglected. *Franklin.*

DISTRIBUTION, in printing, the taking a form asunder, separating the types, and disposing them in the cases again, each in its proper cell. See **PRINTING**.

DISTRICT, *n. s.* Fr. *district*; Ital. *distretto*; Span. *distrito*; Lat. *districtus*, from *distingo*, to bind, as with limits. The limit, or circuit, of a given authority: hence, a region, country, or portion of a country.

His governors, who formed themselves upon the example of their grand monarch, practised all the arts of despotick government in their respective districts. *Addison.*

With stern distate avowed,
To their own districts drive the suitor crowd. *Pope.*

Those districts which between the tropicks lie,
The scorching beams, directly darted, fry. *Blackmore.*

DISTRINGAS, in English law, a writ directed to the sheriff, or other officer, commanding him

to distrain for a debt to the king; or for his appearance at a certain day. There is a *distringas* against peers, and persons entitled to privilege of parliament, under statute 10 Geo. III., cap. 50; by which the effects, in law called issues, levied may be sold to pay the plaintiff's cost, and it has been held that this statute extends to all writs of *distringas*. In detinue, after judgment, the plaintiff may have a *distringas* to compel the defendant to deliver the goods by repeated distresses of his chattels. See *DISTRESS*, *EXECUTION*, and *PARLIAMENT*.

DISTRINGAS JURATORES, a writ directed to a sheriff, whereby he is commanded to distrain upon a jury to appear and to return issues on their lands, &c. for non-appearance. Where an issue in fact is joined to be tried by a jury, which is retained by the sheriff in a pannel upon a *venire facias* for that purpose; there goes forth a writ of *distringas juratores*, for the sheriff to have their bodies in court, &c. at the return of the writ. This writ ought to be delivered to the sheriff in such time, that he may warn the jury to appear four days before the writ is returnable, if the jurors live within forty miles of the place of trial; and eight days if they live farther off. There may be an alias, or pluries *distringas jur*, where the jury doth not appear. See *JURY*, and *TRIAL*.

DISTRUST, *v. a. & n. s.* } *Dis* and *trust*.
DISTRUSTFUL, *adj.* } To regard with
DISTRUSTFULLY, *adv.* } diffidence or sus-
DISTRUSTFULNESS. } picion; not to
 trust.

He sheweth himself unto such as do not *distrust* him.
Wisdom.

To me reproach
 Rather belongs, *distrust*, and all dispraise.
Milton.

Common swearing, if it have any serious meaning at all, argues in man a perpetual *distrust* of his own reputation, and is an acknowledgment that he thinks his bare word not to be worthy of credit.
Tillotson.

You doubt not me; nor have I spent my blood,
 To have my faith no better understood:
 Your soul's above the baseness of *distrust*;
 Nothing but love could make you so unjust.
Dryden.

Generals often harbour *distrustful* thoughts in their breasts.
Boyle.

How frequently is the honesty and integrity of a man disposed of, by a smile or a shrug;—how many good and generous actions have been sunk into oblivion by a *distrustful* look, or stamp with the imputation of proceeding from bad motives, by a mysterious and seasonable whisper.
Sterne.

DISTURB, *v. a. & n. s.* } Span. *disturbar*;
DISTURBANCE, *n. s.* } Ital. and Lat. *dis-*
DISTURBER, } *turbare*, from *dis-*
DISTURBED, *part. adj.* } expulsive, and *tur-*
bo to disorder, a *turba* a crowd. To perplex; disquiet; confound; interrupt; turn off attention, or aim. Milton uses *disturb* as a substantive for confusion or tumult, or synonymous with disturbance.

And thei seyng him walkinge on the see weren *disturbid* and seiden that it is a fantum.
Wiclif. Matt. 14.

He stands in the sight both of God and men most justly blameable, as a needless *disturber* of the peace of God's church, and an author of dissensions.

Hooker.

Where love reigns, *disturbing* jealousy
 Doth call himself affliction's sentinel;
 Gives false alarms, suggesteth mutiny,
 And in a peaceful hour doth cry, kill! kill!
Shakspeare.

Instant without *disturb* they took alarm,
 And onward move embattled.
Milton.

This mischief had not then befallen,
 And more that shall befall: innumerable
Disturbances on earth through female snares.
Id.

He that has his own troubles, and the happiness of his neighbours, to *disturb* him, has work enough.

Collier on Envy.

His youth with wants and hardships must engage;
 Plots and rebellions must *disturb* his age.
Prior.

Ye great *disturbers*, who in endless noise,
 In blood and horror, seek unnatural joys:
 For what is all this bustle, but to shun
 Those thoughts with which you dare not be alone?
Granville.

They can survey a variety of complicated ideas without fatigue or *disturbance*.
Watts.

Thrice round the grave Circea prints her tread,
 And chaunts the numbers which *disturb* the dead.
Darwin.

DISTUR'N, *v. a.* *Dis* and *turn*. To turn off; turn aside. Not in use.

He glad was to *disturn* that furious stream
 Of war on us, that else had swallowed them.
Daniel.

DISVAL'UE, *v. a.* } *Dis* and *value*. To
DISVALUA'TION, *n. s.* } estimate below worth;
 disgrace; diminution of reputation.

What can be more to the *devaluation* of the power of the Spaniard, than that eleven thousand English should have marched into the heart of his countries!
Bacon.

Her reputation was *disvalued*
 In levity. *Shakspeare. Measure for Measure.*

The very same pride which prompts a man to vaunt and overvalue what he is, does as forcibly incline him to condemn and *disvalue* what he has.

Gouverneur of the Tongue.

DISVE'LOP, *v. a.* Fr. *developper*. To uncover.

DISUNITE, *v. a. & n. s.* } *Dis* and *unite*.
DISUNITION, *n. s.* } To separate; di-
DISUNITY. } vide; part union.

While every particular member of the publick provides solely for itself, the several joints of the body politick do separate and *disunite*, and so become unable to support the whole.
South.

Disunity is the natural property of matter, which is nothing else but an infinite congeries of physical monads.
More.

Rest is most opposite to motion, the immediate cause of *disunion*.
Glanville's Sceptis.

Disunion of the corporeal principles, and the vital causeth death.
Grew's Cosmologia Sacra.

The strength of it will join itself to France, and grow the closer to it by its *disunion* from the rest.

Addison on the War.

The beast they then divide, and *disunite*
 The ribs, and limbs. *Pope's Gogarty.*

DISUSAGE, *n. s.* *Dis* and *usage*. The gradual cessation of use or custom.

They cut off presently such things as might be extinguished without danger, leaving the rest to be abolished by *disusage* through tract of time.

Hooker.

DISUSE, *v. a. & n. s.* *Dis* and *use*. To cease to make use of; to disaccustom: with *from* or *to*; more properly *from*.

Disuse me from the queasy pain

Of being beloved and loving.

Donne.

'Tis law, though custom now diverts the course:

As nature's institute is yet in force,

Uncancelled though *disused*.

Dryden's *Fables*.

The *disuse* of the tongue is the only effectual remedy against these.

Addison's *Guardian*.

That obligation upon the lands did not prescribe, or come into *disuse*, but by fifty consecutive years.

Arbuthnot.

DISVOUCH, *v. a.* *Dis* and *vouch*. To destroy the credit of; to contradict.

Every letter he hath writ hath *disvouched* another.

Shakespeare.

DISWITTED, *adj.* *Dis* and *wit*. Deprived of the wits; mad; distracted. A word not in use.

She ran away alone,

Which when they heard, there was not one

But hasted after to be gone,

As she had been *diswitted*. Drayton's *Nymphid*.

DIT, *n. s.* Dutch *dicht*. A ditty; a poem; a tune. Obsolete.

No bird but did her shrill notes sweetly sing;

No song but did contain a lovely dit.

Faerie Queene.

DITATION, *n. s.* Lat. *ditatus*. The act of enriching.

Those eastern worshippers intended rather homage than *ditation*; the blessed virgin comes in the form of poverty.

Hall's *Contemplations*.

DITCH, *n. s. & v. a.*

DITCH-DELIVERED, *part. adj.* } Gothic,

DITCH-DOG, *n. s.* } *digne*; Ice.

DITCH'ER. See } *diki*; Belg.

DIKE. The verb comes from the noun. Ditcher is one who makes ditches: the compounds of Shakespeare explain themselves.

In the great plagues there were seen, in divers *ditches* and low grounds about London, many toads that had tails three inches long.

Bacon.

The *ditches*, such as they were, were altogether dry, and easy to be passed over.

Knolles.

Poor Tom, when the foul fiend rages, eats cow-dung for sallets, swallows the old rat, and the *ditch-dog*.

Shakespeare.

Finger of birth-strangled babe,

Ditch-delivered by a drab.

Id.

To some men the wide seas are but narrow *ditches*, and the world itself too limited for their desires.

Burton.

You merit new employments daily,

Our thatcher, *ditcher*, gardener, bailly.

Swift.

I have employed my time, besides *ditching*, in finishing my travels.

Id.

Sudden the *ditches* swell, the meadows swim.

Thomson.

I have no more pleasure in hearing a man attempting wit, and failing, than in seeing a man trying to leap over a *ditch*, and tumbling into it.

Johnson.

Up again! for every warrior
Slain, another climbs the barrier.
Thicker grows the strife; thy *ditches*
Europe's mingling gore enriches.

Byron.

DITCH, in fortification, called also the foss and moat, is a trench dug round the rampart, or wall of a fortified place, between the scarp and counterscarp. Ditches are either dry or wet, that is, having water in them; both of which have their particular advantages. The earth dug out of the ditch serves to raise the rampart. The ditch in front should be of such breadth as that tall trees may not reach over it, being from twelve to twenty-four fathoms wide, and seven or eight feet deep. But the most general rule is, perhaps, that the dimensions of the ditch be such as that the earth dug out may be sufficient to build the rampart of a proper magnitude.

DITCH is a common fence in marshes, or other wet land, where there are no hedges. They allow these ditches six feet wide against high ways that are broad; and against commons, five feet. But the common ditches about enclosures, dug at the bottom of the bank on which the quick is raised, are three feet wide at the top, one at the bottom, and two feet deep. By this means each side has a slope, which is of great advantage; for where this is neglected, and the ditches dug perpendicular, the sides are always washing down, besides, in a narrow-bottomed ditch, if cattle get down into it, they cannot stand to turn themselves to crop the quick: but where the ditch is four feet wide, it should be two feet and a half deep; and where it is five feet wide, it should be three feet deep; and so in proportion.

DITHYRAMBICK, *n. s. & adj.* Lat. *dithyrambus*. A song in honor of Bacchus; in which among the Italians, the distraction of ebriety is still imitated. Wild; distracted.

Pindar does new words and figures roll
Down his impetuous *dithyrambick* tide.

Cowley.

DITHYRAMBICS were songs in honor of Bacchus, which first gave birth to dramatic representations, and are as ancient as the worship of Bacchus in Greece. Many of the most splendid exhibitions upon the stage, for the entertainment of the people of Athens and Rome, being performed upon the festivals of Bacchus, gave occasion to the calling all those that were employed in them, whether for singing, dancing, or reciting, servants of Bacchus. The *dithyrambus* owes its birth to Greece, and to the transports of wine. Horace and Aristotle tell us, that the ancients gave the name of *dithyrambus* to those verses wherein none of the common rules or measures were observed. As we have now no remains of the *dithyrambus* of the ancients, we cannot exactly tell what their measure was.

DITMARSEN, a district of Holstein, Denmark, separated from Sleswick on the north by the Eyder, and from Bremen on the south-west by the Elbe; and having Holstein Proper to the east, and the German Ocean to the west. It is marshy, and frequently inundated: yet by means of the internal navigation, a number of tracts have been drained, and are highly productive.

Its length is thirty-two miles, and its breadth twenty-seven. The chief towns are Meldorf and Lunden. It is fertile in corn and pasture.

DITONE, in music, an interval comprehending two tones. The proportion of the sounds that form the ditone is 4 : 5, and that of the semitone is 5 : 6.

DITRIHEDRIA, in mineralogy, a genus of spars with twice three sides, or six planes; being formed of two trigonal pyramids joined base to base, without any intermediate column. See SPAR. The species of ditrihedria are distinguished by the different figures of these pyramids.

DITTANDER, *n. s.* The same with pepperwort. See LEPIDIUM.

DITTANY, *n. s.* Lat. *dictamnus*.

Dittany hath been renowned, for many ages, upon the account of its sovereign qualities in medicines. It is generally brought over dry from the Levant.

Miller.

Virgil reports of *dittany*, that the wild goats eat it when they are shot with darts.

More's *Antidote against Atheism*.

DITTANY, BASTARD, a species of marrubium.

DITTANY, OF CRETE. See ORIGANUM.

DITTANY, WHITE. See DICTAMNUS.

DITTEAH, a town and fortress of Bundelcund, Hindostan, about a mile and a half long, and nearly as much in breadth. It is populous and well-built; the houses being chiefly of stone, and tiled. It is surrounded by a stone wall and gates. On an eminence, which overlooks a handsome lake, stands the rajah's palace. The surrounding district yields an annual revenue of between £12,000 and £15,000 sterling. This place is mentioned in early history, and the rajah, who is one of the British allies, boasts of its having belonged to his family for several centuries. During the reign of Aurenzebe, Ditteah was the capital of Dhoolput Roy, a Bondelah rajah of some celebrity.

DITTO, in books of accounts, usually written Do, signifies the aforementioned. The word is corrupted from the Italian *detto*, 'the said:' as in our law-phrase, 'the said premises,' meaning the same as were before-mentioned.

DITTY, *n. s.* } Sax. *tetit*; Swed. *dickt*;

DITTIED, *adj.* } Germ. and Dutch, *dicht*, from Goth. *tia* to show, or, according to Minsheu, from Lat. *dictum*, a thing said or delivered as an oration. A poem to be sung; a song. Adapted to music.

Although we lay altogether aside the consideration of *ditty* or matter, the very harmony of sounds being framed in due sort, and carried from the ear to the spiritual faculties of our souls, is by a native puissance and efficacy, greatly available to bring to a perfect temper whatsoever is there troubled. Hooker.

Being young, I framed to the harp

Many an English *ditty* lovely well,

And gave the tongue a helpful ornament.

Shakspeare.

Strike the melodious harp, shrill timbrels ring,
And to the warbling lute soft *ditties* sing. Sandys.

He, with his soft pipe, and smooth *dittied* song,
Well knows to still the wild winds when they roar.

Milton.

His annual wound in Lebanon, allured

The Syrian damsels to lament his fate,

In amorous *ditties*, all a summer's day? Id.

They will be sighing and singing under thy inexorable windows lamentable *ditties*, and call thee cruel. Dryden.

DIU, or **DIVIPA**, THE ISLAND, an island and harbour at the southern extremity of the Gujrat Peninsula, in lat. 20° 43' N., long. 71° E. The island is not above four miles long by one broad, but formerly contained a Hindoo temple, dedicated to Somnath, celebrated for its sanctity and riches. This was plundered in 1025 by sultan Mahmood of Ghizni, who sent the fragments of the image to Mecca and Medina. The Portuguese obtained possession of Diu in 1515, and were allowed by the sultan of Gujrat to fortify it, about twenty years after. In 1670, however, their establishment was surprised and plundered by the Muscut Arabs, and has since dwindled away. The island has a good port.

DIVAL, in heraldry, the herb nightshade, used by such as blazon by flowers and herbs, instead of colors and metals, for sable or black.

DIVALIA, in Roman antiquity, a feast held in honor of the goddess ANGERONA; also called ANGERONALIA. See these articles.

DIVAN, *n. s.* Arab. *deuan*; Turk. *dovan*, probably from Heb. דין, to judge. The council of Oriental princes: any council assembled.

Forth rushed in haste the great consulting peers,
Raised from the dark *divan*, and with like joy
Congratulant approached him. Milton.

Swift to the queen the herald Medon ran,
Who heard the consult of the dire *divan*.

Pope's *Odyssey*.

DIVAN, a court of justice among the eastern nations, particularly the Turks. The word signifies the same with sofa in the Turkish dialect. There are two sorts of divans; that of the grand signior, called the council of state, which consists of seven of the principal officers of the empire; and that of the grand vizier, composed of six other viziers, or counsellors of state, the chancellor, and secretaries of state, for the distribution of justice.

DIVANDUROW, the name of seven islands in the Indian Ocean, three miles north of the Maldives, and twenty-four from the coast of Malabar, almost opposite to Cananore.

DIVARICATE, *v. a. & v. n.* } Lat. *divari-*
DIVARICATION, *n. s.* } *catus*. To divide into two; to be parted into two; to become bifid. Divarication is, division into two or more.

To take away all doubt, or any probable *divarication*, the curse is plainly specified.

Brown's *Vulgar Errors*.

Dogs running before their masters, will stop at a *divarication* of the way, till they see which hand their masters will take. Ray.

A slender pipe is produced forward towards the throat, whereinto it is at last inserted, and is there *divaricated*, after the same manner as the spermatick vessels. Grew.

The partitions are strained across: one of them *divaricates* into two, and another into several small ones. Woodward.

DIVE, *v. a. & v. n.* } Sax. *ðippan*; Teut.
 Dr̄VER, *n. s.* } *tufan*; Ital. *toffo*, from
 Gr. *φύρω*, to dip. To explore by diving: as a
 neuter verb, to sink, or go under water;
 hence, to enter deeply into a question, or into
 business, and to go beyond sight or observation.

Dive, thoughts, down to my soul.

Shakespeare.

Sweet prince, the untainted virtue of your years
 Hath not yet *dived* into the world's deceit,
 Nor can distinguish.

Id. Richard III.

Crocodiles defend those pearls which lie in the
 lakes: the poor Indians are eaten up by them, when
 they *dive* for the pearl.

Raleigh's History.

I am not yet informed, whether, when a *diver* di-
 veth, having his eyes open, and swimmeth upon his
 back, he sees things in the air greater or less.

Bacon's Natural History.

The wits that *dived* most deep, and soared most
 high,

Seeking man's powers, have found his weakness: such.

Davies.

He would have him, as I conceive it, to be no su-
 perficial and floating artificer; but a *diver* into causes,
 and into the mysteries of proportion.

Wotton's Architecture.

He performs all this out of his own fund, without
diving into the arts and sciences for a supply.

Dryden.

Whosoever we would proceed beyond those simple
 ideas, and *dive* farther into the nature of things, we
 fall presently into darkness and obscurity.

Locke.

You should have *dived* into my inmost thoughts.

Philips.

Then Brutus, Rome's first martyr, I must name;
 The Curtii bravely *dived* the gulph of fame.

Denham.

Perseverance gains the *diver's* prize.

Pope's Dunciad.

That the air in the blood-vessels of live bodies has
 a communication with the outward air, I think, seems
 plain, from the experiments of human creatures being
 able to bear air of much greater density in *diving*, and
 of much less upon the tops of mountains, provided
 the changes be made gradually.

Arbuthnot.

But *dive* into this subject as deep as thou canst.
 Examine thyself; and this knowledge of that which
 passes within thee will be of more use to thee than
 the knowledge of all that passes in the world.

Mason.

Led by the sage, Lo! Britain's sons shall guide
 Huge sea-balloons beneath the tossing tide;
 The *diving* castles, roofed with spheric glass,
 Ribbed with strong oak, and barred with bolts of
 brass.

Dorwin.

To be the Table Talk of clubs up stairs,
 To which th' unwashed artificer repairs,
 To indulge his genius after long fatigue,
 By *diving* into cabinet intrigue.

Couper.

DIVER, in ornithology. See COLYMBUS.

DIVING, the art or act of descending under
 water to considerable depths, and remaining there
 for some time. The uses of diving are very
 considerable, particularly in the fishing for
 pearls, corals, sponges, &c. Various methods
 have been proposed, and machines contrived, to
 render the business of diving more safe and easy.
 The great point is to furnish the diver with fresh
 air; without which he must either make a short
 stay under water or perish. Those who dive for
 sponges in the Mediterranean, assist themselves
 by carrying down sponges dipt in oil in their
 mouths. But considering the small quantity of

air that can be contained in the pores of the
 sponge, and how much that little will be con-
 tracted by the pressure of the incumbent water
 such a supply cannot long maintain the respi-
 ration of the diver. It is found by experiment,
 that a gallon of air included in a bladder, and
 by a pipe reciprocally inspired and expired by
 the lungs, becomes unfit for respiration in little
 more than one minute: for though its elasticity
 be but little altered in passing the lungs, yet it
 loses its vivifying spirit, and is rendered effete.
 A naked diver, Dr. Halley assures us, without a
 sponge, cannot remain above a couple of minutes
 enclosed in water, nor much longer with one,
 without suffocating; nor, without long practice,
 near so long: persons not accustomed to dive,
 beginning to be stifled in about half a minute.
 Hence, where there has been occasion to continue
 long at the bottom, some have contrived double
 flexible pipes, to circulate air down into a cavity,
 enclosing the diver as with armour, both to fur-
 nish air and to bear off the pressure of the water,
 as well as to give room to his breast to dilate
 upon inspiration; the fresh air being forced down
 one of the pipes with bellows, and returning by
 the other. But this method is impracticable when
 the depth surpasses three fathoms; the water
 embracing the bare limbs so closely as to obstruct
 the circulation of the blood in them; and pres-
 sing so strongly on all the junctures where the
 armour is made tight with leather, that, if there
 be the least defect in any of them, the water
 rushes in, and instantly fills the whole engine, to
 the great danger of the diver's life. People being
 accustomed to the water from their infancy, will
 however at length be enabled, not only to stay
 much longer under water than the time above
 mentioned, but put on a kind of amphibious
 nature, so that they seem to have the use of all
 their faculties as well when their bodies are im-
 mersed in water as when on dry land. Most
 savage nations are remarkable for this. The
 inhabitants of the South Sea islands are such
 expert divers, that, when a nail or any piece of
 iron is thrown overboard, they instantly jump
 into the sea after it, and never fail to recover it,
 notwithstanding the quick descent of the metal.
 Even among civilized nations, many persons
 have been found capable of continuing an incre-
 dible length of time below water. The most
 remarkable instance of this kind is the famous
 Sicilian diver Nicolo Pesce. See PESCE.

To obviate the inconveniences of diving dif-
 ferent instruments have been contrived, of
 which the chief is the diving bell. The com-
 mon bell is made in form of a truncated cone,
 the smaller base being closed, and the larger
 open. It is poised with lead; and so sus-
 pended, that the vessel may sink full of air, with
 its open basis downward, and as near as may
 be in a situation parallel to the horizon, so as to
 close with the surface of the water all at once.
 Under this coverlet the diver sitting, sinks down
 with the included air to the depth desired: and
 if the cavity of the vessel can contain a tun of
 air, a single man may remain a full hour, with-
 out much inconvenience, at five or six fathoms
 depth. But the lower he goes, the more the
 included air contracts itself, according to the

DIVING BELL.

weight of the water, which compresses it; so that at thirty-three feet deep the bell becomes half full of water, the pressure of the incumbent water being then equal to that of the atmosphere; and at all other depths the space occupied by the compressed air in the upper part of the bell will be to the under part of its capacity filled with water as thirty-three feet to the surface of the water in the bell below the common surface of it. One inconvenience that attends this condensed air is found in the ears, within which there are cavities which open only outwards, and that by pores so small as not to give admission even to the air itself, unless they be dilated and distended by a considerable force. Hence, on the first descent of the bell, a pressure begins to be felt on the ear; which, by degrees, grows painful, till, the force overcoming the obstacle, what constricts these pores yields to the pressure, and, letting condensed air slip in, ease presently ensues. The bell descending lower, the pain is renewed, and again eased in the same manner. But the greatest inconvenience of this engine is, that the water entering it, contracts the bulk of air into so small a compass, that it soon heats and becomes unfit for respiration, so that there is a necessity for its being drawn up to recruit it; besides the uncomfortable situation of the diver almost covered with water.

To obviate the difficulties of the foregoing kind of diving bell, Dr. Halley contrived further apparatus, whereby not only to recruit and refresh the air from time to time, but also to keep the water wholly out of it at any depth. The manner in which this was effected, he relates in the following words:—‘The bell I made use of was of wood, containing about sixty cubic feet in its concavity, and was of the form of a truncated cone, whose diameter at the top was three feet and at the bottom five. This I coated with lead so heavy that it would sink empty; and I distributed the weight so about its bottom, that it would go down in a perpendicular direction, and no other. In the top I fixed a strong but clear glass, as a window, to let in the light from above, and likewise a cock to let out the hot air that had been breathed; and below, about a yard under the bell, I placed a stage which hung by three ropes, each of which was charged with about 100 weight to keep it steady. This machine I suspended from the mast of a ship by a sprit, which was sufficiently secured by stays to the mast head, and was directed by braces to carry it overboard clear of the ship’s side, and to bring it again within board as occasion required. To supply air when under water, I caused a couple of barrels, of about thirty-six gallons each, to be cased with lead, so as to sink empty, each of them having a bung-hole in its lowest part to let in the water, as the air in them condensed on their descent; and to let it out again when they were drawn up full from below. And to a hole in the uppermost part of these barrels I fixed a leathern trunk or hose, well liquored with bees’ wax and oil, and long enough to fall below the bung-hole, being kept down by a weight appended: so that the air in the upper part of the barrels could not escape unless the lower ends of these hose were first lifted up. The air-barrels

being thus prepared, I fitted them with tackle proper to make them rise and fall alternately, after the manner of two buckets in a well, which was done with so much ease, that two men, with less than half their strength, could perform all the labor required: and in their descent they were directed by lines fastened to the under edge of the bell, which passed through rings on both sides the leathern hose in each barrel; so that, sliding down by these lines, they came readily to the hand of a man who stood on the stage on purpose to receive them, and to take up the ends of the hose into the bell. Through these hose, as soon as their ends came above the surface of the water in the barrels, all the air that was included in the upper parts of them was blown with great force into the bell; whilst the water entered at the bung-holes below, and filled them: and as soon as the air of one barrel had been thus received, upon a signal given, that was drawn up, and at the same time the other descended; and, by an alternate succession, furnished air so quick, and in so great plenty, that I myself have been one of five who have been together at the bottom in nine or ten fathom water, for above an hour and a half at a time, without any ill consequence: and I might have continued there as long as I pleased, for any thing that appeared to the contrary. Besides, the whole cavity of the bell was kept entirely free from water, so that I sat on a bench which was diametrically placed near the bottom, wholly dressed, with all my clothes on. I only observed that it was necessary to be let down gradually at first, as about twelve feet at a time, and then to stop and drive out the water that entered, by receiving three or four barrels of fresh air before I descended further. But being arrived at the depth designed, I then let out as much of the hot air that had been breathed, as each barrel would replenish with cool, by means of the cock at the top of the bell; through whose aperture, though very small, the air would rush with so much violence, as to make the surface of the sea boil, and to cover it with a white foam, notwithstanding the weight of the water over us. Thus I found that I could do any thing that required to be done just under us; and that, by taking off the stage, I could, for a space as wide as the circuit of the bell, lay the bottom of the sea so far dry as not to be overshoes thereon. And, by the glass window, so much light was transmitted, that when the sea was clear, and especially when the sun shone, I could see perfectly well to write or read; much more to fasten or lay hold on any thing under us that was to be taken up. And, by the return of the air barrels, I often sent up orders, written with an iron pen on small plates of lead, directing how to move us from place to place, as occasion required. At other times, when the water was troubled and thick, it would be as dark as night below; but in such cases I have been able to keep a candle burning in the bell as long as I pleased, notwithstanding the great expense of air necessary to maintain flame. By an additional contrivance, I have found it not impracticable for a diver to go out of an engine to a good distance from it, the air being conveyed to him with a continued

stream, by small flexible pipes; which pipes may serve as a clue to direct him back again when he would return to the bell.' Plate, DIVING BELLS, fig. 1, shows Dr. Halley's diving bell. D B L R M represents the body of the bell; D, the glass which serves as a window. B, the cock for letting out the air which has been breathed. L M, the seats. C, one of the air barrels. H, another diver at a distance from the bell, and breathing through the flexible tube F P, of which F is a stop-cock, which I can turn at pleasure to prevent the air being forced back into the oell by the pressure of the water when he stoops below the mouth of the bell. This diver is supposed to have a head-piece of lead, made to fit quite close about his shoulders: this head-piece was capable of containing as much air as would supply him for a minute or two.

Mr. Triewald, F.R.S., military architect to the king of Sweden, invented a diving bell, fig. 2, which, for a single person, is thought to be more eligible than Dr. Halley's, and is constructed as follows:—A B is the bell, which is sunk by lead weights D D, hung to its bottom. This bell is of copper, tinned all over in the inside, which is illuminated by two strong convex lenses, G, G, with copper lids, H, H, to defend them. The iron plate, E, serves the diver to stand on when he is at work; and is suspended at such a distance from the bottom of the bell, by the chains F F, that when the diver stands upright his head is just above the water in the bell, where the air is much better than higher up, because it is colder, and consequently more fit for respiration. But as the diver must always be within the bell, and his head of course in the upper part, the inventor has contrived, that even there, when he has breathed the hot air as long as he can, he may, by means of a spiral copper tube, f b c b c, placed close to the inside of the bell, draw the cooler and fresher air from the lower parts.

But the greatest improvement which the diving bell has received was from the late Mr. Spalding, of Edinburgh. A section of his improved diving bell is represented in fig. 3. This construction is designed to remedy some inconveniences of Dr. Halley's, which are very evident, and of very dangerous tendency. By Dr. Halley's construction, the sinking or raising of the bell depends entirely on the people who are at the surface of the water; and as the bell, even when in the water, has a very considerable weight, the raising it not only requires a great deal of labor, but there is a possibility of the rope breaking by which it is raised, and thus every person in the bell would inevitably perish. And as there are, in many places of the sea, rocks which lie at a considerable depth, the figure of which cannot possibly be perceived from above, there is danger that some of their ragged prominences may catch hold of one of the edges of the bell in its descent, and thus upset it before any signal can be given to those above, which would infallibly be attended with the destruction of the people in the bell: and as it must always be unknown, before trial, what kind of a bottom the sea has in any place, it is plain that, without some contrivance to obviate this last danger, the descent

in Dr. Halley's diving bell is not at all eligible. How these inconveniences are remedied by Spalding's construction will be easily understood from the following description.—A B C D represents a section of the bell, which is made of wood; e, e, are iron hooks, by means of which it is suspended by ropes Q B F e, and Q A E R e, and Q S, as expressed in the figure: c, c, are iron hooks, to which are appended lead weights, that keep the mouth of the bell always parallel to the surface of the water, whether the machine, taken altogether, is lighter or heavier than an equal bulk of water. By these weights alone, however, the bell would not sink: another is therefore added, represented at L, and which can be raised or lowered at pleasure, by means of a rope passing over the pulley u, and fastened to one of the sides of the bell at M. As the bell descends, this weight, called the balance weight, hangs down a considerable way below the mouth of the bell. In case the edge of the bell is caught by any obstacle, the balance weight is immediately lowered down so that it may rest upon the bottom. by this means the bell is lightened so that all danger of oversetting is removed; for being lighter, without the balance weight, than an equal bulk of water, it is evident that the bell will rise, as far as the length of the rope affixed to the balance weight will allow it. This weight therefore will serve as a kind of anchor to keep the bell at any particular depth which the divers may think necessary; or, by pulling it quite up, the descent may be continued to the very bottom. By another very ingenious contrivance, Mr. Spalding rendered it possible for the divers to raise the bell, with all the weights appended to it, even to the surface, or to stop at any particular depth, as they think proper; and thus they could still be safe, even though the rope designed for pulling up the bell was broke. For this purpose the bell is divided into two cavities, both of which are made as tight as possible. Just above the second bottom, E F, are small slits in the sides of the bell; through which the water, entering as the bell descends, displaces the air originally contained in this cavity, which flies out at the upper orifice of the cock H. When this is done, the divers stop the cock; so that if any more air was to get into the cavity A E F B, it could no longer be discharged through the orifice H as before. When this cavity is full of water the bell sinks; but when a considerable quantity of air is admitted it rises. It therefore the divers have a mind to raise themselves, they turn the cock V, by which a communication is made between the upper and under cavities of the bell. The consequence of this is, that a quantity of air immediately enters the upper cavity, forces out a quantity of the water contained in it, and thus renders the bell lighter by the whole weight of the water which is displaced. Thus, if a certain quantity of air is admitted into the upper cavity, the bell will descend very slowly; if a greater quantity, it will neither ascend nor descend, but remain stationary; and if a larger quantity of air is still admitted, it will arise to the top. It is to be observed, however, that the air which is thus let out into the upper cavity must be immediately supplied from the air-barrel; from which the air is to be let

out very slowly, or the bell will rise to the top with so great velocity, that the divers will be in danger of being shaken out of their seats. But, by following these directions, every possible accident may be prevented, and people may descend to great depths without the least apprehension of danger. The bell also becomes so easily manageable in the water, that it may be conducted from one place to another by a small boat with the greatest ease, and with perfect safety to those who are in it. Instead of wooden seats used by Dr. Halley, Mr. Spalding made use of ropes suspended by hooks *b, b, b*; and, on these ropes, the divers may sit without any inconvenience. *K K* are two windows made of thick strong glass, for admitting light to the divers. *N* represents an air-cask with its tackle, and *O C P* the flexible pipe through which the air is admitted to the bell. In the ascent and descent of this cask, the pipe is kept down by a small weight appended, as in Dr. Halley's machine. *R* is a small cock by which the hot air is discharged as often as it becomes troublesome.

A considerable modern improvement is that of supplying air to a diving-bell, by means of a syringe or pump, which forces the air down in a continual stream into the bell, whence it escapes from beneath the lower edges of the bell, or from a waste pipe, as fast as it is supplied. In this way the air is kept very pure, and the people in the bell have no kind of trouble to obtain a supply. Mr. Smeaton was the first who put in practice the method to which we allude, though it had been frequently proposed by other inventors. His first attempt was in 1786, in shallow water, the bell being only intended to enable workmen to examine and repair the foundations of a bridge at Hexham, in Northumberland.

Mr. Smeaton, a few years afterwards, constructed another bell upon the same principle, for the works at Ramsgate harbour. It was used to raise up large stones, which had formerly been thrown into the sea around the base of the pier.

The bell was made of cast iron, of sufficient weight to sink without any extra ballast. In the top were lenses for the admission of light, and a strong shackle for the chain by which the bell was suspended. A strong leathern pipe was connected with the top of the bell, to convey air into it from an air-pump placed either in a boat or on the shore.

This kind of diving-bell has since been applied to the purposes of building foundations of masonry in deep water, under the direction of the late Mr. Rennie, who constructed machinery to move the bell under water in any direction, and which acts with such facility, that the masons in the bell make great despatch in laying the stones. It was used in Plymouth Sound to sweep the bottom for old anchors, &c. At Houth, in Dublin county, Ireland, the foundations for the pier were wholly laid by this machine. In many parts the rocky bottom was too uneven to work upon, and it was then necessary to blast it with powder. The divers bored the hole in the rock, and placed the powder in a tin cartridge, which was well secured in the hole, by running in small fragments of stone. A small tin pipe

was affixed to the canister, long enough to reach above the surface of the water. When all was prepared, the bell was drawn up out of the way, and a nail or other small piece of iron heated red hot, was dropped into the tin pipe, thereby to descend to the powder.

As the diving bell is, however, in any stage of improvement, necessarily very large and unwieldy, several attempts have been made to encase a man sufficiently to enable him to breathe and bear the pressure of the water. Among these the most successful is that of Klingert of Breslau, which is made of strong tin plate, in the form of a cylinder, which goes over the diver's head, and which consists of two parts, that he may conveniently thrust his arms through it and put it on; also a jacket with short sleeves, and drawers of strong leather. All these being water-tight, and closely jointed round the body of the diver, secure every part of him, but his arms and legs, from the pressure of the water, which, at the depth of twenty feet, will occasion no inconvenience to these parts. Plate, DIVING BELLS, &c., fig. 4, represents the diver covered with the harness and drawers. Figs. 5 and 6 are representations of the cylinder, the diameter of which is equal to the breadth of a man at the top of the hipbone. It is fifteen inches in height, has a globular top, and is made of the strongest tin plate. In the inside of the cylinder, at *a*, is a strong broad iron hoop, to enable it to withstand better the pressure of the water; and in the inside of the top there are two pieces of a strong hoop of the same kind, placed over each other in the form of a cross at *b*; a strong ring of brass wire is soldered upon the outside at *c*, that the jacket may be fastened to it with an elastic bandage, to prevent it from slipping downwards; at *d d* are the upper halves of the apertures for the arms; and *e, e*, are holes to afford light, and into which the eye-glasses are screwed: *f* is the opening into which the mouth-piece of the breathing-pipe is screwed, and *g* is an aperture for looking through, as well as for the purpose of breathing when out of the water, and which, by means of the cover *h* suspended from it, can be screwed up before the diver enters the water.

The lower part of the cylinder, which is also fifteen inches in height, is strengthened at *i* and *k* by iron hoops on the inside, in the same manner as the former. To the lower hoop *k* are soldered four small rings, to which are fastened strong leather straps, three inches in breadth, that can be buckled across over the shoulder, and support the whole machine; *l, l*, are the under halves of the apertures for the arms; *m* is also a ring of brass wire soldered to the cylinder, which serves to keep fast the jacket when buckled on, and to support the upper cylinder *d d b*, which slips over the under one; and on that account the under one is a little smaller, so as to fit into the upper one: there is also another such ring at *n*, in order to prevent the drawers from falling down.

At *o* is a strong semicircular piece of iron, the use of which is to prevent the drawers, when pressed by the water, from touching the under part of the body, otherwise the pressure, even at the depth of six feet, would be insupportable. As it is not possible to sew the leather so closely

as to prevent water from forcing its way through the seams, a small pump is suspended at *p* for the purpose of pumping out the water, when it has risen to the height of a few inches in the lower cylinder. Four hooks, *q, q, q, q*, soldered to the lower part of the cylinder, are for the purpose of suspending weights from them.

The jacket *r* (fig. 4), with short sleeves that cover the upper part of the arms, serves to prevent the water from penetrating through the joining of the cylinders where the one is inserted into the other, as also through the holes for the arms, as it is bound fast round both parts of the cylinder, and likewise round the arms. The case is the same with the drawers, which are bound close round the knees.

Fig. 7 represents a brass elastic bandage, employed for fastening on the jacket; and which, when hooked together, is screwed fast by means of the screw *s*, three inches in length; a brass bandage is here used, because leather is apt to stretch, and on that account might be dangerous.

The reservoir *a* (fig. 4), applied in such a manner that it can be screwed off, is for the purpose of collecting the small quantity of water that might force itself into the breathing pipe when long used, and which otherwise would be in continual motion, and render breathing disagreeable.

A man, named Frederick William Joachim, a huntsman by profession, dived in the above apparatus into the Oder, near Breslau, where the water is of considerable depth, and the current strong, on the 24th of June, 1797, before a great number of spectators, and sawed through the trunk of a tree which was lying at the bottom.

THE DIVING BLADDER is a machine invented by Borelli, and by him preferred, though without much reason, to the diving bell. It is a globular vessel of brass or copper, about two feet in diameter, which contains the diver's head. It is fixed to a goat's skin habit exactly fitted to his person. Within the vessel are pipes, by means of which a circulation of air is contrived; and the person carries an air-pump by his side, by which he can make himself heavier or lighter as fishes do, by contracting or dilating their air bladder. By these means he thought all the objections to which other diving machines are liable were entirely obviated, and particularly that of want of air; the air which had been breathed, being, as he imagined, deprived of its noxious qualities by circulating through the pipes. These advantages, however, it is evident, are only imaginary. The diver's limbs, being defended from the pressure of the water only by a goat's skin, would infallibly be crushed if he descended to any considerable depth; and, from the discoveries now made, by Dr. Priestley and others, it is abundantly evident, that air, which is once rendered foul by breathing, cannot, in any degree, be restored by circulation through pipes.

The following description of a DIVING-VESSEL, invented by Mr. Bushnell, of Connecticut, is given in the Philosophical Transactions of America:—The external shape of the sub-marine vessel bore some resemblance to two upper tortoise-shells, of equal size, joined together; the place of entrance into the vessel being represented by the opening made by the swell of the

shells, at the head of the animal. The inside was capable of containing the operator, and air sufficient to support him thirty minutes, without receiving fresh air. At the bottom, opposite to the entrance, was fixed a quantity of lead for ballast. At one edge, which was directly before the operator, who sat upright, was an oar for rowing forward or backward. At the other edge was a rudder for steering. An aperture, at the bottom, with its valve, was designed to admit water, for the purpose of descending; and two brass forcing-pumps served to eject the water within, when necessary for ascending. At the top there was likewise an oar for ascending or descending, or continuing at any particular depth. A water-gauge, or barometer, determined the depth of descent, a compass directed the course, and a ventilator within supplied the vessel with fresh air, when on the surface.

The entrance into the vessel was elliptical, and so small as barely to admit a person. This entrance was surrounded with a broad elliptical iron band, the lower edge of which was let into the wood, of which the body of the vessel was made, in such a manner as to give its utmost support to the body of the vessel against the pressure of the water. Above the upper edge of this iron band there was a brass crown, or cover, resembling a hat with its crown and brim, which shut water-tight upon the iron band; the crown was hung to the iron band with hinges, so as to turn over sideways when opened. To make it perfectly secure when shut, it might be screwed down upon the band by the operator, or by a person without.

There were in the brass crown three round doors, one directly in front, and one on each side, large enough to put the hand through. When open, they admitted fresh air; their shutters were ground perfectly tight into their places with emery, hung with hinges, and secured in their places when shut. There were likewise several small glass windows in the crown for looking through, and for admitting light in the day-time, with covers to secure them. There were two air-pipes in the crown. A ventilator within drew fresh air through one of the air-pipes, and discharged it into the lower part of the vessel; the fresh air introduced by the ventilator expelled the impure light air through the other air-pipe. Both air-pipes were so constructed, that they shut themselves whenever the water rose near their tops, so that no water could enter through them, and opened themselves immediately after they rose above the water.

The vessel was chiefly filled with lead fixed to its bottom; when this was sufficient, a quantity was placed within, more or less, according to the weight of the operator; its ballast made it so stiff, that there was no danger of upsetting. The vessel, with all its appendages, and the operator, was sufficient to settle it very low in the water. About 200 lbs. of the lead, at the bottom for ballast, would be let down forty or fifty feet below the vessel; this enabled the operator to rise instantly to the surface of the water, in case of accident.

When the operator would descend, he placed his foot on the top of a brass valve, depressing

it, by which he opened a large aperture in the bottom of the vessel, through which the water entered at his pleasure; when he had admitted a sufficient quantity, he descended very gradually; if he admitted too much, he ejected as much as was necessary to obtain an equilibrium, by the two brass forcing-pumps, which were placed at each hand. Whenever the vessel leaked, or he would ascend to the surface, he also made use of these forcing-pumps. When the skilful operator had obtained an equilibrium, he could row upward, or downward, or continue at any particular depth, with an oar, placed near the top of the vessel, formed upon the principle of the screw, the axis of the oar entering the vessel; by turning the oar one way, he raised the vessel, by turning it the other way he depressed it.

A glass tube, eighteen inches long, and one inch in diameter, standing upright, its upper end closed, and its lower end, which was open, screwed into a brass pipe, through which the external water had a passage into the glass tube, served as a water-gauge, or barometer. There was a piece of cork, with phosphorus on it, put into the water-gauge. When the vessel descended, the water rose in the water-gauge, condensing the air within, and bearing the cork, with its phosphorus, on its surface. By the sight of the phosphorus, the ascent of the water in the gauge was rendered visible, and the depth of the vessel under water ascertained by a graduated line.

An oar, formed upon the principle of the screw, was fixed in the fore part of the vessel; its axis entered the vessel, and being turned one way, rowed the vessel forward, but being turned the other way, rowed it backward; it was made to be turned by the hand or foot.

A rudder, hung to the hinder part of the vessel, commanded it with the greatest ease. The rudder was made very elastic, and might be used for rowing forward. Its tiller was within the vessel, at the operator's right hand, fixed, at a right angle, on an iron rod, which passed through the side of the vessel; the rod had a crank on its outside end, which commanded the rudder, by means of a rod extending from the end of the crank to a kind of tiller, fixed upon the left hand of the rudder. Raising and depressing the first-mentioned tiller, turned the rudder as the case required.

A compass, marked with phosphorus, directed the course, both above and under the water; and a line and lead sounded the depth when necessary.

The internal shape of the vessel, in every possible section of it, verged towards an ellipsis, as near as the design would allow, but every horizontal section, although elliptical, yet as near to a circle as could be admitted. The body of the vessel was made exceedingly strong; and to strengthen it as much as possible, a firm piece of wood was framed, parallel to the conjugate diameter, to prevent the sides from yielding to the great pressure of the incumbent water, in a deep immersion. This piece of wood was also a seat for the operator.

Every opening was well secured. The pumps had two sets of valves. The aperture at the bottom, for admitting water, was covered with a

plate, perforated full of holes, to receive the water, and prevent any thing from choking the passage, or stopping the valve from shutting. The brass valve might likewise be forced into its place with a screw, if necessary. The air-pipes had a kind of hollow sphere, fixed round the top of each, to secure the air-pipe valves from injury; these hollow spheres were perforated full of holes, for the passage of the air through the pipes; within the air-pipes were shutters to secure them, should any accident happen to the pipes, or the valves on their tops.

Wherever the external apparatus passed through the body of the vessel, the joints were round, and formed by brass pipes, which were driven into the wood of the vessel; the holes through the pipes were very exactly made, and the iron rods, which passed through them, were turned in a lathe to fit them; the joints were also kept full of oil, to prevent rust and leaking. Particular attention was given to bring every part, necessary for performing the operations, both within and without the vessel, before the operator, and as conveniently as could be devised; so that every thing might be found in the dark, except the water gauge and the compass, which were visible by the light of the phosphorus, and nothing required the operator to turn to the right hand, or to the left, to perform any thing necessary.

Description of a magazine, and its appendages, designed to be conveyed, by the submarine vessel, to the bottom of a ship:—In the fore part of the brim of the crown of the submarine vessel was a socket, and an iron tube, passing through the socket; the tube stood upright, and could slide up and down in the socket, six inches; at the top of the tube was a wood-screw, fixed by means of a rod, which passed through the tube, and screwed the wood-screw fast upon the top of the tube. By pushing the wood-screw up against the bottom of a ship, and turning it at the same time, it would enter the planks; driving would also answer the same purpose: when the wood-screw was firmly fixed, it could be cast off by unscrewing the rod, which fastened it upon the top of the tube.

Behind the sub-marine vessel was a place, above the rudder, for carrying a large powder-magazine; this was made of two pieces of oak timber, large enough, when hollowed out, to contain 150 lbs. of powder, with the apparatus used in firing it, and was secured in its place by a screw, turned by the operator. A strong piece of rope extended from the magazine to the wood-screw above-mentioned, and was fastened to both. When the wood-screw was fixed, and to be cast off from its tube, the magazine was to be cast off likewise by unscrewing it, leaving it hanging to the wood-screw; it was lighter than the water, that it might rise up against the object to which the wood-screw and itself were fastened.

Within the magazine was an apparatus, constructed to run any proposed length of time, under twelve hours; when it had run out its time, it unpinioned a strong lock, resembling a gun-lock, which gave fire to the powder. This apparatus was so pinioned, that it could not possibly move, till, by casting off the magazine from the vessel, it was set in motion.

The skilful operator could swim so low on the surface of the water, as to approach very near a ship, in the night, without fear of being discovered, and might, if he chose, approach the stem or stern above water, with very little danger. He could sink very quickly, keep at any depth he pleased, and row a great distance in any direction he desired, without coming to the surface; and, when he rose to the surface, he could soon obtain a fresh supply of air, when, if necessary, he might descend again, and pursue his course.

The first experiment made was with about two ounces of gunpowder, which were exploded four feet under water, to prove to some of the first personages in Connecticut that powder would take fire under water.

The second experiment was made with two pounds of powder, enclosed in a wooden bottle, and fixed under a hoghead, with a two-inch oak plank between the hoghead and the powder; the hoghead was loaded with stones as deep as it could swim; a wooden pipe descending through the lower head of the hoghead, and through the plank, into the powder contained in the bottle, was primed with powder. A match put to the priming exploded the powder, which produced a very great effect, rending the plank into pieces, demolishing the hoghead, and casting the stones and the ruins of the hoghead, with a body of water, many feet into the air, to the astonishment of the spectators. This experiment was likewise made for the satisfaction of the gentlemen above-mentioned.

There were afterwards made many experiments of a similar nature, some of them with large quantities of powder; they all produced very violent explosions, much more than sufficient for any purpose had in view.

In the first essays with the sub-marine vessel, the inventor took care to prove its strength to sustain the great pressure of the incumbent water, when sunk deep, before he trusted any person to descend much below the surface; and he never suffered any person to go under water without having a strong piece of rigging made fast to it, until he found him well acquainted with the operations necessary for his safety. After that, he made him descend, and continue at particular depths, without rising or sinking, row by the compass, approach a vessel, go under her, and fix the wood-screw, mentioned before, into her bottom, &c., until he thought him sufficiently expert to put any design in execution.

It required many trials to make a person of common ingenuity a skilful operator; the first employed was very ingenious, and made himself master of the business, but was taken sick in the campaign of 1776, at New York, before he had an opportunity to make use of his skill, and never recovered his health sufficiently afterwards.

Experiments made with a sub-marine vessel. After various attempts to find an operator to his wish, Mr. Bushnell sent one, who appeared more expert than the rest, from New York, to a fifty-gun ship, lying not far from Governor's Island. He went under the ship, and attempted to fix the wood-screw into her bottom, but struck, as

he supposed, a bar of iron, which passes from the rudder-hinge, and is spiked under the ship's quarter. Had he moved a few inches, which he might have done, without rowing, he would probably have found wood where he might have fixed the screw; or, if the ship were sheathed with copper, he might easily have pierced it: but not being well skilled in the management of the vessel, in attempting to move to another place, he lost the ship; after seeking her in vain, for some time, he rowed some distance, and rose to the surface of the water, but found day-light had advanced so far, that he durst not renew the attempt. The adventurer said he could easily have fastened the magazine under the stem of the ship, above water, as he rowed up to the stern, and touched it before he descended. Had he fastened it there, the explosion of 150 lbs. of powder, the quantity contained in the magazine, must have been fatal to the ship. In his return from the ship to New York, he passed near Governor's Island, and thought he was discovered by the enemy on the island; being in haste to avoid the danger he feared, he cast off the magazine, as he imagined it retarded him in the swell, which was very considerable. After the magazine had been cast off one hour, the time the internal apparatus was set to run, it blew up with great violence.

Afterwards, there were two attempts made in Hudson's river, above the city, but they effected nothing. Mr. Fulton, we believe, afterwards improved on this machine in England, but the attempts to use it proved equally abortive.

DIVERGE, *v. n.* } *Lat. divergo.* To tend
DIVERGENT, *adj.* } various ways from one point.

Homogeneal rays, which flow from several points of any object, and fall perpendicularly on any reflecting surface, shall afterwards *diverge* from so many points. *Newton.*

Thus when the mother-bird on moss-wove nest
Lulls her fond brood beneath her plumpy breast
Warmth from her tender heart diffusive springs
And charmed she shields them with *diverging* wings.
Darwin.

DIVERGENT, or DIVERGING LINES, in geometry, are those which constantly recede from each other. They are opposed to convergent, or converging lines, whose distances continually approach nearer to each other, and become still less and less. Those lines which converge the one way, *diverge* the other.

DIVERGENT RAYS, in optics, are those which, going from a point of the visible object, are dispersed, and continually depart one from another, in proportion as they are removed from the object: in which sense it is opposed to convergent. See OPTICS.

DIVERS, *adj.* *Lat. diversus.* Several; sundry; more than one. Out of use.

We have *divers* examples in the church of such as, by fear, being compelled to sacrifice to strange gods, repented, and kept still the office of preaching the gospel. *Whitgift.*

The teeth breed when the child is a year and a half old: then they cast them, and new ones come about seven years; but *divers* have backward teeth come at twenty, some at thirty and forty.

Bacon's Natural History.

Time travels in *divers* paces with *divers* persons.
I'll tell you who time ambles withal, who time trots
withal, who time gallops withal, and who he stands
still withal. *Shakespeare.*

DIVERSE', v. n. & adj. } Lat. *diversus*. See
DIVERS'ITY, n. s. } **DIVERSIFY.** To
DIVERSE'LY, adv. } differ: different; in
various directions. Diversity, is dissimilitude;
variety; distinct existence. Diversely, differently;
variously.

A nothir clerenesse is of the sunne, a nothir clere-
nesse of the moone, and a nothir clerenesse is of
sterres, and a sterre *diversith* fro a sterre in clerenesse.

Wiclif. 1 Cor. 15.

Mi britheren, deme al ioie whanne ye fallen into
dyvurs temptacions. *Id. James 4.*

Four great beasts came up from the sea, *diverse* one
from another. *Dan. vii. 3.*

And for there is so grette *diversite*

In English and in writing of our tonge
So prais I to God, that none misurte the
Ne the misse-metre for defaute of tonge.

Chawcer. Troilus and Cressida.

Then is there in this *diversity* no contrariety.

Hooker.

But yet their various and perplexed course,
Observed in *diverse* ages, doth enforce
Men to find out so many eccentric parts,
Such *diverse* downright lines, such overthwarts
As disproportion that pure form. *Donne.*

Both of them do *diversely* work, as they have their
medium *diversely* disposed. *Bacon's Natural History.*

Leicester bewrayed a desire to plant him in the
queen's favour, which was *diversely* interpreted by such
as thought that great artizan of courts to do nothing
by chance, nor much by affection. *Wotton.*

Eloquence is a great and *diverse* thing, nor did she
yet ever favour any man so much as to be wholly his.

Ben Jonson.

They cannot be divided, but they will prove oppo-
site, and, not resting in a bare *diversity*, rise into a
contrariety. *South.*

Considering any thing as existing at any determined
time and place, we compare it with itself existing at
another time, and thence form the ideas of identity
and *diversity*. *Locke.*

William's arm

Could nought avail, however famed in war;
Nor armies leagued, and *diversely* assayed
To curb his power. *Philips.*

On life's vast ocean *diversely* we sail;
Reason the card, but passion is the gale. *Pope.*

The most common *diversity* of human constitutions
arises from the solid parts, as to their different degrees
of strength and tension. *Arbuthnot on Aliment.*

And in the whole there is a magnificence like that
ascribed to Chinese plantation, the magnificence of
vast extent and endless *diversity*. *Johnson.*

DIVERSIFY, v. a. } Fr. *diversifier*; Sp.
DIVERSIFICATION, n. s. } Portug. and Italian
diversificare, from Lat. *diversum*, i. e. *dis*, di-
versely, and *verto*, or *verso* to turn, and *facio*
to make. To make different; discriminate; varie-
gate: diversification is variety of form, color, or
quality; change.

There is, in the producing of some species, a com-
position of matter, which may be much *diversified*.

Bacon.

If you consider how variously several things may
be compounded, you will not wonder that such fruitful

principles, or manners of *diversification*, should gene-
rate differing colours. *Boyle on Colours.*

This, which is here called a change of wil., is not
a change of his will, but a change in the object,
which seems to make a *diversification* of the will, but,
indeed is the same will *diversified*.

Hale's Origin of Mankind.

The country being *diversified* between hills and dales,
woods and plains, one place more clear, another
more darksome, it is a pleasant picture. *Sidney.*

It was easier for Homer to find proper sentiments
for Grecian generals, than for Milton to *diversify* his
infernal council with proper characters.

Addison's Spectator.

Nor less attractive is the woodland scene

Diversified with trees of every growth,

Alike yet various.

Cowper.

DIVERT, v. a.

DIVERSION, n. s.

DIVERTER, n. s.

DIVERTISE, v. a.

DIVERTISEMENT, n. s.

DIVERTIVE, adj.

hence, to amuse; to
please; to exhilarate. 'Diversion,' says Dr.
Johnson, 'seems to be somewhat lighter than
amusement, and less forcible than pleasure.' Di-
vertise is an obsolete synonyme of divert. Di-
vertisement is an old word recently revived, and
applied to musical compositions of a particu-
lar cast. Divertive is recreative, amusing.

Knots, by the conflux of the meeting sap,

Infect the sound pine, and *divert* his grain,

Tortive and errant, from his course of growth.

Shakspeare.

Frights, changes, horrors,

Divert and crack, rend and deracinate

The unity and married calm of states. *Id.*

Cutting off the tops, and pulling off the buds, work
retention of the sap for a time, and *diversion* of it to
the sprouts that were not forward.

Bacon's Nat. Hist.

The kings of England would have had an absolute
conquest of Ireland, if their whole power had been
employed; but still there arose sundry occasions,
which divided and *diverted* their power some other way.

Davies on Ireland.

Alas, how simple, to these casts compared,
Was that crude apple that *diverted* Eve!

Milton. Paradise Regained.

Angling was, after tedious study, a rest to his mind,
a cheerer of his spirits, and a *diverter* of sadness.

Walton.

Let orators instruct, let them *divertise*, and let them
move us; this is what is properly meant by the word
salt. *Dryden.*

He finds no reason to have his rent abated, because
a greater part of it is *diverted* from his landlord.

Locke

You for those ends whole days in council sit,
And the *diversions* of your youth forget.

Waller.

How fond soever men are of bad *divertisement*, it
will prove mirth which ends in heaviness.

Government of the Tongue.

What can that man fear, who takes care to please
a Being that is so able to crush all his adversaries? a
Being that can *divert* any misfortune from befalling
him, or turn any such misfortune to his advantage?

Addison's Guardian.

They *diverted* raillery from improper objects, and
gave a new turn to ridicule. *Id. Frecholder*

Such productions of wit and humour as expose vice and folly, furnish useful *diversions* to readers.

Id.

Nothing more is requisite for producing all the variety of colours, and degrees of refrangibility, than that the rays of light be bodies of different sizes; the least of which may make violet, the weakest and darkest of the colours, and be more easily *diverted* by refracting surfaces from the right course; and the rest, as they are bigger and bigger, make the stronger and more lucid colours, blue, green, yellow, and red, and be more and more difficultly *diverted*. *Newton.*

I would not exclude the common accidents of life, nor even things of a pleasant and *diverting* nature, so they are innocent, from conversation. *Rogers.*

I have ranked this *diversion* of Christian practice among the effects of our contentions.

Decay of Piety.

DIVEST', or
DEVEST', *v. a. & n. s.* } Fr. *devestir*; *Lat. divestire*, from
DIVEST'URE, *n. s.* } *de*, privative, and
to, to clothe, à *vestis*; Gr. *εσθης*, a garment.
Denude, strip: divesture the act of disrobing
& stripping.

When of his arms Androgeus he *divests*;
His words, his shield, he takes, and plumed crests. *Denham.*

Let us *divest* the gay phantom of temporal happiness of all that false lustre and ornament in which the pride, the passions, and the folly of men have dressed it up. *Rogers.*

The *divestiture* of mortality dispenses them from those laborious and avocating duties which are here requisite to be performed. *Boyle's Seraphick Love.*

DIVIDE, *v. a. & v. n.* Fr. *diviser*; Span. *dividir*; Ital. *dividere*, from
DIVID'ABLE, *adj.* } and *Lat. dividere*, from
DIVID'ANT, *adj.* } *dis*, diversely, and
DIVIDEND, *n. s.* } *video*, to see, a di-
DIVID'ER, } vided thing being seen
DIVID'UAL, *adj.* }
in more parts than one.—Ainsworth. To part into different pieces; hence to disunite; separate; distribute: as a neuter verb, to sunder; break concord or friendship; differ. A dividend is an allotted share; in arithmetic, however, it is the sum to be divided: dividual is used by Milton for divided; and dividant by Shakspeare, for separable; distinguishable.

Let there be a firmament in the midst of the waters, and let it *divide* the waters from the waters. *Genesis.*

There shall five in one house be *divided*. *Luke.*

Rend us in sunder, thou canst not *divide*
Our bodies so, but that our souls are tied,
And we can love by letters still and gifts,
And thoughts, and dreams; love never wanteth shifts. *Donne.*

Love cools, friendship falls off,
Brothers *divide*. *Shakspeare. King Lear.*

How could communities maintain
Peaceful commerce from *dividable* shores? *Shakspeare.*

Twinned brothers of one womb,
Whose procreation, residence, and birth,
Scarcely is *divident*, touch with several fortunes. *Id.*
According as the body moved, the *divider* did more and more enter into the *divided* body; so it joined itself to some new parts of the medium, or *divided* body, and did in like manner forsake others.

Digby on the Soul.

She shines,
Revolved on heaven's great axle, and her reign
With thousand lesser lights *dividual* holds,
With thousand thousand stars! *Milton.*

If on such petty merits you confer
So vast a prize, let each his portion share:
Make a just *dividend*; and, if not all,
The greater part to Diomedes will fall.

Dryden's Fables.

You must go
Where seas, and winds, and deserts will *divide* you. *Dryden.*

Cham and Japhet were heads and princes over their families, and had a right to *divide* the earth by families. *Locke.*

Money, the great *divider* of the world, hath, by a strange revolution, been the great uniter of a divided people. *Swift.*

Each person shall adapt to himself his peculiar share, like other *dividends*. *Decay of Piety.*

To remedy this inconvenience, it will be necessary to *divide* their troughs into small compartments, in such a manner, that each of them may be capable of containing water; but this is seldom or never done. *Franklin.*

It so happened that persons had a single office *divided* between them who had never spoken to each other in their lives; until they found themselves, they knew not how, pigging together, heads and points, in the same truckle-bed.

Burke. Character of Lord Chatham.

DIVIDEND. See ARITHMETIC.

DIVIDEND OF STOCKS is a share of the interest of stocks erected on public funds, as the South Sea, &c., divided among and paid to the adventurers half-yearly.

DIVINE, *v. a., v. n. s., & adj.* } Fr. *divin*; Ital. *divino*;
DIVINATION, *n. s.* } *vin*; Ital. *divinazione*;
DIVINELY, *adv.* } Span. and
DIVINER, *n. s.* } Port. *divino*;
DIVINENESS, } *rimo*; Lat. *divinus*;
DIVINERESS, *n. s., fcm.* } *divina*;
DIVINITY, *n. s.* } *divinitas*;
the gods; Gr. *θεοι*. See DEITY. To foreknow, foretell, or presage, truly or falsely: as a neuter verb to utter prognostics, or feel presages; to conjecture: divination is the foreseeing, or foretelling, future events, or pretending so to do: diviner and divineress those who make this pretension.

Divine, as an adjective, is partaking of the nature of, or proceeding from, God; superhuman; excellent: divinely, a corresponding adverb: divineness and divinity, participation of the nature of God; Godhead: THE Godhead, the Supreme Being.

And it was don whanne we gheden to preir, that a danyssel that hadde a spirit of *dygnacionun* meete us which ghaif greet wyunnyng to her lordis in *dygnacionun*. *Wiclif. Deutis. 16.*

Surely there is no enchantment against Jacob, neither is there any *divination* against Israel. *Numbers.*

Certain tokens they noted in birds, or in the entrails of beasts, or by other the like frivolous *divinations*. *Hooker.*

The Grecians most *divinely* have given to the active perfection of men, a name expressing both beauty and goodness. *Id.*

Then is Caesar and he knit together.—If I were to *divine* of this unity, I would not prophesy so.

Shakspeare.

If secret powers
Suggest out truth to my *divining* thoughts,
This pretty lad will prove our country's bliss. *Id.*

By Jupiter, an angel! or, if not,
An earthly paragon: behold *divineness*
No elder than a boy. *Id. Cymbeline.*

Hear him but reason in *divinity*,
And, all admiring, with an inward wish
You would desire the king were made a prelate,
Shakespeare.

Give Martius leave to proceed in his discourse;
for he spoke like a *divine* in armour.

Bacon's Holy War.
The *divinest* and the richest mind,
Both by art's purchase and by nature's dower,
That ever was from heaven to earth confined.
Davies.

As with new wine intoxicated both,
They swim in mirth, and fancy that they feel
Divinity within them breeding wings,
Wherewith to scorn the earth. *Milton.*

In the very shapes and colours of brute creatures
there is a *divine* hand, which disposeth them to his
own ends. *Bp. Hall. Contemplations.*

This man born and now up grown,
To shew him worthy of his birth *divine*
And high prediction, henceforth I expose
To Satan. *Milton.*

She fair, *divinely* fair! fit love for gods. *Id.*
The eternal cause in their immortal lines
Was taught, and poets were the first *divines*.
Denham.

Her line
Was hero-make, half human, half *divine*.
Dryden.

His countenance did imprint an awe,
And naturally all souls to his did bow;
As wands of *divination* downward draw,
And point to beds where sovereign gold doth grow.
Id.

The mad *divineress* had plainly writ,
A time should come, but many ages yet,
In which sinister destinies ordain,
A dame should drown with all her feathered train.
Id.

If he himself be conscious of nothing he then
thought on, he must be a notable *diviner* of thoughts,
that can assure him that he was thinking. *Locke.*

Faith, as we use the word, called commonly *divine*
faith, has to do with no propositions but those which
are supposed to be *divinely* inspired. *Id.*

When he attributes *divinity* to other things than
God, it is only a *divinity* by way of participation.
Stillingfleet.

Is it then impossible to distinguish the *divineness* of
this book from that which is human? *Grew.*

The excellency of the soul is seen by its power of
divining in dreams: that several such *divinations* have
been made, none can question who believes the holy
writings. *Addison.*

'Tis the *Divinity* that stirs within us,
'Tis Heaven itself that points out an hereafter,
And intimates eternity to man. *Id.*

Vain idols, deities that ne'er before
In Israel's lands had fix'd their dire abodes,
Beastly *divinities*, and droves of gods. *Prior.*

A *divine* has nothing to say to the wisest congrega-
tion, which he may not express in a manner to be un-
derstood by the meanest among them. *Swift.*

God doubtless can govern this machine he could
create, by more direct and easy methods than employ-
ing these subservient *divinities*. *Cheyne.*

This topick was very fitly and *divinely* made use of
by our apostle, in his conference with philosophers,
and the inquisitive people of Athens. *Bentley.*

Instructed, you'd explore
Divine contrivance, and a God adore.

Blackmore.

I reduced the study of *divinity* into as narrow a
compass as I could; for I determined to study nothing
but my Bible, being much unconcerned about the
opinions of councils, fathers, churches, bishops, and
other men, as little inspired as myself. This mode of
proceeding being opposite to the general one, and es-
pecially to that of the Master of Peterhouse, who was
a great reader, he used to call me *αυτοδιδασκτος*, the
self-taught *divine*. *Bp. Watson.*

Glowing, and circumsused in speechless love,
Their full *divinity* inadequate
That feeling to express, or to improve,
The gods become as mortals, and man's fate
Has moments like their brightest. *Byron.*

DIVINATION, in antiquity, was divided by
Plato, Aristotle, Plutarch, Cicero, and others,
into two species, viz. artificial and natural. Ar-
tificial divination was so called, because it was
not obtained, or pretended to be obtained, by
immediate inspiration, but proceeded upon cer-
tain superstitious experiments and observations
arbitrarily instituted. Of this sort there were
various kinds, as by sacrifices, entrails, flame,
cakes, flour, wine, water, birds, lots, verses,
omens, &c. In the sacred writings nine different
sorts of divination are mentioned. The first per-
formed by the inspection of planets, stars, and
clouds. The practisers of this are supposed to
be those whom Moses calls מעונן *meonen*, of אן
anan, a cloud, Deut. xviii. 10. 2. Those whom
the prophet calls in the same place מנחש *mena-*
chsch, which the vulgate and generality of in-
terpreters render *augur*. 3. Those who in the
same place are called מכשף *mecscheph*, which
the septuagint and vulgate translate 'a man given
to ill practices.' 4. Such augurs whom Moses
in the same chapter, ver. 11, calls חובר *hhober*.
5. Those who consult the spirits called Python;
or, as Moses expresses it in the same book,
שאל אוב 'those who ask questions of Python.'
6. Witches or magicians, whom Moses called
יודעני *judeoni*. 7. Those who consult the dead,
necromancers. 8. The prophet Hosea, chap. iv.
12, mentions such as consult staves, שאל מקלי;
which kind of divination is called rhabdomancy.
9. The last kind is hepatoscopy, or the con-
sideration of the liver. Divination of all kinds
being the offspring of credulity, nursed by im-
posture, and strengthened by superstition, was
necessarily an occult science, retained in the
hands of the priests and priestesses, the magi,
the soothsayers, the augurs, and other like pro-
fessors, till the time of the coming of Jesus
Christ. Since then the pure doctrines of Chris-
tianity, and the spirit of philosophy, becoming
every day more widely diffused have equally
concurred in banishing these visionary opinions.
The following are the principal kinds of divi-
nation practised among the ancients. For a
more minute description of which see their se-
parate articles. 1. Aeromancy, the art of di-
vining by the air. 2. Astrology; divided into

natural astrology and judicial. 3. Augury consisted in observing the flight, singing, &c., of birds. 4. Chiromancy, the art which pretends to discover, by inspecting the hand, not only the inclinations of a man, but his future destiny also. 5. Geomancy was a divination made by observing of cracks or clefts in the earth. 6. Haruspicy consisted in the inspection of the bowels of animals, but principally of victims; and from thence predicting incidents relative to the republic, and the good or bad events of its enterprises. 7. Horoscopy is a branch of Astrology, which see. 8. Hydromancy is the art of divining by water. The Persians, according to Varro, invented it; and Pythagoras and Numa Pompilius made great use of it. 9. Physiognomy, or physiognomancy, is a science that pretends to teach the nature, the temperament, the understanding, and the inclinations of men, by the inspection of their countenances, and is therefore thought by many, to be little less frivolous than chiromancy; though Aristotle, and the celebrated Lavater, have written express treatises concerning it. But as it is an undeniable fact, that our passions, especially when frequently and violently agitated, make indelible impressions on our features, by their repeated action on particular muscles, insomuch that the tempers of many people may be known at first view from their looks; and as it is not improbable, that certain habits of vice may make impressions equally uniform and perhaps equally legible, if we were accustomed to study them, physiognomy appears to be worthy of rather more attention. 10. Pyromancy is a divination made by the inspection of a flame, either by observing to which side it turns, or by throwing into it some combustible matter, or a bladder filled with wine, or any thing else from which they imagined they were able to predict. Natural divination was so called, because it was supposed to be not attainable by any rules or precepts of art, but infused or inspired into the diviner, without his taking any further care about it, than to purify and prepare himself for the reception of the divine afflatus.

DIVINING ROD. We have anticipated, in the article BAGUETTE DEVINATOIRE, which see, all that we feel disposed to give credence to on this subject: but an ingenious gentleman has lately advocated the pretensions of the hazel or willow rod to be naturally, under proper management, a discoverer of metals and springs of water, at great depths; and we insert, just as they are supplied to us, his directions for choosing the rods, and observations on their properties.

I. *Directions for choosing the Rods.*—The hazel and willow rods he has, by experience, found, will actually answer with all persons in a good state of health, if they are used with moderation, and at some distance of time, and after meals, when the operator is in good spirits.

The hazel, willow, and elm, are all attracted by springs of water. Some persons have the virtue interminently; the rod in their hands will attract one half-hour, and repel the next. The rod is attracted by all metals, coals, amber, and lime-stone, but with different degrees of strength. The best rods are those from the hazel or nut-tree, as they are pliant and tough, and cut in the

winter months; a shoot that terminates, equally forked, is to be preferred, about two feet and a half long; but as such a forked rod is rarely to be met with, two single ones of similar length and size may be tied together with thread, and they will answer as well as the other.

The most convenient and handy method of holding the rod, is with the palms of the hands turned upwards, and the two ends of the rod coming outwards: the palms should be held horizontally, as nearly as possible; the part of the rod in the hand ought to be straight, and not bent backward or forward. The upper part of the arm should be kept pretty close to the sides, and the elbows resting on them; the lower part of the arm making nearly a right angle with the upper, though rather a little more acute. The rod ought to be so held, that in its working the sides may move clear of the little fingers.

The best manner of carrying the rod is with the end extended in an angle of about eighty degrees from the horizon, as by this method of carrying it, the repulsion is more plainly perceived than if it was held perpendicularly. But after all the directions that can be given, the adroit use of it can only be attained by practice and attention.

It is necessary that the grasp should be steady, for if, when the rod is going, there be the least succession or counteraction in the hands, though ever so small, it will greatly impair, and, generally, totally prevent its activity, which is not to be done by the mere strength of the grasp; for provided this be steady, no strength can stop it.

II. *Properties observed in the Rod, and Directions for using it.*—As soon as the person's foremost foot comes near the attracting body (as far as I can observe its semi-diameter), the end of the rod is repelled towards the face; then open the hands a little, replace the rod, and approach nearer, and the repulsion will be continued until the foot is on or over the attracting body. When this is the case, the rod will first be repelled a little, viz. two or three inches, and then be attracted towards the metallic body, viz. its end will be drawn down towards it.

When it has been drawn down, it must not be thrown back without opening the hands, a fresh grasp being necessary to every attraction, but then the least opening of the hand is sufficient. As long as the person stands over the attracting body, the rod continues to be attracted; but as soon as the forefoot is beyond it, then the rod is drawn backward to the face.

Metals have different degrees of attraction; gold is strongest, next copper, then iron, silver, tin, lead, bones, coals, springs of water, and limestone.

In using the rod to discover springs and metals, let the person hold the rod as already directed, and then advancing north or south with a slow pace, just one foot before the other, at first the rod may be repelled; but as the person advances slowly, and comes over the spring or vein of ore, the rod will be strongly attracted.

A person who, by frequent practice and experience, can use the rod tolerably, may soon give the greatest sceptics sufficient satisfaction, except they are determined not to be convinced.

Some have supposed that the science called Rhabdomancy (divination by a rod), is alluded to in the following verse of Hosea:—‘ My people ask counsel at their stocks, and their staff declareth unto them.’ ch. iv. As Europe received in very early times many superstitious customs from the east, together with many useful inventions, the conjecture is not improbable. Divination by arrows, a method of a similar kind mentioned in Ezekiel, chap. xxi., continued among the Arabs till the days of Mahomet, who, in the Koran, forbade his followers this idle attempt at prescience.

DIVISION, n. s.

DIVISIBLE, adj.

DIVISIBleness, n. s.

DIVISIBILITY, n. s.

DIVISON.

Span. and Fr. *division*, from Lat. *divisio*, à *dividere*, *divisus*. See **DIVIDE**. The act of dividing; state of being

divided; the separated part, and that which separates: hence disunion, discord, dispute; a rule of arithmetic: divisible is capable of division; divisibility, quality of admitting it. Divisor, an arithmetical term for a given number by which another is divided.

I will put a *division* between my people and thy people. *Exodus.*

Thy tongue

Makes Welsh as sweet as ditties highly penned

Sung by a fair queen in a summer's bower,

With ravishing *division*, to her lute.

Shakespeare. Henry IV.

Naturalists disagree about the origin of motion, and the indefinite *divisibleness* of matter. *Boyle.*

This will easily appear to any one, who will let his thoughts loose in the vast expansion of space, or *divisibility* of matter. *Locke.*

Express the heads of your *divisions* in as few and clear words as you can, otherwise I never can be able to retain them. *Swift.*

If we look into communities and *divisions* of men, we observe that the discreet man, not the witty, guides the conversation. *Addison's Spectator.*

The effects of human industry and skill are easily subjected to calculation: whatever can be completed in a year, is *divisible* into parts, of which each may be performed in the compass of a day. *Adventurer.*

When we frame in our minds any notion of matter, we conceive nothing else but extension and bulk, which is impenetrable, or *divisible* and passive.

Bentley's Sermons.

In dread *divisions* marched the marshalled bands,
And swarming armies blackened all the lands.

Darwin.

DIVISIBILITY, in physics, is that property by which the particles of matter in all bodies are capable of a separation or disunion from each other. The Peripatetics and Cartesians hold divisibility to be an affection of all matter. The Epicureans, again, allow it to agree to every physical continuum; but they deny that this affection agrees to all bodies, for the primary corpuscles or atoms they maintain to be perfectly insecable and indivisible.

DIVISIBILITY OF MATTER. As it is evident that body is extended, so it is no less evident that it is divisible; for since no two particles of matter can exist in the same place, it follows, that they are really distinct from each other; which is all that is meant by being divisible. In this sense the least conceivable particle must still be

divisible, since it will consist of parts which will be really distinct. To illustrate this by a familiar instance.—Let the least imaginable piece of matter be conceived lying on a smooth plain surface, it is evident the surface will not touch it every where: those parts, therefore, which it does not touch may be supposed separable from the others, and so on as far as we please; and this is all that is meant when we say that matter is *infinitely divisible*. The infinite divisibility of mathematical quantity is demonstrated geometrically. All that is supposed, however, in strict geometry, says Mr. Maclaurin, concerning the divisibility of magnitude, amounts to no more than that a given magnitude may be conceived to be divided into a number of parts equal to any given or proposed number. The number of parts, into which a given magnitude may be conceived to be divided, is not to be fixed or limited, because no given number is so great but a greater may be conceived and assigned: but there is not, therefore, any necessity of supposing the number of parts actually infinite; and if some have drawn very absurd consequences from such a supposition, yet geometry ought not to be loaded with them. How far matter may be divided, may, in some measure, be conceived from this fact, that a piece of wire gilt with so small a quantity as eight grains of gold, may be drawn out to a length of 13,000 feet, the whole surface of it still remaining covered with gold. We have also a surprising instance of the minuteness of some parts of matter from the nature of light and vision. Let a candle be lighted, and placed in an open plain, it will then be visible two miles round, and consequently were it placed two miles above the surface of the earth, it would fill with luminous particles a sphere whose diameter was four miles, and that before it had lost any sensible part of its weight. A quantity of vitriol being dissolved, and mixed with 9000 times as much water, will tinge the whole; consequently will be divided into as many parts as there are visible portions of matter in that quantity of water. With respect also to coloring substances, particularly carmine, which is a kind of powder obtained from the insect commonly called cochineal: dilute a small quantity of this powder, to the weight of about three quarters of a grain, by putting it at the bottom of a vessel, in which is afterwards poured nearly thirty pounds of water; the color will be so diffused as to be perceptible throughout the whole volume of the water. The weight of this water being 300,000 times greater than that of five centigrammes of carmine, if it be supposed that each centigramme of the fluid mixture contains only two molecules of the coloring principle, there will be 3,000,000 of vitriol parts in five centigrammes of carmine. Many perfumes also, without a sensible diminution of their quantity, fill a very large space with their odoriferous particles; which must therefore be of an inconceivable smallness, since there will be a sufficient number in every part of that space sensibly to affect the organ of smelling. Dr. Keill demonstrates, that any particle of matter, how small soever, and any finite space, how large soever, being given, it is possible for that small particle of matter to be diffused through

all that space, and to fill it in such a manner, as that there shall be no pore in it whose diameter shall exceed any given line. The chief objections against the divisibility of matter in infinitum are, That an infinite cannot be contained by a finite: and that it follows from a divisibility in infinitum, either that all bodies are equal, or that one infinite is greater than another. But the answer to these is easy; for the properties of a determined quantity are not to be attributed to an infinite considered in a general sense; and who has ever proved, that there could not be an infinite number of infinitely small parts in a finite quantity, or that all infinities are equal? The contrary is demonstrated by mathematicians in innumerable instances. Sir Isaac Newton is said to have derived from the system of Epicurus, the following opinion relative to the limits prescribed to the divisions of body in the actual state of things. We confess it seems to us nothing but a bold conjecture. This great philosopher conceives that the Supreme Being, in creating matter, formed it of various species of elementary molecules, solid, hard, unchangeable, the figures and the different qualities of which were appropriated to the respective ends they were proposed to answer. But such is the fixity of these molecules that no process of art, nor even any force existing in nature, can either divide or alter them, unless the essence of the body should be changed with time. Thus all the modifications experienced by bodies depend solely upon this, that these durable molecules separate the one from the other, and then become reunited in various ways forming new combinations. These different molecules are, hence, the simple substances of chemistry; and the results of the operations which they would present singly, should be the design of the efforts of this science; in the mean time we may consider as simple the substances which we have not yet been able to decompose, and wisely imagine simplicity to reside at the place where observation stops. See the article INFINITE.

DIVISION, in sea affairs, a select number of ships in a fleet or squadron of men of war, distinguished by a particular flag or pendant, and usually commanded by a general officer. A squadron is commonly ranged into three divisions, the commanding officer of which is always stationed in the centre. When a fleet consists of sixty sail of the line, that is, of ships having at least sixty cannon each, the admiral divides it into three squadrons, each of which has its divisions and commanding officers. Each squadron has its proper colors, according to the rank of the admiral, and every division its proper mast. Thus in Britain, the first admiral, or the admiral of the fleet, displays the union flag at the main-top-mast head; next follows the white flag with St. George's cross; and afterwards the blue. The private ships carry pendants of the same color with their respective squadrons at the mast of their particular divisions; so that the last ship in the division of the blue squadron carries a blue pendant at her main-top-mast head.

DIVISIONS OF AN ARMY, in the military art, the several brigades and squadrons into which it is cantoned.

DIVISIONS OF A BATTALION are the several platoons into which it is divided in marching or firing, each of which is commanded by an officer.

DIUM, in ancient geography, the name of a town of Macedonia, in Pieria, on the west side of the Sinus Thermaicus. Strabo and Livy place it on the borders of Pieria to the south, at the foot of mount Olympus towards Thessaly. That it was a splendid city, appears from Polybius; who relates, that its gymnasium and walls were overthrown by the Aetolians. From which overthrow, however, it again recovered, Alexander adding new splendor to it, by the brass statues cast by Lysippus and erected there in memory of those slain at the Granicus: an ornament which was continued down to the time of the Romans; who made it a colony, called Diensis.

DIVODORUM, in ancient geography, a town of the Mediatrix in Gallia Belgica; situated on the Moselle, in the spot where Metz now stands. See METZ.

DIVORCE, *v. a. & n. s.* } Fr. *divorcer*; It. *di-*
DIVORCEMENT, *n. s.* } *divorzare*; from Barb.
DIVORCE, } Lat. *divortere*; *dis*
and *vertere*, *a marito*, to turn, from her husband. The legal separation of a husband and wife, the verb being derived from the noun: hence disunion, or separation generally; and separation by authority or force. Divorcement seems synonymous with the substantive; and a divorcer is, he who causes or procures a divorce.

Write her a bill of *divorcement*, and give it in her hand, and send her out of his house. *Deut.* xxiv. 1.

If so be it were possible, that all other ornaments of mind might be had in their full perfection, nevertheless the mind that should possess them, *divorced* from piety, could be but a spectacle of commiseration. *Hooker.*

To restore the king,
He counsels a *divorce*, a loss of her,
That like a jewel has hung twenty years
About his neck, yet never lost her lustre.
Shakspeare. Henry VIII.

Go with me, like good angels, to my end;
And, as the long *divorce* of steel falls on me,
Make of your prayers one sweet sacrifice,
And lift my soul to heaven. *Id.*

The continent and the island were continued together within men's remembrance by a drawbridge; but are now *divorced* by the downfallen cliffs.

Carew's Survey of Cornwall.

Such motions may occasion a farther alienation of mind, and *divorce* of affections, in her, from my religion. *King Charles.*

No seemed her youthful soul not easily forced,
Or from so fair, so sweet a seat *divorced*. *Waller.*

Divorce is a lawful separation of husband and wife, made before a competent judge, on due cognizance had of the cause, and sufficient proof made thereof. *Ayliffe's Parergon.*

Death is the violent estranger of acquaintance, the eternal *divorcee* of marriage.

Drunmond's Cyprian Grave.

Aerial pasture the lungs with gentle force
Constant embrace by turns, by turns *divorce*.

Blackmore.

DIVORCE. This is a topic connected with many moral and legal considerations; and those of sufficient importance, we apprehend, to justify

our entering upon it at some length. Scarcely has the country survived the moral effects of a recent discussion of it in the highest quarters, and in the inner sanctuary of British justice. It will be sufficient to remark, with regard to that unhappy circumstance, that both the learned professions appeared in a state of even unusual obscurity and doubt upon the subject. Lawyers, unquestionably well versed in the institutions of their country, were as singularly divided with regard to the fair effect of some of our statutes and usages respecting divorce, as the learned prelates were disagreed among themselves respecting what was really the law of God.

The writer of this paper has had occasion to pay considerable attention to this subject, both in a moral and legal point of view. He has seen the laws of his country to be in a remarkable state of confusion respecting it; he is convinced that their ordinary course, with regard to divorces, is opposed to the simple provisions of the law of Jesus Christ. He would therefore offer to the reader a brief statement of the actual laws and practices of this country on the subject, with a view to the examination of their moral effect and propriety; then compare them with the provisions and usages of antiquity generally: and finally, with the express injunctions of Holy Writ.

1. There are many kinds of divorce, say the law authorities mentioned in our books; as *causa præcontractûs*; *causa frigiditytis*; *causa consanguinitatis*; *causa affinitatis*; *causa professionis*, &c. But the usual divorces are of two kinds, i. e. *à mensa et thoro*, from bed and board; and *à vinculo matrimonii*, from the very bond of marriage. A divorce *à mensa et thoro* does not dissolve the marriage; for the cause of it is subsequent to the marriage, and supposes the marriage to be lawful: this divorce may be by reason of adultery in either of the parties, for cruelty of the husband, &c. And as it does not dissolve the marriage, so it does not debar the woman of her dower, or bastardise the issue, or make void any estate for the life of husband and wife, &c. Co. Lit. 235; 3 Inst. 89; 7 Rep. 43. The woman under separation by this divorce must sue by her next friend; and in her own name she may sue her husband for alimony.

A divorce *à vinculo matrimonii*, absolutely dissolves the marriage, and makes it void from the beginning, the causes of it being *preæcedent* to the marriage; as *præcontract* with some other person, consanguinity or affinity, within the Levitical degrees, impotency, impuberty, &c. On this divorce dower is gone; and if, by reason of *præcontract*, consanguinity, or affinity, the children of the marriage are bastards. But in these divorces, the wife, it is said, shall receive all again that she brought with her, because the nullity of the marriage arises through some impediment; and the goods of the wife were given for her advancement in marriage, which now ceases: but this is where the goods are not spent; and if the husband give them away during the coverture, without any collusion, it shall bind her: if she knows her goods unspent, she may bring action of detinue for them; and as for money, &c., which cannot be known, she must sue in the

spiritual court. This divorce enables the parties to marry again.

In regard to the former case, it is the practice in the higher walks of life to apply to parliament to complete the divorce by an *ex post facto* law, when, if the divorce is grounded, as it almost invariably is, on adultery, it is necessary that a clause be inserted in the proposed bill, interdicting the offending parties from intermarrying. Evidence must be given, on the bill, that an action for damages has been brought against the seducer, and judgment for the plaintiff had thereon, or a sufficient reason given why such action was not brought, or judgment obtained. Upon the second reading of the bill in the house of lords (where, indeed, it usually originates), it is necessary that an official copy of the proceedings, and definitive sentence of divorce *à mensa et thoro*, in the ecclesiastical court, at the suit of the petitioner, be delivered at the bar on oath; and that the petitioner attend the house to be examined, if the house think fit, whether there be any collusion respecting the act of adultery, or the divorce, or any action for criminal conversation; and whether the wife was living apart from her husband under articles of separation.

If after a divorce *à mensa et thoro*, either of the parties marry again, the other being living, such marriage is a mere nullity; and by sentence to confirm the first contract, she and her first husband become husband and wife to all intents, without any formal divorce from the second. Also on this divorce, as the marriage continues, marrying again while either party is living, hath been held to be bigamy within the stat. 1 Jac. c. 11.

A divorce for adultery was anciently *à vinculo matrimonii*; and therefore in the beginning of the reign of queen Elizabeth the opinion of the church of England was, that after a divorce for adultery, the parties might marry again; but in *Foliambe's case*, 11. 44 El. in the star-chamber, that opinion was changed; and archbishop Bancroft, by the advice of divines, held, that adultery was only a cause of divorce *à mensa et thoro*. Sentence of divorce must be given in the life of the parties, and not afterwards: but it may be repealed in the spiritual court, after the death of the parties.

It should be added that divorce is, according to our law, a judgment spiritual; hence it must be sued for and pronounced in the spiritual court, where also, 'says Coke upon Littleton,' if there be occasion, it ought to be reversed: and that the canon law, by which these courts are regulated, is followed by the common law, in considering the nuptial tie so strong as not to be capable of being *unloosed* for any cause whatever. Our law, in fact, refers throughout to the Romish notion of the sacrament of marriage, and its utter indissolubility. Such, without entering into minute provisions, is the law and practice of our enlightened country on this important subject.

2. Divorce was allowed in much greater freedom in all the celebrated nations of antiquity. At Rome, barrenness, age, disease, madness, and banishment, were the ordinary causes of divorce. *Spurius Carvilius*, between 500 and 600 years

after the building of Rome, under the consulship of M. Attilius and P. Valerius, was the first who put away his wife because she was barren: though Plutarch, in his Roman questions, maintains that Domitian was the first who permitted divorce. Justinian afterwards added impotence, a vow of chastity, and the profession of a monastic life, as valid reasons of divorce. The Roman lawyers distinguish between repudium and divortium; making the former to be the breaking of a contract or espousal, and the latter separation after matrimony. Romulus enacted a severe law, which suffered not a wife to leave her husband, but gave the man the liberty of turning off his wife, for adultery, for poisoning her children, or counterfeiting his private keys. However, in later times, the women as well as the men might sue for a divorce. The common way of divorcing was by sending a bill to the woman, containing the reasons of separation, and a tender of all her goods which she brought with her; and this was called *repudium mitere*; or else it was performed in her presence, and before seven witnesses, and accompanied with the formalities of tearing the writings, refunding the portion, taking away the keys, and turning the woman out of doors.

The Grecian Laws concerning divorces were different: the Cretans allowed divorce to any man who was afraid of having too many children. The Spartans seldom divorced their wives; and held it extremely scandalous for a woman to depart from her husband. The Athenians allowed divorce on very small grounds, by a bill containing the reason of the divorce, and approved, if the party appealed, by the chief magistrate; and women also were allowed to leave their husbands on just occasions. Persons divorcing their wives were obliged to return their portions; otherwise the Athenian laws obliged them to pay nine oboli a month for alimony. The terms expressing the separation of men and women from each other were different; the men were said *ἀπομπεῖν* or *ἀπολύνειν*, to dismiss their wives; but wives, *ἀπολείπειν*, to leave their husbands.

According to Ricaut (State, Ottom. Emp. ch. xxi.) there are among the Turks three degrees of divorce. The first only separates the man and wife from the same house and bed, the maintenance of the wife being still continued: the second not only divides them in that manner, but the husband is compelled to make good her 'kabin,' which is a jointure or dowry promised at her marriage, so as to have no interest in him or his estate, and to remain in a free condition to marry another. The third sort of divorce, which is called 'Ouch Talae,' is made in a solemn and more serious manner, with more rigorous terms of separation; and in this case the husband, repenting of his divorce, and desirous of retaking his wife, cannot by the law be admitted to her without first consenting to, and contenting himself with, her being temporarily possessed by another man; which the law requires as a punishment of the husband's lightness and inconstancy. These usages seem to have grown out of the laws of Mahomet, who, in the second chapter of the Koran, has ordered that if a man di-

vorces his wife the third time (for he may divorce her twice without being obliged to part with her) if he repent of what he has done, it shall not be lawful for him to take her again, until she has been first married and bedded by another, and divorced by such second husband. (Koran, ch. ii. p. 27). The precaution, on the whole, has had so good an effect, that the Mahomedans are seldom known to proceed to the extremity of divorce, notwithstanding the liberty given them; it being reckoned a great disgrace so to do: and there are few, except those who have little or no sense of honor, that will take a wife again on the condition enjoined. (Seld. ubi. Sup. l. iii. c. 21; Ricaut's Ottom. Emp. b. ii. c. 21). It must be observed, also, that though a man is allowed, by the Mahomedan law, to repudiate his wife, even on the slightest disgust, yet the women are not allowed to separate themselves from their husbands, unless it be for ill usage, want of proper maintenance, neglect of conjugal duty, impotency, or some cause of equal import; but then she generally loses her dowry, which she does not lose if divorced by her husband, unless she has been guilty of impudicity or notorious disobedience. (Koran, ch. iv. p. 62). When a woman is divorced she is obliged, by the direction of the Koran, to wait three months before she marry another; after which time, in case she be not found with child, she is at full liberty to dispose of herself as she pleases; but if she prove with child she must wait till she be delivered: and, during her whole term of waiting, she may continue in her husband's house, and is to be maintained at his expense; it being forbidden to turn a woman out before the expiration of the term, unless she be guilty of dishonesty. (Koran, ch. ii. p. 26, 27; ch. lxxv. p. 454). Where a man divorces a woman before consummation, she is not obliged to wait any particular time (Koran, ch. xxxiii. p. 348); nor is he obliged to give her more than one-half of her dowry. (Koran, ch. ii. p. 28). If the divorced woman have a young child, she is to suckle it till it be two years old; the father, in the mean time, maintaining her in all respects: a widow is also obliged to do the same, and to wait four months and ten days before she marry again. (Koran, ch. ii. p. 27).

The divine law to the Jews on this subject is to this effect (Deut. xxiv. 1, &c.): 'When a man hath taken a wife, and married her, and it come to pass that she finds no favor in his eyes, because he has found in her some uncleanness; then let him write her a bill of divorcement, and give it into her hand, and send her out of his house. And when she is departed, she may go, and be another man's wife; and if her second husband hate her, and write her a bill of divorce, or if he chance to die, her former husband shall not take her again to be his wife, after she is defiled, for that is an abomination to the Lord.' A question has occurred respecting the interpretation of this law, What is meant by the words, 'if he find any uncleanness, turpitude, or nakedness in her?' and the critics are divided in opinion about it. Dr. Geddes has rendered the Hebrew words, פְּרוֹת רָבָר, 'some defect,' but they are by Montanus rendered nuditatem verbi — by our translators, 'something unclean.' Sept.

ασχημον πραγμα. Vulg. aliquam feditatem, and so equivalently Onk. Syr. and both Arabs. But Tharg. פְּנֵי עֲבֵרָה, 'some transgression;' and this transgression is supposed by Rabbi Sammai and his followers to be adultery. R. Hillel and his party extend the עֲוֹנוֹ רַבָּה to *whatever may displease the husband*; and such appears to have been the loose construction of this law in our Saviour's time. The opinion of the Sammaites is untenable; for adultery was punished with death; while that of the Hillelites appears to be too lax. It was probably either some very great bodily blemish, or some base immoral habit, that was meant by the legislator. The form of the bill of divorce was to this effect: 'Such a day, month, or year, I, such an one, of such a place, upon, or, near such a river, do, of my own free consent and choice, repudiate thee, such an one, my late wife, banish thee from me, and restore thee to thy own liberty; and thou mayest henceforth go whither, and marry whom thou wilt: and this is thy bill of divorcement, and writing of expulsion, according to the law of Moses and Israel.' This writing was signed by two witnesses, and delivered in the presence of as many, at least. From this time, the wife was as much at her liberty, as if she had been a widow; only, in both cases, she was obliged to stay at least ninety days, before she was married to another, lest she should prove pregnant by the last. It does not appear that women were indulged by the law of Moses with the privilege of divorcing their husbands upon the same ground; unless in the case of a virgin betrothed by her parents before she was twelve years of age, who might then refuse to ratify the contract which her parents had made, without giving any other reason than that she did not like the person designed for her; but this cannot be called a divorcement, because there is no marriage in the case. Josephus, therefore, thinks (Ant. lib. xv. c. 11; xviii. 7; xx. 15), that a divorce was so far from being permitted to women, that, if the husband forsook his wife, it was not lawful for her to marry another, till she had first obtained a divorce from him. He adds, that Salome, sister of Herod the Great, was the first who took upon her to repudiate her husband, whose example was soon followed by others, mentioned by the same author.

3. Let us now regard the subject more particularly in its various relations to society, and as a topic of legislation with the great Christian lawgiver.

Divorce is always an evil. The sufferings of the innocent, the regrets of the wise and virtuous, and the abhorrence of God, attend upon it; while it opens a breach in the foundations of human society to which no other domestic evil is comparable. That it may be the refuge of a good man from the vices of an incorrigible companion, and the prospect of indefinite future injuries, who can deny? but never can it be his remedy for the past; never will it offer any thing to his mind in the shape of compensation. It is of that species of punishment on the guilty, of which the innocent is compelled to share the shame and the suffering, in a peculiar manner; and to bear, perhaps, in this life the chief mis-

ries. The feelings of the mind that preserve that innocence, the very affections that prompt and support him in the path of duty, prepare for him present sufferings, against which the criminal party must be hardened; and to the same remote generations, that hear the tale of delinquency on the one side, the humiliation, and, generally, the groundless blame of the other, will be faithfully conveyed.

As far as the immediate parties to a divorce are concerned, all the objects and uses of marriage are ruinously overthrown and defeated by it. The husband (following the supposition of his being the innocent party), can no longer—never more, perhaps, can he—regard the character of woman in its true light. No longer has she power to infuse a peculiar sensibility into his heart, to give candor and patience to his mind, or sweetness to his disposition. All his recollections of her influence are calculated to inspire just the opposite feelings. 'More bitter than death,' have been the consequences of his submission to it. And when the husband is the guilty, and the wife the innocent party (for the only just cause of divorce will compel the Christian moralist to hold the balance even between the sexes), what must the widowed heart of an all-confiding female endure? It is hardly possible that she should ever more look up to man; that she should again believe that his judgment can strengthen hers, or his character become a safe pillar of her hope.

The mischiefs of divorce are but too often capable of a still greater aggravation, i. e. when children are connected with its consequences. For a father's authority (in our boyish days particularly) it is as impossible to find a substitute, as for a mother's care in earlier life. Let not parents forget, that no hireling, however faithful or respectable, can do their duty to their children—a duty ever, as a whole, intransferable, 'because he is a hireling;' but divorces generally break into a family when all that is most important in the character of each parent should be in full exercise; when, if there are children, they are of tender years, and every thing in relation to their character and hopes is in the bud, or in blossom. Now, either 'father,' or 'mother' (names especially in conjunction, of greater moral power than any other that belong to creatures), becomes a term worse than unmeaning, worse than dead. As soon as the mind can be influenced by the fatal example, it is weakened on the side of virtue, and influenced to evil by one or other of these endearing and important names; which it connects for life with the ideas of tyranny, and cruelty, and profligacy—or with those of treachery, and folly, and female shamelessness. Nor is this all; though one of the less direct, it is not one of the least blessings of marriage to society, that it frequently draws together numerous collateral parties into kindred, and, like a single branch of an inland navigation, unites the resources and blends the interests of distant neighbourhoods. Imagine this one branch to be obstructed or annihilated, and the effect is felt wherever its waters flow. Something like this, or worse than this, occurs in every case of

orce, however just. Amongst all the parties connected by affinity with the original tie, the inhibition of it distils evil. Where only ordinary good wishes were increased by it, and approving aunts and smiling cousins felt it but decent to remember the relationship when it did not infringe on their selfishness, or on prior aims, the warmest discussion of the facts and circumstances, the merits and demerits of the case, will spread; and wounded pride will be no more productive of hatred and of falsehoods, than any such ties ordinarily are of affection. Every divorce is thus a party affair with a number of families and individuals, an evil unseen, but increasing with the increasing intelligence of the community—and proportionably destroying the safeguards of virtue amongst them, by familiarising them with the details of the worst of crimes.

It is rather remarkable that we have a most elaborate disquisition on this subject from the pen of Milton. As his prose writings generally, and his theological sentiments in particular, have recently attracted considerable public notice, we may be allowed to notice his views of divorce somewhat in detail. He had made what he would call 'a disastrous and misyoked marriage,' 'a remediless mistake;' in which it were as vain to go about to compel the unhappy pair 'into one flesh, as to weave a garment of wind, to compel the vegetable and nutritive powers of nature to assimilations and mixtures which are not alterable each by the other; or force the connective stomach to turn that into flesh, which is so totally unlike that substance as not to be wrought upon.' In other words, the prince of poets had proved himself but man in his choice of a wife; and because she was not more than woman in bearing with his learned peculiarities at home, and not a well advised or discreet woman, in refusing to return home after a short absence at her father's house, Milton branded her as 'no wife,' 'an adversary,' 'a desertice;' and actually paid his addresses to another lady with a view to supplying her place. The sequel of the poet's history speaks of a romantic reconciliation taking place between them. She rushed to his feet in tears at the house of a relative; and, after a short reluctance, he sacrificed his resentment to her entreaties, and the solicitation of surrounding friends. To this event, according to Fenton, we owe much of the painting in 'that pathetic scene in *Paradise Lost*, in which Eve addresses herself to Adam for pardon and peace. Now then, the 'mistake' was remedied; the uncongenial 'assimilations' mixed; and the champion of divorce and his 'adversary' became 'one flesh;' but he had published, in the interim, his work on Divorce, and others in defence of it; and he through life justified the theory he had, under these untoward circumstances, espoused. Milton composed two sonnets on the treatment he received from the public, and particularly from the clergy, on account of these works. In one he says:—

A book was writ of late, called *Tetrachordon*
And woven close, both matter, form, and style;
The subject new: it walked the town awhile,
Numbering good intellects; now seldom pored on.

Cries the stall-reader, 'Bless us! what a word on
A title-page is this!' And some in file
Stand spelling false, while one might walk to Mil-
End-Green.—

In the other he is more serious:—

I did but prompt the age to quit their clogs
By the known rules of ancient liberty,
When straight a barbarous noise environs me
Of owls and cuckoos, asses, apes, and dogs:
As when those hinds that were transformed to frogs,
Railed at Latona's twin-born progeny,
Which after held the sun and moon in fee.
But this is got by casting pearls to hogs,
That bawl for freedom in their senseless mood,
And still revolt when truth would set them free.

A definition of marriage, which the poet furnishes in due form and order, certainly lies at the basis of the 'Doctrine of Divorce.'

'The material cause of matrimony,' says Milton, 'is man and woman; the author and efficient, God and their consent. The internal form and soul of this relation is conjugal love, arising from a mutual fitness to the final causes of wedlock,—help, and society in religious, civil, and domestic conversation, which includes, as an inferior end, the fulfilling of natural desire and specifical increase; these are the final causes, both moving the efficient and perfecting the form.' p. 272.

Or again, and with all the eloquence of a disappointed lover:—

'Marriage is a divine institution, joining man and woman in a love fitly disposed to the helps and comforts of domestic life. A divine institution. This contains the prime efficient cause of marriage: 'Joining man and woman in a love, &c. This brings in the parties' consent, until which be, the marriage hath no true being. When I say 'consent,' I mean not error: for error is not properly consent; and why should not consent be here understood with equity and good to either part, as in all other friendly covenants—and not be strained and cruelly urged to the mischief and destruction of both! Neither do I mean that singular act of consent which made the contract; for that may remain, and yet the marriage not true nor lawful; and that may cease, and yet the marriage both true and lawful, to their sin that break it. So that either as no efficient at all, or but a transitory, it comes not into the definition. That consent I mean which is a love fitly disposed to mutual help and comfort of life; this is that happy form of marriage, naturally arising from the very heart of divine institution in the text, in all the former definitions either obscurely, and under mistaken terms expressed, or not at all. This gives marriage all her due, all her benefits, all her being, all her distinct and proper being. This makes a marriage not a bondage—a blessing not a curse—a gift of God not a snare. Unless there be a love, and that love born of fitness, how can it last? Unless it last, how can the best and sweetest purposes of marriage be attained? And they not attained, which are the chief ends, and with a lawful love constitute the formal cause itself of marriage, how can the essence thereof subsist? How can it be,

indeed, what it goes for? Conclude, therefore, by all the power of reason, that where this essence of marriage is not, there can be no true marriage; and the parties, either one of them or both, are free, and without fault, rather by a nullity than by a divorce, may betake them to a second choice, if their present condition be not tolerable to them. If any shall ask, why 'domestic' in the definition? I answer, that because both in the Scriptures, and in the gravest poets and philosophers, I find the properties and excellencies of a wife set out only from domestic virtues; if they extend further, it diffuses them into the motion of some more common duty than matrimonial.' pp. 276, 7.

We have but one objection to both these definitions. They envelope in a cloud of words the chief design of marriage; or rather they wholly mis-state its chief design to be the personal comfort of the immediate parties. 'Help and society in religious, civil, and domestic conversation;' 'a love fitly disposed to the help and comfort [of each other] in domestic life.' The relative bearing of the institution, or its aspect towards society at large, is almost wholly overlooked. Now we are not about to tempt an unequal warfare with the able quills, or still more formidable frowns, of our fair countrywomen, by denying for one moment the reality of the 'only want' of our primitive sire; or disputing the superior personal comforts he enjoyed, after the formation of his bride. But even a Milton must not be allowed to stigmatise, in prose, the dearest hope of the marriage state, the possession of children, as 'an inferior end' of marriage. We contrast such a sentiment with the nobler views of the author of *Paradise Lost*, and smile at the versatility of our nature:—

Hail wedded love, mysterious law, true source
Of human offspring, sole propriety
In Paradise, of all things common else!
By thee adulterous lust was driven from men
Among the bestial herds to range; by thee,
Founded in reason, loyal, just, and pure,
Relations dear, and all the charities
Of father, son, and brother, first were known.

The Roman moralist (Cicero) understood the matter better than either of these definitions state it: or rather, unbiassed by his private grievances in respect to marriage (for he too had them, it will be remembered), he expressed its great objects far more correctly, when he called it 'The beginning of a city, the seminary of the commonwealth.' In fact, if either the Mosaic narrative of the original institution, or the positive declaration of the almighty Author, is to be held decisive on the subject, the relative objects of marriage, as a 'source of human offspring,' and a natural guarantee of their education, far from being subordinate to any other, constituted his principal design in it. Every other part of creation is represented by the sacred historian as containing, at its birth, some provision for its perpetuity. Light is divided into successive days; the gramineous tribes are secured against destruction in the seed which they yield, and the fruits in that which they contain; all the inferior creatures of the deep, the earth, and the air, are created 'after their kind:' and God saw this arrangement,

in particular, to be טוב 'good,' perfect, complete. The male of the human species only was, at first produced 'alone;' perhaps to teach man more distinctly some of the lessons we are about to consider. This was 'not good,' not a perfect arrangement with regard to man; it did not provide for the complete development of the divine plans concerning him. Marriage was accordingly instituted; and the nuptial benediction pronounced in these terms: 'Be fruitful, and multiply, and replenish the earth, and subdue it and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth.' Jehovah formed for man 'a companion, a covenanted wife.' 'Did he not make (two) one flesh? And is there not one spirit thereto? And what doth he seek? A godly seed.' Abp. Newcome's version of Mal. ii. 15. The endearing names of husband and wife are subordinated by revelation to the important duties of parents. It is truly surprising to see so accurate a textuary, so good a moralist, and so profound a divine, as Milton unquestionably was, bringing together a ponderous volume on marriage and divorce, in which this consideration does not occupy the extent of one page.

The parties then, as we contend, who are in the first instance capable of forming a good and binding marriage, are incapable afterwards of dissolving the contract. The will that binds becomes bound by its own act, and the tie can neither be less strong nor less reasonable on that account. Too common is the notion of measuring the obligation of this, the most important of our voluntary engagements, by the same sort of capricious feeling in which it often originates. With regard, indeed, to the particular person we marry, we are and may justifiably be directed by our own inclinations and preference; but if hence it is assumed, that inclination rather than duty may be a safe future rule, a decent recollection of the ends of marriage will show the fallacy of the conclusion; while to the Christian, who sincerely feels that 'the way of man is not in himself,' it will appear perfectly monstrous. Various are the contracts that bring us into such new relations to others, that, after having once voluntarily engaged in them, no power of withdrawal is reserved to us. 'The formal' promise and promissory undertakings of the merchant, most of the actual engagements of the learned professions, the acceptance of political office at a military rank, but all marriages pre-eminently are contracts of this description. They bring us into a new moral state; we disengage ourselves from one class of duties, and undertake another; and our good or evil conduct supports the good or evil, promotes the prosperity or adversity, of all men of our class. If we would retreat, we cannot replace numerous other interested parties, nor can we be ourselves replaced in our respective situations before contracting. Among these other interested parties to marriage, the appointment of God and nature places pre-eminently—children. Their being is to be considered as a matter of course, and the promotion of their moral well-being as a matter of duty, attendant upon every marriage;—a see

and 'a godly seed.' The cases in which this relation may be lawfully entered into, without any view to the obtaining a family, are to be regarded as exceptions to the general purposes of the institution; they are clearly out of analogy with what we have seen to be its chief design.

We would press particularly on the consideration of the moral reader, married or unmarried, the divinely established connexion between marriage and education. Men and women are united, when God is duly acknowledged to join them together, for objects worthy their own future destiny. A new tribe of creatures, wearing the image of our Almighty Maker, is designed to spring from the union—creatures whose duties, and whose happiness, whose temporal, and whose everlasting destiny, will be more materially affected by the conduct of their parents, as such, than by that of any other human beings. These are the parties, for the sake of whom Christianity has banished polygamy, and restrained divorce; for the sake of whom, even the course of nature seems to dictate the expediency of pairing, and the permanency of the marriage tie, all animals, whose care is necessary for the rearing of their young, having a similar instinct; and none discarding them while their parental care is important:—but what animal has eternal destinies connected with that care, except man? In an age greatly distinguished for the promotion of education by substitute, we have never seen these considerations sufficiently insisted upon in print. Let us educate by substitute, we say, and let any adequate moral superintendence be introduced, when there are no means (from whatever cause) of bringing the parent to watch over and control the machinery of education. But where this can be done, let it be done. It ought to be done. It is the Divine appointment that it should be done; and in those classes of society that have so laudably stood forward for the benefit of others, it is ever practicable—it should ever be borne in view.

Our poet's 'Doctrine of Divorce,' proportionably defective with his definition of marriage, would place the most important of our voluntary contracts on the weakest of all possible grounds. With him, the peculiar temperament of mind and character which first determines us to marry a particular person may, if afterwards reversed, reverse and annul the bond. 'Indisposition, unfitness, or contrariety of mind!' It would be irreverence to the memory of this great man, to multiply quotations from his mode of reasoning on the subject.

Milton defends his doctrine by contending that the law of Moses on this subject is not, in point of fact, repealed by Jesus Christ; and that is other reasons of divorce than actual adultery were allowed by the Jewish legislator, the Christian magistrate should yet admit of them. He minutely examines the celebrated text, Deut. xxiv. 1; and compares it with the original institution of marriage; insisting that no covenant whatever obliges against the main end of itself and the parties covenanting, which main end he calls, in marriage, the 'remedy of loneliness' in man. He then objects to the ignorance and in-

iquity, as he terms it, of the 'canon law, providing for the right of the body in marriage, but nothing for the wrongs and grievances of the mind.' He contends, that the ordinary construction of Matt. v. 32, as repealing the Mosaic law, in reality charges that law with conniving at open and common adultery among the chosen people of God. Nine reasons are given (chap. ii. to xiii.) for the Mosaic precept, thus assumed to be still in force. 1. A meet and proper conversation is the chiefest end of marriage. 2. Without this law, marriage, as it happens oft, is not a remedy of that [kind] which it promises [to be]. 3. Without it, he who finds nothing but remediless offences and discontents, is in greater temptations than ever before. 4. God regards love and peace in the family more than a compulsive performance. 5. Nothing more hinders and disturbs the whole life of a Christian, than a matrimony found to be incurably unfit. 6. To prohibit divorce sought for natural causes is against nature. 7. Sometimes the continuance in marriage may be evidently the shortening or endangering of life. 8. It is probable, or rather certain, that every one who happens to marry hath not the calling. 9. Marriage is not a mere carnal coition, but a human society. Such are the contents of book I. of the *Doctrine and Discipline of Divorce*.

He examines, in his second book, the Christian doctrine on the subject. Christ, it is insisted, neither 'did nor could' abrogate the law of divorce, but only reprov'd the abuse thereof. He afterwards combats the common exposition of divorce being permitted to the Jews, 'because of the hardness of their hearts,' and insists, that the law cannot permit, much less enact a permission of, sin; that to allow sin by law is against the nature of law; that if divorce be no command, neither is marriage; and that divorce could be no dispensation, if it were sinful.

He further objects, that if a dispensation of the real law of marriage be supposed, Christians need it as much as the Jews did, and that the gospel is apter to dispense than the law. In defining (chap. viii.) the true sense in which Moses suffered divorce for hardness of heart, he says:—

'Moses, Deut. xxiv. 1. established a grave and prudent law, full of moral equity, full of due consideration towards nature, that cannot be resisted, a law consenting with the laws of wisest men and civilised nations; that when a man hath married a wife, if it come to pass that he cannot love her, by reason of some displeasing natural quality or unfitness in her, let him write her a bill of divorce. The intent of which law undoubtedly was this, that if any good and peaceable man should discover some helpless disagreement or dislike, either of mind or body, whereby he could not cheerfully perform the duty of a husband, without the perpetual dissembling of offence and disturbance to his spirit; rather than to live uncomfortably and unhappily, both to himself and to his wife; rather than to continue undertaking a duty, which he could not possibly discharge, he might dismiss her whom he could not tolerably, and so not conscientiously, retain. And this law, the spirit of God by the mouth of

Solomon, Prov. xxx. 21, 23, testifies to be a good and a necessary law, by granting it that 'a hated woman' (for so the Hebrew word signifies rather than 'odious,' though it come all to one) that 'a hated woman when she is married, is a thing that the earth cannot bear.' What follows then, but that the charitable law must remedy what nature cannot undergo? pp. 99, 100.

The opening of chap. ix. of this book is, perhaps, the most remarkable part of his whole reasoning. It shows indeed the difficulty of making the worse appear the better cause, in this instance. We recollect no equal display of dignified quibbling:—

'And to entertain a little their overweening arrogance,' he is speaking of our Lord's reply to the Pharisees on this subject, Mark x., 'as best befitted, and to amaze them yet further, because they thought it no hard matter to fulfil the law, as draws them up to that unseparable institution, which God ordained in the beginning before the fall, when man and woman were both perfect, and could have no cause to separate: just as, in the same chapter, he stands not to contend with the arrogant young man, who boasted his observance of the whole law, whether he had indeed kept it or not, but screws him up higher to a task of that perfection, which no man is bound to imitate. And in like manner, that pattern of the first institution he set before the opinionative Pharisees, to dazzle them, and not to bind us. For this is a solid rule, that every command, given with a reason, binds our obedience no otherwise than that reason holds. Of this sort was that command in Eden, 'Therefore shall a man cleave to his wife, and they shall be one flesh;' which we see is no absolute command, but with an inference, 'therefore:' the reason then must first be considered, that our obedience be not disobedience. The first is, for it is not single, because the wife is to the husband 'flesh of his flesh,' as in the verse going before. But this reason cannot be sufficient of itself; for why then should he for his wife leave his father and mother, with whom he is far more 'flesh of flesh, and bone of bone,' as being made of their substance? And besides, it can be but a sorry and ignoble society of life, whose inseparable injunction depends merely upon flesh and bones. Therefore we must look higher, since Christ himself recalls us to the beginning; and we shall find that the primitive reason of never divorcing, was that sacred and not vain promise of God to remedy man's loneliness, by 'making him a meet help for him,' though not now in perfection, as at first, yet still in proportion as things now are.—To make a meet help is the only cause,' he goes on to assert, 'that gives authority to this command of not divorcing to be a command. And it might be further added, that if the true definition of a wife were asked at good earnest, this clause of being 'a meet help' would show itself so necessary and so essential, in that demonstrative argument, that it might be logically concluded; therefore she who naturally and perpetually is no 'meet help' can be no wife; which clearly takes away the difficulty of dismissing such a one.' p. 102—104.

According to the same lax mode of interpreta-

tion, 'whom God hath joined together,' only describes a married pair, 'when their minds are fitly disposed and enabled to maintain a cheerful conversation to the solace and love of each other,' p. 127, and the term 'fornication,' in the exceptive clause of Matt. v. 32, &c., will include 'such things as give open suspicion of adulterising, as the wilful haunting of feasts, and invitations with men not of her near kindred, the lying forth of her house, without probable cause, the frequenting of theatres against her husband's mind.' p. 136.

We are not acquainted with the writings of any modern advocate of these notions who is also a believer in Christianity. The great name of Milton, however, will ever confer a degree of interest on his sentiments generally; while we with pleasure reflect, how little it weighs, in England, in point of authority on the subject of divorce:—a proof of the predominance of sound moral feeling on that topic in this country. Let us retain our English household virtues, and the springs of virtuous life and life eternal will be still untouched. But modern infidelity, with its characteristic indifference to all our real good, has spun similar theories to those of Milton on the subject of marriage, even in this land of Bibles; and we cannot forget that the political reign of that abortion of the human mind in France was distinguished for its numerous and most profligate divorcees. Infidelity has recently reared its head amongst us; and is ever likely to reason and act in this way. The idea of marriage, and all its engagements, being mere matters of private right and private feeling, rather than of express and irrevocable law between God and man, is perhaps natural to us; but it is not a Christian sentiment: and because all classes of society are warmly interested in reprobating it, we shall venture a little deeper into the topics of marriage and divorce.

We are advocates for adverting at once to revelation, upon every subject on which it professedly treats; and few are the moral duties that are more copiously, or more definitely, exhibited in Scripture, than those of the marriage state. Few are the needful remedies for worse evil, that, in our judgment, are more clearly prescribed in Scripture, than the unhappy one of divorce. The divine Saviour, in referring to the original institution of marriage, calls his heavenly Father, as Chrysostom long ago remarked, 'the Maker of all holy matches.' He professes to republish the primitive law of the institution; he defines it as embracing only two persons, 'They twain shall be one flesh;' he restores the woman to her station of equality, as to the nature and duration of the tie; while he shows that it binds equally both parties from all others, and through the whole of life. The apostolical epistles dwell upon its purposes, honors, and duties. The earliest and most distinguished of the Christian teachers had 'commandments' from 'the Lord' on the topic (1 Cor. vii. 10, 11), which he distinguishes from his own warmest recommendations. He endeavours to illustrate the most profound Christian doctrines by a figurative use of the institution and its duties; which he presses, in detail, as

amongst the most important parts of Christian practice.

As a system of morals Christianity must be held to be decidedly friendly to marriage. It attributes expressly all the most abominable vices of the heathen world to 'forsaking' its wholesome provisions, while, externally, it exhibits some of its most beneficial influences in society, in the changes it has produced in the condition of women, wherever it has spread. Unhallowed affections fly before it. They are not merely represented as impolitic, inconvenient, and ruinous, in their temporal consequences, which they are; but plainly declared to exclude men from the kingdom of God, 1 Cor. v. 9, Gal. v. 19, Heb. xiii. 4. Other systems of religion transfer the impurities of human passion and lust to another world—Christianity brings down heavenly purity into all our earthly affections and passions. It interposes a positive command in all ordinary situations of society: 'Let every man have his own wife, let every woman have her own husband.' 'I will that the younger women marry, bear children, guide the house, give none occasion to the adversary to speak reproachfully.'

The few texts in St. Paul's writings, which, when isolated from their connexion, have been supposed to express a general preference for celibacy, far from inculcating any such sentiment, will be seen, when duly compared with their context, to establish the very opposite doctrine. They state, in effect, that when marriage may be to the highest degree *imprudent*, from circumstantial considerations, it is not in all cases sinful; in some cases it may be advisable, and in others even a duty, 1 Cor. vii. 9. In circumstances of *avayκη*, 'distress,' tribulation, (compare Luke xxi. 23,) such in some instances, as had not been equalled in the history of the world, and never shall be exceeded; when all the powers of the state were arrayed in open hostility against the Christian cause; when a false philosophy instigated, and its most able, and most amiable disciples, as the younger Pliny and others, watched inquisitorially over the execution of a deliberate attempt to extirpate Christianity from the earth; and when its advocates and professors (for all the professors of primitive Christianity were its open advocates in some intelligible way) not only were compelled to meet in cells and 'caves of the earth' in that character, but had no certain dwelling-place as individuals; then, indeed, wrote the apostle, 'I suppose—it is good, for the present distress, for a [single] man so to be.' But even then he adds, 'Art thou bound to a wife? seek not to be loosed.' Fear not, despair not. 'If thou marry, thou hast not sinned; and if a virgin marry, she hath not sinned.' Let this doctrine be contrasted with the too common speculation of parents for the splendid misery of their children, in either persuading or compelling them into matches for the mere love of money; let it be compared with the undue severity with which what are called imprudent marriages, of which we are not the advocates, are ordinarily visited by parents, amongst whom adultery is a fashionable gaiety, especially if committed

with 'the lower orders,' and fornication a mere peccadillo; let it even be taken as a test of the antichristian application and effect of that part of our marriage law which respects the royal family; and the recent unhappy agitation of these topics may yield some ultimate good.

The clear and definite limitations of divorce in the Christian Scriptures occur but infrequently, for the best of all reasons—sincere and discreet Christians can very rarely be interested in them. It is a moral question, upon which no man need seek to be experimentally informed; and the Gospel would teach us to be 'simple concerning that which is evil.' But our great Master more than once delivers a formal judgment on the topic; and the apostle Paul enlarges and confirms the spirit of the Saviour's rule.

The great duties of marriage, common to both parties, are fidelity, the cultivation of love and peace, the joint pursuit of God's glory in the order of the family, and the education of children. All the individual duties of a husband are comprehended, by inspired wisdom, under one great admonition, 'Husbands, love your wives;' on the proofs of which, however, the New Testament is not silent: while those of a wife are contained in another, 'Let the wife see that she reverence her husband.' These duties supply the best view of the nature of the tie. In point of fact, they can never be fully exercised by one party, without the concurrence of the other. So far, then, there is an essential reciprocity in them: they impart rights to each; from both they command corresponding duties. Christianity knows nothing of human rights that are not thus connected with duty. Without meaning to afford to either a justification for individual negligence on this ground—or to give at once, even to the innocent party, all the power and right of punishing the guilty—clear it is, that revelation regards marriage as a mutual interchange of rights and privileges. Does it grant a husband peculiar, and almost absolute authority? It demands of him a peculiar and equivalent protection of the gentler sex. Does it give him the ruling arm? It also describes him as the moral head of his family, particularly of his wife (Eph. v. 23); and requires from him spiritual and moral wisdom, spiritual and moral conduct, accordingly. On the other hand, has Christianity conferred on woman privileges unknown to her in the ancient world, and even amongst God's chosen people? She is exhorted also to an intelligent submission and obedience, and to exhibit an unreserved devotion to the wants and comforts of man, never before required, and fully equal to the protection she claims. They are formed to develope each other's excellencies—to bear with, and to win away each other's faults: 'The man is not without the woman,' not himself—not the man that God made, ere he would rest from his works—says this unimpeachable authority; 'nor the woman without the man, in the Lord.' Only such views of the institution can give us a correct idea of its rupture.

The same divine system clearly regards marriage as a constant interchange of duties. It

knows nothing of the modern fashion of separation; it allows no sanction, as we think, to the modern laws of partial divorce. The consideration of these subjects will necessarily lead to the only legitimate cause of divorce the Scriptures acknowledge. Separation by mutual consent, as it is called, is nothing less (and how, in point of bad faith, could it be more!) than two accountable human beings undertaking privately to contradict and renounce what they had sworn publicly, in the name of God, to do and perform. Apart from its being wholly opposed to the general obligation of lawful vows, it holds up a man and woman to the world, it sends them into the world, as neither married nor unmarried both and neither. 'Joined together' of God, or in obedience to a law under which he has placed them, and separated by the inconveniences of keeping it! The express determination of Scripture anticipates the awful moral evils to which such a monstrous system leads. 'I wish not myself any other advocate, nor you any other adversary,' says the devout bishop Hall, to a friend who inclined to a separation, 'than St. Paul who never gave, I speak boldly, a direct precept, if not in this.' Should the remaining part of our quotation grate a little ungraciously on a delicate ear, let the substantial interests of religion and virtue, and the possible prevention of such mischiefs in other ranks, as have lately stared upon us from a throne, be our apology. His express charge whereupon I insisted is, 'defraud not one another; except with consent, for a time, that you may give yourselves to fasting and prayer; and then come again together, that Satan tempt you not for your incontinency.' Every word, if you weigh it well, opposes your part, and pleads for mine. If consent of all divines, ancient and modern, 'defrauding' is refraining from matrimonial conversation. See what a word the Spirit of God hath chosen for this abstinence—never taken but in ill part!

But there is no fraud in consent, as Chrysostom, Athanasius, Theophylact, expound it: true. Therefore St. Paul adds, 'unless with consent;' that I may omit to say, that in saying, 'unless with consent,' he implies, both that there may be a defrauding without it, and with a consent a defrauding, but not unlawful. But see what he adds—'for a time.' Consent cannot make this defrauding lawful, except it be temporary: no defrauding without consent; no consent for a perpetuity. 'How long then, and wherefore? Not for every cause; not for any length of time: but only for a while, and for devotion, ut vacetis, &c. Mark how the apostle adds, 'that you may give yourselves to fasting and prayer.' It is a solemn exercise which the apostle here intends, such as is joined with fasting and external humiliation; wherein all earthly comforts must be forborne. 'But what if a man list to task himself continually?' No: 'Let them meet together again, saith the apostle; not as a toleration, but a charge. 'But what if they can both live safely thus severed? This is more than they can undertake: there is danger, saith our apostle, in this abstinence, lest Satan tempt you for your incontinency.' What can be more plain? Bishop

Hall's *Epistles*, decad, v. ep. 9.; *Works*, vol. vii. p. 249.

The application of these remarks to our present legal practice with regard to divorce is plainly this. The apostolic rule will include a prohibition of the divorce à thoro et mensâ, except in cases of adultery. *It sanctions no partial divorces.* There is but one scriptural cause for any divorce, and then it is to be a complete one. By our ecclesiastical law (Can. 107) it is enjoined, 'that in all sentences pronounced only for divorce and separation à thoro et mensâ, there shall be a caution and restraint inserted in the act of the said sentences, that the parties so separated shall live chastely and continently; neither shall they, during each other's life, contract matrimony with another person. And, for the better observation of this last clause, the said sentences of divorce shall not be pronounced, until the party or parties requiring the same have given good and sufficient caution and security into the court, that they will not any way break or transgress the said restraint or prohibition. We are not acquainted with the kind of caution or security which is found to satisfy the learned judges of this court in such cases, but St. Paul would not have taken any. He estimated human nature, it would seem, according to a different rule; and would not believe that even devout Christians could offer such security. He would prevent the crime of adultery, by removing the temptations to it. His language is not, Meet again when ye are—but lest ye be tempted.

Permanent separation of every kind is adultery, our old English word for adultery. It is contrary to vow. 'God will contempne adulterers and whorekeepers,' says an old version of Heb. xiii. 4, now before us. So again Wicliffe's translation of Matt. xv. 19, is, 'Of the herte gon out yvel thoughtis, mansleynghis, avoutries, &c. And of Mark x. 11. 'Whoever leevith his wife, and weddith another, he doth avoutrie.' We vow, in marriage, 'Forsaking all other to keep to the object of our choice, so long as we both do live.' To take another is a final and irrevocable breach of this vow; but not to keep to the espoused object is also a breach of it: it proves and encourages alienate affection; it is the harbinger of all that is evil in the violation of this tie. Look at its consequences again in this way; the Jewish law of divorce, upon which the Christian system was introduced as an improvement, when it sent the wife away, provided for her freedom. 'When she is departed out of the house' of her husband, 'she may go,' said Moses, 'and become another man's wife.' It particularly provided, that the repudiating husband was never afterwards to reclaim her; Deut. xxiv. 4. This was a moral and merciful system, compared with which all articles of separation are both impure and cruel. They 'send away' a wife, but they keep her bound; they expose her to second attachments, which she cannot lawfully entertain; they suspend over her a husband's power, while they deprive her of his protection and his smile.

In the spirit of these remarks, we apprehend, the Christian legislator pronounced the repudiation of a husband or wife unlawful, except for a previous violation of the marriage vow. No basis of Christian morals can be more firm or orthodox than the sermon on the Mount; and here stands conspicuously the simple and unequivocal rule, 'Whosoever shall put away his wife, saving for the cause of fornication, πορνεία, [except for whoredom, Campbell] causeth her to commit adultery; and whosoever shall marry her that is divorced, committeth adultery.' The same doctrine was inculcated in reply to the question of the Pharisees on this point, 'Is it lawful for a man to put away his wife? He answered and said, What did Moses command you? And they said, Moses suffered to write a bill of divorcement, and put her away. And Jesus answered and said unto them, For the hardness of your heart he wrote you this precept: but from the beginning of the creation God made them [a] male and [a] female.'—'And in the house his disciples asked him again of the same matter, and he saith unto them, Whosoever shall put away his wife, and marry another, committeth adultery against her. And if a woman shall put away her husband, and be married to another, she committeth adultery.' The exceptive clause is not here added; but it is clear, on a comparison with the passage in St. Matthew, that it may be safely understood.

2. May not the Christian moralist ask, why should we have one kind of law upon this subject for the rich, and another, or rather no law at all, in the vast majority of cases, for other classes? for *a real divorce is unattainable by our law in its ordinary course.* It must be an *ex post facto* law, made for each specific case, and by application in the first instance, at an enormous cost, to the highest court of appeal in the country: at once, in all instances of its occurrence, attesting the imperfect and crude state in which the subject is left in the statute-book, and precluding, by the expensive manner of proceeding necessary, the greater portion of the people from availing themselves of it. Is this a compliment that our legislators pay the middle and lower classes, supposing the crime, so conspicuous among themselves, never to desolate these walks of life! We are quite sure that the affections and fire-side feelings of these classes deserve as much protection as those of the higher orders." Let the same courts and course of law, we suggest, which are now appealed to in all cases to prove the fact of adultery, pronounce in all cases, where it is sought for, the Scriptural remedy of divorce to poor or rich, forthwith; and without additional expense.

We believe, in conclusion, that Dr. Paley is mistaken when he says, 'the law of this country, in conformity to our Saviour's injunction, confines the dissolution of the marriage contract to the single case of adultery in the wife,' for all the remedies for this evil, such as they are, regard adultery in husband or wife, as equally a ground of divorce; but we fully and heartily join in his enquiry, 'Whether a law might not be framed, directing 'the fortune of the adulteress to descend as in case of her natural death:

VOL. VII.—PART 2.

reserving a certain proportion of the produce of it, by way of annuity, for her subsistence (such annuity in no case to exceed a certain sum), and also so far suspending the estate in the hands of the heir, as to preserve the inheritance to any children she might bear to a second marriage, in case there was none to succeed in the place of their mother by the first, and whether such a law would not render female virtue in higher life less vincible, as well as the seducers of that virtue less urgent in their suit? I would recommend this,' continues he, 'to the deliberation of those who are willing to attempt the reformation of this important but *most incorrigible class* of the community. A passion for splendor, for expensive amusements and distinctions, is commonly found in that description of women who would become the subjects of such a law, not less inordinate than their other appetites. A severity of the kind proposed applies immediately to that passion. And there is no room for any complaint of injustice, since the provisions above stated, with others which might be contrived, confine the punishment, so far as it is possible, to the person of the offender; suffering the estate to remain to the heir, or within the family of the ancestor from whom it came, or to attend the appointments of his will.'

DIURETIC, *adj.* Διουρητικός. Having the power to provoke urine.

Diuretics are decoctions, emulsions, and oils of emollient vegetables, that relax the *urinary passages*: such as relax ought to be tried before such as force and stimulate. Those emollients ought to be taken in open air, to hinder them from perspiring, and on empty stomachs. *Arbutinot.*

Graceful as John, she moderates the reins,
And whistles sweet her *diuretick* strains. *Young.*

DIURETIC, DIURETICUS, Διουρητικός; from διουρησις, a discharge of urine. That which, when taken internally, augments the flow of urine from the kidneys. It is obvious that such an effect will be produced by any substance capable of stimulating the secreting vessels of the kidneys. All the saline diuretics seem to act in this manner. They are received into the circulation; and, passing off with the urine, stimulate the vessels, and increase the quantity secreted. Murray, in his *Elements of Materia Medica*, classes the super-tartrate of potassa, or cream of tartar, and nitrate of potassa, or nitre, the muriate of ammonia, or crude sal-ammoniac, potassa, and the acetate of potassa, or kali acetatum, among the saline diuretics; and selects the following from the vegetable kingdom:—*scilla maritima*, *digitalis purpurea*, *nicotiana tabacum*, *solanum dulcamara*, *lactuca virosa*, *colchicum autumnale*, *gratiola officinalis*, *spartium scoparium*, *juniperus communis*, *copaifera officinalis*, *pinus balsamea*, and *pinus larix*; and the *lytta vesicatoria* from the animal kingdom. The principal articles included by Dr. Cullen, in his catalogue of diuretics, are *dulcamara*, *digitalis*, *scilla*; some of the *alliaceæ* and *siliquosæ*; the balsams and resins; *cantharides*, and the diuretic salts.

DIURNAL, *n. s. & adj.* } Lat. *diurnalis*:
DIURNALLY, *adv.* } from *dies*, a day.
DIURNE, *adj.* } See DAY. A jour-

nal, or record of daily transactions: relating to or constituting the day; daily.

Performed hath the sonne his arke *diurne*,
No longer may the body of him sojourne
On the orisont, as in that latitude.

Chaucer. Cant. Tales.

We observe in a day, which is a short year, the greatest heat about two in the afternoon, when the sun is past the meridian, which is the *diurnal* solstice, and the same is evident from the thermometer.

Browne's Vulgar Errors.

The prime orb,

Incredible how swift, had thither rowled

Diurnal.

Milton.

The *diurnal* and annual revolution of the sun have been, from the beginning of nature, constant, regular, and universally observable by all mankind.

Locke.

Why does he order the *diurnal* hours

To leave earth's other part, and rise in ours?

Prior.

In my former I represented that the *diurnal* rotations of the planets could not be derived from gravity, but required a divine arm to impress them.

Sir Isaac Newton. Letters to Bentley.

As we make the enquiries, we shall *diurnally* communicate them to the publick.

Tatler.

You with soft breath attune the vernal gale,
When breezy evening broods the listening vale;
Or wake the loud tumultuous sounds, that dwell
In echo's many-toned *diurnal* shell.

Darwin.

DIUTURNITY, *n. s.* Latin, *diuturnitas*. Length of duration.

Such a coming, as it might be said that that generation should not pass till it was fulfilled, they needed not suppose of such *diuturnity*.

Browne's Vulgar Errors.

DIVULGE, *v. a.* } Fr. *divulguer*; Span.
DIVULGE, *n. s.* } and Port. *divulgar*; Lat.
and Ital. *divulgare*; *dis* and *vulgo*, to spread a report, from *vulgus*; Gr *πολλος*, the common people. To publish; make universally known; proclaim.

Men are better contented to have their commendations suppressed, than the contrary much *divulged*.

Hooker.

I will pluck the veil of modesty from the so seeming mistress Page, and *divulge* Page himself for a secure and wilful Acteon.

Shakespeare. Merry Wives of Windsor.

I think not any thing in my letters could tend so much to my reproach, as the odious *divulging* of them did to the infamy of the *divulgers*. *K. Charles.*

This is true glory and renown, when God,
Looking on the earth, with approbation marks
The just man, and *divulges* him through heaven
To all his angels, who with true applause
Recount his praises.

Milton's Paradise Lost.

These answers, in the silent night received,
The king himself *divulged*, the land believed.

Dryden's Æneid.

The cabinets of the sick, and the closets of the dead, have been ransacked to publish private letters, and *divulge* to all mankind the most secret sentiments of friendship.

Pope.

DIVULSION, *n. s.* Lat. *divulsio*. The act of plucking away.

Aristotle, in his Ethics, takes up the conceit of the beaver, and the *divulsion* of his testicles.

Browne's Vulgar Errors.

DIXAN, a large town of Tigré, Abyssinia, on the side of Taranta, under the government of the Baharnegash. It is built on the top of a conical hill: a deep valley surrounds it like a trench, and the road winds spirally up the hill. The houses are flat-roofed and without chimneys. Dixan is the seat of a considerable trade in slaves. The other commodities most common here are tobacco, black pepper, white cloths, looking glasses, snuff, spirits, and large beads. It was formerly a fief under Axum. The priests are very active in the disgraceful traffic in slaves.

DIXCOVE, a British African fort, in the country of Ahantah, on the Gold Coast. It stands at the entrance of a small cove, which will admit vessels of thirty or forty tons at high water. The channel is narrow but safe, and the situation strong. It is forty miles south-west of Cape Coast Castle.

DIXMUYDEN, a town of West Flanders, in the kingdom of the Netherlands, situated in the tract called the Freye Lande, on the river Yperlee. The trade has of late declined; but there is still a great yearly horse-fair in the month of June, and the place is noted for its butter and cheese. The sea came at one time up to the walls, forming a small harbour. Here are salt refineries, soap works, and breweries. The great church is a fine building. Eleven miles south of Ostend, and twenty-four east of Dunkirk.

DIZEN, *v. a.* (Corrupted from *dight*.) To dress; to deck; to rig out. A low word.

Your ladyship lifts up the sash to be seen;
For sure I had *dizened* you out like a queen.

Swift.

DIZIER (St.), a town of France, in the department of Upper Marne, and ci-devant province of Champagne, seated on the Marne, at the place where it becomes navigable by boats, seventeen miles south-east of Vitri le François, and 157 east of Paris. The road between these two towns, being levelled and planted with trees, is one of the finest walks in France. St. Dizier is famous for boat-building, and contains 5900 inhabitants. It was formerly a strong fortress, being remarkable for a siege which it sustained in 1544, for six weeks against the emperor Charles V. A sharp action took place here between the French and allies on the 27th of January 1814, and again on the 26th of March of the same year.

DIZUK, a district of the province of Mekran, Persia, forming part of the country of Baloo-chistan. Within its precincts are seven or eight villages, designated by the general term Dizuk, though each has also a distinct name. It is governed by a chief, who receives a tenth of the produce, in wheat and dates. His revenues are computed at 60,000 or 70,000 rupees, or from £8000 to £9000 yearly.

DIZZY, *v. a. & adj.* } Sax. *deusigh*; Belg
DIZZINESS, *n. s.* } *dysysigh*. See **DAZE**.
DIZZARD, *n. s.* } Giddy; vertiginous; having a swimming or whirling sensation in the head; thoughtless; the verb being derived from the adjective. Dizzard, says Johnson, is a blockhead; a fool.

How fearful
And dizzy 'tis to cast one's eyes so low!
Shakespeare. King Lear.

Not the dreadful spout,
Which shipmen do the hurricano call,
Shall dizzy with more clamour Neptune's ear
In his descent, than shall my prompted sword
Falling on Diomedes. *Id. Troilus and Cressida.*

All on a sudden miserable pain
Surprised thee, dim thine eyes and dizzy swam
In darkness. *Milton's Paradise Lost.*

Fixed seriousness heats the brain in some to distraction,
and causeth an aching and dizziness in
sunder heads. *Glanville.*

You who have stood all storms and never sunk,
And climbed up to the pinnacle of power,
And never fainted by the way, and stand
Upon it, and can look down steadily
Along the depth beneath, and ne'er feel dizzy.
Byron.

DLUGOSS (John Longinus), a Polish divine, was born in 1415. Having received his education at Cracow, he was taken into the service of the bishop, who gave him some considerable preferments, and appointed him one of his exco-ecutors. In 1450 Dlugoss went to Palestine, and became on his return tutor to the sons of Casimir IV. He was at one time disgraced, but recalled at the end of three years, and employed on many state affairs. At length he became archbishop of Leopold, but died in 1480, before consecration. His principal work is *Historia Polonica*, 1615, folio; and 1712. His other writings are 1. *Vita St. Stanislai*, 1611. 2. *Polocensium Episcoporum Vita*, fol. 3. *Vita Episcoporum Postpasiensium*, 4to.

DMITROU, a town and circle of European Russia, in the government of Moscow, on the river Jachroma. The environs are celebrated for yellow and white apples, as also for a beautiful palace of the counts of Soltikof, to which the French set fire in 1812. Here are manufactories of cloth, leather, porcelain, and a yearly fair for horses on the 5th of September, which lasts a fortnight. It is thirty-two miles north of Moscow.

DNIÉPER, DNEPER, or NIEPER, the ancient Boristhenes, a large river of Europe, rising in the government of Smolensko, running a long course in a south direction, and falling into the Black Sea, between Cherson and Oczakof. From its source to its mouth, it flows entirely through the Russian dominions, a course of above 800 miles, and its navigation is only once interrupted by a series of cataracts which begin below the mouth of the Samara, and continue for about forty miles. They are not so dangerous but they may be passed in spring by loaded barks. At other seasons, the goods are landed at Kemensk, and transported by land to Kitchkase, six miles from Alexandrowsk, where they are again embarked and descend the river to Cherson. These cataracts might be rendered navigable at all seasons; and, although the expense would be considerable, the navigation would soon repay it. In 1784 the empress Catherine II. caused some of the rocks which occasioned these waterfalls to be blown up, but without any material benefit to the navigation. Above its mouth the river widens into a kind of lake or marsh, called

Jaman. The lower part of its course has been the scene of many conflicts between the Turks and Russians, and the upper part, in the neighbourhood of Smolensko, was the scene of some severe conflicts in Buonaparte's retreat in November 1812. Its principal tributary streams are the Berezya, the Pripitz, the Rose and the Bog. The water, though often unfit for domestic use, abounds in fish, particularly shad, sturgeon, pike, and carp. The chief towns which it passes are Smolensko, Orcha, Mohilev, Bobryow, Kiev, Crementchong, Ekaterinoslav, Nicopol, and Cherson.

DNIÉSTER, or NIÉSTER, the ancient Tyras, a fine river of Europe, which rises in Austrian Galicia, and running south-east visits Choczim, dividing Podolia from Moldavia: it then separates the Turkish province of Bessarabia, from the Russian government of Catherinenslaf, and after watering Egerlik, Bender, &c., falls into the Black Sea, between the mouths of the Dnieper and the Danube. At its mouth it forms a large bay, and though somewhat dangerous to navigate, on account of rocks, the improvements lately made in it by the Russian government have induced the Poles to send a considerable portion of the produce of their soil through its medium, to the port of Odessa.

DO, *v. a. & v. n.* } Sax. *don*; Teut. *thuen*;
Do'ER, *n. s.* } Goth. *dogan*, from Goth.
Do'ING. } *taijan*; Gr. *τενω*, to
build. Coming into our language in modern times from the same root as *to*, Mr. Tooke (*Diversions of Purley*) contends that it is the same word; and that, as we still put *to* before the infinitive, *do* used formerly to mark other parts of a verb not distinguished by their terminations. See *To*. We still, indeed, often say, when we wish to speak emphatically or formally, *I do love*; *I did go*, &c. Its present office, as an auxiliary verb, is, however, as Mr. Tyrwhitt observes, not very easy to define. But if a distinguishing termination is used with a verb, it is always omitted. It has a peculiar expletive use: thus it will perform the office of a substitute for other verbs, expressed or understood, as, *I shall go*, but if *I do not*, will you? and beside giving emphasis on other occasions, as we have noticed, it adds vehemence to a command or entreaty, as, *Do come, do*; and strength to a question or negative, as, *Do you love him? I do not believe him*. As an active verb it signifies to practise; perform; execute with any degree of success; as also to finish and complete: Spenser uses it for *to cause to be done*. As a neuter verb it signifies to behave in any manner; to fare in regard to health; to succeed; to cease. The meaning of the nouns obviously follows.

Therfore whanne thou doist almes, nyle thou trumpe before thee as ypoocrites *don* in synagogis and stretis, that thei be worschippid of men.

Wiclif. Matt. vi.

To him not without desert was ghoun power to write the *dogngis* of apostlis in her mynysterie.

Wiclif. Prologe to Dedis.

Unto this day they *do* after the former manners: they fear not the Lord, neither *do* they after the law and commandment which the Lord commanded the children of Jacob.

2 Kings.

What will ye *do* in the end thereof? *Jer. v. 31.*
Do thy diligence to come shortly unto me.

2 *Tim. iv. 9.*

We *do* you to wit of the grace of God bestowed on the churches of Macedonia. *Bible. 2 Cor. viii. 1.*

He for despit, and for his tyrannie,
 To *don* the ded bodies a vianie,
 Of alle our lordes, which that ben yslavee,
 Hath alle the bodies on an hepe ydrawe.

Chaucer. Cant. Tales.

My lute, adieu! perform the last
 Labour that thou and I shall waste,
 And end that I have now begun;
 For when this song is sung and past,
 My lute, be still, for I have *dune*. *Wyatt.*

For steward was excessive Gluttony,
 That of his plenty poured forth to all:
 Which *doen*, the chamberlain Slowth did to rest them
 call. *Spenser. Faerie Queene.*

A fatal plague which many *did* to dye. *Spenser.*

In this we shew ourselves weak, and unapt to be
doers of his will, in that we take upon us to be con-
 trollers of his wisdom. *Hooker.*

Dangerous it were for the feeble brains of man to
 wade far into the *doings* of the most High. *Id.*

They are great speakers but small *doers*; greater in
 show than in deed. *Knolles's History.*

Thou canst not say I *did* it. *Shakspeare.*

Off with the crown, and with the crown his head:
 And whilst we breathe take him to *do* him dead. *Id.*

May one, that is a herald and a prince,
 Do a fair message to his kingly ears?
Id. Troilus and Cressida.

If there be any good thing to be *done*,
 That may to thee *do* ease, and grace to me,
 Speak to me. *Id. Hamlet.*

The lord Aubrey Vere
 Was *done* to death. *Id. Henry VI.*

Good woman, how *dost* thou?

—The better that it pleases your good worship
 to ask. *Shakspeare.*

Perdition catch my soul
 But I *do* love thee; and when I love thee not,
 Chaos is come again. *Id. Othello.*

Fear not, my lord, we will not stand to prate;
 Talkers are no good *doers*; he assured,
 We go to use our hands and not our tongues.
Shakspeare.

I have but killed a fly. —
 —But how if that fly had a father and mother?
 How would he hang his slender gilded wings,
 And buz lamented *doings* in the air! *Id.*

No man, who hath to *do* with the king, will think
 himself safe, unless you be his good angel and guide
 him. *Bacon.*

The jury prayed of the senate a guard, that they
 might *do* their consciences. *Id.*

The Turks *do* acknowledge God the Father creator
 of heaven and earth, being the first Person in the
 Trinity, though they deny the rest.
Bacon's Holy War.

Too much thinking doth consume the spirits; and
 oft it falls out, that while one thinks too much of
doing, he leaves to *do* the effect of his thinking.

Sir P. Sidney.

Hitherto appertaineth the saying of St. John, how
 that the children of God cannot sin; speaking not
 of the present time only, but finally and perpetually,
 no less attributing to God's seed, which he saith *doth*

abide in them that are born of God, than to the seed
 of the devil in our corrupt nature and flesh.

Manuscript Note of Bradford the Martyr.

To will implies delay, therefore now *do*. *Donne.*

The same act varies in the manner of *doing* and in
 the intention of the *doer*. *Bp. Hall. Contemplations.*

No sooner he does peep into

The world, but he has *done* his *doe*. *Hudibras.*

Go to the reading of some part of the New Testa-
 ment, not carelessly, or in haste, as if you had a
 mind to have *done*; but attentively, as to be able
 to give some account of what you have read.

Duppa.

But God like his unwearied bounty flows;
 First loves to *do*, then loves the good he *does*.

Denham. Cooper's Hill.

At length a reverend sire among them came,
 And of their *doings* great dislike declared,
 And testified against their ways. *Milton.*

Thus painters Cupids paint, thus poets *do*
 A naked god, blind, young, with arrows two.

Sidney.

Doing good is the only certainly happy action of a
 man's life. *Id.*

I have been deterred by an indisposition from
 having much to *do* with steams of so dangerous a
 nature. *Boyle.*

Men are many times brought to that extremity,
 that, if it were not for God, they would not know
 what to *do* with themselves, or how to enjoy them-
 selves for one hour. *Tillotson.*

When all is *done*, there is no man can serve his own
 interest better than by serving God. *Id.*

No men would make use of disunited parties to
 destroy one body, unless they were sure to master
 them when they had *done* with them. *Stillington.*

It may be indeed a public crime, or a national mis-
 chief; yet it is but a private act, and the *doer* of it
 may chance to pay his head for his presumption.

South.

As every prince should govern as he would desire
 to be governed, so every subject ought to obey as he
 would desire to be obeyed, according to the maxim of
doing as we would be *done* by. *Temple.*

—Loose me.—I will free thee.

—*Do*, and I'll be thy slave.

Dryden's King Arthur.

When *did* his pen on learning fix a brand,
 Or rail at arts he did not understand? *Dryden.*

Gigantick hinds, as soon as work was *done*,
 To their huge pots of boiling pulse would run. *Id.*

Though lending to foreigners, upon use, doth not
 at all alter the balance of trade between those coun-
 tries, yet it *does* alter the exchange between those
 countries. *Locke.*

What had I to *do* with kings and courts?

My humble lot had cast me far beneath them.

Rowe.

'Tis true, I *did* so; nor was it in vain:
 She *did* me right, and satisfied my vengeance. *Id.*
 Come, 'tis no matter; we shall *do* without him.

Addison.

Id.

Part of the work being already *done*, more care is naturally bestowed on the other part.

Johnson.

O my soul, look back but a few years, and thou wast nothing !—And how *didst* thou spring out of that nothing ?—Thou couldst not make thyself.

Mason.

What I have *done* is *done* ; I bear within

A torture which could nothing gain from thine :

The mind which is immortal makes itself

Requital for its good or ill.

Byron.

DO, in music, a note of the Italian scale, corresponding to *ut* of the common gamut. See *MUSIC*.

DOAB; a name which, according to Mr. Hamilton, should include all the territory between the Jumna and the Ganges; but the term is usually restricted to the southern portion of it, comprehended, for the most part, in the province of Agra, and, during the Mogul government, subdivided into the districts of Furruckabad, Kanoge, Etawah, Korah, Currah, and Allahabad. There are several Doabs in Hindostan, the name meaning any tract of country included between two rivers.

The cultivated part of this country is very fertile. Tamarind and mango trees abound every where; the millet is also raised, and, although a small-eared grain, furnishes straw ten feet long, which is of great use as provender. Barley and the sugar-cane are likewise cultivated; and, in the neighbourhood of Kanoge, considerable quantities of tobacco. Indigo is found in a wild state, and of superior quality. The cattle are generally small. The climate of the Doab is excessively sultry in April and May, before the commencement of the rains; and even in the winter season it is the morning only that is cool. The natives manufacture a coarse cotton cloth, dyed red with cheap materials. Dowlet Row Sindia on the 30th December 1803, ceded his part of this country to the British. The southern part of the Doab was ceded, during the administration of the marquis Wellesley, in 1801, by the reigning Nabob of Oude, Saadet Ali.

DOABEH BARRY, or BARI RESIDENCE, a district in the province of Lahore, situated between the Beyah and Ravey rivers, and the thirtieth and thirty-first degrees of north latitude. In modern maps this territory is placed in Mooltan; but, according to Abul Fazel's arrangement, in 1582, says Mr. Hamilton, it belonged to Lahore. This country, named also Manjha, contains the cities of Lahore and Amritseer; and becomes, in consequence, the great centre of the power of the seiks. It is of the same general climate and soil as

DOABEH JALLINDER, another district in the province of Lahore, included between the

Sutleje and Beyah rivers, and for the most part between the thirtieth and thirty-first degrees of north latitude. This is the most fruitful of all the possessions of the seiks. The soil is light, but well watered and very productive; and the country, which is open and level, abounds in grain. The principal towns are Jalindra and Sultanpoor. This territory is principally occupied by the Malawa Singh Seiks, who are called the Doabeh Singhs, or Singhs who dwell betwixt two rivers.

DOAT, *v. n.* See *DORE*.

DOBSON (William), an eminent English portrait and historical painter, born at London in 1610. He served an apprenticeship with one Peck, a stationer and picture dealer; and owed his improvement to the copying some pictures of Titian and Van Dyck, whose manner he always retained. A picture of Dobson's being exposed at a shop in Snowhill, Van Dyck passing by was struck with it; and enquiring after the author, found him at work in a garret. Van Dyck generously equipped him in a manner suitable to his merit; and presented him to king Charles I. who took him under his protection, kept him with him at Oxford all the time he continued in that city, and not only sat to him several times for his picture, but caused the prince of Wales, prince Rupert, and most of the lords of his court, to do so too. Dobson, however, being extravagant, did not improve the many opportunities he had of making his fortune; and died very poor in 1647, at his house in St. Martin's Lane.

DOBUNI, or BODUNI, an ancient people of Britain, who possessed the territory which now forms the counties of Oxford and Gloucester. Both the names of this British people seem to have been derived from the low situation of a great part of the country which they inhabited: for both *Duvn* and *Bodun*, signify profound, or low, in the ancient language of Gaul and Britain. The Dobuni are not mentioned among the British nations who resisted the Romans under Julius Caesar, which was probably owing to the distance of their country from the scene of action; and before the next invasion under Claudius, they had been so much oppressed by their ambitious neighbours the Cattivelanni, that they willingly submitted to the Romans. Cogidunus, who was at that time prince of the Dobuni, recommended himself so effectually to the favor of Claudius, by his ready submission, that he was not only continued in the government of his own territories, but had other states put under his authority. This prince remained so steady a friend and ally to the Romans, that his subjects never revolted, nor stood in need of forts or forces to keep them in subjection. So that we meet with very few Roman towns and stations in the country anciently inhabited by the Dobuni. The Durocoronovium of Antoninus, and the Corinium of Ptolemy, are believed by antiquaries to have been the same place, the capital of the Dobuni, and situated at Cirencester, in Gloucestershire, where there are many marks of a Roman station. Clevum or Glevum, in the thirteenth iter of Antoninus, stood where the city of Gloucester now stands; and Abone, in the fourteenth iter, was probably situated at Avinton on the Severn.

The country of the Dobuni was comprehended in the Roman province, Britannia Prima.

DOCE RRO, a river of Brasil, which rises near the town of Villa Rica, and after a north course, through a fine country, turns eastward and discharges itself into the Atlantic, in lat. 19° 30' S. It has a course of about 500 miles. Until lately the fertile neighbourhood of this river has been totally neglected: otherwise the abundance of timber, cotton, and sugar, it is capable of yielding, would long since have found their way to European markets. There is another river of this name, which falls into the ocean in lat. 8° 10' S.

DOCTE, from *δοκew*, to appear, in ecclesiastical history, the followers of Julius Cassianus, one of the Valentinian sect, towards the close of the second century, who revived a notion that had been adopted by a branch of the Gnostics, against whom St. John, Ignatius, and Polycarp, had asserted the truth of the incarnation. They believed and taught, as their name imports, that the actions and sufferings of Jesus Christ were not in reality, but only in appearance.

DOCILITY, *n. s.* } Fr. *docile*; Span. and
Do'CILE, *adj.* } Portug. *docil*; Ital. and
Do'CIBLE, *adj.* } Lat. *docibile*, *docile*, from
Do'CIBleness, *n. s.* } *facilis* easy, and *doceo*
to teach; Gr. *δοκew*, to judge, *δοκew*, to observe. Teachableness; aptness to receive instruction. The adjectives and substantives are respectively, synonymous.

The asinine feast of sow-thistles and brambles is commonly set before them, as all the food and entertainment of their tenderest and most *docible* age.

Milton.

I might enlarge in commendation of the noble hound, as also of the *docibleness* of does in general.

Walton's Angler.

What is more admirable than the fitness of every creature for our use? the *docility* of an elephant, and the insinuity of a camel for travelling in deserts?

Grew.

All the perfection they allowed his understanding was aptness and *docility*, and all that they attributed to his will was a possibility to be virtuous.

South.

Soon *docile* to the secret acts of ill,

With smiles I could betray, with temper kill.

Prior.

Dogs soon grow accustomed to whatever they are taught, and, being *docile* and tractable, are very useful.

Ellis's Voyage.

DOCIMASIA, in Greek antiquity, a probation of the magistrates and persons employed in public business at Athens. It was performed publicly in the forum, where they were obliged to give account of themselves and their past lives before certain judges. Among several questions proposed to them, we find the following: whether they had been dutiful to their parents, had served in the wars, and had a competent estate?

DOCIMASTIC ART, a name given to the art of assaying by operations in small, the nature and quantity of metallic or other matters which may be obtained from mineral or other compound bodies. See METALLURGY and REFINING.

DOCIMENUM MARMOR, a name given by the ancients to a species of marble of a bright and clear white, much used in large and sumptuous buildings.

It had its name from Docimenes, a city of Phrygia, near which it was dug, and whence it was sent to Rome. It was accounted little inferior to the Parian in color, but not capable of so elegant a polish; whence it was less used by the statuary, or in the smaller works. Adrian used this marble in building the temple of Jupiter; and many other of the great Roman buildings are formed of it.

DOCK, *n. s.* Sax. *docca*. A plant; a weed.

Nothing teems

But hateful docks, rough thistles, kecksies, burs,
Losing both beauty and utility.

Shakespeare. Henry V.

My love for gentle Dermot faster grows

Than yon tall dock that rises to thy nose:

Cut down the dock, 'twill sprout again; but know,
Love rooted out again will never grow. Swift.

The species are seventeen, ten of which grow wild, several of them being used in medicine; and the sort called the oriental burdock, is said to be the true rhubarb.

Miller.

Dock, in botany. See RUMEX.

DOCK, *v. a. & n. s.* } From Fr. *decouer*, *decouer*,

DOCK'ET, *n. s.* } to dock, à Lat. *cauda*, a tail.

To cut short, or trim: as a substantive, the thing trimmed or cut short: a docket is an abridged writing, a summary of legal proceedings.

The Reve was a slendre colerike man,

His berd was shave as neigh as ever he can,

His here was by his eres round yshorne;

His top was docked like a priest beforene.

Chaucer. Prologue to Cant. Tales.

The tail of a great rhinoceros is not well described by Bontius. The dock is about half an inch thick, and two inches broad, like an apothecary's spatula.

Grew's Muscum.

One or two stood constant century, who docked all favours handed down; and spread a huge invisible net between the prince and subject, through which nothing of value could pass.

Swift's Examiner.

Dock, *n. s. & v. a.* Flem. *dok*; Teut. *dock*; Swed. *docka*; Suid-Goth. *docku*; perhaps from *dekken*, to cover, protect, secure; and also from Gr. *δοχειον*, a receptacle; *πρωτοσκευα* (the ship-house), a dock. An enclosed receptacle for ships: see the article. Also an enclosed place for prisoners in a court of justice. As a verb, to put in dock.

The boatswain and mariner may bring religion to what dock they please.

Hume.

There are docks for their galleys and men of war, as well as work-houses for all land and naval preparations.

Addison.

Dock, in the manege, is used for a large case of leather, as long as the dock of a horse's tail, which serves it for a cover. The French call the dock troussequeue. It is made fast by straps to the crupper, and has leathern thongs that pass between his thighs, and along his flanks to the saddle straps, in order to keep the tail tight, and to hinder it from whisking about.

Docks, for shipping, are enclosed excavations or basins formed in rivers and harbours, for the receiving, building, or repairing of ships. They are constructed of brick, stone, or timber; with locks or flood-gates, pointed to or from the tide, to keep the water in or out, as the object and nature of the docks require.

* **WET DOCKS** are for the reception of ships to lie afloat while loading or unloading, with gates pointed from the tide, to keep the water in at low water. Locks are attached to them, generally with double gates, for the more easy admission and egress of shipping; and, to aid the operation of opening and shutting these gates, sluices are made within to regulate the water, until the same level is produced within as without. A wet dock without gates is called, both by the French and ourselves, a *basin*; a dry dock is with them *une forme*, and a slip, *un calle*. Wet docks are in fact artificial harbours for the keeping a vessel afloat at all periods of the tide; and to no other modern improvement do our great commercial towns owe so much of their general superiority and opulence. Liverpool, as it has been often remarked, might still have remained a poor fishing village without them.

Basins, or docks open to the tide, are called **Dry Docks**, because the vessels frequenting them ground at low water, and lie dry on the ebb tide, and float again on the next rise of the tide. They are used at Liverpool as entrances to the wet docks, and are frequented by coasters, and small or light vessels, that do not injure by lying on the shore. Dry as well as wet docks are enclosed with gates which exclude the tide as circumstances may require; and often have the interior water completely pumped out by means of horses and machinery, or the steam engine. Here ships are conveniently built and floated out: though generally there are places set apart for this purpose, called *slips*. The port of Liverpool, from the badness of its harbour, the rapidity of the river Mersey, and the shifting of its sands, resorted to the construction of docks in 1708. The management of the first undertaking of this kind was invested in the corporation for the term of twenty-one years, which gave for this purpose four acres of land; and they were empowered to borrow the sum of £6000. In 1717 the term was prolonged for fourteen years, and they were authorised to borrow £4000 more. In 1737 the term was further extended to thirty-one years, and powers given to make an additional dock, to build a pier in the open harbour, and to light the docks. The corporation on this occasion gave seven acres of land, and they were empowered to borrow £6000. In 1761 the commerce of Liverpool was so much increased, and its shipping had become so numerous, and so enlarged in size, that further accommodation was wanting. The term of the corporation's management was again extended for twenty-one years, with powers to make another dock, and to erect a light-house for the benefit of the port; for these purposes they were authorised to borrow the sum of £25,000, and to raise the further sum of £2000 on the light-house duties. In 1784 the powers of all the former acts were enlarged, and the term extended to forty-one years, with liberty to make two additional docks and piers, and to borrow for this purpose £70,000. In 1799 an act was passed to alter and enlarge the powers of former acts, and to render the docks and the port more commodious and safe; by which a further extension of term was granted

for thirty years. The corporation again gave some lands, and they were empowered to make two additional docks, and other docks; with liberty to raise the sum of £120,000, and to double the former tolls.

Under the authority of these various acts of parliament the several docks have been constructed, and it has been found that each successive improvement, by affording additional convenience to foreign trade, has been followed by its increase, and prepared the way for the further extension of this excellent system of accommodation. In the course of the last century there were established within this port six wet and three dry docks, and five graving or repairing docks, independent of the Duke of Bridgewater's dock, for canal purposes. In the ten years, ending with 1808, the number of ships that entered these docks was 48,497, tonnage 4,954,204; and the dock duties received £329,566; in the following ten years, ending in 1818, the number of ships was 60,200, the tonnage 6,375,560, and the amount of duties £666,438. Hull, Bristol, and Leith, have successfully emulated this example.

In 1794 a general meeting of merchants was convened, to consider the great inconveniences of the port of London, arising from the crowded state of the river, and the confined extent of the legal quays; when a committee was appointed to consider of the best mode of relief, who took into consideration all the plans which had been suggested, when they approved of the plan for making *wet docks* in Wapping with wharfs and warehouses on their borders, as the most effectual means of remedying the evils of the port. In consequence of this determination, Mr. Daniel Alexander, an ingenious architect and surveyor, who was conversant with operations connected with the tide, was directed to make a survey, and prepare plans and estimates for forming docks at Wapping, with the addition of a cut or canal leading to them, from that part of Blackwall where the present East India docks are now situated, and a long line where the West India docks have been since constructed. The plan and estimates were laid before a meeting of merchants, held 22d December, 1795, and the sum of £800,000 subscribed towards their completion in a few hours. A committee was appointed to make application to parliament, who presented a petition in January 1796, which was referred to a select committee of the house of commons, who were directed 'to enquire into the best mode of providing sufficient accommodation for the increased trade and shipping of the port of London.' The project of the merchants experienced great opposition both from the corporation of the city of London and from private interests; and a great variety of plans and projects were brought forward for the extension of the legal quays above and below the bridge, and the improvement of the river with or without docks. At length, through the great exertions and perseverance of William Vaughan, esq. assisted by several other highly respectable mercantile characters, the various obstacles to the plan of the London docks were successively overcome, and in August, 1798,

the subscribers gave notice, that in the ensuing session of parliament they meant to renew their application for forming docks at Wapping. In December following they petitioned for leave to bring in a bill for this purpose. A few days after a petition was presented by the corporation of London, with a view to similar objects, by making a navigable canal or passage across the Isle of Dogs from Blackwall to Limehouse, purchasing the mooring-chains in the river, which were mostly private property, and appointing harbour-masters to regulate the navigating and mooring of vessels in the port; they also proposed to make wet-docks in some part of the Isle of Dogs for the reception and discharge of West India shipping. The latter part of the plan had, however, been taken up by a number of *West India* merchants and planters, who had formed themselves into a company distinct from the subscribers to the London docks, for the purpose of forming docks for the reception of the West India trade only, either alone, or in conjunction with the other improvements projected by the corporation. The general conviction of the necessity of some measure of this kind was not sufficient to produce a union of interests in favor of either of the proposed plans. At length the committee of the house of commons made a report, recommending the formation of wet-docks as the only remedy for the evils of the port, and that they should be made both at Wapping and the Isle of Dogs, but that the latter should be adopted first. The corporation and the West India merchants of London forming a junction, the act for making the West India docks passed in July, 1799. In the next session, on the 30th June, 1800, an act was passed for forming the docks at Wapping, which was followed by other acts for making docks at Blackwall for the East India trade.

The first stone of these last docks was laid in March 1805, and the first ship entered them in August, 1806. The dimensions of the dock for unloading, inwards, are 1110 feet in length, and 560 feet in width, containing about eighteen acres and one-eighth: the dock for loading outwards, which was a part of Mr. Perry's dock, is 780 feet in length, and 520 feet in width, containing nine acres and one-fourth. The extent of the entrance basin, which connects them with the river, is two acres and three-fourths; the length of the entrance lock 210 feet; the width of the gates forty-eight feet in the clear, and the depth of water at ordinary spring-tides twenty-four feet. The great West India dock is 420 yards in length, and 230 yards in width, covering an area of twenty acres. A basin of three acres nearly connects it with the river. The warehouses are most noble buildings: the tobacco warehouse is the most spacious erection of the kind in the world; being capable of containing 25,000 hogsheads of that article, and the vaults underneath as many pipes of wine. This single building, under one roof, is said to occupy upwards of four acres of ground. These docks were opened in February 1805.

The dry docks and slips of his majesty's yards have recently added to their other improvements, that greatest of the whole, the actual

covering or roofing in of vessels, a plan which seems to have been long since used at Venice. Roofs have been thus constructed at Plymouth of ninety-five feet span, without a single beam, and one at Chatham, under the direction of Mr. Seppings, of 100 feet, and having an entrance width of 150 feet.

The wicket-gate of docks, a contrivance resorted to where the abutments are too weak for swinging gates, is represented below. Fig. 1 the plan; fig. 2 the elevation. It consists of three parts, which, when opened, are removed separately, and is the most simple, though by no means the most effective, contrivance for keeping out the water.

Fig. 1.

Fig. 2.

We also give below a diagram of swinging gates, which open in the middle, and lie flat, one part against each wharf or side-wall of the passage, leading into the dock or basin. This kind of gate is made with sound timber, and good iron, of great strength, and the gudgeons on which the hinges turn, must be well secured in the abutments. The bottom of the passage, and of the gates, must be also perfectly plane and parallel, to prevent leakage, and give facility to their opening and shutting. This is usually aided by rollers fixed in a groove, and turned by means of a small capstern on each pier. At top is often placed a foot bridge with railing.

In *docking* a ship formerly, if her keel required inspection or repair, it was found necessary to lift up her whole immense weight off the blocks; but about twenty years ago, Mr. Seppings contrived a very simple and excellent improvement, by which twenty men will suspend the largest ship in the navy, or, which amounts in practice to the same thing, will disengage any one block that may be required in the space of two or three minutes, without the necessity of suspending her. This improvement may be thus exhibited:

K is the keel; **W** the wedge on which the keel rests, having its obtuse angle equal to 170° , and **PP** are two inclined planes, having each an acute angle of 5° . The wedge is of iron or hard wood, having its two sides lined with iron; the inclined planes are of cast iron. A few smart blows on the two sides of the inclined planes will disengage them, when the middle part or wedge drops.

DOCK-YARDS, in the navy, are magazines of naval stores, and timber for ship-building; the royal dock-yards in England are those at Chatham, Deptford, Pembroke, Plymouth, Portsmouth, Sheerness, and Woolwich. In time of peace, ships of war are laid up in these docks, in ordinary; those of the first rates mostly at Chatham, where, and at other yards, they receive, from time to time, such repairs as are necessary.

Chatham dock-yard consists of a line of wall, extending 5500 feet along the right bank of the Medway, being 400 feet in width at the upper, 800 at the lower end, and 1000 feet in the middle. Its superficial area is about ninety acres. In front it has six building-slips of different sizes, and four dry-docks. At the southern extremity is the ropery, hemp, and yarn houses, rigging and general storehouses, 1000 feet in length, by about fifty in breadth; in front of which, and along the wharf, are the anchor racks, nearly 1000 feet long. Next to these are the slips and docks, with the working sheds and artificers' shops in the rear, an excellent smithery, timber-births, deal and iron yard, seasoning sheds, &c. The commissioner's house and garden are in the centre, and, on the eastern extremity of the yard, the officers' houses and gardens. The lower or north-east part is occupied by mast-ponds, mast-houses and slips, store boat-houses and slips, ballast-wharf, timber-births, and saw-pits.

The river Medway forms the principal wet-dock or basin appertaining to this yard; and it is sometimes so shallow, and the navigation so intricate, that vessels are obliged to take in their stores and provisions at various different points a circumstance that often delays them here much longer than even at Deptford.

The improved saw-mill of Mr Brunell, erected here, is supposed to be equal to the power of fifty saw-pits, and one hundred sawyers; and is capable of supplying the dock-yards of Chatham and Sheerness with all their straight-sawn timber. The greatest advantage of the plan is its application of the steam-engine to the management and arrangement of the timber, by which the labor and expense of a vast number of horses are saved. See **SAW-MILL**.

In war the dock and rope-yard of Chatham employed together about 2250 men.

Deptford yard has a front or wharf wall facing the Thames, of about 1700 feet in length, the mean breadth of the yard 650 feet, and the superficial area about thirty acres. It has three slips for ships of the line, and two for smaller vessels on the face next the river, with a basin, or wet-dock, 260 by 220 feet. Here are also three dry-docks, one of them a double dock, communicating with the Thames. The proximity of Deptford Dock-yard to the capital is a great convenience, and it became, during the last

war the general magazine of stores and necessities for the fleet, whence they were transmitted as occasion required to the other yards, the out-ports, and foreign stations.

The great storehouse is a large quadrangular building surrounding a square, of three stories in height, with cellars underneath, for pitch, tar, rosin, &c. Its length is about 210 feet, but the sides vary in width from forty-six to twenty-four feet. Parallel to the west front is the rigging-house and sail-loft, 240 feet, and nearly fifty feet wide, in which all the rigging is fitted for ships and stowed away. On the eastern side is the pavilion, a long range of buildings, in which the beds, hammocks, and slop-clothing are kept, and in which also are the house-carpenters', the joiners', and wheelwrights' shops. This range is about 580 feet long by twenty-six feet wide. Other buildings are an excellent blacksmith's shop, plumbers', glaziers', and painters' shops, seasoning-sheds, store-cabins, saw-pits, mast-house and pond, boat-houses, mould-loft, timber-births, besides houses and gardens, coach-houses and stabling, for the officers. The number of men employed here, in time of war, was about 1500, of whom about one-half were shipwrights. There were, besides, in constant employ, eighteen or twenty teams, of four horses each. Adjoining to the dock-yard is the victualling-yard, the most complete establishment of the kind in the kingdom. The principal naval stores kept at Deptford are small cordage, canvas and ship sails, hammocks, beds and hair for beds, slops and marine clothing, and anchors under the weight of about seventy-five cwt.

Pembroke dock-yard was a small establishment for the building of vessels undertaken at the close of the war. It contains an area of sixty acres, ascending from the southern shore of Milford Haven, about two miles from the town of Pembroke. Here are two dry-docks and twelve building-slips which are built of wood on a limestone foundation. There have never been above 500 hands employed here.

Plymouth dock-yard extends along the shores of Hamoaze, in a circular sweep of 3500 feet, its width about the middle being 1600, and at each extremity 1000 feet. Its superficial area is about ninety-six acres. In the front towards the harbour are two dry-docks for ships of the first rate, a double dock for seventy-four gun ships, communicating with Hamoaze, and another dock for ships of the line, opening into the basin, which is 250 feet long by 180 feet wide. There is also a graving dock without gates, and a canal or camber, similar to that in Portsmouth yard, for the admission of vessels bringing stores. This, communicating with the boat-pond, cuts the dock-yard nearly into two parts. Five jetties project from the entrances of the dry-docks into Hamoaze, along side of which ships are brought to be undocked. These are situated between the centre and the northern extremity of the harbour line. On the south are three building-slips for the largest class of ships, and two for smaller vessels, the smithery, the outer mast-pond and mast-houses, timber-births, and saw-pits. Higher up on this end is an extensive mast-pond and mast-locks, with

plank-houses over them; and above these three hemp magazines, close to which is the noble ropery of this establishment, consisting of two ranges of buildings, one the laying-house, the other the spinning-house, each being 1200 feet in length, and three stories high. No wood has been used in the construction of the rope-house, excepting the shingles of the roof, to which the slates are fastened. All the rest is of iron; so that the whole building is considered as fire-proof.

The northern part of the yard, besides the docks and basin, working sheds and artificers' shops, contains a quadrangle of elegant stone buildings, the longer sides being about 450 feet, and the shorter 300 feet. Within are also two new ranges of magazines, built principally with iron instead of wood. The upper and northern part of the yard is occupied by a range of handsome houses, with good gardens, for the commissioner and principal officers of the yard, the chapel, guard-house, pay-office, stabling for the officers and teams, and a fine reservoir of fresh water. Plymouth is an excellent refitting yard, and employed, during the war, upwards of 3000 hands of various descriptions. Here, as at Portsmouth, is an unconnected victualling establishment.

In the time of Edward VI. *Portsmouth* was the only dock-yard that could be considered as a national one; indeed it was almost the only naval station in England. All the ships in the public service, amounting to fifty-three in number, lay in this port, with the exception of three, two of which lay at Deptford and one at Woolwich. The crews belonging to these vessels, including soldiers, marines, and gunners, did not amount to 8000 men; yet, from such beginnings has the naval power of England risen to a height unparalleled in history. Edward, sensible of the great consequence of this port to the future glory of his kingdom, augmented its fortifications by the addition of two strong castles. But *Portsea* has the advantage of having both the dock-yard and gun-wharf within its precincts.

The former is entered from the town by a lofty gateway, after passing which the first objects that attract attention, are the porter's residence, the mast-houses, and a large modern guard-house. A little further on stands the pay-office; and beyond it is the royal naval academy, which consists of a centre and two wings. This building is furnished with every requisite accommodation for naval instruction, and has an excellent observatory on its summit. The commissioner's house next appears, and to it succeeds an immense range of store-houses, to the right of which is a handsome modern chapel; thence a visitor is generally conducted through the anchor-wharf, where hundreds of anchors of every size and description are piled up ready for immediate service; then to the rope-house, a spacious pile three stories high, fifty-four feet broad, and 1094 feet long. Here the cables are formed with immense labor; but of late years the operation is much facilitated by the use of machinery. The operations in this division of the yard are particularly ingenious and highly interesting. Leaving it, and passing various store-houses, stables, and other buildings, and

many vast piles of timber for the service of the yard, a sort of square presents itself to the view, and displays in its centre a statue of William III. in a Roman habit. On the east side of this square is a row of handsome houses appropriated for the residence of the chief officers of the yard, and on the north and south sides are various offices, store-houses, &c. Proceeding onwards, the next impressing object that arrests the attention is the vast building called the anchor-forging, and, on entering it, both the eye and ear are confounded by the terrific noise and scenes, which spread throughout this *Vulcanic* abode. Many of the anchors which are here wrought weigh from seventy to ninety tons each.

Approaching nearer the harbour the visitor beholds, in time of war, numerous ships upon the stocks, either building or repairing. The jetty heads, with the basins and docks, are next in order, and, with the shipping in the haven, present a very grand and imposing spectacle, to which the extraordinary capaciousness of the new range of docks greatly contributes. These immense works are all peculiarly adapted for their respective purposes, and while the ships are under repair are kept completely dry; but, in their immediate vicinity, the depth of water is sufficient to float the largest vessels in the navy. Many other parts of this celebrated arsenal, and particularly the rigging houses, claim the examination of the curious. The number of workmen employed in this dock-yard is very great, but varies considerably. In time of peace seldom fewer than 2000 are kept at constant work in its different departments. Here, as at Plymouth, the workmen receive sixpence a day as a commutation for their former perquisite of chips.

The sea-wall of this yard extends from north to south about 3800 feet, and has a mean depth of about 2000 feet. The area enclosed is about 100 acres. The great basin, into which enter four fine dry-docks, is 380 feet in length by 260, and contains an area of two acres and one-third. Here are two docks, at the ends, opening into the harbour; the whole six being capable of receiving vessels of the largest dimensions. Here is also a camber, with a wharf-wall on each side 660 feet in length, and of sufficient width to admit of transports and merchant-ships bringing stores to the yard. In the same face of the yard are three building-slips capable of receiving the largest ships; a small one for sloops; two building-slips for frigates on the northern face of the yard, and a smaller slip for sloops. The range of store-houses on the north-east side, and the rigging-house and sail-loft on the south-west side of the camber, are magnificent buildings. The two hemp-houses and the two sea-store houses occupy a line of building which extends 800 feet. The rope-house, tarring-house, and other appendages of the ropery, are on the same scale. The two sets of quadrangular store-houses, and the two corresponding buildings, with the intervening timber-births and saw-pits, at the head of the dry-docks, issuing from the great basin, are also all excellent. The smithery is on a large scale, and close by is an iron-mill, a copper-mill, and a copper refinery, at which is remelted and rolled all the old copper which is taken from ships.

bottoms: here, also, are cast bolts, gudgeons, and various articles of copper used in the navy. The number of sheets manufactured in one year of the war amounted to about 300,000, weighing above 12,000 tons.

The WOOD MILLS are at the head of the north dock, at which every article of turnery, rabbiting, &c., is made for the use of the navy. The principal part of these mills is the machinery for making blocks contrived by Mr. Brunell. See our article BLOCK-MACHINERY.

Notwithstanding that every precaution that can be devised is taken, to guard against the destructive element of fire, three great conflagrations have occurred in this dock-yard since the year 1760. The first, which appears to have been accidental, broke out in the night of the 3rd of July, 1761, and raged for a long time with dreadful fury. The night had been extremely tempestuous; and the fire was attributed to the lightning striking upon the hemp store-house, the windows of which had been left open to air it. By this conflagration many hundred tons of tar, 500 tons of cordage, 700 sails, and 1050 tons of hemp, were totally consumed. The second fire occurred on the morning of the 27th of July, 1770, when the damage done was still greater; and it was even for some time doubtful whether any part of the yard would escape destruction. From its bursting forth at different places at one time, and various other circumstances, great suspicions were entertained of its having been occasioned intentionally, but the officers were unable to discover the offenders. The third fire happened on the 7th of December, 1776, and in this instance was undoubtedly the effect of design, as the incendiary was traced, tried, condemned, and executed, upon incontestable proof, afterwards confirmed by his own confession. The real name of this malefactor was John Aitken; but the appellation by which he is commonly known is that of 'Jack the Painter.' He is supposed to have acted under foreign influence, and had previously attempted to destroy the docks at Plymouth and Bristol, but failed in both those attempts, though he excited very considerable alarm. His plans were laid with great sagacity and forethought; and, in order the more effectually to ensure their success and avoid suspicion, he had invented a very ingenious machine, which he contrived to lodge among the cordage over night, and setting fire to it left it, and passed out of the gates in the morning unmolested. In the course of the same day the fire broke out, as it luckily happened, several hours before the incendiary had purposed, for, had it not begun to display itself till after the fall of night, the destruction would probably have been much greater than it was. The immediate and effective assistance which was given to check the progress of the flames, and the favorable direction of the wind, confined the damage to the rope-house, and a few adjoining store-houses. The incendiary immediately quitted Portsmouth, but was apprehended about two months afterwards, and, his villany being distinctly traced, he suffered the penalty of the law on the 7th of March, 1777, having previously made all the reparation to his country in his power, by pointing

out some effectual measures for securing the dock-yards from similar attempts.

Portsmouth dock-yard, during the war, employed above 4000 workmen, of whom about 1500 were shipwrights and caulkers; 500 joiners and house-carpenters; the smiths nearly 200; the sawyers 250; the riggers 200; other laborers about 700; and the ropers 350.

Sheerness dock-yard is situated on the island of Sheppey, on a point of land composed of sand and mud, brought from the sea on the one side and down the Medway on the other. It commands the mouths of both this river and the Thames. Till a short time ago this was a very unhealthy and disagreeable place, and as a dock-yard totally destitute of convenience or arrangement. The whole premises of the dock-yard, indeed, divided among wharfs and buildings belonging to the ordnance department, did not exceed fifteen acres of ground. It had at this period only two small inconvenient docks for frigates or small vessels. These inconveniences of Sheerness suggested at one time an extensive project for a new naval arsenal at Northfleet, but a committee of engineers and others being appointed to report on the possibility of improving this station, among whom were Watt, Huddart, and Jessop, their plan was afterwards examined, and some improvements suggested in it by Mr. Rennie. The first stone of a new establishment was laid on the 19th of August, 1814. This plan embraced the addition of nineteen acres to the area of the dock-yard, on the west shore of the Medway; the construction of a wet-dock or basin 520 feet long by 300 feet in width, entered by a lock from the Medway; the erection of three dry-docks on the east side of this basin; the enclosure of Major's marsh, as a further addition of ten to twelve acres of area; and the construction of store and mast houses, mast-ponds, a smithery, governor's and officers' houses, as at the other royal yards. The whole area of the new yard is about fifty acres.

We come, lastly, to the most ancient of our dock-yards, that at *Woolwich*. This occupies a frontage to the Thames 3300 feet; the breadth extends irregularly from 250 to 750 feet: the whole enclosed area being about thirty-six acres. It has five slips, which open into the river, three of which are for ships of the line, one for frigates, and one for small vessels. It has likewise three dry-docks, one double and one single dock; all of these are capable of receiving ships of the line.

Woolwich yard has produced some of the largest and finest ships in the navy, and is chiefly important as a building yard; but of late years the increasing shallowness of the river, and the immense accumulation of mud, which is often found in a few weeks to block up all the entrances into the docks and slips, has much injured it. In the Eighth Report of the Select Committee on Finance (1818) it is stated, that 'the wharf wall at Woolwich, owing to the action of the tide on the foundation, is in a falling state, and in danger of being swept into the river, it being secured only in a temporary manner, and requiring to be immediately rebuilt in a direction that will preserve it from similar injury hereafter.' This re-

commendation has been acted upon; but the works are as yet, we believe, incomplete.

The new mast-houses and mast-slip, the new mast-ponds, and the houses here for stowing yards, topmasts, &c., with the locks under them, are all excellent. The timber births are also well arranged, and the addition lately made to the western extremity of the yard will allow the stacking and classing of several thousand loads of timber.

The present situation of the ropery, at a distance from the yard, is very inconvenient: but it is of good dimensions, being 180 fathoms long, and having store room for 2000 tons of hemp and 6000 barrels of pitch and tar. The process of tarring, or passing the yarns through heated tar, and then drawing them through apertures in an iron plate, is here performed by four horses. The laying of a cable of twenty-two or twenty-three inches is performed by the labor of 170 or 180 men, and requires upwards of an hour of the most severe exertion of strength, especially on the part of those who are stationed at the cranks. Woolwich dock-yard is pretty complete in its work-shops, store-cabins, offices for the clerks, houses and gardens for the commissioner and principal officers. The number of men employed during the war amounted to about 1800, of whom nearly 1100 were shipwrights and artificers. The spinners, knitters, layers, laborers, &c., in the ropery, were about 260. Upwards of twenty teams of horses were also employed here daily.

Henry VIII. first established a royal dock-yard at Woolwich; where it appears that the *Harry Grace de Dieu*, of 1000 tons, was built in 1512. This ship is stated to have been in length 128 feet, and in breadth forty-eight feet: she had three flush decks, a fore-castle, half-deck, quarter-deck, and round-house, and carried 176 pieces of ordnance: she had eleven anchors, the largest of which weighed 4400lbs. M. Dupin, who regarded all our establishments with the eye both of a man of science and of a jealous rival, says of our present ship-building: 'The English ships of war, with all the improvements which we have just made known, are superior to French ships of war, 1st. As fabrics that are solid, durable, and, as preserving their form, nearly unchangeable; 2d. As military machines, without any weak points, being capable, within the same space, to discharge a mass of fire much more considerable; and nevertheless to exercise more at ease this accumulated artillery; 3d. As habitable fabrics. They have banished from these ships of war the fantastical mixture of mean and highly finished ornaments, of a species of decoration more suited for dwelling houses, and fit only to degrade the austere beauties of naval architecture. They have banished all those refinements of bad taste; refinements which always produced a most miserable effect, which, nevertheless, giving to the exterior an air of luxury and magnificence, encourage naval officers to expend in the interior a still greater degree of luxury; in short, which pervert from its purpose a floating fortress, by changing it into a furnished hotel, supported at a great expense to the nation.' tom. i. p. 165.

The officers of an established dock-yard are,
1. The commissioner. 2. The master attendant.
3. The master shipwright. 4. The clerk of the check. 5. The store-keeper. 6. The clerk of the survey; to which have recently been added the subordinate officers of timber-master, and the master measurer. There are besides several assistants to the master attendant and master shipwright, foremen, sub-measurers, quartermen, and converters, surgeon, chaplain, boatswain, warden, &c. The establishment at Portsmouth, which will convey an idea of the others, consisted, at the close of the war, of—

1. The commissioner, having a salary of £1100 a year (all others £1000); three clerks with salaries from £400 to £120.

2. Two masters attendant, one at £650, the other at £500 a year; one clerk to both.

3. Master shipwright, £720 a year; three clerks from £300 to £120.

4. Clerk of the check, salary £600; eight clerks from £400 to £80.

5. Storekeeper, salary £600 a year; twelve clerks from £400 to £80.

6. Clerk of the survey, £500; eight clerks from £400 to £80.

7. Clerk of the rope-yard, £350; one clerk.

8. Engineer and mechanist, £600 (at Portsmouth only), with a draughtsman; one clerk.

9. Timber-master, salary £500; seven clerks from £250 to £80.

10. Three assistants to the master attendant at £220 each; one assistant to the timber-master, £200; three assistants to the master shipwright, £400 each.

11. The master-measurer, £250 a year; ten clerks from £200 to £80.

12. Thirty-five foremen, from £250 to £80 each.

13. Sub-measurers, quartermen, and converters, from £180 to £160 each.

14. The master mast-maker, sail-maker, boat-builder, joiner, house carpenter, bricklayer, smith, rope-maker, rigger, painter (wood-mills, metal-mills, mill-wright, at Portsmouth only); with salaries each, from £260 to £200 a year.

15. Twenty-two cabin-keepers from £100 to £60 each.

16. A surgeon, £500; assistant, £200.

17. Chaplain, £500.

18. Boatswain, £250.

19. Warden of the gate, £200.

Watchmen, warders, and rounders.

The total amount of the salaries paid to the above mentioned officers in the year 1817, in Portsmouth yard alone, was £50,065. 5s.—*Estimates of the Ordinary of the Navy*, 1817.

According to the above estimates the expenses of the principal of these establishments in 1817, were as follow:

Deptford dock-yard	£27,582	0	0
Woolwich ditto	32,440	12	0
Chatham ditto	36,883	10	4
Sheerness ditto	26,659	6	0
Portsmouth ditto	59,969	5	0
Plymouth ditto	45,299	13	0

See NAVY.

DOCKUM, a town of the Netherlands, in Friesland, seated at the mouth of a canal which

high water brings up large vessels. It has a harbour, built in 1248, by Ubbo, duke of Friesland. The town is very well built, and fortified by ramparts and bastions. It is ten miles north-east of Lewarden, and thirty-three west of Deltzyl. Population 3100. The trade is in salt, cheese, and butter.

DOCTOR, *n. s. & v. a.* } Fr. *docteur* ; Sp. }
 DOCTORAL, *adj.* } and Port. *dotor* ; }
 DOCTORALLY, *adv.* } Ital. *dottore* ; Lat. }
 DOCTORATE, *n. s.* } *doctor*, from *doceo*, }
 DOCTORSHIP. } to teach. See Do-

CILE. He who teaches in any faculty ; hence, one who has taken a high degree in the learned professions, and is an able or skilful man, generally. The verb is a low word derived from the noun. Doctorate and doctorship are the degree or rank of a doctor.

And prophetis and *doctouris* weren in the church that was at Antioche. *Wiclif. Dedis. 13.*

No woman had it, but a civil doctor,
 Who did refuse three thousand ducats of me,
 And begged the ring.

Shakespeare. Merchant of Venice.

By medicine life may be prolonged, yet death
 Will seize the doctor too. *Id. Cymbeline.*

Changing hands without changing measures, as if
 a drunkard in a dropsy should change his doctors,
 and not his diet. *Saville.*

The physicians resorted to him to touch his pulse,
 and consider of his disease *doctorally* at their depart-
 ure. *Hackewill.*

From a scholar he became a fellow, and then the
 president of the college, after he had received all the
 graces and degrees, the proctorship and the *doctor-*
ship. *Clarendon.*

Then subtle *doctors* scriptures made their pride,
 Casuists, like cocks, struck out each other's eyes.
Jenham.

To 'pothecaries let the learned prescribe,
 That men may die without a double bribe ;
 Let them but under their superiors kill,
 When *doctors* first have signed the bloody bill.
Dryden.

He that can cure by recreation, and make pleasure
 the vehicle of health, is a *doctor* at it in good earnest
Collier.

In truth, nine parts in ten of those who recovered,
 owed their lives to the strength of nature and a good
 constitution, while such one happened to be the
doctor. *Swift.*

I thank you, my dear Lord, for your congratulations
 on my advancement to the *doctorate* ; though I doubt
 it will seem a little incongruous in me to combat the
 scarlet whore in her own vestments. *Bp. Hurd.*

DOCTOR, *Διδασκαλος*, in the Greek church, is a particular officer appointed to interpret part of the Scriptures : he who interprets the gospels is called doctor of the gospels ; he who interprets St. Paul's epistles doctor of the apostle ; he who interprets the psalms doctor of the psalter.

DOCTOR is also an appellation adjoined to several specific epithets, expressing the merit of some of the schoolmen : thus, Alexander Hales is called the irrefragable doctor ; Thomas Aquinas, the angelic doctor ; St. Bonaventure, the seraphic doctor ; John Duns Scotus, the subtle doctor ;

Raimond Lully, the illuminated doctor ; Roger Bacon, the admirable doctor, &c.

DOCTOR OF THE CHURCH, a title given to certain fathers whose doctrines and opinions have been the most generally followed and authorised. Of these there are four of the Greek church, and three of the Latin. The first are St. Athanasius, St. Basil, St. Gregory Nazianzen, and St. Chrysostom. The latter are St. Jerome, St. Augustine, and Gregory the Great. In the Roman breviary there is a particular office for the doctors. It only differs from that of the confessors, by the anthem of the Magnificat, and the lessons.

DOCTOR OF THE LAW, a title of honor among the Jews. The investiture of this order was performed by putting a key and table book in their hands ; which is what some authors imagine our Saviour alluded to, when, speaking of the doctors of the law (Luke xi. 52), he says, 'Woe unto you doctors of the law, for you have taken away the key of knowledge : you entered not in yourselves, and them that were entering you hindered.'

The establishment of the doctorate, such as now in use among us, is ordinarily attributed to Irnerius, who himself drew up the formulary. The first ceremony of this kind was performed at Bologna, in the person of Bulgarus, who began to profess the Roman law, and on that occasion was solemnly promoted to the doctorate, i. e. installed juris utriusque doctor. But the custom was soon transferred from the faculty of law to that of theology ; the first instance whereof was given in the university of Paris, where Peter Lombard and Gilbert de la Portree, the two chief divines of those days, were created doctors in theology, sacre theologie doctores. Spelman takes the title of doctor not to have commenced till after the publication of Lombard's sentences, about 1140, and affirms, that such as explained that work to their scholars were the first that had the appellation of doctors. Others go much higher, and hold Bede to have been the first doctor at Cambridge, and John de Beverly at Oxford, which last died A. D. 721. But Spelman will not allow doctor to have been the name of any title or degree in England, till the reign of king John, about 1207. By stat. 37, Hen. VIII. c. 17, sect. 4, a doctor of the civil law may exercise ecclesiastical jurisdiction, though a layman.

To pass D. D. at Oxford, it is necessary for the candidate to have been four years bachelor of divinity. For LL. D. he must have been seven years in the university ; to commence LL. B. five years, after which he may be admitted doctor. Otherwisc, in three years after taking the degree of M. A. , he may take the degree of LL. B., and in four years more that of LL. D., which method and time are likewise required to obtain the degree of M. D. At Cambridge, to take the degree of D. D., it is requisite that the candidate have been seven years B. D., though in several of the colleges the taking of the bachelor's degree is dispensed with, and they may go out per saltum. To commence LL. D. the candidate must have been five years LL. B., or seven M. A. To pass M. D. he must have been five years B. D., or seven years M. A.

DOCTRINE, *n. s.* } Fr. *doctrine*; Ital.
DOCTRINAL, *adj. & n. s.* } Span. and Port.
DOCTRINALLY, *adv.* } *dottrina*; Lat. *doc-*
trina, from *docceo*, *docetus*, to teach. See **DOCILE**.
 Principles or propositions taught; the act of
 teaching: doctrinal has been formerly used
 synonymously. As an adjective it signifies
 relating to, or containing doctrine; and doctri-
 nally is the corresponding adverb.

Whiche things we speken also not in wise wordis
 of manny's wisdom, but in the *doctrine* of the spyryt,
 and maken a liknesse of spyritual thingis to goostli
 men. *Wiclif. 1 Cor. ii.*

He said unto them in his *doctrine*.

Mark iv.

To make new articles of faith and *doctrine*, no man
 thinketh it lawful: new laws of government, what
 church or commonwealth is there which maketh not,
 either at one time or other? *Hooker.*

What special property or quality is that, which,
 being no where found but in sermons, maketh them
 effectual to save souls, and leaveth all other *doctrinal*
 means besides destitute of vital efficacy? *Id.*

Humility is a virtue all preach, none practise, and
 yet every body is content to hear. The master
 thinks it good *doctrine* for his servant, the laity for the
 clergy, and the clergy for the laity. *Selden.*

Not such as assent to every word in scripture, can
 be said in *doctrinals* to deny Christ. *South.*

Scripture accommodates itself to common opinions,
 and employs the usual forms of speech, without
 delivering any thing *doctrinally* concerning these
 points. *Ray.*

Ye are the sons of clergy, who bring all their *doc-*
trines fairly to the light, and invite men with freedom
 to examine them. *Atterbury.*

That great principle in natural philosophy is the
doctrine of gravitation, or mutual tendency of bodies
 toward each other.

Watts's Improvement of the Mind.

Spirits and *doctrines* therefore may be considered,
 the latter word as explanatory of the former: and
 error sometimes signifying idolatry, erroneous *doc-*
trines may comprehend idolatrous, as well as false
doctrines. *Bp. Newton.*

DOCUMENT, *n. s.* } Fr. *document*; Ital.
DOCUMENTAL, *adj.* } Span. and Port. *docu-*
mento; Lat. *documentum*, from *docceo*, *docui*, to
 teach. The thing taught: precept; instruction.
 Hence written evidence in law.

It is a most necessary instruction and *document* for
 them, that as their majesty made them dispensators
 of her favour, so it behoveth them to shew themselves
 equal distributors. *Bacon.*

It is not unnecessary to digest the *documents* of
 cracking authors into several classes.

Harrey on Consumption.

Gentle insinuations pierce, as oil is the most pene-
 trating of all liquors; but in magisterial *documents* men
 think themselves attached, and stand upon their guard.

Government of the Tongue.

Learners should not be too much crowded with a
 heap or multitude of *documents* or ideas at one time.

Watts.

DOD (John), a puritan divine, was born at
 Shotledge in Cheshire, in 1547. He became
 fellow of Jesus College, Cambridge, and was ap-

pointed minister of Hanwell, in Oxfordshire;
 whence he removed to Fenny Compton, and
 to Cannons Ashby, in Northamptonshire. In
 1624 he was presented to the living of Faws-
 ley, in the same county, where he died in 1645.
 He wrote, 1. An Exposition of the Command-
 ments, 4to., which work procured him the name
 of the Decalogist; 2. An Exposition of the Book
 of Proverbs, 4to.

DODART (Denis), a regent of the faculty of
 medicine at Paris, was born in that city in 1634.
 He had an exquisite taste for music and painting,
 was in high esteem at court as a physician, and
 a member of the Academy of Sciences. He
 wrote *Memoires pour servir a l'Histoire de*
Plantes; and a curious work, entitled *Medicina*
Stativa Gallica. He died in 1707. His son,
 Claude John Baptiste Dodart, became physician
 to Louis XV., and died in 1730.

DODARTIA, in botany, a genus of the an-
 giospermia order, and didynamia class of plants;
 natural order fortieth, personata: cal. quinque-
 dentated; cor. under lip twice as long as the
 upper: caps. bilocular and globose. Species two,
 natives of Palestine.

DODBROOK, a market town and parish of
 Devonshire, fifteen miles south-west from Dart-
 mouth, and 207 W.S.W. from London. It is
 noted as being the first place where white ale was
 brewed, of which the rector claims tythe; but in
 lieu thereof receives 10*l.* from each innkeeper.
 Market, third Wednesday in every month.

DODD (Charles), a Roman catholic priest,
 at Harvington in Worcestershire, where he died
 in 1745. He wrote *The Church History of*
England, 3 vols. folio, printed at Brussels, from
 1737 to 1742.

DODD, (Dr. William), an unfortunate En-
 glish divine, born in 1729. He was sent in
 1745, at the age of sixteen, to the university of
 Cambridge. In 1749 or 1750 he took the degree
 of B. A. with considerable honor. Leaving the
 university, he married in 1751; was ordained a
 deacon the same year; priest in 1753, and soon
 became a celebrated preacher. His first preferment
 was the lectureship of West-Ham. In
 1754 he was also chosen lecturer of St. Olave's,
 Hart-Street; and in 1757 took the degree of
 M. A. at Cambridge. On the establishment of
 the Magdalen Hospital in 1758, he was a strenu-
 ous supporter of that charity, and soon after be-
 came preacher at the chapel. By the patronage
 of bishop Squire, he, in 1663, obtained a pre-
 bend of Brecon, and, by the interest of some city
 friends, was appointed one of the king's chap-
 lains; soon after which he had the care of the
 education of the earl of Chesterfield. In 1766
 he went to Cambridge and took the degree of
 LL.D. Impatient for further advancement, he
 adopted measures which eventually terminated
 in his ruin. On the living of St. George, Hanover
 Square, becoming vacant, he wrote an anonym-
 ous letter to the lord chancellor's lady, offering
 3000 guineas if by her assistance he was promoted
 to it. This being traced to him, complaint was
 immediately made to the king, and Dr. Dodd
 was dismissed with disgrace from his office of
 chaplain. From this period he lived neglected,
 if not despised; and his extravagance still cou-

tinuing, he became involved in difficulties, which tempted him to forge a bond from his late pupil lord Chesterfield, February 4th, 1777, for £4200, which he actually received; but, being detected, was tried at the Old Bailey, found guilty, and received sentence of death. Notwithstanding numerous and, we believe, unprecedented applications for mercy, he was executed at Tyburn, June 27th, 1777. Dr. Dodd was a voluminous writer and compiler. He published a Commentary on the Bible, 3 vols. folio; Sermons to Young Men, 3 vols. 12mo.; Reflections on Death, 12mo.; The Visitor, a periodical paper, 2 vols. 12mo.; Sermons on the Miracles and Parables, 4 vols. 8vo.; Several Poems and Miscellaneous Pieces; and lastly, he left for the press Thoughts in Prison.

DODD (Ralph), a civil engineer, the original projector of a tunnel under the Thames, and various other public works of importance. In 1795, he published an Account of the principal Canals in the known World, with Reflections on the great Utility of Canals. In 1798, he laid before the public his plan for a tunnel under the Thames, which was approved by government; but the scheme was abandoned soon after its commencement. He had also a share in the improvement of steam vessels; and the first impetus to the scheme for navigating by steam in England was given by a patent which he obtained for a steam-boat on the Thames, from London to Gravesend, which, however, was not carried into effect. He afterwards navigated, in a steam-vessel, round the coasts of England and Ireland. He died at Cheltenham, in April, 1832.

DOD'DER, *n. s. & v. a.* } According to
DOD'DERED, *adj.* } Skinner from Dut.
touteran, to shoot up; but Mr. Thomson says, from Goth. *daudi*; Teut. *totder*, the slayer, because injurious to corn and flax. A plant. See the extract from Ifill. The verb is derived from the noun. Doddered is overspread; dodder, excrescencies.

DODDRIDGE (Philip), D.D., an eminent Independent minister, born in London, 1702. Having completed the study of the classics, he was, in 1719, placed under the tuition of the Rev. John Jennings, who kept an academy at Kibworth in Leicestershire. He was first settled as a minister at Kibworth, where he preached to a small congregation of the Independent persuasion; but, on Mr. Jennings's death, succeeded to the care of his academy; and soon after was chosen minister by a large congregation at Northampton, to which he removed, and where the number of his pupils increased. He instructed them with the freedom and tenderness of a father; and never desired that they should blindly follow his sentiments. He checked every appearance of bigotry and uncharitableness. Yet while thus liberal to the opinions of others, he refused a very handsome offer of patronage made him by the duchess of Bedford, on condition of entering the church of England. He died at Lisbon, whither he went for the recovery of his health, in 1751. He wrote, 1. Free Thoughts on the most probable means of reviving the Dissenting Interest; 2. The Life of Colonel James Gardiner;

3. Sermons on the Education of Children; 4. The Rise and Progress of Religion in the Soul; 5. The Family Expositor, in 6 vols. 4to., &c. of which several of the prelates of the church have spoken highly. Among others, the late bishop of Durham observes:—'In reading the New Testament, I recommend Doddridge's Family Expositor, as an impartial interpreter and faithful monitor. Other expositions and commentaries might be mentioned greatly to the honor of their respective authors, for their several excellencies; such as, elegance of composition, acuteness of illustration, and copiousness of erudition; but I know of no expositor who unites so many advantages as Doddridge whether you regard the solidity of his version, the fulness and perspicuity of his composition, the utility of his general and historical information, the impartiality of his doctrinal comments or, lastly, the piety and pastoral earnestness of his moral and religious applications.' Since the author's death a volume of his Hymns has been published, and his Theological Lectures. Several of his works have been translated into Dutch, German, and French.

DODECAGON, *n. s.* Δωδεκα and γωνια
A figure of twelve sides

DODECAGON, a regular polygon of twelve equal sides and angles. If the side of a dodecagon be 1, its area will be equal to 3 times the tan. of $75^\circ = 3 \times 2 + \sqrt{3} = 11.961524$ nearly, and, the areas of plane figures being as the squares of their sides, therefore 11.961524 multiplied by the square of the side of any dodecagon will give its area.

DODECAGYNIA; from δωδεκα, twelve, and γυνη, a woman; the fifth order in the class dodecandria; consisting of plants, which, along with the general characteristics of the class, have twelve female organs. See BOTANY.

DODECAHEDRON, in geometry, one of the Platonic bodies, or regular solids, contained under twelve equal and regular pentagons.

DODECANDRIA; from δωδεκα, twelve, and ανηρ, a man; the eleventh class in Linnæus's sexual system, consisting of plants with hermaphrodite flowers, that have twelve male organs. It is not, however, limited to this number. Many genera have sixteen, eighteen, and even nineteen stamina. The essential character is, that the stamina, however numerous, are inserted into the receptacle. See BOTANY.

DODECAS, in botany, a genus of the trigynia order, and dodecandria class of plants: *cat.* half quadrifid, having the corolla above: *cor.* quinquefid: *caps.* unilocular, conjoined with the calyx. Species one only, a Surinam shrub.

DEDECATEMORION, *n. s.* Δωδεκατημοριον. The twelfth part.

'Tis dodecatemorion thus described:

Thrice ten degrees, which every sign contains,
Let twelve exhaust, that not one part remains;
It follows straight, that every twelfth confines
Two whole and one half portion of the signs.

Creech.

DODECATHEON, in botany, meadia; a genus of the monogynia order, and pentandria class of plants; natural order twenty-first, precise:

cor. verticillated and reflexed: STAM. placed in the tube: CAPS. unilocular and oblong. Species one only; a native of Virginia, with leaves like a lettuce, but bearing beautiful flowers somewhat resembling a cowslip.

DODGE, *v. n.* Dr. Johnson says from a corruption of dog, but more probably from Teut. *ducken, dongen*, to conceal. To deal craftily; shift place so as to hide; treat capriciously.

DODINGTON (George Bubb, lord Melcombe Regis), was the son of a gentleman of fortune; or, as others say, of an apothecary, named Bubb, who married into a wealthy family, in Dorsetshire. He was born in 1691, was elected member of parliament for Winchester, in 1715, and was soon after appointed envoy to the court of Spain. In 1720, by the death of his maternal uncle, he came into possession of a large estate, and took the surname of Dodington. In 1724, having closely connected himself with Sir Robert Walpole, he was appointed a lord of the treasury, and became clerk of the pells in Ireland. He afterwards joined the opposition, and, on the fall of Walpole, became treasurer of the navy. This party he also quitted, in order to lead the opposition under Frederic, prince of Wales, whose death for some time arrested his career. In 1755, he accepted his former post of treasurer of the navy, under the duke of Newcastle, but lost it the following year. On the accession of George III., he was early received into the confidence of lord Bute; and, in 1761, was advanced to the peerage by the title of lord Melcombe, and died the following year. This versatile politician was generous, magnificent, and convivial in private life, and the patron and friend of Young, Thomson, Glover, Fielding, Bentley, Voltaire, Lyttelton, and Chesterfield, who, with many of meaner pretensions, mingled at his hospitable table. He is best known by his celebrated Diary, published in 1784, by Henry Penruddock Wyndham, Esq. A more curious exposition of avarice, vanity, servility, and selfishness, as a place-hunter and trading politician, has seldom been exhibited.

DODKIN, *n. s.* Dut. *doitken*. A doitkin or little doit; a contemptuous name for a slow coin.

DODMAN, *n. s.* The name of a fish.

DODO, in ornithology. See **DIDUS**.

DODONA, a town of Thesprotia in Epirus, or, as some say, in Thessaly. There was in its neighbourhood a celebrated oracle of Jupiter. The town and temple of the god were first built by Deucalion, after the general deluge. It was supposed to be the most ancient oracle of all Greece; and according to the traditions of the Egyptians, mentioned by Herodotus, it was founded in consequence of an oracular message by a dove. Two black doves, he says, took their flight from the city of Thebes in Egypt; one of which flew to the temple of Jupiter Ammon, and the other to Dodona, where with a human voice they acquainted the inhabitants that Jupiter had consecrated the ground, which in future would give oracles. This fable might have been founded on the double meaning of the word *τελειαι*, which signifies doves in most parts of Greece, while in a dialect of the Epirots it

implies old women. In ancient times the oracles were delivered by the murmuring of a neighbouring fountain; but the custom was afterwards changed. Large kettles were suspended in the air near a brazen statue, which held a lash in its hand. When the wind blew strong, the statue was agitated, and struck against one of the kettles, which communicated the motion to all the rest, and raised the clattering and discordant din, which continued for a while, and from which the artifice of the priests drew the predictions. The ship Argo was built with wood of the oaks of Dodona, and some of the beams, it is said, gave oracles to the Argonauts, and warned them against the approach of calamity. Within the forest of Dodona there was a miraculous stream, and a fountain of cool water, which had the power of lighting a torch as soon as it touched it. This fountain was totally dry at noon-day, and was restored to its full course at midnight, from which time till the following noon it began to decrease, and at the usual hour was again deprived of its waters. The oracles of Dodona were generally delivered by women. No traces of this town have been discovered in modern times; but in Mount Tomarus, there is a forest of vast extent, spreading far to the westward, which seems to answer to the site. In the higher parts, where the oak does not thrive, there are immense ranges of pines and firs. Dr. Holland, one of the latest travellers in Albania, when describing the city of Ioannina, enters into the long controverted point of the site of Dodona, which he endeavours to fix between Thesprotia and Molossia. Strabo distinctly says, that it belonged at first to the Thesprotians, and afterwards to the Molossians. And we are not aware of its having been assigned by any writers of the same era to these two different nations at the same time. It is singular that Dr. Holland should have overlooked one proof of the opinion supported by him, as it occurs in the very passage of Æschylus, to which he refers in the note to p. 143. Æschylus speaks of his going to the Molossian plains and the temple of Thesprotian Jove.

ἔπει γὰρ ἡλῶδες πρὸς Μολοσσῶν γάπηδα,
τὴν αἰπύνωντόν τ' ἄρβι Δωδώνην, ἵνα
μαντεῖα θάκός τ' ἥσσι Οἰσπρωτοῦ Διὸς,
τερας τ' ἄπιστον, αἱ προσήγοροι δρῶντες.

Prom. 854—857.

DODONEUS, **DODONTIAN**, in antiquity, an epithet given to Jupiter, because he was worshipped in a temple built in the forest of Dodona. Dodonides were the priestesses who gave oracles at this temple.

DODSLEY (Robert), an eminent bookseller, and ingenious writer, born at Mansfield in Nottinghamshire in 1703. He was originally a livery servant, but his natural genius, and early passion for reading, soon elevated him to a superior station. He wrote an elegant satirical farce called *The Toy Shop*, which was acted with great applause in 1735, and which recommended him to the patronage of Pope. The following year he produced the *King and Miller* of Mansfield. The profits of these two farces enabled him to commence bookseller, and his own merit procured him eminence in that pro-

fession. He wrote some other dramatic pieces, and published a collection of his works in one vol. 8vo., under the modest title of *Trifles*; which was followed by *Public Virtue*, a poem, in 4to.; he also collected several volumes of well-chosen *Miscellaneous Poems* and *Fugitive Pieces*, whose brevity would otherwise have endangered their being totally lost to posterity. He was also the original publisher of the *Annual Register*, of which Burke was the editor; and in 1750 he published his best work, *The Economy of Human Life*. He died in 1764.

DODWELL (Henry), a learned controversial writer, born at Dublin in the year 1641. He wrote a great number of tracts; but bishop Burnet and others accuse him of doing injury to Christianity, by his indiscreet love of paradoxes and novelties, and thus exposing himself to the scoffs of unbelievers. His pamphlet, *On the Immortality of the Soul*, gave rise to the well-known controversy between Mr. Collins and Dr. Clark on that subject. He died in 1711.

DOE, *n. s.* From Sax. *da*; Dan. *dua*; Lat. *dama*. A she deer; the female of a buck.

Then but forbear your food a little while,
While, like a *doe*, I go to find my fawn,
And give it food. *Shakespeare. As You Like It.*

Bucks have horns, *does* none.

Bacon's Natural History.

The fearful *doe*

And flying stag amidst the greyhounds go.
Dryden's Virgil.

DOE, in zoology. See **CERVUS**.

DOES (Jacob Vender), a painter, born at Amsterdam in 1623, died in 1673. He studied at Rome, where he followed the manner of Bamboccio. His landscapes are dark, but fine, and the figures beautifully executed. He had two sons, Jacob and Simon, both good artists; the first of whom died in 1693, the latter in 1717.

DOFF, *v. a.* From *do off*. To put off dress; to shift; divest; delay.

You have deceived our trust,
And made us *doff* our easy robes of peace,
To crush our old limbs in ungentle steel.
Shakespeare. Henry IV.

Your eye in Scotland
Would create soldiers, and make women fight,
To *doff* their dire distresses. *Id. Macbeth.*
Every day thou *doffest* me with some device, Iago.
Id. Othello.

Nature, in awe to him,
Hath *doffed* her gaudy trim,
With her great master so to sympathize.
Milton.

That judge is hot, and *doffs* his gown.
Dryden's Juvenal.

Alcides *doffs* the lion's tawny hide. *Roué.*

Why art thou troubled, Herod? What vain fear
Thy blood-revolving breast doth move?
Heaven's king, who *doffs* himself our flesh to wear,
Comes not to rule in wrath, but serve in love.
Crashaw.

Could they *doff*
Their hose as they have *doffed* their hats, 'twould be
A blessing, as a mark the less for plunder.
But let them fly, the crimson kennels now
Will not much stain their stockings, since the mire
Is of the self-same purple hue. *Byron.*

VOL. VII.

DOFREFIELD, or **DOFRINE**, the highest peak of the mountains which divide Norway from Sweden. King Christian V. rode over it in 1686, while his attendants only ventured to go on foot. He was saluted with nine pieces of cannon by general Webe; and erected a pyramid on the peak, in memory of the exploit.

DOG, *n. s. & v. a.*

DOG-BANE, *n. s.*

DOG-BERRY,

DOG-BOLT,

DOG-BRIAR,

DOG-CHEAP,

DOG-DAYS,

DOG-DRAW,

DOG-FISH,

DOG-FISHER,

DOG-FLY,

DOGGED, *adj.*

DOGGEDLY, *adv.*

DOGGEDNESS, *n. s.*

DOGGISH, *adj.*

DOG-HEARTED, *adj.*

DOG-HOLE, *n. s.*

DOG-KENNEL,

DOG-LOUSE,

DOG-ROSE,

DOG-SLEEP,

DOG-STAR,

DOG-TEETH,

DOG-TRICK,

DOG-TROT,

DOG-WEARY,

DOG-WOOD,

DOG'S-MEAT.

Fr. *dogue*; Dutch *dogghe*; Teut. *dagghe*, according to Minshew, from Belg. *ducken*, to shut up, because dogs are shut up in the daytime, or from Gr. *ῥακος*, a biter. See the article. A name of contempt for man. As a verb it signifies to watch or hunt as a dog does. Dog-bane, dog-berry, dog-briar, dog-rose, and dog-wood are plants; dog-bolt is a coarse fellow, as Dr. Johnson thinks, from the coarser part of flour having been called dog-bolt; dog-cheap, cheap as the food of dogs; dog-days begin when the dog-star rises and sits with the sun; a dog-draw is, says Cowell, a manifest apprehension of an offender against

venison in the forest, when he is found drawing after a deer by the scent of a hound which he leads in his hand. Dog-fish is another name for the shark; dog-fisher another and small, but voracious fish; dog-fly a voracious fly. Dogged and doggish is morose, ill-tempered, surly; and doggedly and doggedness the corresponding adverb and substantive; dog-hearted is doggish; dog-hole a mean hole or habitation, sometimes not equalling that of the dog, or a dog-kennel; dog-louse a louse that is frequently found on the dog; dog-sleep, pretended sleep: dog-star, Sirius, the star that gives name to the dog-days, once reckoned unhealthy; dog-teeth are those teeth next the grinders, which resemble the dog's: dog-trick is a mischievous or ill turn: dog-trot a gentle trot, like that of a dog: dog-weary, excessively weary dogs'-meat, a refuse, offal.

Beware of dogs, beware of evil workers

Phil. iii. 2.

She bringeth me the grete clobbed staves,
And cryeth, slee the *dogges* everich on,
And breke hem bothe bak and every bon.

Chaucer. Cant. Tales.

I never heard a passion so confused,
So strange, outrageous, and so variable,
As the *dog* Jew did utter in the streets.

Shakespeare.

I have *doggied* him like his murderer.

Id.

Your uncle must not know but you are dead;
I'll fill these *doggied* spies with false reports.

Id. King John.

2 C

His unkindness,
That stript her from his benediction, turned her
To foreign casualties, gave her dear rights
To his *doghearted* daughters. *Id. King Lear.*

Such smiling rogues as these sooth every passion
Renege, affirm, and turn their halcyon beaks
With every gale and vary of their masters,
As knowing nought, like *dogs*, but following. *Id.*

France is a *doghole*, and it no more merits the tread
Of a man's foot : to the wars. *Id.*

Oh, master, master, I have watched so long,
That I'm *dogweary*. *Id. Taming of the Shrew.*

Sorrow *dogging* sin,
Afflictions sorted. *Herbert.*

I fear the dread events that *dog* them both,
Lest some ill-greeting touch attempt the person
Of our renowned sister. *Milton.*

Few miles on horseback had they jogged,
But fortune unto them turned *dogged*. *Hudibras.*

His only solace was, that now
His *dogbolt* fortune was so low,
That either it must quickly end,
Or turn about again, and mend. *Id.*
This said, they both advanced, and rode
A *dogtrot* through the bawling crowd. *Id.*

Behold an Egyptian in the skin of an Hebrew !
How *dogged* an answer doth Moses receive to so gentle
a reproof ! *Bp. Hall Contemplations.*

Nor was it more in his power to be without promo-
tion and titles, than for a healthy man to sit in the
sun, in the brightest *dog-days*, and remain without
warmth. *Clarendon.*

The *dog-fisher* is good against the falling sickness. *Walton.*

These spiritual joys are *dogged* by no sad sequels. *Glanville.*

The same ill taste of sense will serve to join
Dog foxes in the yoke, and sheer the swine. *Dryden.*

But could you be content to bid adieu
To the dear playhouse, and the players too,
Sweet country seats are purchased every where,
With land and gardens, at less price than here
You hire a darksome *doghole* by the year. *Id. Juvenal.*

Good store of harlots, say you, and *dogcheap*. *Id.*
A certain nobleman beginning with a *dogkennel*,
never lived to finish the palace he had contrived. *Id.*

His reverence bought of me the flower of all the
market ; these are but *dogsmeat* to 'em. *Dryden.*

Learn better manners, or I shall serve you a *dog-
trick* ; I'll make you know your rider. *Dryden's Don Sebastian.*

Why should we not think a watch and pistol as dis-
tinct species one from another, as a horse and a *dog* ?
Locke.

Of the rough or hairy excrescence, those on the
briar, or *dogrose*, are a good instance. *Derham's Physico-Theology.*

Thump-buckler Mars began,
And at Minerva with a lance of brass he head-long
ran ;
These vile words ushering his blows, Thou *dog-fly*,
what's the cause

Thou makest gods fight thus ? *Chapman's Hind.*

I am desired to recommend a *dogkennel* to any that
shall want a pack. *Tatler.*

Juvenal indeed mentions a drowsy husband, who
raised an estate by snoring ; but then he is represented
to have slept what the common people call *dog-sleep*.
Addison.

All shun the raging *dog-star's* sultry heat, *
And from the half-unpeopled town retreat. *Id.*

It is part of the jaw of a shark or *dog-fish*.
Woodward.

The best instruments for dividing of herbs are inci-
sor-teeth ; for cracking of hard substances, as bones
and nuts, grinders or mill-teeth ; for dividing of flesh,
sharp-pointed or *dog-teeth*. *Arbuthnot on Aliments.*

Had whole Colepeper's wealth been hops and hogs,
Could he himself have sent it to the *dogs* ? *Pope.*

I have been pursued, *dogged* and way-laid through
several nations, and even now scarce think myself
secure. *Id.*

Reverse your ornaments and hang them all
On some patched *doghole* eked with ends of wall. *Id.*

Hate *dogs* their rise, and insult mocks their fall.
Johnson. Vanity of Human Wishes.

Dog, in zoology, an animal remarkable for its
natural docility, fidelity, and affection for its
master ; qualities which mankind are careful to
improve for their own advantage. These useful
creatures guard our houses, gardens, and cattle,
with spirit and vigilance. By their help we are
enabled to take not only beasts, but birds ; and to
pursue game both over land, and through the wa-
ter. In some northern countries they draw sledges,
and are also employed to carry burdens. In several
parts of Africa and China dogs are eaten, as well
as by the West Indian negroes, and accounted
excellent food ; and we have the testimony of
Mr. Forster, that dog's flesh in taste exactly re-
sembles mutton. They were also used as food
by the Romans, and long before them by the
Greeks, as we learn from several treatises of
Hippocrates.

From the structure of the teeth, it is evident
that the dog is a carnivorous animal. He is
possessed of such strong digestive powers, as to
draw nourishment from the hardest bones. When
oppressed with sickness, to which he is very sub-
ject, especially in the beginning of summer, and
before ill weather, in order to procure reachings,
he eats the leaves of the quicken-grass, the
bearded wheat-grass, or the rough cock's-foot
grass, which give him immediate relief. His
drink is water, which he takes in small quantities
at a time, by lapping with his tongue. His ex-
crements are generally hard scybals, which, es-
pecially after eating bones, are white, and were
once in great repute as a drug ; but are now
justly disregarded.

The dog is an animal not only of quick mo-
tion, but remarkable for travelling very long
journeys. He can easily keep up with his mas-
ter either on foot or horseback for a whole day.
When fatigued, he does not sweat, but lolls out
his tongue. He lies generally on his breast,
with his head turned to one side, and sometimes
with his head above his two fore feet. He
sleeps little, and even that does not seem to be
very quiet ; for he often starts, and seems to hear
with more acuteness in sleep than when awake.
He can trace his master by the smell of his feet
in a church, or in the streets of a populous city.
This sensation is not equally strong in every
kind. The hound can trace game, or his mas-
ter's steps, twenty-four hours afterwards. He
barks more furiously the nearer he approaches

the fowls, unless he be trained to silence. The females admit the males before they are twelve months old. They remain in season ten, twelve, or even fifteen days, during which time they admit a variety of males. They come in season generally twice a-year, and more frequently in the cold than in the hot months. The female goes with young about nine weeks. They generally bring forth from six to twelve puppies. Those of a small size bring forth four or five, sometimes but two. The whelps are commonly blind, and cannot open their eyes till the tenth or twelfth day : the males resemble the dog, the females the bitch. In the fourth month, they lose some of their teeth, which are soon succeeded by others.

Buffon has given a genealogical table of all the known dogs, in which he makes the chien de berger, or shepherd's dog, the origin of the whole species, because it naturally possesses the greatest share of instinct. This table is intended not only to exhibit the different kinds of dogs, but to give an idea of their varieties as arising from a degeneration in particular climates, and from a commixture of the different races. 'The chien de berger, or shepherd's dog,' says Buffon, 'is the root of the tree. This dog, when transported into Lapland, or other very cold climates, assumes an ugly appearance, and shrinks into a smaller size; but in Russia, Iceland, and Siberia, where the climate is less rigorous, and the people a little more advanced in civilisation, he seems to be better accomplished. These changes are occasioned solely by the influence of those climates, which produce no great alteration on the figure of this dog; for, in each of these climates his ears are erect, his hair thick and long, his aspect wild, and he barks less frequently, and in a different manner, than in more favorable climates, where he acquires a finer polish. The Iceland dog is the only one that has not his ears entirely erect; for their extremities are a little inclined; and Iceland, of all the northern regions, has been longest inhabited by half-civilised men. The shepherd's dog, when brought into temperate climates, and among a people perfectly civilised, as Britain, France, Germany, would, by the mere influence of the climate, lose his savage aspect, his erect ears, his rude, thick, long hair, and assume the figure of the bull-dog, the hound, and the Irish grey-hound. The bull-dog and the Irish grey-hound have their ears still partly erect, and very much resemble, both in their manners and sanguinary temper, the dog from which they derive their origin. The hound is farthest removed from the shepherd's dog; for his ears are long, and entirely pendulous. The gentleness, docility, and even timidity of the hound, are proofs of his great degeneration, or rather of the great perfection he has acquired by the long and careful education bestowed on him by man. The hound, the harrier, and the terrier, constitute but one race; for, it has been remarked, that in the same litter, hounds, harriers, and terriers, have been brought forth, though the female hound had been covered by only one of these three dogs. I have joined the common harrier to the Dalmatian dog, or harrier of Bengal, because they differ only in

having more or fewer spots on their coat. I have also linked the turnspit, or terrier with crooked legs, with the common terrier; because the defect of the legs of the former has originally proceeded from a disease similar to the rickets, with which some individuals had been affected, and transmitted the deformity to their descendants.'

¶ We shall now proceed to describe more particularly the principal varieties of this animal:—

1. The *Beagle*, the smallest hunting-dog used in this country, is chiefly employed in chasing the hare, and is remarkable for the melody of its tone. Huntsmen distinguish the rough and smooth beagle, but they are both the same species.

2. The *Bull-dog* derives its name from the barbarous diversion of bull-baiting in which it is used. It is of the mastiff kind, but is smaller with a somewhat flatter snout, the lower jaw projecting considerably beyond the upper one. Its aspect is very ferocious, and its courage and obstinacy in attacking the bull are well known. It generally seizes on the lip or other part of the face, pinning the bull, as it is called, to the ground, and maintaining its hold in spite of every effort of the animal to disengage himself. Goldsmith relates, that, at a bull-bait in the North of England, a young man wagered that his dog would attack the bull after his feet were cut off one by one. The cruel experiment was tried, and the dog seized the bull as eagerly as ever!

3. *Dalmatian*, or *Coach-dog*, is an animal of great beauty, being of a white color, elegantly marked on all parts with numerous round black spots. The native country of this breed is uncertain; it is commonly termed the Danish dog, and is usually kept by gentlemen as an attendant on the carriage.

4. *Greenland*, or *Kamtschatdale dog*. Dogs of this species have a long sharp nose, erect pointed ears, and a long tail, and are more like the shepherd's dog of various parts of Europe than any other. They are of different colors, and many of them curiously spotted. In summer they scratch a hole in the earth in which they lie, as being cooler, and in the winter they bury themselves in the snow in the same way, as a shelter from the frost. They can bear any degree of cold better than heat; and in spring, when the weather begins to be warm, they pant as if come off a long journey. As soon as these dogs can eat, their training begins. They are then tied to a stake, and plentifully fed with soup made of fish, by which means they grow stronger and larger than if suffered to be loose. A dark place or pit is considered best for their confinement, as this makes them timid, and afraid of surrounding objects, and they exert their strength more effectually to avoid them. All those designed for the draught are castrated, and have their tails cropped, and such as have large bones, a broad foot, a wide mouth, and are thick made at the back of the head and in the breast, are considered as the best adapted for work. Each dog has a particular name, as with us, which is of great use in driving them, as the whole set is managed by the voice, neither reins nor whip being used for this purpose. They are

fed on fish, which is given them in all possible forms; raw, dressed, dried, fresh, frozen, or putrid. After they are full grown they are suffered to range at large during the summer, as their services are not then wanted, and they provide their own food without any trouble to their owners. They frequent the shore, and lurk on the banks of the rivers, often standing up to the belly in water catching the fish, at which they snap with such a certain aim, that they seldom miss it if within reach. When the salmon ascend the rivers in great numbers, their food is abundant, and they only eat the heads, as being the finest flavored. In autumn, want of food obliges them to return to the dwellings of their masters, where they are tied up, that they may be ready for use when wanted. They are then very fat, so that a small piece of dried fish is all that is given them, and this very sparingly, that they may be the sooner fit for work, as a fat heavy dog is never a good traveller. They do not bark like the European dogs, but make a sort of howl, and at this season they express the most piteous lamentations day and night for the loss of their liberty. The villages generally consist of fifteen or twenty houses, each of which has at least six dogs belonging to it, and when one dog sets up a howl, all the rest immediately follow, and make the most horrible noise imaginable.

Six of these dogs are the usual number yoked to a sledge, and they are capable of drawing a weight of 600 or 700 pounds, at the rate of ten or twelve versts an hour; the best dogs, however, will often go fifteen versts or more, which is from eight to ten miles. With about half a dried or frozen fish given them in the morning, they will run sixty or eighty, and sometimes even a hundred versts a day; after which they are well fed. At other times food is very sparingly administered to them. The price of the common dogs is from thirty to forty rubles, but a good leader will sometimes sell for 100 rubles.

5. The *greyhound* is remarkable for the slenderness of its form, its elongated snout, and the extreme swiftness of its course. It is indeed esteemed the fleetest of all the hunting dogs, but, as it wants the faculty of scent, follows by the eye. Formerly, the greyhound was held in such esteem, that, by the laws of king Canute, it was enacted that no one under the degree of a gentleman should presume to keep one.

6. *Irish greyhound*. This is the largest of the dog kind, and in its appearance the most beautiful and majestic. The breed is peculiar to Ireland, where it was formerly of great use in destroying the wolves, with which that country was much infested, but is now extremely rare. These dogs are generally of a white or cinnamon color, and more robust than the greyhound, their aspect mild, and their disposition gentle and peaceable. It is said that their strength is so great, that in combat the mastiff or bull dog is far from being equal to them. They commonly seize their antagonists by the back, and shake them to death.

7. *Italian greyhound*, has the body arched and the snout tapering, but its size is only half that

of the common greyhound. It is a beautiful and delicate animal, not common in this country, the climate being too cold.

8. *Harrier*, another of the hunting dogs, closely allied to the beagle, and like that kind comprehending several varieties. This is larger than the beagle, more nimble, and better adapted to endure the labor of the chase. In the pursuit of the hare it evinces the warmest ardor, and frequently outstrips the speed of the fleetest sportsman. A hybrid breed between this and the terrier, is sometimes kept for hunting the otter.

9. *Blood-hound* or *Sleuth* dog. This sort of hound was held in high request among our ancestors, and as it was remarkable for the most exquisite sense of smelling, was frequently employed in recovering game that had escaped from the hunter. It could follow, with great certainty, the footsteps of a man to a considerable distance, and was therefore of the utmost utility in those barbarous and uncivilised times, in tracing murderers and other felons through the most secret coverts. In many districts, infested with robbers, a certain number of these hounds were maintained at the public charge, and in general proved the means of discovering the perpetrators of crimes when every other endeavour failed of success. The breed of this kind of dog is not very generally cultivated at this time. Some few are kept for the pursuit of deer which have been previously wounded by a shot to draw blood, the scent of which enables the dog to pursue with the greatest certainty. During the American war numbers of them were sent to that country, and employed in discovering fugitives concealed in the woods and other secret places: they were in use also, for a similar purpose, during the late revolts in the West-India islands, and likewise in Ireland at the time of the last rebellion. They are sometimes employed in discovering deer-stealers, whom they infallibly trace by the blood that issues from the wounds of their victims. They are also said to be kept in convents situated in the lonely mountainous countries of Switzerland, both as a guard to the sacred mansions, and to find out the bodies of men who have been unfortunately lost in crossing those wild and dreary tracts.

10. *Old English hound* is distinguished by its great size and strength: the body is long, with a deep chest, its ears long and sweeping, and the tone of its voice peculiarly deep and mellow. It possesses the most exquisite sense of smelling, and can often discover the scent an hour after the beagles have given it up. Dogs of this kind were once common in Britain, and are said to have been formerly much larger than at present.

11. *Fox-hound*. The breeding and training of this kind of dog is attended to with so much care in this country, that they are superior in strength, agility, and swiftness, to those of every other part of the world. It is affirmed, that the fox-hounds reared in this country lose much of their native vigor, on being transported into any other climate. In choosing these animals, such as stand high and appear light in their make are deemed preferable. The fox-hound is not limited to the pursuit of the fox only, but is instructed also to hunt the stag and other deer, and is found

equal to the most arduous contests of the chase. A chase of six or eight hours has been sustained by these hounds on many occasions; and in 1795, Merkin, a celebrated fox-hound bitch, was challenged to run any hound of her years, five miles over Newmarket, giving 220 yards, for 10,000 guineas, and as a run for trial, performed a race of four miles in seven minutes and a half.

12. *King Charles's dog*, a variety of the most elegant kind, and which is sufficiently known in this country under the appellation above-mentioned. The head is small and rounded, with the snout short, and the tail curved back; its ears are long, hair curled, and feet webbed. Its name is derived from its being a favorite of Charles II., who was always accompanied by some of these beautiful animals.

13. *Lion-dog*, an animal generally of small size, having the head and fore part of the body covered with shaggy hair, while the hind part is quite smooth, except a tuft at the end of the tail.

14. *Lurcher*, the usual attendant on the poacher, is a dog of smaller size than the greyhound, and stouter in proportion; its hair rough and commonly of a pale yellowish color, and the aspect of its visage remarkable for its sullenness. As this dog possesses the advantage of a fine scent, it is most commonly employed in killing hares and rabbits during the night-time. When turned into the warren it lurks about with the utmost precaution, and darts upon the rabbits, while feeding, without barking or making the least noise; and then conveys his booty in silence to his master.

15. *Maltese dog*, a variety with long soft and silky hair, appertaining to the spaniel kind, very small, and of a white color in general. This is one of the most elegant of the lap-dog kind, and in some varieties, as in the shock, is almost concealed in the hair which covers it from head to foot.

16. *Mastiff*. This is the size of a wolf, very robust in its form, and having the sides of the lips pendulous. Its aspect is sullen, its bark loud and terrific; and he appears every way formed for the important trust of guarding property committed to his care. As a house or yard dog, he may be perhaps more valuable than the Newfoundland breed, which is more commonly kept for this purpose. The mastiff, in its pure state, is seldom met with. The generality of dogs, distinguished by that name, are crossed breeds between the mastiff and bull-dog, or the ban-dog.

17. *Newfoundland dog*, a variety of large size, superior strength, sagacity, and docile disposition. The feet of this kind of dog are more palmed than usual, and the animal is remarkably partial to the water. The breed of Newfoundland dogs was originally brought from the country of which they bear the name, where they are extremely useful to the settlers on those coasts, who employ them as animals of burden, to bring wood from the interior of the country to the sea side: three or four of them yoked to a sledge will draw two or three hundred weight of wood piled upon it for several miles with great ease.

18. *Pointer*, originally a native of Spain, but long since naturalised in this country. This dog

is remarkably apt at receiving instruction, and is chiefly employed in finding partridges, pheasants, &c., for the dog or gun.

19. *Pug-dog* has the nose turned upwards, the ears pendulous, and body square. In its outward appearance this animal resembles the bull-dog in miniature: it was formerly very common in England, but has of late years become scarce.

20. *Setter*, a nardy, nimble, and handsome dog, possessed of an exquisite scent and sagacity in discovering various kinds of game, especially birds, and esteemed one of the most valuable of our hunting dogs.

21. *Shepherd's dog*, *canis domesticus* of Linnaeus, and *le chien de berger* of Buffon, is distinguished by its upright ears and remarkable velocity of the tail beneath; and stands at the head of the first class of farm dogs. This breed of dogs is said to be preserved in the greatest purity in the northern parts of Scotland. In driving a number of sheep to any distant part, a well-trained dog never fails to confine them to the road; he watches every avenue that leads from it, and pursues the stragglers, if any should escape, and forces them into order without doing them the least injury. If the herdsman be at any time absent from the flock, he depends upon his dog to keep them together; and, as soon as he gives the well-known signal, this faithful creature conducts them to his master, though at a considerable distance.

22. The *Spaniel* is known by its curled hair, and propensity to the water. It is far more elegant than the water dog, and its aspect more sagacious and mild: the ears are long and pendulous, and the hair beautifully crisped. It is chiefly used in discovering the haunts of water-fowl, and in finding birds that have been shot in marshy places.

23. *Terrier*, a small thickset dog, of which there are two kinds, one with the legs short, the back long, and most commonly of a black or yellowish color mixed with white; the other of more sprightly appearance, with the body shorter, and the color reddish-brown or black. In both the disposition is nearly the same; it has an acute smell, is generally an attendant on every pack of hounds, and is very expert in forcing foxes and other game out of their coverts.

24. *Turnspit*, a spirited and active dog, once an indispensable attendant on the spit. The turnspit is distinguished by having the body long, the legs very short, and the tail curled on the back; its usual color is grayish, with black spots. Gmelin has three varieties of this family of dogs, one of which has the feet straight, another the feet curved, and the third having the body covered with long curly hair.

25. *Water dog*, a variety, distinguished by its curly hair, which much resembles wool. The webs between the toes are larger than in most other dogs, which sufficiently accounts for the ease with which it swims, and renders it useful in hunting ducks and other water-fowl. Dogs of this breed are also frequently kept on board ships, for the purpose of sending into the water after any small article that may chance to fall overboard.

In order to choose a dog and bitch for good whelps, take care that the bitch come of a generous kind, be well proportioned, having large ribs and flanks; and likewise that the dog be of a good breed and young; for a young dog and an old bitch breed excellent whelps. The best time for hounds to be lined in, are the months of January, February, or March. The bitch should be used to a kennel, that she may like it after her whelping, and she ought to be kept warm. Let the whelps be weaned after two months old; and though it be somewhat difficult to choose a whelp under the dam that will prove the best of the litter, yet some approve that which is last, and account him to be the best. Others remove the whelps from the kennel, and lay them severally and apart one from the other; then they watch which of them the bitch first takes and carries into her kennel again, and that they suppose to be the best. Others again imagine that which weighs least when it sucks to be the best: this is certain, that the lighter whelp will prove the swifter. As soon as the bitch is littered, it is proper to choose them you mean to preserve, and drown the rest: keep the black, brown, or of one color, for the spotted are not much to be esteemed, though of hounds the spotted are to be valued. Hounds for chase are to be chosen by their colors. The white, with black ears, and a spot at the setting on of the tail, are the principal to compose a kennel of, if of good scent and condition. The black hound, or the black tanned, or the all liver-colored, or all white: the true talhots are the best of the stronger line; the grizzled, whether mixed or unmixed, so they be shag-haired, are the best verminers, and a couple of these are proper for a kennel. In short, take these marks of a good hound: that his head be a middle proportion, rather long than round: his nostrils wide, his ears large, his back bowed; his fillet great, his haunches large, thighs well trussed, ham straight, tail big near the reins, the rest slender, the leg big, the sole of the foot dry, and in the form of that of a fox, with large claws. As pointers and spaniels, when good of their kinds, and well broken, are very valuable to sportsmen, it is worth while to take some care to preserve them in health. This very much depends on their diet and lodging; frequent cleaning their kennels, and giving them fresh straw to lie on, is very necessary; or, in summer time, deal shavings or sand, instead of straw, will check the breeding of fleas. A dog is of a very hot nature; he should therefore never be without clean water by him, that he may drink when he is thirsty. In regard to their food, carrion is by no means proper for them: it must hurt their sense of smelling, on which the excellence of these dogs greatly depends. Barleymeal, the dross of wheat flour, or both mixed together, with broth or skimmed milk, is very proper food. For change, a small quantity of greaves, from which the tallow is pressed by the chandlers, mixed with flour, or sheep's feet well baked or boiled, are a very good diet: and when you indulge them with flesh, it should always be boiled. In the season of hunting, it is proper to feed the dogs in the evening before, and give them nothing in the

morning they are to be taken out, but a little milk; but if you stop for your own refreshment in the day, the dogs should also get a little bread and milk. A pointer ought not to be hunted oftener than two or three days in a week; and unless you take care of his feet, and give him good lodging as well as proper food, he will not be able to perform that through the season. You should therefore, after a day's hard hunting, wash his feet with warm water and salt; and when dry, wash them with warm broth, or beer and butter, which will heal their soreness, and prevent a settled stiffness from fixing. It has been already observed, that dogs are of a hot constitution; the greatest relief to them in summer is twitch grass, sometimes called dog grass. It will therefore be proper to plant some of it in a place into which the dogs may be turned every morning; and by feeding freely on it, they will be cured of the sickness they are subject to, as well as of any extraordinary heat of the blood; but unless the grass be of this sort, it will have no effect. Dogs are exposed to different casualties, such as bites, blows, poison, &c. If dogs are bitten by any venomous creatures, as snakes, adders, &c., squeeze out the blood, and wash the place with salt and urine; then lay a plaster to it made of calamine, pounded in a mortar, with turpentine and yellow wax, till it come to a salve. If you give your dog some of the juice of calamine to drink in milk, it will be of service; or an ounce of treacle dissolved in sweet wine. If a dog has received any little wounds by forcing through hedges, or gets any lameness from a blow or strain, bathe the wound or grieved part with salt and cold vinegar (for warming it only evaporates the fine spirit); and when dry, if a wound, you may pour in it a little friar's balsam, which will perform the cure sooner than any method hitherto experienced.

For stealing a dog a man is to forfeit to the king, for the first offence, not less than £30, nor more than £50, with the charges attendant on his conviction, or be imprisoned not less than six, or more than twelve, months. Any person keeping a dog accustomed to bite, is liable to be indicted for a common nuisance; and an action will lie against any person for any sheep, horse, &c., torn by a dog, if it is proved that the animal has done so before.

DOGS, DISEASES OF. Dogs are subject to various diseases: the principal are thus described by Blaine, with the method of their cure.

The *canine asthma* is hardly ever observed to attack any but either old dogs, or those who, by confinement, too full living, and want of exercise, may be supposed to have become diseased by these deviations from a state of nature. It is hardly possible to keep a dog very fat for any great length of time, without bringing it on. This cough is frequently confounded with the cough that precedes and accompanies distemper, but it may be readily distinguished from this by an attention to circumstances, as the age of the animal, its not affecting the general health, nor producing immediate emaciation, and its less readily giving way to medicine. The cure is often very difficult, because the disease has in general been long neglected before it is sufficiently

noticed by the owners. As it is in general brought on by confinement, too much warmth, and over-feeding; so it is evident the cure must be begun by a steady persevering alteration in these particulars. The medicines most useful, are alteratives, and of these occasional emetics are the best. One grain of tartarised antimony (i. e. tartar emetic), with two, three, or four grains of calomel, is a very useful and valuable emetic. This dose is sufficient for a small dog, and may be repeated twice a week with great success—always with palliation.

Of diseases of the *eyes* dogs are subject to almost as great a variety as ourselves, many of which end in blindness. No treatment yet discovered will remove or prevent this complaint. Sore eyes, though not in general ending in blindness, are very common among dogs. It is an affection of the eyelids, is not unlike the scrofulous affection of the human eyelids, and is equally benefited by the same treatment: an unguent made of equal parts of nitrated quicksilver ointment, prepared tutty and lard, very lightly applied. Dropsy of the eyeball is likewise sometimes met with, but is incurable.

Cancer. The virulent dreadful ulcer, that is so fatal in the human subject, and is called cancer, is unknown in dogs; yet there is very commonly a large schirrous swelling of the teats in bitches, and of the testicles (though less frequent) in dogs, that as it sometimes becomes ulcerated, so it may be characterised by this name. In the early state of the disease discutients prove useful, as vinegar with salt, and camphor and Spanish flies, with mercurial ointment, have sometimes succeeded; taking care to avoid irritating the part so much as to produce blister. But when the swelling is detached from the belly, and hangs pendulous in the skin, it had better be removed, and as a future preventive suffer the bitch to breed. Schirrous testicles are likewise sometimes met with; for these no treatment yet discovered succeeds but the removal of the part, and that before the spermatic chord becomes much affected, or it will be useless.

Colic. Dogs are subject to two kinds of colic; one arising from constipation of the bowels, the other is of a kind peculiar to dogs, apparently partaking of the nature of rheumatism, and also of spasm. From a sudden or violent exposure to cold, dogs become sometimes suddenly paralytic, particularly in the hinder parts; having great tenderness and pain, and every appearance of lumbago. In every instance of this kind there is considerable affection of the bowels, generally costiveness, always great pain. A warm bath, external stimulants, but more particularly active aperients, remove the colic. Colic, arising from costiveness, is not in general violently acute from the pain it produces; sometimes it appears accompanied with more spasm than is immediately dependent on the confinement of the bowels. In the former give active aperients, as calomel with pil. cochine, i. e. aloetic pill and glysters; in the latter castor oil, with laudanum and ether.

Cough. Two kinds of cough are common among dogs, one accompanying distemper, the other in an asthmatic affection of the chest. See *Canine Asthma*.

Distemper. This is by far the most common and most fatal among the diseases of dogs; hardly any young dog escaping it; and of the few who do escape it in their youth, three-fourths are attacked with it at some period afterwards: it being a mistake that young dogs only have it. It, however, generally attacks before the animal arrives at eighteen months old. When it comes on very early, the chances of recovery are very small. It is peculiarly fatal to greyhounds, much more so than to any other kind of dog generally carrying them off by excessive scouring. It is very contagious: but it is by no means necessary that there should be contagion present to produce it; on the contrary, the constitutional liability to it is such, that any cold taken may bring it on: and hence it is very common to date its commencement from dogs being thrown into water, or shut out on a rainy day, &c. There is no disease which presents such varieties as this, either in its mode of attack or during its continuance. In some cases it commences by purging, in others by fits. Some have cough only, some waste, and others have moisture from the eyes and nose, without any other active symptom. Moist eyes, dulness, wasting, with slight cough, and sickness, are the common symptoms that betoken its approach. Then purging comes on, and the moisture from the eyes and nose from mere mucus becomes pus, or matter. There is also frequently sneezing, with a weakness in the loins. When the disease in this latter case is not speedily removed, universal palsy comes on. During the progress of the complaint, some dogs have fits. When one fit succeeds another quickly, the recovery is extremely doubtful. Many dogs are carried off rapidly by the fits, or by purging; others waste gradually from the running from the nose and eyes, and these cases are always accompanied with great marks of putridity. In the early stages of the complaint give emetics; they are peculiarly useful. A large spoonful of common salt, dissolved in three spoonfuls of warm water, has been recommended; the quantity of salt being increased according to the size of the dog, and the difficulty of making him to vomit. While a dog remains strong, one every other day is not too much: the bowels should be kept open, but active purging should be avoided. In case the complaint should be accompanied with excessive looseness, it should be immediately stopped by balls made of equal parts of gum arabic, prepared chalk, and conserve of roses, with rice-milk as food. Two or three grains of James's powder may be advantageously given at night, in cases where the bowels are not affected, and in the cases where the matter from the nose and eyes betokens much putridity, we have witnessed great benefit from balls made of what is termed friars' balsam, gum guaiacum, and chamomile flowers in powder: but the most popular remedy is a powder prepared and vended under the name of Distemper Powder, with instructions for the use of it. Dogs, in every stage of the disease, should be particularly well fed. A seton we have not found so useful as is generally supposed; where the nose is much stopped, rubbing tar on the upper part is useful, and when there

is much stupidity, and the head seems much affected, a blister on the top is often serviceable.

Fits. Dogs are peculiarly subject to fits. These are of various kinds, and arise from various causes. In distemper, dogs are frequently attacked with convulsive fits, which begin with a champing of the mouth and shaking of the head, gradually extending over the whole body. Sometimes an active emetic will stop their progress, but more generally they prove fatal. *Worms* are often the cause of fits in dogs. These deprive the animal wholly of sense; he runs wild till he becomes exhausted, when he gradually recovers, and perhaps does not have one again for some weeks. Confinement produces fits and likewise costiveness. Cold water thrown over a dog will generally remove the present attack of a fit; and for the prevention of their future recurrence it is evident, that the foregoing account of causes must be attended to.

Inflamed bowels. Dogs are very subject to inflammation of their bowels, from costiveness, from cold, or from poison. When inflammation arises from costiveness it is in general very slow in its progress, and is not attended with very acute pain, but it is characterised by the want of evacuation and the vomiting of the food taken, though it may be eaten with apparent appetite. In these cases the principal means to be made use of are the removal of the constipation by active purging, clysters, and the warm bath. Calomel with aloes forms the best purge. But when the inflammation may be supposed to arise from cold, then the removing of any costiveness that may be present is but a secondary consideration. This active kind of inflammation is characterised by violent panting, total rejection of food, and constant sickness. There is great heat in the belly, and great pain; it is also accompanied with great weakness, and the eyes are very red. The bowels should be gently opened with clysters, but no aloes or calomel should be made use of. The belly should be blistered, having first used the warm bath. When the inflammation arises from poison, there is then constant sickness, the nose, paws, and ears are cold, and there is a frequent evacuation of brown or bloody stools. Castor oil should be given, and clysters of mutton broth thrown up, but it is seldom any treatment succeeds.

Inflamed lungs. Pleurisy is not an uncommon disease among dogs. It is sometimes epidemic, carrying off great numbers. Its attack is rapid, and it generally terminates in death on the third day, by a great effusion of water in the chest. It is seldom that it is taken in time, when it is, bleeding is useful, and blisters may be applied to the chest.

Madness. The symptoms of madness are thus summed up by Mr. Daniel:—"At first the dog looks dull, shows an aversion to his food and company, does not bark as usual, but seems to murnur; is peevish, and apt to bite strangers; his ears and tail drop more than usual, and he appears drowsy; afterwards he begins to loll out his tongue, and froth at the mouth, his eyes seeming heavy and watery: if not confined he soon goes off, runs panting along with a dejected air, and endeavours to bite any one he

meets. If the mad dog escapes being killed, he seldom runs above two or three days, when he dies exhausted with heat, hunger, and disease." Blaine describes this formidable disease as commencing sometimes by dullness, stupidity, and retreat from observation; but more frequently, particularly in those dogs which are immediately domesticated around us, by some alteration in their natural habits; as a disposition to pick up and swallow every minute object on the ground; or to lick the parts of another dog incessantly; or to lap his own urine, &c. About the second or third day the disease usually resolves itself into one of two types. The one is called raging, and the other dumb madness. These distinctions are not, however, always clear; and to which is owing so much discrepancy in the accounts given by different persons of the disease.

The raging madness, by its term, has led to an erroneous conclusion, that it is accompanied with violence and fury; which, however, is seldom the case: such dogs are irritable and snappish, and will commonly fly at a stick held to them, and are impatient of restraint: but they are seldom violent except when irritated or worried. On the contrary, till the last moment they will often acknowledge the voice of their master, and yield some obedience to it. Neither will they usually turn out of their way to bite human persons; but they have an instinctive disposition to do it to dogs; and in a minor degree to other animals also: but, as before observed, seldom attack mankind without provocation.

Dumb madness is so called because there is seldom any barking heard, but more particularly, because the jaw drops paralytic, and the tongue lolls out of the mouth, black, and apparently strangulated. A strong general character of the disease, is the disposition to scratch their bed towards their belly; and equally so is the general tendency to eat trash, as hay, straw, wood, coals, dirt, &c.: and it should be remembered, that this is so very common and so inviolable, that the finding these matters in the stomach after death, should always render a suspicion formed of the existence of the disease confirmed into certainty. Blaine is also at great pains to disprove the notion generally entertained, that rabid dogs are averse to water; and neither drink or come near it. This error he contends has led to most dangerous results; and is so far from true, that mad dogs from their heat and fever are solicitous for water, and lap it eagerly. When the dumb kind exists in its full force, dogs cannot swallow what they attempt to lap; but still they will plunge their heads in it, and appear to feel relief by it: but in no instance out of many hundreds, did he ever discover the smallest aversion to it. He lays very great stress on the noise made by rabid dogs, which he says is neither a bark nor a howl, but a tone compounded of both. It has been said by some that this disorder is occasioned by heat or bad food, and by others that it never arises from any other cause but the bite. Accordingly this malady is rare in the northern parts of Turkey, more rare in the southern provinces of that empire, and totally unknown under the burning sky of Egypt. At Aleppo, where these

animals perish in great numbers, for want of water and food, and by the heat of the climate, this disorder was never known. In other parts of Africa, and in the hottest zone of America, dogs are never attacked with madness. Blaine knows of no instance of the complaint being cured, although he has tried to their fullest extent the popular remedies of profuse bleedings, strong mercurial and arsenical doses, vinegar, partial drowning, night-shade, water plantain, &c.: he therefore recommends the attention to be principally directed towards the prevention of the malady. The preventive treatment of rabies or madness is, according to Blaine, always an easy process in the human subject, from the immediate part bitten being easily detected; in which case the removal of the part by excision or cautery is an effectual remedy. But, unfortunately for the agriculturist, it is not easy to detect the bitten parts in cattle, nor in dogs; and it would be therefore most desirable if a certain internal preventive were generally known. Dr. Mead's powder, the Ormskirk powder, sea-bathing, and many other nostrums are deservedly in disrepute: while a few country medicines, but little known beyond their immediate precincts, have maintained some character. Conceiving that these must all possess some ingredient in common, he was at pains to discover it; and which he appears to have realized, by obtaining, among others, the composition of Webb's Watford drink. In this mixture, which is detailed below, he considers the active ingredient to be the buxus or box, which has been known as a prophylactic as long as the times of Hippocrates and Celsus, who both mention it. The recipe, detailed below, has been administered to nearly three hundred animals of different kinds, as horses, cows, sheep, swine, and dogs: and appears to have succeeded in nineteen out of every twenty cases, where it was fairly taken and kept on the stomach. It appears also equally efficacious in the human subject; in which case he advises the extirpation of the bitten parts also. The box preventive is thus directed to be prepared:—Take of the fresh leaves of the tree-box two ounces, of the fresh leaves of rue two ounces, of sage half an ounce, chop these fine, and boil in a pint of water to half a pint; strain carefully, and press out the liquor very firmly; put back the ingredients into a pint of milk, and boil again to half a pint; strain as before; mix both liquors, which forms three doses for a human subject. Double this quantity is proper for a horse or cow. Two-thirds of the quantity is sufficient for a large dog, half for a middling-sized, and one-third for a small dog. Three doses are sufficient, given each subsequent morning, fasting; the quantity directed being that which forms these three doses. As it sometimes produces strong effects on dogs, it may be proper to begin with a small dose; but in the case of dogs we hold it always prudent to increase the dose till effects are evident, by the sickness, panting, and uneasiness of the dog. In the human subject, where this remedy appears equally efficacious, we have never witnessed any unpleasant or active effects, neither are such observed in cattle of any kind: but candor obliges us to add, that in a considerable

proportion of these, other means were used, as the actual or potential cautery: but in all the animals other means were purposely omitted. That this remedy, therefore, has a preventive quality, is unquestionable, and now perfectly established; for there was not the smallest doubt of the animals mentioned either having been bitten, or of the dog being mad who bit them, as great pains were in every instance taken to ascertain these points. To prevent canine madness, Pliny recommends worming of dogs; and from his time to the present it has had, most deservedly, says Daniel, its advocates. He tells us, that he has had various opportunities of proving the usefulness of this practice, and recommends its general introduction. Blaine, on the contrary, asserts that the practice of worming is wholly useless, and founded in error; and that the existence of any thing like a worm under the tongue is incontestably proved to be false; and that what has been taken for it, is merely a deep ligature of the skin, placed there to restrain the tongue in its motions. He also observes, that the pendulous state of the tongue in what is termed dumb madness, with the existence of a partial paralysis of the under jaw, by which they could not bite, having happened to dogs previously wormed, has made the inability to be attributed to this source, but which is wholly an accidental circumstance; and happens equally to the wormed and unwormed dog.

Mange. This is a very frequent disease in dogs, and is an affection of the skin, either caught by contagion, or generated by the animal. The scabby mange breaks out in blotches along the back and neck, and is common to Newfoundland dogs, terriers, pointers, and spaniels, and is the most contagious. The cure should be begun by removing the first exciting cause, if removable, such as filth or poverty; or, as more generally the contrary (for both will equally produce it), too full living. Then an application should be made to the parts, consisting of sulphur and sal ammoniac: tar-lime-water will also assist. When there is much heat and itching, bleed and purge. Mercurials sometimes assist, but they should be used with caution; dogs do not bear them well.

Worms. Dogs suffer very much from worms, which, as in most animals, so in them, are of several kinds: but the effects produced are nearly similar. In dogs having the worms the coat generally stares; the appetite is ravenous, though the animal frequently does not thrive: the breath smells, and the stools are singular, sometimes loose and flimsy, at others hard and dry; but the most evil they produce is occasional fits, or sometimes a continued state of convulsion, in which the animal lingers some time, and then dies; the fits they produce are sometimes of the violent kind, at others they exhibit a more stupid character, the dog being senseless, and going round continually. The cure consists, while in this state, in active purgatives joined with opium, and the warm bath; any rough substance given internally, acts as a vernifuge to prevent the recurrence. The worming of whelps is performed with a lancet, to slit the thin skin which immediately covers the worm; a small awl is then to be introduced under the centre of the worm to

raise it up; the farther end of the worm will, with very little force, make its appearance, and with a cloth taking hold of that end, the other will be drawn out easily; care should be taken that the whole of the worm comes away without breaking, and it rarely breaks unless cut into by the lancet, or wounded by the awl.

DOGS' SKINS, dressed with the hair on, are used in muffs, made into a kind of buskins for persons in the gout and for other purposes. Dressed without the hair, they are used for ladies' gloves, and the linings of masks, being thought to make the skin peculiarly white and smooth. The French import many of these skins from Scotland, under a small duty. Here, when tanned, they serve for upper leathers for neat pumps. Dogs' skins dressed are exported under a small, and imported under a high duty. The French import from Denmark large quantities of dogs' hair, both white and black. The last is esteemed the best, and is worked up in the black list of a particular kind of woollen cloth.

DOGS, ISLE OF, a small tract of low land in the county of Middlesex, opposite to Greenwich; where Togodumnus, brother of Caractacus, is said to have been killed in a battle with the Romans, A.D. 46. The Isle of Dogs is said to have derived its name from being the depot of the spaniels and greyhounds of Edward III.; and to have been chosen for this purpose because it lay contiguous to his sports of woodcock shooting, and coursing the red deer, in Waltham and the other royal forests in Essex. It is well known that, for the more convenient enjoyment of these sports, he generally resided, in the sporting season, at Greenwich.

One of the largest canals ever attempted in England has been cut, nearly one mile and a quarter in length, 142 feet wide at top, and twenty-four feet deep, across the Isle of Dogs, for shortening the passage of vessels to and from the pool, and to avoid the long circuit by Greenwich and Deptford. When the locks and other works of this canal were nearly finished, an unforeseen accident, by the blowing up of the coffer and preventer dams, just as the entrance-locks were completed, on the 24th of July 1805, prevented this canal from being opened until the 9th of December, when the Duchess of York West Indian, of 500 tons burden, passed through it, in presence of the lord mayor and corporation of London. Several large sums of public money having been granted out of the consolidated fund, in aid of this project, for the repayment of them, vessels passing through this canal of 200 tons or upwards paid, for three years after its completion, 2*d.* per ton; those from 200 to 100 tons, 1½*d.* per ton; from 100 to 50 tons, 1*d.* per ton; 50 to 20 tons, 5*s.* each, and boats and craft 1*s.* each. This canal is now the property of the directors and company of the noble docks adjoining.

DOG-BANE, in botany. See *APOCYNUM*.

DOG-BERRY-TREE. See *CORNUS*.

DOG-DAYS. See *CANICULA*.

DOGE, *n. s.* Ital. *dodge*. The title of the chief magistrate of Venice and Genoa.

Doria has a statue at the entrance to the *doge's* palace with the title of deliverer of the common wealth.

Addition.

DOGE OF VENICE was formerly the chief of the council, and the mouth of the republic; yet the Venetians did not go into mourning at his death, as not being their sovereign, but only their first minister. At Venice he was elected for life; at Genoa, only for two years; he was addressed under the title of serenity, which was esteemed superior to that of highness. In fact, the doge of Venice was only the shadow of a prince; all the authority being reserved to the republic. Anciently, indeed, the doges were sovereigns; but, for a considerable time past, all the prerogatives reserved to the quality of doge were these: he gave audience to ambassadors; but did not give them any answer from himself, in matters of any importance; only he was allowed to answer as he pleased to the compliments they made to the seignory. The doge, as being first magistrate, was head of all the councils; and the credentials which the senate furnished its ministers in foreign courts, were written in his name; but a secretary of state signed and sealed them with the arms of the republic. The ambassadors directed their despatches to the doge: yet he was not allowed to open them but in presence of the counsellors. The money was struck in the doge's name, but not with his stamp or arms. All the magistrates rose and saluted the doge when he came into council: but the doge rose to none but foreign ambassadors. He nominated to all the benefices in the church of St. Mark; he was protector of the monastery of the Virgin, and bestowed certain petty offices of ushers of the household, called commanders of the palace. His family was not under the jurisdiction of the master of the ceremonies; and his children had staff-officers, and gondoliers in livery. But his grandeur was tempered with various circumstances, which rendered it burdensome. He could not go out of Venice without leave of the council; and if he did he was liable to receive affronts, without being entitled to demand satisfaction. His children and brothers were excluded from all the chief offices of state. They could not receive any benefice from the court of Rome; but were allowed to accept of the cardinalate, as being no benefice, nor including any jurisdiction. The doge could not divest himself of his dignity, for his case; and, after his death, his conduct was examined by three inquisitors and five correctors, who sifted it with great severity.

DOG-FISH. See *SQUALUS*.

DOGGER, in sea-language, a strong vessel with two masts, used by the Dutch, &c., for fishing in the German sea, and on the Dogger-bank. On the main-mast are set two square-sails; on the mizen-mast a gaff-sail, and above that a top-sail. Also a bow-sprit with a sprit-sail, and two or three jibs.

DOGGER-BANK, in geography, a very extensive sand-bank in the German Ocean, between the coast of England and Germany. It stretches south-east and north-west, beginning about twelve leagues from Flamborough-head, and extending nearly seventy-two leagues towards the coast of Jutland. Between the Dogger and the Well-bank, to the south, are the silver pits of the Marins, which supply London with cod; a fish which loves the deep water near the banks.

A sanguinary but indecisive engagement was fought near it on 5th August 1781, between the English and Dutch.

DOGGEREL, *adj.* & *n. s.* From dog. Loosed from the measures or rules of regular poetry; vile; despicable; mean.

Beside all this, he served his master
In quality of poetaster,
And rhymes appropriate could make
To every month i' the almanack;
When terms begin and end could tell,
With their returns, in *doggerel*. *Hudibras.*

Then hasten Og and Doeg to rehearse,
Two fools that crutch their feeble sense on verse;
Who by my muse to all succeeding times
Shall live, in spite of their own *doggerel* rhymes.

Dryden.
The hand and head were never lost of those
Who dealt in *doggerel*, or who pined in prose.

Dryden's Journal.
It is a dispute among the critics, whether burlesque poetry runs best in heroic verse, like that of the *Dispensary*; or in *doggerel*, like that of *Hudibras*.

Addison's Spectator.
The vilest *doggerel* Grub-street sends
Will pass for yours with foes and friends. *Swift.*

DOGGET (Thomas), an Irish comedian, was a native of Dublin. He played comic characters at Drury-lane with applause, and finally became joint manager of that house. He died at Eltham in Kent in 1721, leaving a sum to provide a coat and badge to be rowed for by six watermen, yearly on the 1st of August, the day of the accession of George I. He wrote a comedy called the *Country Wake*, afterwards altered to *Flora*, or *Hob in the Well*.

DOGGERS, in the English alum-works, a name given by the workmen to a sort of stone found in the same mines with the true alum rock, and containing some alum, though not near so much as the right kind. The county of York, which abounds greatly with the true alum rock, affords also a very considerable quantity of these doggers; and in some places they approach so much to the nature of the true rock, that they are wrought to advantage.

DOG'MA, *n. s.*

DOGMA'TIC, *adj.*

DOGMA'TICAL, *adj.*

DOGMA'TICALLY, *adv.*

DOGMA'TICALNESS, *n.*

DOG'MATISM,

DOG'MATIST,

DOG'MATIZE, *v. n.*

DOG'MATIZER, *n. s.*

liffe: dogmatic and dogmatical mean authoritative; positive; in the manner of a teacher. Dogmatism and dogmaticalness, positiveness of opinion; over-bearing manner. To dogmatise, to lay down propositions or opinions positively.

Such opinions, being not entered into the confessions of our church, are not properly chargeable either on Papists or Protestants, but on particular *dogmatizers* of both parties. *Hammond.*

I could describe the vanity of bold opinion, which the *dogmatists* themselves demonstrate in all the controversies they are engaged in. *Glauville's Scipias.*

The dim and bounded intellect of man seldom prosperously adventures to be *dogmatical* about things

that approach to infinite, whether in vastness or litteness. *Bayle.*

I shall not presume to interpose *dogmatically* in a controversy, which I look never to see decided.

South.

Our poet was a stoic philosopher, and all his moral sentences are drawn from the *dogmas* of that sect.

Dryden.

Learning gives us a discovery of our ignorance, and keeps us from being peremptory and *dogmatical* in our determinations. *Collier on Pride.*

Critics write in a positive *dogmatick* way, without either language, genius, or imagination. *Spectator.*

One of these authors is indeed so grave, sententious, *dogmatical* a rogue, that there is no enduring him. *Swift.*

Dogma, in canon law, is that determination which consists in, and has a relation to, some casuistical point of doctrine, or some doctrinal part of the christian faith. *Ayliffe's Parergon.*

A *dogmatist* in religion is not a great way off from a bigot, and is in high danger of growing up to be a bloody persecutor. *Watts's Improvement of the Mind.*

Nothing can be more unphilosophical than to be positive or *dogmatical* on any subject; and even if excessive scepticism could be maintained, it would not be more destructive to all just reasoning and inquiry. *Hume.*

Perhaps what I have here not *dogmatically* but deliberately written, may recal the principles of the drama to a new examination.

Johnson's Preface to Shakspeare.

If the present establishment should fall, it is this religion which will triumph in Ireland and in England, as it has triumphed in France. This religion, which laughs at creeds, and *dogmas*, and confessions of faith, may be fomented equally amongst all descriptions, and all sects; amongst nominal catholics, and amongst nominal churchmen; and amongst those dissenters who know little, and care less, about a presbytery, or any of its discipline, or any of its doctrines.

Burke.

At present, we can well conceive the probability of his *dogmatism* being patiently supported by attending admirers, awed by the literary eminence on which he stands. *Seward.*

DOGMATISTS, a sect of ancient physicians, of which Hippocrates was the founder. They are also called *logici*, *logicians*, from their using the rules of logic in medical subjects. They laid down definitions and divisions; reducing diseases to certain genera, and those genera to species, and furnishing remedies for them all; supposing principles, drawing conclusions, and applying those principles and conclusions to particular diseases under consideration; in which sense, the dogmatists stand contradistinguished from empirics and methodists.

DOG-RIBBED INDIANS, a nation of North Americans, who inhabit round Lake Edland, in the north-west part of North America. They are often at war with the Arathapescow Indians. Both these tribes are among the most savage of the human race. They trade with the Hudson Bay Company's settlements.

DOG-STAR. See *SIRIUS*.

DOGS-TOOTH. See *ERYTHRONIUM*.

DOG-WOOD. See *CORNUS*.

DOG-WOOD OF JAMAICA, a species of erythrina

DOG-WOOD TREE. See *PISCIDIA*.

DOIAGOI, an island of Asiatic Russia, in the Frozen Sea, at the entrance of Vagatskoi, or Waygat's Straits. Long. 57° 14' E., lat. 70° 5' N.

DOILY, *n. s.* A species of woollen stuff, so called, I suppose, says Dr. Johnson, from the name of the first maker.

We should be as weary of one set of acquaintance, though never so good, as we are of one suit, though never so fine: a fool and a *doily* stuff, would now and then find days of grace, and be worn for variety.
Congreve's Way of the World.

DOIT, *n. s.* Dut. *duyt*; Ersc. *doight*. A small piece of money.

When they will not give a *doit* to relieve a lam beggar, they will lay out ten to see a dead Indian.

Shakespeare. Tempest.

In Anna's wars a soldier, poor and old,
Had dearly earned a little purse of gold;
Tired with a tedious march, one luckless night
He slept, poor dog! and lost it to a *doit*. *Pope.*

DORT was the ancient Scottish penny piece; of which twelve were equal to a penny sterling. It was a small copper coin, as thin as a silver penny and not much larger. *Doits* were extremely numerous in Scotland before the Union, and were current for several years after it. Two of them were equal to the bodle, six to the baubee, and eight to the acheson. Some of them, struck in the reigns of Charles I. and II., with C. R. I or C. R. II on the one side, and the thistle on the other, are still to be found in the cabinets of antiquaries.

DOL, a town of France, in Brittany, department of the Ille and Vilaine. Population 3300. It is thirty-four miles north-west of Rennes, and 232 west of Paris.

DOLBEN (John), an English prelate, born at Stanwick, in Northamptonshire, in 1625. Was educated at Westminster School, and at Christ Church, Oxford. In the civil wars he served as an officer in the royal army, and rose to the rank of major. Returning on the decline of the king's affairs to college, he took his degrees and entered into orders. At the Restoration he obtained a canonry of Christ Church, and the deanery of Westminster. He was promoted in 1666 to the see of Rochester, and from thence in 1683 he removed to York, where he died of the small pox in 1686. Some of his sermons are still extant.

DOLCE (Charles, or Carlino), a celebrated historical and portrait painter, born at Florence in 1616. He was the disciple of Vignali, and was particularly fond of representing pious subjects, though he sometimes painted portraits. His works are easily distinguished by the peculiar delicacy with which he perfected all his compositions, by a pleasing tint of color, and by a judicious management of the *chiaro scuro*. His performance was remarkably slow; and it is reported that his brain was fatally affected by seeing Lucas Jordana despatch more business in four or five hours than he could have done in as many months. He died in 1686.

DOLE, *n. s.* From *deal*; Sax. *dealan*. The act of distribution or dealing. The thing dealt.

It was your presumption,
That in the *dole* of blows your son might drop.

Shakespeare.

Now my masters, happy man be his *dole*, say I every man to his business. *Id.*

The personal fruition in any man cannot reach to feel great riches: there is a custody of them, or a power of *dole* and donative of them, or a fame of them, but no solid use to the owner. *Bacon.*

Now thou art lifted up, draw me to thee,
And, at thy death giving such liberal *dole*,
Moist with one drop of thy blood my dry soul.
Donne. Divine Poems.

What if his eye-sight, for to Israel's God
Nothing is hard, by miracle restored,
He now be dealing *dole* among his foes,
And over heaps of slaughtered walk his way.
Milton.

Let us, that are unhurt and whole,
Fall on, and happy man be 's *dole*.
Hudibras.

Clients of old were feasted; now a poor
Divided *dole* is dealt at the outward door,
Which by the hungry rout is soon dispatched.
Dryden's Juvenal.

At her general *dole*,
Each receives his ancient soul. *Cleaveland.*

DOLE, *n. s.* Old Fr. *dole*, seems to be the origin of the
DOLEFULLY, *adj.* first class of these
DOLEFULLY, *adv.* words; and Lat. *dolor*
DOLEFULNESS, *n. s.* of the second. The
DOLEFULNESS, *n. s.* } substantive roots sig-
DOL, *n. s.* nify, in both, grief;
DOLOR, *n. s.* sorrow; and hence its
DOLORIFIC, *adj.* causes, pain; deprivation;
DOLOROUS, *adj.* and its expres-
DOLOROUSLY, *adv.* } sion, lamentation, complaint.

For none but you, or who of you it learns,
Can rightly arcad so *doleful* lay. *Spenser.*

With kindly counter under mimic shade,
Our pleasant Willy, ah! is dead of late;
With whom all joy and jolly merriment
Is also deaded, and in *dolour* drent. *Id.*

We are taught, by his example, that the presence
of *dolorous* and dreadful objects, even in minds most
perfect, may, as clouds, overcast all seasonable joy.
Hooker.

Our sometime sister, now our queen,
Have we, as 'twere, with a defeated joy,
With mirth in funeral, and with dirge in marriage,
In equal scale weighing delight and *dole*,
Taken to wife. *Shakespeare. Hamlet.*

I've words too few to take my leave of you,
When the tongue's office should be prodigal,
To breathe the abundant *dolour* of the heart. *Id.*

You take me in too *dolorous* a sense:
I spake t' you for your comfort. *Id.*
A mind fixed and bent upon somewhat that is
good, doth avert the *dolors* of death. *Bacon.*

They might hope to change
Torment with ease, and soonest recompense
Dole with delight. *Milton's Paradise Lost.*

No light, but rather darkness visible,
Served only to discover sights of woe,
Regions of sorrow; *doleful* shades, where peace
And rest can never dwell. *Id.*

Yet to that hideous place not so confined
By rigour unconvincing, but that oft
Leaving my *dolorous* prison I enjoy
Large liberty. *Id.*

No man could comfort other : every man was too full of his own sorrow : helping rather to make the noise of the lamentation more *doleful* and astonishing.

Bp. Hall. Contemplations.

With screwed face, and *doleful* whine, they only ply with senseless harangues of conscience against carnal ordinances.

South.

The pain returned, dissipating that vapour which obstructed the nerves, and giving the *dolorifick* motion free passage again.

Ray.

She earnestly entreated to know the cause thereof, that either she might comfort or accompany her *doleful* humour.

Sidney.

Never troubling him either with asking questions or finding fault with his melancholy ; but rather fitting to his *dolour*, *dolorous* discourses of their own and other folks' misfortunes.

Id.

Hell-ward bending o'er the beach descry
The *dolousome* passago to the infernal sky.

Pope's Odyssey.

Talk not of ruling in this *dolorous* gloom,
Nor think vain words, he cried, can ease my doom.

Pope.

Happy the mortal man, who now at last
Has thought this *doleful* vale of misery past ;
Who to his destined stage has carried on
The tedious load, and laid his burden down.

Prior.

This, by the softness and rarity of the fluid, is insensible, and not *dolorifick*.

Arbutnot on Air.

DOLF, a large well-built town of France, on the river Doubs, in Franche Compté, in the department of the Jura. The country around has, from its fertility and beauty, received the name of the Val d'Amour. It has several good edifices, as the Palais de Justice, the former Chambre des Comptes, the church of Notre Dame, the College d'Arc, and the Hotel Dieu Hospital. It has also a pleasant public promenade.

Dole was the Dola Sequanarum of the Romans, and contains considerable remains of that people. The great Roman road to Lyons passed through this place ; and here are two aqueducts and a public edifice near the river of their erection. It was the capital of Franche Compté until 1674, and, is twenty-three miles south of Besançon, and twenty-eight south-east of Dijon.

DOLF, LA, a lofty point of the Jura chain of mountains, between the department of Jura and the Swiss canton of Vaud, it is elevated 5600 feet above the level of the sea, and has the appearance of an immense rock. From its summit there is a most magnificent view for 100 miles in each direction, and, on the side of France, a prospect which extends into Burgundy.

DOLGELLY, or **DOLGETT**, a town of North Wales, in Merionethshire, at the foot of the mountain Cader-Iddris. A new court-house has been erected, in which the summer assizes for the county are held. The county jail is situated at a small distance from the town. The town and its neighbourhood have a peculiar manufacture of coarse undyed woollen cloth, called webbing or white plains, which is chiefly exported. It has a market on Tuesday. It is seated in a valley on the banks of the Avon, thirty-one miles north-west of Montgomery, and 212 north-west of London.

DOLICHOS, in botany, a genus of the dicandria order, and diadelphia class of plants ; natural order thirty-second, papilionaceæ. The basis of the vexillum has two callous knobs, oblong, parallel, and compressing the alæ below. There are fifty-three species, natives of the East and West Indies and of the Cape : the most remarkable are : 1. *D. lablab*, with a winding stalk, a native of warm climates, where it is frequently cultivated for the table. The Egyptians make pleasant arbour with it, by supporting the stem and fastening it with cords ; by which means the leaves form an excellent covering, and an agreeable shade. 2. *D. pruriens*, the couhage, cow-itch, or stinging bean, is also a native of warm climates. It has a fibrous root, and an herbaceous climbing stalk, which is naked, dividing into a great number of branches ; and rises to a great height when properly supported. The leaves are alternate and trilobate, rising from the stem and branches about twelve inches distant from each other. The foot-stalk is cylindrical, from six to fourteen inches long. From the axilla of the leaf descends a pendulous solitary spike, from six to fourteen inches long, covered with long blood-colored papilionaceous flowers, rising in clusters of three each, in a double alternate manner, from small fleshy protuberances, each of which is a short pedunculus of three flowers. These are succeeded by leguminous, coriaceous pods, like those of kidney beans, four or five inches long, densely covered with sharp hairs, which penetrate the skin, and cause great itching, stinging like a nettle, though not quite so painfully. This will grow in any soil in those countries where it is a native : but is generally eradicated from all cultivated grounds ; because the hairs from the pods fly with the winds, and torment every animal they happen to touch. If it was not for this mischievous quality, the beauty of its flower would entitle it to a place in the best gardens. It flowers in the cool months, from September to March, according to the situation. The spiculate, or sharp hairs, of this plant, have been long used in South America as a vermifuge, and have of late been frequently employed in Britain. The spiculate of one pod mixed with syrup or molasses, and taken in the morning fasting, is a dose for an adult. The beans are used in the East Indies as a cure for the dropsy. 3. *D. soja* is a native of Japan, where it is termed daidsu ; and, from its excellence, name ; that is, the pod, by way of eminence. It grows with an erect, slender, and hairy stalk, to the height of about four feet. The leaves are like those of the garden kidney bean. The flowers, of a bluish-white, are produced from the blossom of the leaves, and succeeded by bristly hanging pods resembling those of the yellow lupine, which commonly contain two, sometimes three, large white seeds. This legumen is doubly useful in the Japanese kitchens. It serves for the preparation of a substance named miso, that is used as butter ; and likewise of a pickle celebrated among them under the name of soju or soy.

DOLL, *n. s.* A contraction of Dorothy ; and hence a child's toy.

Doll tear-sheet

Shakspeare.

DOLLAR, *n. s.* Dutch *daler*. See below. A Dutch and German coin of different value, from about two shillings and sixpence to four and sixpence.

He disbursed

Ten thousand *dollars* for our general use.

Shakespeare. Macbeth.

DOLLAR, in this country, is chiefly applied to the Spanish silver coin, otherwise called a piece of eight. Dollars are also coined in different parts of Germany and Holland: and have their subdivisions into semi dollars, quarter dollars, &c. See **COINS**.

DOLLART BAY, or **THE DOLLERT**, an arm of the North Sea, extending between East Friesland in Hanover, and Groningen in the Netherlands, to the mouth of the Ems. It is said to have been formed by the sea breaking in here towards the close of the thirteenth century; when it swept away nearly fifty villages. On the side of East Friesland, the sea has in some measure receded.

DOLLOND (John), a celebrated optician, the inventor of the achromatic telescope, was descended from that useful body of artificers the French refugees of Spitalfields, London, where he was born 10th June, 1706. His education was limited by the circumstances of his friends, who could only destine him to their own occupation, and he is said to have passed many years of his life as an operative silk-weaver. Mr. Dollond, however, possessed a mathematical and philosophical taste, which soon disclosed itself; he acquired the Greek and Latin languages, together with a considerable knowledge of anatomy and scholastic divinity; and though he married early, found means to continue his scientific pursuits, and bring up his family. In his eldest son Mr. Peter Dollond, he was happily afforded an heir of his own taste, and in 1752 he had so well established him in business as an optical instrument-maker, that he quitted Spitalfields to join him in partnership. This same year was read in the Royal Society, a letter of Mr. J. Dollond's to James Short, A. M. F. R. S., concerning a mistake in Mr. Euler's Theorem for correcting the Aberration in the Object Glasses of Refracting Telescopes, together with an introductory letter of Mr. Short, in which Euler's calculations are disputed; with Euler's answers to Short and Dollond. (Phil. Trans. 1753, p. 287.) 'It is somewhat strange,' says Mr. Dollond, 'that any body now-a-days should attempt to do that which so long ago has been demonstrated impossible:' and his discoveries were doubtless for a while retarded by his deference to the great name of Newton, whom Euler considered to agree with him; and whose experiments were certainly compatible with the doctrine of Euler, while Mr. Dollond was better acquainted than either with the mechanism of the eye. In 1753 he describes, in a second letter to Mr. Short, a telescope with six glasses, 'calculated for correcting, either wholly or in a great measure, the errors of refraction arising from the dispersion of the different colors, as well as from the spherical form of the surfaces of the eye-glasses;' appealing to the superiority of the telescopes, which he had thus constructed, above those

which had before been in use. He here reserves the detail of his theory for a future occasion.

His great discovery is narrated in an 'Account of some Experiments concerning the different Refrangibility of Light,' Phil. Trans. 1758, p. 733. Mr. Dollond commenced the decisive experiments here described, by putting a common prism of glass into a prismatic vessel of water, and varying the angle of the vessel till the mean refraction of the glass was compensated; when he found that the colors were not destroyed, as they were supposed to have been in a similar experiment of Sir Isaac Newton's; for the remaining dispersion was nearly as great as that of a prism of glass of half the refracting angle. A thinner wedge of glass being then employed, our optician found that the image was colorless when the refraction of the water was about one-fourth greater than that of the glass. He next attempted to construct compound object-glasses by enclosing water between two lenses; but in this arrangement he found great inconvenience from the spherical aberration. He was, therefore, obliged to try the effects of different kinds of glass, and fortunately discovered that the refractions of flint and crown glass were extremely convenient for his purpose, the image afforded by them being colorless, when the angles were to each other nearly as two to three: hence he inferred that a convex lens of crown-glass, and a convex one of flint, would produce a colorless image when their focal distances were in the same proportion. 'The spherical aberration, where the curvature was so considerable, still produced some inconvenience; but, having four surfaces capable of variation, he was enabled to make the aberrations of the two lenses equal; and since they were in opposite directions, they thus corrected each other.' These arrangements required great accuracy of execution for their complete success; but, in the hands of the inventor, they produced the most admirable instruments; and he was fortunate in obtaining a quantity of glass of remarkably uniform density. He afterwards made some small Galilean telescopes, with triple object-glasses.

For these inventions Mr. Dollond received the Copleian medal of the Royal Society; and in 1761 he was chosen a fellow of that learned body, and appointed optician to the king. Other valuable contributions of his to the Society were, A description of a Contrivance for Measuring Small Angles, and an Explanation of an Instrument for that purpose. Trans. 1753 and 1754. His instrument consisted of a divided object-glass, with a scale for determining the distance of the images by measuring the linear displacement of the two portions of the glass.

Mr. Dollond, however, did not long enjoy these well-deserved honors. On the 30th of November, 1761, as he was reading a new work of Clairaut on the theory of the moon, he fell down in an attack of apoplexy, which shortly became fatal. He left two sons who succeeded to his business.

DOLLOND (Peter), eldest son of Mr. John Dollond, the optician, was born in 1730. He communicated, in 1765, a paper to the Royal

Society on his improvement of telescopes; adopting his father's contrivance for measuring small angles (see above); and in 1772 another on his additions to and alterations in Hadley's quadrant. In 1779 he gave an account of his equatorial instrument for correcting the errors arising from refraction in altitude; and in 1789, 'Some account of the discovery made by his father in refracting telescopes,' which became also a separate publication. He died at Kensington in 1820, at the advanced age of ninety years.

DOLOMIEU (Deodate-Guy-Silvain Tancred Gratet de), a celebrated geologist, was born in Dauphiny in 1750. He entered into the service of the knights of Malta, and became a member of the order; but, happening to kill one of his companions, was sentenced to death. The grand master, however, granted him a pardon, but it was necessary that this should be confirmed by the pope, and Dolomieu was closely confined for nine months under suspense. This perhaps decided his future studious habits. At the age of twenty-two he went to Metz, where he studied chemistry and natural history. In 1783 he published his voyage to the Lipari Isles, and a memoir on the earthquakes of Calabria. In 1788 appeared his *Memoire sur les Isles Ponces*, et catalogue raisonné de l'Etna.

On the breaking out of the revolution, Dolomieu ardently embarked, with his friend La Rochefoucault, in the supposed cause of liberty; he was at Paris on the 14th of July, and when La Rochefoucault fell a victim to the horrors of the day, watched his last moments, and received the affectionate messages which he sent to his mother and his wife. He now resumed his geological studies in other parts of Europe, and particularly in its southern countries. He afterwards extended his researches into the physical constitution of Egypt, on which subject he addressed a Memoir inserted in the *Journ. Phys.*, v. xlii. In 1795 we find him again in France; and, upon the establishment of the school of Mines, he became Professor of Geology and Inspector of Mines. He was also one of the original members of the National Institute of Sciences and Arts. From this time he redoubled his philosophical labors, and published a great number of memoirs in the course of a few years. He also furnished various contributions to the *Encyclopédie Méthodique*. On the scientific arrangements being made for the expedition to Egypt, he was invited to take part in them: and on his journey was employed as a negociator for the surrender of Malta. In Egypt he visited the pyramids, and examined some of the mountains which form the limits of the country; but his health compelled him to return long before his companions. On his voyage home, the vessel was nearly lost in a tempest, and was only saved at the last extremity by running into a port in the gulf of Tarentum. Here, as a knight of Malta, he was pronounced a traitor to the existing government, and committed to close confinement at Messina. In this unfortunate situation he remained until the peace of 1800, in which the French government stipulated expressly for his release. During this period he had commenced

a Series of Lectures on the Philosophy of Mineralogy, written with bones and soot-water, on the margin of the few books he was allowed to read. He was appointed, during his confinement, the successor of Daubenton in the Museum of Natural History. His last publication was *Sur la Philosophie Minéralogique et sur l'espèce Minéralogique*. He died at Paris, universally respected, 27th of November, 1801.

DOLOMITE. Of this calcareo-magnesian carbonate, we have three sub-species.

1. Dolomite, of which there are two kinds, viz. 1st. White granular. It occurs massive, and in fine granular distinct concretions, loosely aggregated. Lustre glimmering and pearly. Fracture imperfect slaty; hard as fluor, and brittle. Specific gravity 2.83. It effervesces feebly with acids, and is phosphorescent on heated iron, or by friction. Its constituents are 46.5 carbonate of magnesia, 52.08 carbonate of lime, 0.25 oxide of manganese, and 0.5 oxide of iron. 2d. Brown dolomite, or magnesian limestone of Tennant. Color, yellowish-gray and yellowish-brown. Massive, in minute granular concretions. Lustre, internally glistening. Fracture splintery. Harder than calcareous spar. Brittle. Specific gravity of crystals, 2.8. It dissolves slowly, and with feeble effervescence. Its constituents are, lime 29.5, magnesia 20.3, carbonic acid 47.2, alumina and iron 0.8. In the north of England it occurs in beds of considerable thickness, and great extent, resting on the Newcastle coal formation. In the Isle of Man it occurs in a limestone which rests on gray wacke.

2. Columnar Dolomite. Color, pale grayish-white. Massive, and in thin prismatic concretions. Cleavage imperfect. Fracture uneven. Lustre vitreous, inclining to pearly. Breaks into acicular fragments. Brittle. Specific gravity 2.76. Its constituents are, 51 carbonate of lime, 47 carbonate of magnesia, 1 carbonated hydrate of iron. It occurs in serpentine in Russia.

3. Compact Dolomite, or Gurhofite. Color, snow-white. Massive and dull. Fracture flat conchoidal. Semi-hard. Difficultly frangible. Specific gravity 2.76. When pulverised, it dissolves with effervescence in hot nitric acid. It consists of 70.5 carbonate of lime, and 29.5 carbonate of magnesia. This kind occurs in veins of serpentine rocks, near Gurhoff, in Lower Austria.

DOLPHIN, *n. s.* Fr. *dauphin*; Germ. Span. Ital. and Lat. *delphin*, from Gr. *δελφίς* à *δελφας*, a pig, because the dolphin resembles a pig in its fatness, and the form of its intestines, &c., says Minshew after Beamanus. A fish. See our article **DELPHINUS**.

His delights

Were *dolphin* like; they shewed his back above
The element they lived in. *Shakspeare.*

Draw boys riding upon goats, eagles, and *dolphins*.
Peacham.

Misshappen seals approach in circling flocks,
In dusky mail the tortoise climbs the rocks,
Torpedoes, sharks, rays, porpus, *dolphins*, pour
Their twinkling squadrons round the glittering shore.
Darwin.

DOLPHIN OF THE MAST, in sea language, a peculiar kind of wreath, formed of plaited cordage, to be fastened occasionally round the masts as a support to the puddening, whose use is to sustain the weight of the fore and main yards in case the rigging or chains by which those yards are suspended should be shot away in the time of battle; a circumstance which might render their sails useless at a season when their assistance is extremely necessary.

DOLT, *n. s.* } Teut. and Sax. *dol*. A heavy
DOLTISH, *adj.* } stupid fellow; a blockhead; a
 thickskull; a loggerhead. It is clearly the past
 participle of *dull*, as Mr. Tooke says.

Thou hast not half that power to do me harm,
 As I have to be hurt: oh gull, oh dolt,
 As ignorant as dirt! *Shakspeare. Othello.*

Like men condemned to thunder-bolts,
 Who, ere the blow, become mere dolt; ;
 They neither have the hearts to stay,
 Not wit enough to run away. *Hudibras.*

Dametas, the most arrant doltish clown that ever
 was without the privilege of a bauble. *Sidney.*

Let dolt in haste some altar fair erect
 To those high powers, which idly sit above. *Id.*

Wood's adulterate copper,
 Which, as he scattered, we, like dolt,
 Mistook at first for thunder-bolts. *Swift.*

DOMAIN, *n. s.* Fr. *domaine*, from Lat. *dominium*. Empire; dominion; possession. Hence also, we may remark, our termination *dom* as birthdom, kingdom, &c.

Rome's great emperor, whose wide domain
 Had ample territory, wealth and power. *Milton.*

A Latian field, with fruitful plains,
 And a large portion of the king's domains.
Dryden's Æneid.

Ocean trembles for his green domain. *Thomson.*

So Howard, Moira, Burdett, sought the cells,
 Where Want, or Wo, or Guilt in darkness dwells;
 With Pity's torch illumed the dread domains,
 Wiped the wet eye, and eased the galling chains.
Darwin.

Vain end of human strength, of human skill,
 Conquest, and triumph, and domain, and pomp,
 And ease, and luxury! *Byron.*

DOMAIN. See **DEMESNE**.

DOMAT (John), a celebrated French lawyer born in 1625, who, observing the confused state of the laws, digested them in 4 vols. 4to, under the title of *The Civil Laws in their Natural Order*; for which Louis XIV. settled on him a pension of 2000 livres. Domat was intimate with the famous Pascal, who left him his private papers at his death. He died in 1696.

DOMBES, a ci-devant principality of France, about twenty-four miles long, and twenty-one broad, lying around and partly in the late province of Burgundy, but not under its government, on the west bank of the Soane. Trevous was the capital. It now forms part of the department of Ain.

DOMBEY (Joseph), a French botanist of celebrity, was born at Macon in 1742. He took the degree of doctor of physic at Montpellier, and in 1773 went to South America, where he discovered the majestic tree of the tribe of pines, now named after him, *Dombeya*. On his return

to Europe, in 1785, the revolution disgusted him so much that he re-embarked for America; and, being captured on the passage, died in prison in the island of Montserrat, February 19th, 1796.

DOMBEYA, in botany, a genus of the class monodelphia and order dodecandria: CAL. double, outer three-leaved, deciduous: PET. five: STAM. ten or twenty: STYL. five-cleft: CAPS. five, united, one-celled, one or many seeded. Species twelve, chiefly natives of the isles of Bourbon and Mauritius.

DOMBOO, a considerable town of Bornou, Africa, situated on the caravan route from Mourzouk, and the first which occurs after passing the desert of Bilma. It is situated amid fertile plains.

DOMBOO LAKES are situated on the northern extremity of Bornou, and supply that kingdom, Cassina, and the states on the south of the Niger, with salt. The merchants of Agadez bring hither annually a large caravan, which they load with this commodity, and convey it to the surrounding counties. These lakes are supposed to be the *Chelonides Palus* of Ptolemy.

DOME, *n. s.* Fr. *dome*, from Lat. *domus*. A building, nouse; fabric. Also, from an early shape of roofs, probably a hemispherical arch, a cupola.

Best be he called among good men,
 Who to his God this column raised;
 Though lightning strike the dome again,
 The man who built it shall be praised. *Prior.*

Stranger! whoe'er thou art, securely rest
 Affianced in my faith, a friendly guest;
 Approach the dome, the social banquet share.

Pope's Odyssey.

From dome to dome when flames infuriate climb,
 Sweep the long street, invest the tower sublime;
 Gild the tall vanes amid the astonished night,
 And reddening heaven returns the sanguine light.
Darwin.

While the vine-mantled brows
 The pendent goats unveil, regardless they
 Of hourly peril, though the clefted domes
 Tremble to every wind. *Byron.*

DOME, in architecture is a roof of a hemispherical form, raised over the middle of a building, as a church, hall, pavilion, vestibule, stair-case, &c., by way of crowning. Domes are the same with what the Italians call *cupolas*; or, according to Vitruvius, *tholi*. They are usually made round, though we have instances of square ones; as those of the Louvre; and others that are polygons, as that of the ci-devant Jesuits' church in the Rue St. Antoine at Paris. They have usually columns ranged around their outsides, both by way of ornament, and to support the vault. See **ARCHITECTURE**.

DOME, in chemistry, the upper part of furnaces, particularly portable ones. It has the figure of a hollow hemisphere, or small dome. Its use is to form a space in the upper part of the furnace, the air of which is continually expelled by the fire; hence the current of air is considerably increased, which is obliged to enter by the ash-hole, and to pass through the fire, to supply the place of the air driven from the dome. The form of this piece renders it proper to reflect or reverberate a part of the flame upon substances

which are in the furnace, which has occasioned this kind of furnace to be called a reverberatory one. See CHEMISTRY.

DOME, or DOOM, signifies judgment, sentence, or decree. The homagers' oath in the black-book of Hereford ends: 'So help me God at his holy dome, and by my trowthe.'

DOMENICHINO, a famous Italian painter, born at Bologna in 1581. He was at first a disciple of Calvart the Fleming, but soon quitted his school for that of the Caraccis. He always applied himself to his work with much study and thoughtfulness; and never offered to touch his pencil but when he fancied a kind of enthusiasm upon him. His great skill in architecture also procured him the appointment of chief architect of the apostolical palace from pope Gregory XV. nor was he without a theoretical knowledge of music. He died in 1611.

DOMESDAY BOOK, an ancient record, made in the time of William I. and containing a survey of all the lands of England. It consists of two volumes. The first is a large folio, written on 382 double pages of vellum, in a small but plain character; each page having a double column. Some of the capital letters and principal passages are touched with red ink; and some have strokes of red ink run across them, as if scratched out. This volume contains a description of thirty-one counties. The other volume is in 4to., written upon 450 double pages of vellum, but in a single column, and in a large but very fair character. It contains the counties of Essex, Norfolk, Suffolk, part of the county of Rutland included in that of Northampton, and part of Lancashire in the counties of York and Chester. This work, according to the red book in the exchequer, was begun by order of William the Conqueror, with the advice of his parliament, in the year of our Lord 1080, and completed in the year 1086. The reason given for taking this survey, as assigned by several ancient records and historians, was, that every man should be satisfied with his own right, and not usurp with impunity what belonged to another. But, besides this, it is said by others, that now all those who possessed landed estates became vassals to the king, and paid him so much money by way of homage in proportion to the lands they held. This appears very probable, as there was at that time extant, a general survey of the whole kingdom, made by order of king Alfred. For the execution of the survey recorded in domesday book, commissioners were sent into every county and shire; and juries summoned in each hundred, out of all orders of freemen, from barons down to the lowest boors. These commissioners were to be informed by the inhabitants, upon oath, of the name of each manor, and that of its owner; also by whom it was held in the time of Edward the Confessor; the number of hides; the quantity of wood, of pasture, and of meadow land; how many ploughs were in the demesne, and how many in the tenanted part of it; how many mills, how many fish-ponds or fisheries belonged to it; with the value of the whole together in the time of king Edward, as well as when granted by king William, and at the time of this survey; also whether it was capable of improvement, or

of being advanced in its value: they were likewise directed to return the tenants of every degree, the quantity of lands then and formerly held by each of them; what was the number of villains or slaves, and also the number and kinds of their cattle and live stock. These inquiries being first methodised in the country, were afterwards sent up to the king's exchequer. This survey, at the time it was made, gave great offence to the people; and occasioned a jealousy that it was intended for some new imposition. But notwithstanding all the precaution taken by the conqueror, to have this survey faithfully and impartially executed, it appears, from indisputable authority, that a false return was given in by some of the commissioners; and that, as it is said, out of a pious motive. This was particularly the case with the abbey of Croyland in Lincolnshire, the possessions of which were greatly under-rated, both with regard to quantity and value. Perhaps more of these pious frauds were discovered, as it is said Ralph Flambard, minister to William Rufus, proposed the making a fresh and more rigorous inquiry; but this was never executed. Notwithstanding this proof of its falsehood in some instances, which must throw a suspicion on others, the authority of domesday book was never permitted to be called in question; and always, when it has been necessary to distinguish whether lands were held in ancient demesne, or in any other manner, recourse was had to that only to determine the doubt. From this definitive authority, from which, as from the sentence pronounced at domesday, or the day of judgment, there could be no appeal, the name of the book is said to have been derived. But Stowe assigns another reason for this appellation; namely that domesday book is a corruption of domus Dei book; a title given it because heretofore deposited in the king's treasury, in a place of the church of Westminster, or Winchester, called domus Dei. From the great care formerly taken for the preservation of this survey, we may learn the estimation in which its importance was held. The dialogue de Scaccaris says, 'Liber ille (Domesday) sigilli regis comes est individuus in thesauro.' Until lately it has been kept under three different locks and keys; one in the custody of the treasurer, and the others in that of the two chamberlains of the exchequer. It is now deposited in the chapter-house at Westminster, where it may be consulted on paying to the proper officers a fee of 6s. 8d. for a search, and 4d. per line for a transcript. Besides the two volumes above mentioned, there is also a third made by order of the same king; and which differs from the others in form more than matter. There is also a fourth called domesday, which is kept in the exchequer; which, though a very large volume, is only an abridgment of the others. In the remembrancer's office in the exchequer is kept a fifth book, likewise called domesday, which is the same with the fourth book already mentioned. King Alfred had a roll which he called domesday; and the domesday-book made by William the Conqueror, referred to the time of Edward the Confessor, as that of king Alfred did to the time of Ethelred. The fourth book of domesday having many pictures and gilt letters

in the beginning relating to the time of king Edward the Confessor, this led some to a false opinion that domesday-book was composed in the reign of king Edward.

In 1767, in consequence of an address from the House of Lords, his late Majesty gave directions for the publication of domesday-book, among other records. An engraved fac-simile was at first contemplated; but the great expense of such an undertaking caused it to be laid aside: and a tolerably exact fac-simile metal type having at length been obtained, the editing of the work was confided to Mr. Abraham Farley, Deputy Keeper of the Records in the Chapter-house, at Westminster, a gentleman of singular learning and experience in this department of literature, who had had almost daily recourse to the book for more than forty years. The work was commenced in 1770, and was completed early in 1783, at the press of Mr. John Nichols—the type with which it was executed, was destroyed in the fire which consumed his printing-office in February, 1808. Accurately as Mr. Farley accomplished the task which had been assigned to him, the printed Domesday was comparatively of little value for want of minute indexes. This deficiency has been supplied under the direction of the Record Commission, in a folio volume, containing indexes of names of persons, of places, and things, so minute, (and from frequent reference, we can state, so accurate,) that the object of enquiry, if in the work, may be readily ascertained. These indexes have been compiled

by the clerks in the Record Office of the Chapter-house, under the superintendence of the late Right Hon. George Rose, the principal keeper of that repository of our national muniments: and to them is prefixed a very elaborate Introduction to Domesday, by Mr. Ellis, one of the librarians of the British Museum, containing dissertations on the formation and execution of the Record, the principal matters therein contained, its original uses, conservation, and authority in courts of law. From these disquisitions, which are comprised in eighty-eight well-filled folio pages, the preceding particulars have been chiefly abridged. In further illustration of this ancient and important record, the Commissioners have thought it their duty to print a supplemental volume of similar surveys, of nearly coeval date, for Exeter, Ely, and Winton or Winchester, which appear to have been the original inquiries whence the general survey was compiled, so far as relates to those districts: and, as the county palatine of Durham was not comprised within the Conqueror's survey, they have deemed it expedient to add the contents of a similar survey for that county, denominated the Boldon Book, though its date is somewhat later. This supplement to Domesday forms a large volume in folio, and is enriched with a critical and historical dissertation on the records there printed, together with appropriate indexes, by its editor, Mr. Ellis.

The following extract will give our readers an idea of the nature of this venerable Record:

IN BRIXISTAN HUND.

Rex ten^{com} BERMUNDESYE. herald⁹ tenuit. Tc se defid
p. xiii. hid. m^o p. xii. hid. Tra. c. viii. car. In dñio. c una
car. 7 xxv. viñti 7 xxxiii. bord cū. un. car.

Ibi nova 7 pulchra ecclia. 7 xx. ac p^ati. Silva v. porc
de pasnag: In Lundonia. xiii. burges de xliiii. der.

T. R. E. 7 m^o val. xv. lib 7 vicecom: hñ. xx. sol.

Comes morit ten. i. hidā que T. R. E. 7 post fuit in hoc m

That is:

IN BRIXISTAN HUNDREDO.

Rex tenet BERMUNDESYE. Heraldus comes tenuit. Tunc se defendebat pro xiii hidis, modo pro xii hidis. Terra est viii carrucatarum. In dominio est una carrucata et xxv villani et xxxiii bordarii cum una carrucata. Ibi nova et pulchra ecclesia, et xx acra prati. Silva v porcis de pasnagio. In Lundonia xiii burgenses de xliiii denarii. Tempore Regis Edwardi et modo valet xv libras et vicecomes habet xx solidos. Comes Moritonensis tenet i hidam quae Tempore Regis Edwardi et post fuit in hoc Manerio.

In English thus:

IN BRIXISTAN HUNDRED.

'The king holds BERMUNDESYE. Earl HERALD held it [before]. At that time it was rated at thirteen hides; now, at twelve. The arable land is eight carrucates [or plough-lands]. There is one carrucate in demesne; and twenty-five villans, and thirty-three bordars, with one carrucate. There is a new and handsome church, with twenty acres of meadow, and woodland for five hogs in pasnage [pasturage] time. In LONDON are thirteen burgesses at forty-four pence. In the time of king Edward it was valued, as it now is, at fifteen pounds; and the sheriff has twenty shillings. The Earl of Moriton holds one hide, which, in the time of King Edward, and afterwards, was in this manor.'

Independently of the immediate uses of this survey to the Conqueror, it is to this day a record of no small importance to the historian and to the antiquary, for the light it throws on the different classes of persons into which the English people were divided—the different denominations of lands, their culture and measurement—the different denominations of money, and the persons and places that enjoyed the liberty of coinage—territorial jurisdictions and franchises—tenures and services—criminal and civil jurisdictions—ecclesiastical and historical matters therein noticed, besides many curious illustrations of ancient manners, which we have not room to detail.

DOMESTIC, *n. s. & adj.* } *Fr. domestique* ;
DOMESTICAL, *adj.* } *Span. Portug.*
DOMESTICALLY, *adv.* } *and Ital. domes-*
DOMESTICATE, *v. a.* } *tico* ; *Lat. do-*
mesticus, from *domus*, a house. See **DOMINION**. Perhaps the adjective domestic, of or belonging to the house, is here the root; it means also private, and tame. To domesticate is to make as a domestic, to familiarize.

Domestical evils, for that we think we can master them at all times, are often permitted to run on forward, till it be too late to recall them,

Hooker. Dedication.

Equality of two domestic powers
 Breeds scrupulous faction.

Shakspeare. Antony and Cleopatra.

Next to the sin of those who began that rebellion, theirs must needs be, who hindered the speedy suppressing of it, by *domestick* dissensions.

King Charles.

If the first corruption be not sucked in from the domestic manners, a little providence might secure men in their first entrance into the world.

Clarendon.

A servant dwells remote from all knowledge of his lord's purposes : he lives as a kind of foreigner under the same roof ; a *domestick*, and yet a stranger too.

South.

Beholding thus, O happy as a queen !

We cry ; but shift the gaudy, flattering scene,

View her at home in her *domestick* light,

For thither she must come, at least at night.

Granville.

The practical knowledge of the *domestick* duties is the principal glory of a woman.

Clerissa.

The faithful prudent husband is an honest, tractable, and domestic animal.

Addiso. Spectator.

Probably a philosopher would rejoice in that liberty which Englishmen give their *domestics* ; and for my own part, I cannot avoid being pleased at the happiness of those poor creatures, who in some measure contribute to mine.

Goldsmith.

DOMIFYING, in astrology, the dividing or distributing the heavens into twelve houses, to erect a theme, by means of six great circles, called circles of position. Regiomontanus makes the circles of position pass through the intersections of the meridian and the horizon : others make them pass through the poles of the zodiac. See **ASTROLOGY**.

DOMINANT, among musicians, is used either as an adjective or substantive ; but these different acceptations are far from being indiscriminate.

In both senses it is explained by Rousseau as follows :—

DOMINANT, *adj.* The dominant or sensible chord, is that which is practised upon the dominant of the tone, and which introduces a perfect cadence. Every perfect major chord becomes a dominant chord, as soon as the seventh minor is added to it.

DOMINANT, *n. s.* Of the three notes essential to the tone, it is that which is a fifth from the tonic. The tonic and the dominant fix the tone ; in it they are each of them the fundamental sound of a particular chord : whereas the median, which constitutes the mode, has no chord peculiar to itself, and only makes a part of the chord of the tonic. Rameau gives the name of dominant in general to every note which carries a chord of the seventh, and distinguishes that which carries the sensible chord by the name of a tonic dominant ; but on account of the length of the word, this addition to the name has not been adopted by artists : they continue simply to call that note a dominant which is a fifth from the tonic ; and they do not call the other notes, which carry a chord of the seventh, dominants, but fundamentals ; which is sufficient to render their meaning plain, and prevents confusion.

A **DOMINANT**, in that species of church music which is called plain chant, is that note which is most frequently repeated or beaten, in whatever degree it may be from the tonic. In this species of music there are dominants and tonics, but no median.

DOMINANT, *n. s.* } *Fr. domain* ; *Span.*
DOMINATION, *n. s.* } *Portug. and Ital. domi-*
DOMINANT, *adj.* } *nio* ; *Lat. dominium*, from
DOMINATOR, *n. s.* } *domus* ; *Gr. δαμος*, a
DOMINION, *n. s.* } house, à *δῆμιω*, to build.

To prevail over : domination and dominion both signify supreme authority, power, as over a man's own house or territory : a dominator is he who thus rules.

Settunge him on his right half in heuenli thingis aboue ech principat and potestat and vertu and *dominacion*, and (above) ech name that is named, not onli in this world, but also in the world to comyng.

Wiclif. Effgies i.

By him were all things created, visible and invisible, whether they be thrones or dominions, or principalities or powers.

Col. i. 16.

Thou and thine usurp

The domination, royalties, and rights

Of this oppressed boy. *Shakspeare. King John.*

Jupiter and Mars are *dominators* for this north-west part of the world, which maketh the people impatient of servitude, lovers of liberty, martial, and courageous.

Camden's Remains.

Conquest and good husbandry both enlarge the king's dominions : the one by the sword, making the acres more in number, the other by the plough, making the same acres more in value.

Fuller.

The Law of Works is that empire and dominion which God exercised over man, using his utmost right, and obliging man to the rigorous observation of all that law he should impose upon him.

Bp. Taylor.

He gave us only over beast, fish, fowl,

Dominion absolute ; that right we hold

By his donation : but man over man

He made not lord.

Milton.

*Hear, all ye angels, progeny of light,
Thrones, dominations, principedoms, virtues, powers.*
Id.

What can our travellers bring home
That is not to be learnt at Rome?
What politics, or strange opinions,
That are not in our own dominions? *Hudibras.*

I thus conclude my theme,
The dominating humour makes the dream.

Dryden.

He could not have private dominion over that which
was under the private dominion of another. *Locke.*

Maximinus traded with the Goths in the product of
his own estate in Thracia, the place of his nativity;
whither he retired, to withdraw from the unjust
domination of Opilius Macrinus. *Arbutnot on Coins.*

Blest use of power, O virtuous pride in kings!
And like his bounty whence dominion springs.

Tickell.

Of all the enemies of idleness, want is the most
formidable. Fame is soon found to be a sound, and
love a dream. Avarice and ambition may be justly
suspected of being privy confederacies with idleness,
for when they have, for a while, protected their vota-
ries, they often deliver them up, to end their lives
under her dominion. *Johnson.*

To sit on rocks, to muse o'er flood and fell,
To slowly trace the forest's shady scenes,
Where things that own not man's dominion dwell,
And mortal foot hath ne'er, or rarely been.

Byron.

DOMINEER, *v. n.* Fr. *dominer*. See DOMI-
NATE. To rule with absolute authority: hence
to swell; bluster.

Go to the feast, revel, and domineer,
Carouse full measure.

Shakespeare. Taming of the Shrew.

The voice of conscience now is low and weak,
chastising the passions, as old Eli did his lustful domi-
neering sons. *South.*

Both would their little ends secure;
He sighs for freedom, she for power:
His wishes tend abroad to roam,
And hers to domineer at home. *Prior.*

DOMINGO (St.), HISPANIOLA, or HAYTI, one of the largest and most fertile of the West India islands, and the second in point of size, is situated between Porto Rico on the east, and Jamaica and Cuba on the west. It is approached on its northern side by the southern part of the Bahama chain, while southward the Caribbean sea runs between it and Terra Firma. The extreme length of St. Domingo is generally stated at about 400 miles; Rainsford, however, extends it to 490 miles, and its utmost breadth 150; but a considerable peninsula projects for nearly 140 miles towards the west, and, with a large promontory on the north, forms a spacious bay opposite the island of Cuba. Its medium length may therefore be computed at 300 miles, and its breadth at 100, which gives a superficial area of about 30,000 square miles, equal therefore to that of Ireland. Its most northerly point is in 19° 46'; and its most southerly in 17° 37' N. lat.; westward its extreme point (Cape Tiboron) is in 74° 15'; and eastward, Cape Engano, its extreme point in this direction, is 67° 35' W. long. Columbus, who discovered it in his first voyage to the New World,

found it known at Cuba as Hayti, signifying, it appears, a highland country; thus the natives also called it, and the name has been revived of late years by the independent black governments who have revolutionised the French portion of the island. This great navigator himself called it, according to Dr. Robertson, Espagnola, or Little Spain; or at first, as other writers say, Isabella, in honor of the queen of Spain. It is, however, best known to European geographers as St. Domingo, the name of the capital of the Spanish part of the island.

St. Domingo, as it existed before the revolution of 1789, is described by the abbé Raynal as abounding in 'delightful vales, where all the sweets of spring are enjoyed, without either winter or summer. There are but two seasons,' he continues, 'in the year, and they are both equally fine. The ground always laden with fruit, and covered with flowers, realises the delights and riches of poetical descriptions. Wherever we turn our eyes, we are enchanted with a variety of objects, colored and reflected by the clearest light. The air is temperate in the day-time, and the nights are constantly cool.' The Spaniards and French were the European masters of this island, until a very recent period; the line of demarcation, between their respective territories, commencing at the river Massacre on the north side, at the head of the bay of Mancenille, and extending to the river Pedernates south. All the country east of this line, being about three-fourths of the island, was claimed by Spain; and all to the westward by France. The French part of the island, of a very irregular figure, comprehended 2,500,000 acres, of which 1,500,000 were in high cultivation previous to 1789.

The coast of St. Domingo is abrupt and rocky, and the navigation of the neighbourhood dangerous: in his course from Cuba to Cape François, Columbus, it is well known, lost the vessel in which he originally sailed from Europe. None of its harbours will admit vessels of considerable burden. On the south side are the bays of St. Domingo, Neyba and Acon, or Acoa. The first has become, of late years, very shallow and full of reefs. The bay of Neyba receives vessels of thirty tons burden; but a river of this name flowing into it, divides itself, before entering the ocean, into various channels, which, changing in the rainy season, perplex the pilot. Acoa Bay has also several small rivers falling into it. The entrance is two leagues across, and it widens inwards to nearly six leagues. On the east side is the capacious port of Caldera, one of the best and safest of the island. On the north-east coast is the Bay of Samana, extending from its southern point, Cape Rafael, to the opposite side or peninsula of Samana, eighteen miles, and enclosed by a bulwark of rocks and sands, the entrance only being left clear, but having a safe and deep channel between the shore of Samana and some detached islands: it receives the rivers Yuna and Cambu after their junction. The former has a course of about 100 miles. This bay is about sixty miles deep, and is surrounded on every side by a fertile country. In Puerto Plata is Balsama Bay, which has only fourteen feet depth of water, and is of difficult navigation,

the entrance being very narrow: the neighbourhood is rich in valuable woods. Batia Ecosseise, or Scots' Bay, is in this direction, but is a dangerous, rocky inlet; and there are several other small harbours and bays on this side of the island. None of the rivers are practicable, even for boats, in the dry season. Eleven leagues east of Port-au-Prince is a salt lake, named Henriquelle, twenty-two leagues in circuit; its water is deep, clear, and bitter, and it abounds in alligators and tortoises of a large size; in it is an island, two leagues long, abounding with wild goats, and having a spring of fresh water.

The independent portion of St. Domingo (the former French part), is mountainous and well-wooded, containing mines of silver and iron. Much of the central part of the Spanish territories is also composed of elevated mountains, many of them capable of cultivation, and having a soil extremely rich. They also have yielded gold and silver. From the city of St. Domingo several wide plains, from twenty to twenty-five miles in breadth, stretch for about eighty miles to the east. They are called the *Los Llanos*, and are adapted to the growth of every tropical production. A beautiful valley to the north of these, through which the river *Cotu* flows, is said to be still more productive. The mountains are principally composed of two parallel chains, running from east to west, with several collateral branches. Excellent timber abounds throughout the mountains. In those of *Cibao* originate the principal streams of the island; and the influence of these lofty ranges, in mitigating the winds and cooling the atmosphere, is most important in this climate. Some of them rise to the height of 6000 feet above the level of the sea.

Such, according to Edwards, is the unrivalled fertility of the plains of this island, that they are alone capable of producing more sugar and other valuable commodities than all the British West Indies put together. Common attention to their decided advantages was alone wanting in the Spanish colonists to render this one of the most important possessions of that crown. But when, by the arts of cruelty and oppression, they had extirpated the aboriginal inhabitants, many of them became speculators in adventures to South America; while those who remained sunk into such wretched indolence, as to suffer this beautiful part of the country to become a luxuriant wilderness. The *Savannahs*, and fine plains in the interior, became, in consequence, entirely occupied by wild animals, such as swine, horses, and horned cattle; and herds of domestic animals ran wild in every direction. The export of those animals to the French settlements of the neighbourhood, formed an important branch of commerce to the Spaniards; and it was in exchange for them chiefly that they received the manufactures of Europe.

The climate is moist, hot, and unhealthy to Europeans; the thermometer in the plains rising as high as 99°; and in the higher parts to 72° and 77°. But these heats are moderated by the regular sea-breeze, which sets in about ten in the morning, and which is succeeded, towards the evening, by a land breeze. The heaviest rains of the wet season fall in May and June;

and so impregnated with moisture is the atmosphere at this season, that the brightest metallic polish becomes tarnished; the brooks now swell into torrents, and not seldom overwhelm the adjacent plantations. From time immemorial the inhabitants of the dryer parts of the island have reserved a portion of these copious streams by an artificial irrigation. The sea-coast is said to be more unfavorable to European constitutions than the interior. On the northern coast severe gales are felt, but the violent hurricanes of other parts of the West Indies seldom blow here; when they occur, it is chiefly on the southern coast, where they are denominated southern gales.

St. Domingo is chiefly valuable for its vegetable productions. The useful and elegant mahogany-tree here grows to a noble size and is of very superior grain. The largest of its plants is the cotton-tree, whose stem often furnishes the entire body of the Indian canoes: the pine is also abundant; and here is a species of oak, resembling the American, which yields planks of from sixty to seventy feet long. Brasil, satin, and various hard and ornamental woods are also found. Sugar, coffee, and cotton, of a fine quality, are produced in abundance. Indigo was once cultivated, but it has been long since abandoned. Vanilla grows spontaneously in the woods, and the plantain, also, is abundant. Flowers are numerous, and are distinguished both by their beauty and fragrance: all the tropical fruits are produced in high perfection.

The only indigenous quadruped remaining is the agouti cat, called by the natives *hectia*. But the stock of horned cattle, horses, mules, asses, sheep, and goats, is prodigious. Many of the cattle, as we have stated, run wild, and are the prey of any one who will pursue them: some farmers of the interior own 10,000 or 12,000, worth from six to eight dollars a head: the horse is here very sure-footed, and useful, but of small size and inferior paces. The whole number of horses, mules, and asses, both the latter being valuable breeds, is estimated at 150,000; the horned cattle at 300,000.

Birds are numerous, particularly wild fowl; but the Jamaica nightingale, or mocking-bird, and the banana, are the only songsters. The flesh of the wild pigeon is particularly savory, though somewhat bitter; the parrot is also eaten, and ortolans are numerous. The best fish of the rivers are the mullet, snook, calapever, pargo, grooper, baracooter, craw and rock-fish, and particularly the land-crab. Turtle abounds on the coast, and immense quantities of tarapins, together with a small species of amphibious tortoise, which is a very delicate and luxurious food.

The serpent tribes, though numerous, are not venomous, but the centipede is very annoying. A venomous crab-spider is also found here; the destructive white-ant, and abundant swarms of insects. This ant will eat through any kind of packing box, from side to side, and penetrate every fold of goods.

The aborigines of St. Domingo have been long since extirpated by the Spaniards. When it was discovered by Columbus, 9th of December, 1492, it formed five kingdoms, called *Maqua*,

Marien, Higuay, Maguana, and Xaraguay, each governed by its own cacique. The Spaniards had possession of the whole of it for 120 years. This island, their earliest settlement in the new world, was at first in high estimation for the quantity of gold it supplied. But its wealth diminished with the inhabitants of the country, whom they obliged to dig it out of the bowels of the earth; and the source of its wealth was entirely dried up, when they were extinct. Benzoni relates, that of 2,000,000 of inhabitants, contained in the island when discovered by Columbus in 1492, scarcely 153 were alive in 1545. Bishop Las Casas makes the extermination of the natives by his countrymen still greater and more rapid. He states the original number at 3,000,000, and says they were reduced to 60,000 within fifteen years. A vehement desire of opening again this source of wealth first inspired the thought of obtaining slaves from Africa; but, besides that these were found unfit for the labors they were destined to, the multitude of mines, then beginning to be wrought on the continent, made those of St. Domingo no longer of any importance. An idea now suggested itself, that the negroes, who were healthy, strong, and patient, might be usefully employed in husbandry. The produce of their industry was at first extremely small, because the laborers were few. Charles V. had granted an exclusive right of the slave trade to a Flemish nobleman, who made over his privilege to the Genoese. These avaricious republicans conducted this infamous commerce as all monopolies are conducted: they resolved to sell dear, and they sold but few. When time and competition had fixed the price of slaves, the number of them increased. It may easily be imagined that the Spaniards, who had been accustomed to treat the Indians as beasts, did not entertain a higher opinion of these unfortunate Africans, whom they substituted in their place. Degraded still farther in their eyes by the price they had paid for them, even religion could not restrain them from aggravating the weight of their servitude. They made frequent attempts, however, to recover the undeniable rights of mankind, and thus procured somewhat better treatment. The cultivation of the island was, at times, therefore, pursued with tolerable success. About the middle of the sixteenth century, Spain drew annually from this colony 10,000,000 weight of sugar, a large quantity of wood for dyeing; tobacco, cocoa, cassia, ginger, cotton, and peltry in abundance. One might imagine, that such favorable beginnings would have given both the desire and the means of carrying them further; but a train of events, more fatal each than the other, ruined these hopes. The first misfortune arose from the depopulation of the island. The Spanish conquests on the continent should naturally have contributed to promote the success of an island, which seemed to have been formed to be the centre of that vast dominion arising around it. But it fell out quite otherwise: on a view of the immense fortunes raising in Mexico, and other parts, the richest inhabitants of Hispaniola began to despise their settlements, and the government endeavoured in vain to put a stop to emigration:

the laws were always either artfully eluded, or openly violated. The weakness, which was a necessary consequence of such conduct, leaving the coasts without defence, encouraged the enemies of Spain to ravage them. See our article **BUCCANERS**. Even the capital of this island was taken and pillaged by Sir Francis Drake. Cruizers of less pretensions contented themselves with intercepting vessels in their passage through those latitudes, which were the best known at that time of any in the new world. To add to these misfortunes, the Spaniards themselves commenced pirates. They attacked no ships but those of their own nation; which were more rich, worse provided, and worse defended, than any others. The custom they had of fitting out ships clandestinely, to procure slaves, prevented them from being known; and the assistance they purchased from the ships of war, commissioned to protect the trade, insured to them impunity. The foreign trade of the colony was its only resource in this distress; and that was illicit: but as it continued to be carried on, notwithstanding the vigilance of the governors, or, perhaps, by their connivance, the policy of an exasperated and short-sighted court exerted itself in demolishing most of the sea-ports, and driving the miserable inhabitants into the inland country. This act of violence threw them into a state of dejection, which the incursions and settlement of the French on the island afterwards carried to the utmost pitch. The latter, after having made some unsuccessful attempts to settle on the island, had part of it yielded to them, in 1697, by the Spaniards. The court of Spain, totally taken up with that vast empire which they had formed on the continent, used no pains to dissipate this lethargy. They even refused to listen to the solicitations of their Flemish subjects, who earnestly pressed that they might have permission to clear the fertile parts of this island. Rather than run the risk of seeing them carry on a contraband trade on the coasts, they chose to bury in oblivion a settlement which had been of considerable consequence, and was likely again to become so. This colony, which had no longer any intercourse with the mother country but by a single ship, of no great burden, that arrived hence every third year, consisted, in 1717, of 18,410 inhabitants, including Spaniards, Mestees, Negroes, and Mulattoes. The complexion and character of this population differed according to the different proportions of American, European, and African blood they had received from that natural and transient union, which restores all races and conditions to the same level. Demi-savages, in fact, the greater part of them plunged into extreme sloth, lived upon fruits and roots, or dwelt in cottages without furniture, and most of them without clothes. The few among them, in whom indolence had not totally suppressed the sense of decency and taste for the conveniences of life, purchased clothes of their neighbours, the French, in return for their cattle, and the money sent to them for the maintenance of 200 soldiers, the priests, and the government. A century after its original settlement it was found necessary to remit annually from Mexico 300,000 dollars, for the sup-

port of the local government of this colony. Nor did the company formed at Barcelona, in 1757, with exclusive privileges for the re-establishment of St. Domingo, ever make any considerable progress. They only sent out two small vessels annually, which were freighted back with 5000 hides, and other commodities.

The Spanish government was, however, roused to some exertions in favor of St. Domingo at the close of the last century. Settlers were encouraged to come hither from the Canary Islands, the monopoly imposed on its trade was relaxed, and encouragements were held out to agriculture and commerce. Under the influence of these measures the colony began to improve, the towns and villages were rebuilt and peopled, new plantations were laid out, and the trade with the French part of the island became considerable. At the period of the French revolution, in 1789, the Spaniards had twenty-four sugar-works in St. Domingo. They paid with raw sugar, hides, timber, and piastres for the small number of cargoes they received from Europe. Besides 11,000 heads of cattle, they furnished the French part of St. Domingo with horses, mules, and some tobacco. Next to the ancient city of St. Domingo, their principal towns were Monte Christi, La Vega, St. Jago, Zeibo, St. Thomé, Azua, and Isabella.

This part of the island was ceded formally to France by the treaty of Basle, July 22nd, 1795: but it was not taken possession of by that power until 1801, when the unfortunate Toussaint L'Ouverture appeared before the capital at the head of a considerable French force. At this period it is said 25,000 of the inhabitants emigrated to Cuba, South America, or other of the Spanish settlements, so averse were they to the French yoke. At the close of 1808 attempts to expel the French were openly made: in November the French commander was shut up in the capital; but it was not until July of the following year that he surrendered, when a British armament, under General Carmichael, came to the aid of the Spaniards. Since this period they have declared their independence of the mother country, and offered their allegiance to the new republic of Colombia. At the period of its cession to France, the Spanish part of St. Domingo had 125,000 inhabitants, 110,000 of whom were free people, and 15,000 negro slaves. Land was at six French livres, or five shillings the arpent; and labor at two French livres, sixty-one cunes, or a little better than two shillings per day. Walton estimates the inhabitants of this part, in 1810, at 104,000. We have seen that there had been a considerable emigration, which he excludes from this amount.

We have noticed the visits, and, under that article, the settlement, of the BUCCANERS, in St. Domingo. That part of this singular community, which abandoned the sea for its fertile valleys, consisted principally of Frenchmen, and became acknowledged subjects by the government of France at the close of the seventeenth century. In 1669 the planters here amounted to upwards of 1500; Bertrand Dogeron, a man of considerable talents and probity, having been deputed to form them into a regular colony. In

1670, however, the oppressive measures of the French West India Company caused the inhabitants of this part of St. Domingo to revolt: and tranquillity was only restored at the price of a free trade to France, subject to a duty of five per cent. paid to the company on the arrival and departure of all vessels.

Under the excellent management of Dogeron the colony continued to prosper; but after his death, in 1673, it languished under the monopoly of exclusive trading companies. Three years before his death the town of Cape François had been founded by Gobin, a French Protestant, whom the persecutions of Louis XIV. had driven from his native land. In 1688, several slaves having been taken from the English, the inhabitants of St. Domingo began to turn their attention to the culture of the sugar-cane. With this view they increased their stock of negroes, and in 1694, taking advantage of the misfortunes which had befallen the English colony of Jamaica, they effected a landing in that island, and carried off a considerable number of slaves. The English, in their turn, attacked the settlement of Cape François in the following year, which they plundered and reduced to ashes. It was, however, soon rebuilt. At the peace of Ryswick, the French obtained the first regular cession of the western part of St. Domingo, and in 1702, Port-au-Prince was made the seat of the government, but the town of the cape continued in every other respect the capital of the colony. The French in St. Domingo flourished as the Spaniards decayed. Their colony, which in the time of Herrera counted 14,000 Castilians, besides a proportional number of other inhabitants, had, in 1717, only 18,410 individuals of every description; whilst, according to the abbé Raynal, the produce of the French colony, in 1720, amounted to 1,200,000 lbs. of indigo, 1,400,000 lbs. of white sugar, and 21,000,000 lbs. of raw sugar. From 1722, when the French colony of St. Domingo was freed from the yoke of exclusive trading companies, it rose gradually to the highest pitch of prosperity. In the year 1754, the value of the various commodities of the colony was £1,261,469 sterling, and the imports from the mother country £1,777,509 sterling. There were 14,000 white inhabitants, 4000 free mulattoes, and upwards of 172,000 negroes; 599 sugar plantations, 3379 of indigo, 98,946 cocoa trees, 6,300,367 cotton plants, and nearly 22,000,000 cassia trees; 63,000 horses and mules, 93,000 heads of horned cattle, 6,000,000 banana trees; upwards of 1,000,000 plots of potatoes, 226,000 plots of yams; and nearly 3,000,000 trenches of manioc.

In 1789 the prosperity of the French part of St. Domingo was at its greatest height. It was divided into the northern, western, and southern provinces. The first extended about forty leagues along the northern coast, from the river Massacre to cape St. Nicholas, and contained, inclusive of the island of Tortuga, twenty-six parishes. The principal towns were Cape François, Fort Dauphin, Port de Paix, and Cape St. Nicholas. The western province commenced at this cape, and terminated at Cape Tiburon. It contained fourteen parishes; its chief towns were Port-au-

Prince, St. Marc, Leogane, Petit Goave, and Jérémie. The southern province occupied the remaining coast from Cape Tiburon to l'Anse-à-Pitre, and contained ten parishes and two towns, Cayes and Jacmel. The cultivated land amounted to 2,290,000 English acres, or 771,275 carreaux of French measurement, 350 feet on every side to the carreau. But Barbé Marbois, in his *Compte rendu des finances de St. Domingue*, en 1789, reckons the cultivated land at 570,210 carreaux only. There were 792 sugar plantations, 2810 coffee plantations, 705 cotton plantations, 3097 indigo plantations, sixty-nine cacao plantations, and 173 distilleries of rum. The produce of these plantations, in 1783, consisted of 163,405,500lbs. of sugar, 68,151,000lbs. of coffee, 6,289,000 lbs. of cotton, 930,000lbs. of indigo, 150,000 lbs. of cacao, 34,453,000lbs. of syrup, worth in all, with some less important articles, 135,763,000 French livres. It was sent to France in 686 vessels of 199,122 tons. The goods imported into the colony from different ports of France, in 465 vessels of 138,624 tons, amounted to the value of 54,578,000 French livres. Before the revolution, the exportation from the whole island employed 1070 vessels, navigated by 7936 seamen.

The population consisted in 1788, according to Marbois, of 27,717 white inhabitants, of whom there were 14,571 males, 4482 females, and 8664 children; of 405,564 negro slaves, of whom there were 174,971 males, 138,800 females, and 91,793 children; and of 21,808 free people of color.

Soon after 1789 a most dreadful reverse took place. At this period, says Mr. Bryan Edwards, in his *Historical Survey of the French Colony in St. Domingo*, London, 4to. 1797, 'the mulattoes were in a situation more degrading and wretched, than that of the enslaved negroes in any part of the West Indies. No law allowed the privileges of a white person to any descendant of an African, however remote.'—'The laws, he adds, were dreadfully unequal.' In such a situation it is not to be wondered at, that they should have listened with pleasure to the news of the French revolution, and to the acts of the assembly, which abolished slavery, and established equality of rights. A colonial assembly met at St. Mark, on the 16th of April, 1790, composed of 213 members, which, says Mr. Edwards, 'fairly and fully represented the inhabitants.' 'They passed acts of indulgence, and rectified gross abuses. But persons interested in the continuance of these abuses were displeased. They counteracted the proceedings of the assembly, and misrepresented their intentions. M. Peynier, the governor, attempted to restore the old despotic system: whereupon eighty-five members of the assembly embarked for France;' as did also M. Peynier, who resigned in November 1790. 'The pride of power,' adds this writer, 'the rage of reformation, the contentions of party, and the conflict of opposing interests, now produced a tempest, that swept every thing before it.' In October, 1790, James Oge, a free mulatto, who had been at Paris, and who is characterised by Mr. Edwards, as 'an enthusiast for liberty, but mild and humane,' returned from France, and put himself at the

head of the insurgent negroes and people of color; but being defeated, in March 1791, was betrayed by the Spaniards, to whom he had fled for refuge, and, with Mark Chavane his lieutenant, broke alive on the wheel. The eighty-five members of the colonial assembly were arrested in France, and their act of the 12th of October 1790, annulled. In March, 1791, 8000 troops arrived from France; and Mauduit the new governor was murdered by his own soldiers, with circumstances of horrible barbarity. By a decree of the National Assembly, of the 15th of May 1791, people of color were declared eligible to seats in the colonial assembly. And on the 11th of September, a concordat, or truce, was signed between the whites and mulattoes. 'But the operation of this truce,' says Edwards, 'was destroyed by the absurd decree of the national assembly of the 24th of September, repealing the decree of the 15th of May, whereby in the very moment when the justice and necessity of this decree were acknowledged, and its faithful observance promised by the colonial assembly, its repeal was pronounced by the legislative assembly in the mother country. To such repugnancy and absurdity must every government be driven, that attempts to regulate and direct the local concerns of a country 3000 miles distant. Open war in all its horrors was now renewed. All the workings of humanity were absorbed, in the raging and insatiable thirst of revenge, which inflamed each class alike. It was no longer a contest for mere victory, but a diabolical emulation which party could inflict the most abominable cruelties on the other.' On the 23d of August, 1791, Cape François was burnt, and in the space of two months it was computed, that upwards of 2000 white persons perished by these horrible massacres; and that of the mulattoes and negroes not fewer than 10,000 died by famine and the sword, besides several hundreds that suffered by the executioner. Meantime citizens Santhonax, Polverel, and Ailhaud, arrived from France as commissioners, accompanied by 6000 of the national guards; and citizen Galbaud was appointed governor. Their attempts, however, to stop these enormities proved fruitless, though they proclaimed the total abolition of slavery, and a general indemnity.

In October, 1793, a body of British forces under colonel Whitlock, were landed, and took possession of Tiburon, Treves, Jérémie, Leogane, Cape Nicolas Mole, and upwards of ninety miles of the eastern coast with little opposition. But though the loss of the British in these engagements, or rather skirmishes, did not exceed 100 men, yet the victims of disease, within six months after their arrival, were upwards of 6000, among whom were 150 officers. Leogane was soon after retaken by the negroes, who now amounted to above 100,000, under their general Toussaint l'Ouverture; and Tiburon was taken by the French under general Rigaud. To remedy these disasters, and to supply the Mole with provisions, an expedition was undertaken against the fort of Bombarde, but the reduction of it (which was not accomplished till the 18th of June 1796) cost an immense number of men, and after it was taken, instead of being able to supply

the Mole, it was found necessary to supply it from thence, at a vast expense, and with the loss of many brave troops. These and similar losses, with the deaths of lieutenant colonels Brisbane and Markham, who were killed in 1795, together with the faithlessness of the French emigrants, upon whose suggestions this expedition had been undertaken, at last determined the British commander to surrender Jeremie, Port au Prince, and Cape Nicolas Mole, the only places remaining in the hands of the British, to general Hedonville, by capitulation in August 1798; and on the 1st of October the island was totally evacuated by the British. The name of Port au Prince was at this time changed to Port Republicain; and the Spanish part of the island, having been ceded to the French by treaty was taken possession of, as we have already intimated, by l'Ouverture. We must refer our readers to the life of this chieftain in another part of our work, for the detailed proofs of his very superior talents and character. He applied himself at this period to heal the wounds of this his native country with the greatest success; and such was his popularity, that though the commissioners, who had been sent out by the French directory, remained in the island, and were treated with every external mark of respect, they were, in fact, mere cyphers, destitute of influence, and dependent on Toussaint for support.

Agriculture and commerce were the first objects of his care. Many of the planters were restored to their former estates, but no property in human beings was allowed. The blacks, however, were not permitted to waste their lives in idleness. The planters were obliged to employ their laborers as hired servants, and a third part of the crops was assigned for their remuneration. While ample encouragement was afforded to industry, penalties were at the same time denounced for the punishment of idleness. The beneficial effects of such an administration were soon visible. The wasted colony began to revive; the plantations were again brought into a fertile state; the sugar-works and distilleries were rebuilt; the ports were opened to foreign vessels; and, notwithstanding the ravages of a ten years' war, the exports of St. Domingo were raised from the lowest ebb to one-third of their former amount and value in the most prosperous periods. Population also increased with astonishing rapidity; and while the planters of the neighbouring West-India Islands were continually urging the necessity of annual importations from Africa, to supply the constant diminution among the negroes, in St. Domingo their numbers were considerably augmented, notwithstanding the waste of blood during the troubles and sanguinary conflicts of the ten preceding years. The churches were re-opened, public worship was restored; the elegant arts and amusements of civilised life began to resume their sway; and the combined result of all these causes was a visible and striking improvement in every class of society. In the intercourse of the social hour, all were on a perfect equality; thus presenting a striking contrast to the very strict subordination which prevailed in the army.

The military establishment, when the British forces evacuated the island in 1798, did not exceed 40,000; but in two years it was more than double that number. The soldiers regarded Toussaint as an extraordinary being: his generals trembled before him (Dessalines durst not look him in the face); and every one trembled before his generals. No European army, indeed, was ever subject to a more rigorous discipline, than that which was observed by the troops of Toussaint. Every officer commanded, pistol in hand; and had the power of life and death over the subalterns. 60,000 men were frequently reviewed and exercised together on the plain of the Cape. On these occasions 2000 officers were seen in the field, carrying arms, from the general to the ensign, yet with the utmost attention to rank; without the smallest symptom of the insubordination indulged in the leisure of the hotel. Each general officer had a demi-brigade, which went through the manual exercise with a degree of expertness seldom witnessed; and performed equally well several manœuvres applicable to their method of fighting. At a whistle a whole brigade would run 300 or 400 yards, then, separating, throw themselves flat on the ground, changing to their backs or sides, keeping up a strong fire the whole of the time, till they were recalled: then they would form again, in an instant, into their wonted regularity. This single manœuvre used to be executed with such facility and precision, as totally to prevent cavalry from charging them in bushy and hilly countries. Such complete subordination, such promptitude and dexterity, prevailed the whole time, as would have astonished any European soldier who had the least knowledge of their previous situation. (*History of St. Domingo, 1818.*)

'In these reviews,' says M. de la Croix, 'Toussaint appeared like an inspired person, and became the fetiché or idol of the blacks who listened to him. In order to make himself better understood, he frequently addressed them in parables, and often made use of the following:—In a glass vessel full of grains of black maize, he would mix a few grains of white maize, and say to those who surrounded him:—"You are the black maize; the whites, who are desirous of enslaving you, are the white maize." He would then shake the vessel, and presenting it to their fascinated eyes, exclaim, "See the white here and there!" in other words, see how few the white are in comparison of yourselves.' The gleam of prosperity, however, which resulted from his wise administration, was of short continuance.

The independence of St. Domingo was proclaimed on the 1st of July, 1801; and, while the inhabitants were indulging the hope of future happiness, a storm was gathering, which burst upon them with accumulated fury. Scarcely was the peace of Amiens concluded, when a formidable armament of twenty-six ships of war was equipped by order of the first consul, with the determination of reducing the revolted colony of St. Domingo. On board this fleet were embarked 25,000 chosen troops, amply furnished with all the apparatus of military slaughter. The better to ensure success to the expedition (the

chief command of which was confided to general Le Clerc, the brother-in-law of Buonaparte), recourse was first had to perfidious means. Attempts were made to sow disunion among the free people of St. Domingo. Proclamations and letters, expressed in all the delusive jargon of the republic, were widely circulated. The chiefs of both colors, then in France, and the two sons of Toussaint himself, who had sent them thither for instruction, were pressed into the service of this expedition.

The French forces arrived in January, 1802; yet so little did Toussaint expect to have any enemy to combat, that he had given no orders for resistance in case of attack. When the French squadron was descried, he was making a tour round the eastern part of the island: and, if some of the generals resisted, it was only in consequence of the menaces and hostile manner in which they were summoned to surrender.

After his troops had disembarked, and previously to commencing operations in the interior of the country, and perhaps in the hope that the sight of so formidable a force would inspire the Haytiens with terror, Le Clerc thought proper to try what effect these circumstances, the sight of his two sons, and a specious letter from Buonaparte, would produce upon Toussaint. Coisson, their tutor, who had accompanied them from France, and was one of the chief confidential agents in this expedition, was accordingly deputed on this errand, with instructions to press Toussaint's instant return to the Cape, and to bring back the children in case he should not succeed. When he reached Eunery, Toussaint's country residence, that chief was absent in a distant part of the island, whence he did not return till the second day. The wily Frenchman availed himself of this delay to work upon the feelings of their mother; whose tears, and the solicitations of the children, for a while shook the resolutions of Toussaint. Being at length confirmed in his suspicions of the snare that had been laid for him, by the conduct and language of Coisson, Toussaint suddenly composed his agitated countenance; and, gently disengaging himself from the embraces of his wife and children, he took their preceptor into another apartment, and gave him this dignified decision:—'Take back my children; since it must be so, I will be faithful to my brethren and my God.' Unwilling to prolong the painful scene, Toussaint mounted his horse, and rode to the camp. A correspondence was subsequently opened with him by Le Clerc, but it failed to produce Toussaint's submission.

Le Clerc now proceeded to hostilities, the minute circumstances of which we have not room to detail. It must therefore suffice to state, that the numbers and discipline of the French troops, added to the military skill of their commanding officers, overpowered all open resistance in the field, so that the blacks, after several obstinate conflicts, and after the burning of several of their principal towns, were finally compelled to retire into the inaccessible fastnesses of the interior, whence they carried on, under their brave chieftain, Toussaint, a desultory, but destructive, warfare against detached parties of their enemies.

This mode of fighting was dictated by the nature of their country. They would frequently place whole lines in ambush, sometimes reaching from one part to another, and sometimes extending to a considerable distance from each wing of a camp. By their admirable discipline, and astonishing celerity, their enemies were often disconcerted, and thrown into disorder; and sometimes, when the French thought themselves sure of a victory, detachments in ambush suddenly made their appearance, and mortified them with a defeat. At length, however, the negroes and cultivators were either subdued by the terror of the French army, or cajoled by the deceitful promises of the French general, who had published in his own name, and in that of the first consul, repeated solemn declarations, that the freedom of all the inhabitants of St. Domingo, of all colors, should be preserved inviolate. But elated by his successes, he now threw aside the mask, and issued an order, expressly restoring to the proprietors or their attorneys, all their ancient authority over the negroes upon their estates. This order opened the eyes of the negro population. Toussaint, descending from his fastnesses with several hundred men, effected a junction with Christophe, who was at the head of three hundred, and marched rapidly to the north of the island. Wherever he came, he summoned the cultivators to arms, multitudes of whom flocked to his standard. His force speedily became formidable: they drove in the enemy's posts in all directions, and surrounded the town of Cape François, within whose walls they had taken refuge. To save that place from being stormed by the infuriated black troops, Le Clerc was obliged to abandon all his conquests in other parts of the island, and hasten by forced marches to its relief. Sensible of his precipitancy in throwing off the mask, he again had recourse to his former acts; and having issued a proclamation couched in the most specious terms, the black chieftains, who were weary of the war, and whose troops began to quit the ranks, agreed to lay down their arms, on condition of a general amnesty, and the preservation of their own rank, and that of their officers.

Scarcely had the French thus succeeded in extending their dominion over the whole island, when they began to put in execution their frightful system of slavery and destruction; and, as a preliminary step towards this object, Le Clerc caused Toussaint to be privately seized, in the dead of the night, together with his family, and embark for France, on board a fast-sailing frigate, about the middle of May, 1802. He was kept a close prisoner on the voyage, and heard of no more by his countrymen. See L'OUVREURE.

To justify this base act of treachery, Le Clerc accused Toussaint of having intended to excite an insurrection among the working negroes, and to raise them in a mass. The only proof alleged by the French general was two intercepted letters, said to have been written by him to his aide-camp Fontaine. M. de la Croix (who was an officer in the army of Le Clerc) has printed one of these letters as genuine: the manifesto addressed to the sovereigns of Europe by Christophe, on his accession to the throne of Hayti, affirms it

to be a forgery; and such is the opinion of M. de Castine, who observes further, that the pretended letters not only do not prove that Toussaint was preparing to take up arms again, but that every thing concurs to prove that they were forged, otherwise the French would have tried him before a special commission, instead of transporting him 2000 miles from his country, in defiance of the law of nations and of humanity.

The base treachery of Le Clerc aroused the black chieftains, and opened the eyes of their countrymen to the designs of the French. Dessalines, Christophe, and Clerveaux, again raised their standards, and were soon found at the head of considerable bodies of troops, ready to renew the struggle for liberty, and determined to succeed or perish in the attempt. During the latter half of the year, 1802, actions were fought with various success. And though the French were continually receiving fresh supplies of men, yet these did not suffice to supply the place of those who perished by the sword and by sickness. Their hospitals were crowded with sick, and disease daily made new ravages. At length Rochambeau, who had succeeded to the chief command on the death of Le Clerc, was compelled by Dessalines to evacuate Cape François, where the remains of the French army were surrounded; and, as the war had then recommenced between Great Britain and France, the French gladly surrendered themselves prisoners of war to a British squadron, and were conveyed to this country. We shall not harrow up the feelings of our readers by a recital of the refined cruelty and savage barbarity practised by the French during this residence of twenty-one months on the island of St. Domingo. According to the returns which have been subsequently made to the Haytian Government, more than 16,000 negroes and people of color perished under the various tortures inflicted by them. The barbarities committed by these modern conquerors upon the children of Hayti far exceeded indeed the crimes of the Pizarros, Cortez, and the Bovalillas, those early scourges of the New World.

The French being expelled, at a general meeting of the National Assembly, on the 1st of January, 1804, the independence of the island was again proclaimed; the aboriginal name of Hayti was resumed, and the Haytians pronounced the oath to die free and independent, and never again to submit to any foreign domination whatever. Dessalines was elected governor-general for life, which title, a few months afterwards, he exchanged for that of emperor, being crowned by the style of Jacques I. But his reign was of short duration; the cruelties he perpetrated caused a conspiracy to be formed against him; and, two years after his coronation, he was surrounded by the conspirators at his head-quarters, and, struggling to escape, received a wound, which terminated his life. His death produced a division of St. Domingo, and another civil war.

In the north, Christophe assumed the reins of government, with the modest designation of chief of the government of Hayti; while Pétion, a mulatto, asserted his claim to sovereign

power. For several years these rival chieftains carried on a sanguinary contest, with various success on both sides, until the year 1810, when hostilities were suspended; and, though no formal treaty was concluded, the country long enjoyed the blessings of peace. Christophe was crowned king of Hayti in March 1811, by the title of Henry I.; and Pétion, as president of the republic of Hayti, governed the southern part until 1818, when he died, and was succeeded by general Boyer, whom he was allowed to nominate his successor.

Both governments encouraged agriculture as the basis of their national prosperity, and displayed a laudable solicitude for the instruction of the rising generation. Christophe examined the rival claims of the two systems of mutual instruction practised in England, and gave the preference to that of the British and Foreign School Society. Schools, under the care of English teachers, were established in his dominions at Cape Henry, Sans Souci, Port de Paix, Gonaives, and St. Marc. In the primary schools, the instructions are principally given in English.

In the republican part of the island, a school was established at Port-au-Prince, on the British and Foreign Society's plan, by an English teacher, to whose conduct and ability the president, general Boyer, has borne the most honorable testimony. This school is under the superintendence of a native teacher. A lyceum has likewise been instituted for teaching the higher branches of literature and science.

Christophe, in imitation of other monarchs, created various orders of nobility, together with numerous officers of state, each of whom had a fixed order of precedence, according to the supposed dignity of their office. His dynasty, however, was like his predecessor's, but short-lived. In 1820 a successful conspiracy was formed against him, and finding himself surrounded by an overwhelming force, he committed suicide. See CHRISTOPHE. The president of the republic, Boyer, now advanced upon the kingdom, and succeeded, with but little opposition, in adding it to the republic of Hayti.

The population of the two Haytian governments, in 1820, was computed to be about 501,000, viz. :—

Blacks	.	.	.	480,000
Persons of color	.	.	.	20,000
Whites	.	.	.	1,000
				— — —
				501,000

Of this number, 261,000 were in the republican part, and 240,000 in the kingdom of Christophe. The introduction of vaccination has greatly facilitated the increase of population.

The revenues of the two governments are supposed to be about 48,000,000 francs; and the expenses of their administration, in 1817, scarcely exceeded 18,000,000 francs, thus leaving a surplus of 15,000,000 at the disposal of each.

The Catholic religion is declared to be that of both divisions of the island; the hierarchy of the northern part consists of an archbishop, three bishops, and a rector in each parish. At Sans Souci there is a royal and parochial church.

It was erected by Henry, and was mentioned in the royal almanack as 'a monument of his royal munificence and piety.' The archbishop, whom the pope has hitherto refused to consecrate, has a chapter, a seminary, and a college attached to the metropolitan see, all well endowed. He has also three archi-episcopal palaces assigned to him; and the bishops have each a chapter and a seminary, endowed with considerable revenues.

The armies of the two governments, in 1820, were composed of about 24,000 regular troops each; but not more than 5000 or 6000 were on duty at one time. They were relieved alternately every three months; and received pay while on actual service. During the remaining nine months of the year, they were quartered upon the great provision-grounds of the two governments. Since the revolution, commerce is said to have greatly declined. From 1804 to 1808, according to Waiton, only about seventy-five vessels arrived annually, with cargoes amounting to about £150,000 sterling.

The Haytiens express themselves with great energy and propriety, on moral and political subjects. Some of the state-papers of the late king might vie with those of far more advanced communities. 'Five-and-twenty years ago,' says the black baron de Vastey, in his *Political Reflections*, printed at the press of Sans Souci, 'we were plunged in the most complete ignorance; we had no notion of human society, no idea of happiness, no powerful feeling; our faculties, both physical and moral, were so overwhelmed under the load of slavery, that I myself, who am writing this, I thought that the world finished at the spot which bounded my sight; my ideas were so limited, that things the most simple were to me incomprehensible, and all my countrymen were as ignorant, and even more so than myself, if that were possible. I have known many of us,' he continues, 'who have learned to read and write of themselves without the help of a master; I have known them walking with their books in their hands, enquiring of the passengers, and praying them to explain to them the signification of such a character or such a word, and in this manner many, already advanced in years, became able to read and write without the benefit of education. Such men,' he adds, 'have become notaries, attorneys, advocates, judges, administrators, and have astonished the world by the sagacity of their judgment; others have become painters and sculptors from their own exertions, and have astonished strangers by their works; others again have succeeded as architects, mechanics, weavers; in short, others have worked mines of sulphur, fabricated saltpetre, and made excellent gunpowder, in mills and establishments similar to those of Europe, with no other guides than books of chemistry and mineralogy. And yet,' he continues, 'the Haytiens pretend not to be a manufacturing and commercial people'—'like the Romans, we go from arms to the plough, and from the plough to arms.' But he contemplates the time when they shall call to their assistance the mechanical arts, the employment of machines, of animals, and of the natural agents, air, fire, and water, and put in practice those

means, 'which,' says he, 'will render our country the most beautiful, populous, and flourishing, and its inhabitants, heretofore so unfortunate, the happiest people in the world.'

In July 1816, after Louis XVIII. was restored to the throne, commissioners were sent from France to St. Domingo, entrusted with the administration of all the affairs of the island, both civil and military, but all their overtures were firmly rejected in both parts of the island. His majesty Charles X. has been more successful in asserting the claims of France to this island. He has procured that kind of recognition of the interest of the former planters, which has resulted in a treaty of indemnity in regard to them, whereby the French government stipulates to acknowledge the independence of Hayti, which is on the other hand to pay a sum of money to France, and give certain advantages to the French commerce above that of other nations.

We conclude with the excellent reflections of a modern periodical publication. 'The establishment of a black empire in the midst of the British West Indies,' observes this writer, 'excited the most fearful apprehensions in the minds of the planters. Subsequent events have shown that, however well founded those apprehensions might seem, they have little to fear, so long as their slaves are treated with kindness and humanity. The abolition of the nefarious traffic in slaves, and other wise measures of the British legislature, have already contributed to ameliorate the condition of the slaves; and we may reasonably expect that, in proportion as these measures have their full effect, the condition of the negroes in our West-India colonies will be progressively improved. In their present state entire freedom would be no boon to them. Nothing indeed can prepare their minds for its reception and enjoyment but the introduction of Christianity, and the diffusion of moral and religious education. We have no data by which we can compute the actual number of Christian slaves in the West Indies; but we know generally that, in almost all the larger islands, there are active and zealous missionaries, who devote themselves to the pious and benevolent task of imparting religious instruction to those neglected outcasts. In Antigua, especially, this greatest of blessings has been imparted to many thousands of slaves, who bear the yoke of bondage with patience, cheered by the hope which the Gospel reveals, as the end and compensation of all their sufferings. In many other islands, the prejudice of planters against the tuition of their slaves is silently wearing away; while the number of those, who, from various causes, are favorable to their instruction, is gradually increasing; and a conviction is gaining ground, most advantageous to the interests of all parties, of the inefficacy of human restraints and punishments to produce that uniform obedience, which is seen in well instructed and religious slaves. These are truly encouraging signs of the times; and when we add to them the increasing liberality of British Christians in this country, we may reasonably indulge the hope that the period is not far distant, when the entire black population in the West Indies shall hail with devout gratitude the day, that trans-

ported them from their native deserts, to make them free men in the noble sense suggested by the New Testament.

DOMINICA, the last of the Leeward or Caribbee islands, taking them from north-west to south-east; so named by Christopher Columbus, from his having discovered it on Sunday, Nov. 3d, 1493. It is situated about half way betwixt Guadaloupe on the north-west, and Martinico on the south-east, fifteen leagues from each, between $15^{\circ} 20'$ and $15^{\circ} 44' 30''$ N. lat., and between $61^{\circ} 17'$ and $61^{\circ} 30'$ W. long. It is twenty-nine miles long from Crab-Point on the south, to the north-west cape of Agusha Bay on the north; and nearly sixteen broad from Raymond Bay east, to Coulihaut on the west. It contains 186,436 acres of land, and is divided into ten parishes, viz. St. John, St. Andrew, St. Peter, St. Joseph, St. Paul, St. David, St. George, St. Patrick, St. Luke, and St. Martin. It has many high and rugged mountains, interspersed with fertile valleys, and is watered by upwards of thirty rivers, besides a number of rivulets. Several of the mountains contain unextinguished volcanoes, which often discharge vast quantities of sulphur. Here are also several hot springs, esteemed efficacious in removing tropical disorders. Some of the waters are said to be hot enough to coagulate an egg. Vast swarms of bees produce a great quantity of wax and honey: they hive in the trees, and are thought to have been transported from Europe; the native bee of the West Indies being a smaller species, unprovided with a sting, and very different in its manners from the European. The forests afford an inexhaustible quantity of rose wood. The fruits and other productions are similar to those in the neighbouring islands; but the soil, being generally thin, is more adapted to the rearing of cotton than sugar. The best eye-stones that are known, are found on the shores of this island. They are shaped like a lentil, smooth and sleek, but much smaller, and of a gray color. The anchorage is good all round the coast of Dominica; but it has no port or bay for retiring into; but the vessels have the advantage of shelter behind many of its capes. Charlotte town (Roseau of the French), the chief place, is on a point of land between two bays on the south-west side of the island. It has 500 houses. Portsmouth, or Prince Rupert's Bay, on the north-west side of the island, is the only other town.

The imports from the island to England, and the exports from the latter were,

	Imports.	Exports.
In 1809 . .	£315,584	£161,291
1810 . .	282,002	39,686.

The principal imports were,

	Coffee. cwt's.	Sugar. cwt's.	Rum. galls.	Cotton. lbs.
In 1809	3,254	41,990	56,356	75,425.
1810	27,185	61,522	39,397	59,742.

This island was reduced in 1778 by the French, under the marquis de Bouille, governor of Martinico; who made a descent with 2000 men, and found only 100 regulars, and a few companies of militia, to oppose him. Resistance therefore

being vain, the only thing the garrison could do, was to procure as favorable terms as possible. These were granted with such readiness as did great honor to the character of this officer; the inhabitants experiencing no kind of change except that of transferring their obedience from Britain to France. A large quantity of military stores, with 164 pieces of cannon, and twenty-four brass mortars, were found in the place; so that the French themselves expressed their surprise at finding so few hands to make use of them. It was restored to Britain at the conclusion of the peace in 1783; and, in 1795, the French attempted to take it again, but were unsuccessful; all the Frenchmen who landed being either killed or taken prisoners. The position of Dominica renders it of great consequence to England in war with France; for a squadron, stationed at Prince Rupert's Bay, may effectually cut off the communication between Martinique and Guadaloupe.

DOMINICA, or **HEEVAROA**, is the largest of the Marquesas islands, called by the natives Hiwaia and Ohiwana, extending east and west eighteen miles. It is about forty-eight miles in circumference; full of rugged hills, and of a barren surface, but is, however, inhabited. Long. $139^{\circ} 3' W.$, lat. $9^{\circ} 44' N.$

DOMINICAL, *adj.* *lat. dominicalis.* Relating to the Lord's day, or Sunday.

The cycle of the moon serves to shew the epochs, and that of the sun the *dominical* letter, throughout all their variations. *Holder on Time.*

DOMINICAL LETTER, or SUNDAY LETTER, See **CHRONOLOGY**. The dominical letters were introduced into the kalendar by the primitive Christians, instead of the nundinal letters in the Roman kalendar.

DOMINICANS, an order of religious, so named from their founder Dominic de Guzman, who preached with great zeal against the Albigenses in Languedoc, where he laid the first foundation of this order. See **GUZMAN**. It was approved of in 1215, by Innocent III., and confirmed in 1216, by a bull of Honorius III., under the title of St. Augustin; to which Dominic added several austere precepts and observances, obliging the brethren to take a vow of absolute poverty; to abandon entirely all their revenues and possessions; and to take the title of Preaching Friars, because the public instruction was the main end of their institution. The first convent was founded at Thoulouse by the bishop thereof and Simon de Montfort. Two years afterwards they had another at Paris, near the bishop's house; and some time after a third in the rue St. Jacques, whence the denomination of Jacobins. Just before his death, Dominic sent Gilbert de Fresney, with twelve of the brethren, into England, where they founded their first monastery at Oxford, in 1221, and soon after another at London. In 1276 the mayor and aldermen of the city of London gave them two whole streets by the river Thames, where they erected a very commodious convent, whence that place is still called Black Friars, from the name by which the Dominicans were called in England. Dominic, at first, only took

the habit of the regular canons ; that is, a black cassock and rochet ; but this he quitted in 1219, for that which they now wear, which it is pretended was shown by the blessed Virgin herself to the beatified Renaud of Orleans. This order has been spread throughout the whole known world. Before the revolutionary wars, it had forty-five provinces under the general, who resided at Rome ; and twelve particular congregations, governed by vicars general. There have been three popes of this order, above sixty cardinals, several patriarchs, 150 archbishops, and about 800 bishops ; besides masters of the sacred palace, whose office has been constantly discharged by a religious of this order, ever since St. Dominic, who held it under Honorius III. in 1218. Of all the monastic orders, none enjoyed a higher degree of power and authority than the Dominicans. Their credit was great, and their influence universal. But the measures they used to maintain and extend their authority were so perfidious and cruel, that their influence began to decline towards the beginning of the sixteenth century. The tragic story of Jetzer, conducted at Bern in 1509, for determining an uninteresting dispute between them and the Franciscans, relating to the immaculate conception, reflects indelible infamy on this order. See an account of it in Mosheim's *Eccles. Hist.* vol. iii. p. 294, 8vo. They were indeed perpetually employed in stigmatising with the opprobrious name of heresy numbers of learned and pious men ; in encroaching upon the rights and properties of others, to augment their possessions ; and in laying the most iniquitous snares and stratagems for the destruction of their adversaries. They were the principal counsellors, by whose instigation and advice Leo X. was determined to the public condemnation of Luther. The papal see never had more active and useful abettors than this order, and that of the Jesuits. The dogmata of the Dominicans are opposite to those of the Franciscans. There are nuns of this order, called in some places Preaching Sisters. These are even more ancient than the friars ; St. Dominic having founded a society of religious maids at Proilles in 1206. There is also a third order of Dominicans, both for men and women.

DOMINIS (Mark Anthony de), archbishop of Spalatro in Dalmatia at the close of the fifteenth and beginning of the sixteenth centuries. Becoming acquainted with bishop Bedell, while chaplain to Sir Henry Wotton, ambassador from James I. at Venice, he became resolved to abandon the Roman Catholic religion, concerning the authority of which he had long had his doubts. He had written *De Republicâ Ecclesiasticâ*, but had hitherto dreaded to publish his work ; he now therefore committed them to Bedell, and they were afterwards published at London, with his corrections. He came to England with Bedell ; where he was received with great respect, and preached and wrote against the Romish religion. He had a principal share in publishing father Paul's History of the Council of Trent, which was inscribed to king James in 1619. But on the promotion of pope Gregory XIV., who had been his school-fellow and old acquaintance, he was deluded by Gondomar, the Spanish ambas-

sador, into the hopes of procuring a cardinal's hat, by which he fancied he should prove an instrument of great reformation in the church. Accordingly he returned to Rome in 1622, recanted his errors, and was at first well received ; but he afterwards wrote letters to England, repenting his recantation ; which being intercepted, he was imprisoned by pope Urban VIII., and died in 1625. He was the author of the first philosophical explanation of the rainbow.

DOMINIUM DIRECTUM, in Scotch law, the right which a superior retains in his lands, notwithstanding the feudal grant to the vassal. See LAW.

DOMINIUM EMINENS, in Scotch law, that power which the state or sovereign has over private property, by which the proprietor may be compelled to sell it for an adequate price where public utility requires.

DOMINIUM UTILE, in Scotch law, the right which the vassal acquires in the lands by the feudal grant from his superior.

DOMINUS, a title antiently prefixed to a name, usually to denote the person either a knight or a clergyman. The title was sometimes also given to a gentleman not dubbed ; especially if he were lord of a manor. In Holland, the title dominus distinguished a minister of the reformed church.

DOMUS, in antiquity, is sometimes used for all sorts of houses, either magnificent or ordinary ; but it is often taken by writers to intimate a mansion of some lord, or palace of some prince, as in Virgil, speaking of the palace of Dido.

' At domus interior regali splendida luxu.'

These houses were built with much magnificence, and were of a vast extent ; for they had many courts, apartments, wings, cabinets, bag-nios, stoves, and halls, either to accommodate their owners at table, or for transacting matters of consequence. Before these houses was generally a large place or porch, where clients and persons giving attendance to great men waited to make their court. It is supposed that this was covered, for the convenience of persons, who were sometimes waiting very long before they were admitted.

There was a second part to these houses, called *cavum-cœdium*, or *cavædium* : it was a spacious enclosed court.

The third part was called *atrium interius*, i. e. in general the whole inside of the house. Virgil used this word in this sense, when he said,

' Apparet domus intus, et atria longa patescunt ;'

for it is plain that Virgil means by the word *atria*, that all may be seen in the inside of a house when the doors are opened. There was a porter waiting at the atrium, called *servus atriensis*. Within this there were many figures ; for the Romans raised every where trophies and statues, to leave monuments of their great actions to posterity, not only in the provinces, which they subdued to the empire, but also in public places, and their own palaces at Rome.

Here were therefore painted or engraven battles, axes, bundles of rods, and the other badges of the offices that their ancestors or them-

selves had obtained : and statues of wax or metal, representing their fathers in basso relievo, were set up in niches of precious wood or rare marble. On the days of their solemn feasts, or triumphal pomp, these niches were opened, and the figures, crowned with festoons and garlands, carried about the town. When any of the family died, these statues accompanied the funeral parade ; wherefore Pliny says, that the whole family was there present from the first to the last. There were also large galleries in these houses, adorned with pillars and other works of architecture.

The halls were built after the Corinthian or Egyptian order. The first had only a row of pillars set upon a pedestal, or on the pavement, and supported nothing but the architrave, and cornish of joiners' work or stud, over which was the ceiling in form of a vault ; but the later halls had architraves upon pillars, and the architraves of the ceilings made of pieces joined together, which make an opened circular terrace. These houses had many apartments, some for men, and others for women ; some for dining-rooms called triclinia, others for bed-chambers named dormitoria ; and some others to lodge strangers. So large was ancient Rome, that there were 48,000 houses standing by themselves, or being so many insulæ, and having a light on every side.

The Greeks built in a different manner from the Romans ; for they had no porch, but from the first door they entered into a narrow passage ; on one side of it there were stables, and on the other was the porter's lodge ; at the end of this passage there was another door, to enter into a gallery supported with pillars, and this gallery had piazzas on three sides.

Within the Greek houses there were halls, for the mistresses of the family, and their servant maids to spin in ; in the entry both on the right and left hand there were chambers ; one called *thalamus*, and the other *antithalamus*. Round the piazzas there were dining-rooms, chambers, and wardrobes. To this part of the house was joined another which was considerably larger. The finest entries and most magnificent doors were at this part of the house. There were sometimes four square halls, so large and spacious, that they would easily hold four tables, with three seats in form of beds, and leave room enough for the servants and gaudsters. They entertained their friends in these halls, for it was not the custom for women to sit amongst men. On the right and the left of these buildings were small apartments, and convenient rooms to receive the guests ; and among the Greeks wealthy and magnificent men kept apartments, with all their conveniences, to receive any persons who came to lodge at their houses. The custom was, that after they had given them an entertainment the first day, they sent them afterwards every day some present, as chickens, eggs, pulse, and fruits ; so that travellers were lodged as they had been at their own houses, and might live in these apartments privately.

The apartments were paved with mosaic or inlaid work. Pliny tells us, that the pavements that were painted and wrought with art came from the Greeks, who called them *λιδωπορτα*. These were in fashion at Rome during the time

of Sylla, who had one made at Præneste, in the temple of Fortune. This pavement was not only used for paving the courts of houses and the halls, but also in chambers, and wainscoting the walls, and called *musæa*, *musia*, and *musiva*, because ingenious works were ascribed to the muses, and the muses and sciences were thereby represented.

DON, *v. a.* [To do on.] To put on ; to invest with ; the contrary to doff. Obsolete.

The purple morning left her crimson bed,
And donned her robes of pure vermilion hue.

Fairfax.

Her helm the virgin donned.

Id.

What ! should I *don* this robe, and trouble you ?

Shakespeare.

DON, *n. s.*

} Lat. *dominus*. The Spanish
DONSHIRE, *n. s.* } title for a gentleman ; as, Don
Quixote. It is with us used ludicrously : don-
ship is the rank of a don or gentleman.

To the great *don*s of wit,
Phœbus gives them full privilege alone
To damn all others, and cry up their own.

Dryden.

I'm none of those,
Your bosom-friends, as you suppose
But Ralph himself, your trusty squire,
Wh' has dragged your donship out o' the mire.

Hudibras.

Here *don*s, grandees, but chiefly dames abound,
Skilled in the ogle of a roguish eye,
Yet ever well inclined to heal the wound.

Byron.

DON, a river of Russia, anciently called *Ta-nais*, which takes its rise from the small lake of St. John, near Tula, in the government of Moscow, and passing through part of the province of Voronetz, a small portion of the Ukraina Slobovskaia, and the whole province of Azof, divides itself near Teherkask into three streams, and falls in these separate branches into the sea of Azof. The river has so many windings, is in many parts so shallow, and abounds with such numerous shoals, as to be scarcely navigable, excepting in the spring, upon the melting of the snows ; and its mouth is also so choked up with sand, that only flat-bottomed vessels can pass into the sea of Azof, at any other season. The banks of the Don, and the rivulets which fall into it, are clothed with large tracts of forest, whose timber is floated down the stream to St. Demetri and Rostof, where the frigates for the sea of Azof are chiefly constructed. The navigation of the Don, Mr. Coxe observes, may possibly hereafter be rendered highly valuable, by conveying to the Black Sea the iron of Siberia, the Chinese goods, and the Persian merchandise : which latter commodities, as well as the products of India, formerly found their way into Europe through this same channel.

DON, a river of Scotland, in Aberdeenshire, which rises about four miles north of the castle of Brae-Mar, through the district of Alford ; so named from the river being almost all ford, or every where fordable, in that part of its course ; afterwards joins the Ury at Inverury, and falls into the British Ocean at New Aberdeen, within two miles of the mouth of the Dee. It has been long famous for its salmon fishery

A space of within 500 yards of this river has in one year produced fish to the amount of £2000.

DONAGHADEE, a post, market, and port town in the barony of Ardes, and county of Down, twenty-seven miles and a half distant from Port Patrick in Scotland, the corresponding packet station. Lat. 54° 45' N., long. 5° 40' W. The ancient quay, in form of a crescent, was built by lord Montgomery, and accommodated from twelve to fourteen sail. The present pier was built at the expense of government, and is intended to enclose a surface of 100 fathoms square, accessible at low water for vessels of fifteen feet draft. The south pier is completed, but shelter is much wanted on the north. Port Patrick lies N. E. by E. $\frac{1}{2}$ N., or nearly north-east by compass from Donaghadee. It has been suggested that the execution of this harbour, according to the original design, i. e. with a funnel-shaped mouth, might possibly cause vessels to steer wildly when entering in a heavy swell.

DONALDSON (John), a painter and engraver of some repute, was born at Edinburgh in 1737. He painted portraits in miniature, and was distinguished also for his skilful imitations of the old engravers, which he executed so correctly as to deceive even connoisseurs. He published a volume of poems, and an Essay on the Elements of Beauty. He also cultivated chemistry, and discovered a method of preserving meat and vegetables during long voyages. He died in 1801.

DONARIA, among the ancients, in its primary signification, was taken for the places where the oblations offered to the gods were kept; but afterwards was used to denote the offerings themselves; and sometimes, improperly, the temples.

DONATIA, in botany, a genus of the trigynia order and triandria class of plants: CAL. triphylous perianth, with short subulate leaves standing at a distance from one another: COR. petals from eight to ten, of an oblong linear shape, twice as long as the calyx: STAM. three subulate filaments, the length of the calyx; the anthers roundish, didymous, and two-lobed at the base. Species, one only, a native of Terra del Fuego.

DONATIO MORTIS CAUSA, in law, a disposition of property made by a person in his last sickness, who, apprehending his dissolution near, delivers or causes to be delivered to another the possession of any personal goods, to keep in case of his decease. If the donor dies, this gift needs not the consent of his executor; but it shall not prevail against creditors; and it is accompanied with this implied trust, that, if the donor lives, the property shall revert to himself, being only given in prospect of death, or mortis causa. This method of donation seems to have been conveyed to us from the civil lawyers, who borrowed it from the Greeks.

DONATION, *n. s.* } Fr. *donation*; Span. *don'ative*, *n. s.* } *donacion*; Ital. and Lat. *Do'not*, *n. s.* } *donatio*. from *dono*, expressive of *do*, to give. A donation is a grant; the act of giving; and a gift: for donative see the following article. A donor is a giver or bestower.

The Roman emperor's custom was, at certain solemn times, to bestow on his soldiers a *donative*; which

donative they received wearing garlands upon their heads.

Howsoever the letter of that *donation* may be regarded by men, yet the sense thereof is so imprinted in their hearts, as if every one laid claim for himself unto that which was conferred upon all.

Raleigh's Essays.

He gave us only over beast, fish, fowl,
Dominion absolute; that right we hold
By his *donation*. *Milton's Paradise Lost.*

After *donation* there is an absolute change and alienation made of the property of the thing given: which being so alienated, a man has no more to do with it than with a thing bought with another's money.

South.

Litters thick besiege the donor's gate,
And begging lords and teeming ladies wait
The promised dote. *Dryden's Juvenal.*

It is a mighty check to beneficent tempers to consider how often good designs are frustrated and perverted to purposes, which, could the donors themselves have foreseen, they would have been very loth to promote.

Atterbury.

Never did steeple carry double truer;
His is the *donative*, and mine the cure. *Cleveland.*

DONATISTS, ancient schismatics in Africa, so denominated from their leader Donatus. They had their origin A. D. 311, when, in the room of Mensurnus, who died in that year on his return to Rome, Cæcilian was elected bishop of Carthage, and consecrated without the concurrence of the Numidian bishops, by those of Africa alone; whom the people refused to acknowledge, and to whom they opposed Majorinus; who, accordingly, was ordained by Donatus bishop of Case Nigræ. They were repeatedly condemned, in different councils held at Rome and Arles: and particularly in one at Milan, in 316, before Constantine the Great, who deprived them of their churches, banished their bishops, and punished some of them with death. Their cause was espoused by another Donatus, called the Great, the principal bishop of that sect, who, with numbers of his followers, was exiled by Constantine. Many of them were punished with great severity. See *CIRCONESSIONS*. However, after the accession of Julian, in 362, they were restored to their former liberty. Gratian, in 377, deprived them of their churches, and prohibited their assemblies. But, notwithstanding these severities, they had a very considerable number of churches towards the close of the fourth century; till they began to decline, on account of a schism among themselves, occasioned by the election of two bishops, in the room of Parmenian, the successor of Donatus. One party elected Primian, and were called Primianists, and another Maximian, and were called Maximianists. Their decline was also precipitated by the zealous opposition of St. Augustine, and by the violent measures pursued against them by Honorius, at the solicitation of two councils held at Carthage; the one in 404, and the other in 411. Many of them were fined, their bishops were banished, and some put to death. This sect revived and multiplied under the protection of the Vandals, who invaded Africa in 427, and took possession of this province; but it sunk again under new severities, when their empire

was overturned in 534. Nevertheless, they remained in a separate body till the close of the sixth century, when Gregory, the Roman pontiff, used various methods for suppressing them; his zeal succeeded, and there are few traces to be found of the Donatists after this period. They were distinguished by other appellations; as Montenses, Campites, Rupites, &c. They held three councils, one at Cirta in Numidia, and two at Carthage. The peculiar opinions of the Donatists were, 1. That baptism conferred out of the church, that is, out of their sect, was null; and accordingly they rebaptised those who joined their party from other churches, and re-ordained their ministers. Donatus seems likewise to have given into the doctrine of the Arians, with whom he was closely allied; and, accordingly, St. Epiphanius, Theodoret, and some others, accused the Donatists of Arianism; and it is probable that the charge was well founded, because they were patronised by the Vandals, who were of these sentiments. But St. Augustine (Ep. 185, to count Boniface, and *Ilær.* 69.) affirms, that the Donatists, in this point, were clear of the errors of their leader.

DONATIVE, in the canon law, a benefice given by the patron merely without a presentation to the bishop. If chapels founded by laymen be not approved by the diocesan, and, as it is called, spiritualised, they are not accounted proper benefices, neither can they be conferred by the bishop, but remain to the pious disposition of the founders, and their heirs, who may give such chapels without the bishop. Gwin observes, that the king might anciently found a free chapel, and exempt it from the jurisdiction of the diocesan; so may he, by letters patent, give liberty to a common person to found such a chapel, and make it donative, not presentable; and the chaplain or beneficiary, is deprivable by the founder or his heir, and not by the bishop. Donatives are within the statute against simony; and, if they have cure of souls, within that against pluralities. If the patron of a donative does not nominate a clerk, there can be no lapse thereof, unless it be specially provided for in the foundation; but the bishop may compel him to do it by spiritual censures. But, if it be augmented by queen Anne's bounty, it will lapse like other presentative livings. 1 Geo. I. stat. 2, cap. 10. The ordinary cannot visit a donative, and therefore it is free from procuration, and the incumbent is exempted from attendance at visitations. All bishoprics anciently were donative by the king. Where a bishop has the gift of a benefice, it is properly called a donative, because he cannot present to himself.

DONATIVE, DONATIVUM, in antiquity, was properly a gift made to the soldiers, as congiarium was to the people. The Romans made large donatives to their soldiers. Julia Pia, wife of the emperor Severus, is called on certain medals *mater castrorum*, because of the care she took of the soldiery, by interposing for the augmentation of their donatives, &c. Salsmasius, in his notes to Lampridius, on his Life of Helio-gabalus, mentioning a donative that emperor gave of three pieces of gold per head, observes, that this was the common and legitimate rate of

a donative. Casaubon, in his notes on the Life of Pertinax by Capitolinus, observes, that Pertinax made a promise of 2000 denarii to each soldier; which amounts to upwards of £97 sterling. The same author writes, that the legal donative was 20,000 denarii; and that it was not customary to give less, especially to the prætorian soldiers: that the centurions had double, and the tribunes, &c., more in proportion.

DONATUS (*Ælius*), a celebrated grammarian, who lived at Rome, about A. D. 354. He was one of St. Jerome's masters; and composed commentaries on Terence and Virgil, which are esteemed.

DONATUS (*Jerom*), a learned and noble Venetian, who flourished in the end of the fifteenth century, and died in the beginning of the sixteenth. He was a benefactor to his country, both as a commander and as a negotiator, and procured its reconciliation with pope Julius II. He wrote many books, which remain in MS.; besides a translation of Alexander Aphrodisæus de Anima, which he published. He died of a fever at Rome just as he had completed his negotiation with Julius.

DONAVESCHINGEN, or **DONESCHINGEN**, a town of Germany, in the circle of Suabia, situated in the Black Forest, where the prince of Furstenberg has a palace, near which is a spring, said to be the source of the Danube, thirteen miles N. N. W. of Schaffhausen, and thirteen west of Duttlingen.

DONAUEWERTH, a strong and well built town of Bavaria, in the circle of the Upper Danube, on the left bank of that river. It has been taken and retaken several times in the wars of Germany; and was formerly an imperial city. It has a bridge over the Danube, four good churches and four hospitals: it lies thirty miles west of Ingoldstadt, and eighteen north of Augsburg. In this neighbourhood were the famous lines of Schellenberg, when the allies under the duke of Marlborough obtained an important victory over the Bavarians on the 2d July 1704.

DONAX, a genus of insects belonging to the order of *vermes testacei*. It is an animal of the oyster kind; and the shell has two valves, with a very obtuse margin in the fore part. There are nineteen species, principally distinguished by the figure of their shells.

DONCASTER, an ancient, large, and populous town, in the West Riding of Yorkshire, seated on the Don, with a castle, whence its name. It is incorporated, and is governed by a mayor, recorder, six aldermen, and twenty-four councillors. In this town is a handsome theatre, town-hall, bank, free grammar-school, almshouse, work-house, a public dispensary, and various other benevolent societies and institutions for the relief of sick and afflicted persons. The parish church is an ancient structure; and its steeple is a piece of excellent workmanship. Here are numerous meeting-houses for religious sects of different denominations. Doncaster has long been celebrated for its races; on the course, which is one of the most eligible in the kingdom, is erected an elegant stand for the accommodation of the spectators and visitors, who are always numerous and fashionable. It has a

market on Monday; and carries on manufactures of vests, petticoats, stockings, gloves, &c. It has two bridges over the Don, with a high causeway beyond them, the river being apt to overflow its banks. It has also the relics of an old Roman road, and lies thirty-seven miles south of York, and 160 north by west of London.

DONE, a kind of interjection. The word by which a wager is concluded: when a wager is offered, he that accepts it says 'Done!'

Done: the wager? Shakespeare. Tempest.

One thing, sweet heart, I will ask:

Take me for a new-fashioned mask.

—*Done: but my bargain shall be this,*

I'll throw my mask off when I kiss. *Cleveland.*

'Twas *done* and *done*, and the fox, by consent, was to be the judge. *L'Estrange.*

DONEGAL, anciently Tyrconnel, is a county in the province of Ulster, bounded on the north and west by the Atlantic Ocean, by parts of Leitrim and Fermanagh on the south, and by Tyrone, Londonderry, and Fermanagh on the east. It is divided into six baronies, and forty-two parishes. Its superficies measures about 679,550 plantation acres. The line of coast is adorned by many islands, of which seventeen are inhabited; and it is also indented by numerous excellent harbours and bays, capable of being made available either for the West-India trade, or the encouragement and growth of valuable fisheries. The chief islands are Aranmore, containing 2000 acres, 132 houses, and 778 inhabitants: Inishbofin, having forty-three houses and 252 inhabitants: Tory Island, supporting a population of 296 in fifty-nine houses. The most important harbours are, the noble inlet of Lough Swilly, extending thirty miles in length; Mulroy and Sheep-haven in the north; Teelin, Killybegs, and Brucklis in the south. The whale fishery was once successfully prosecuted on this coast, and a pier was erected at Inver, as an auxiliary, which now, unhappily, is a total ruin. Inver and Brucklis Bay continue to be the chief seat of the herring fishery; but from the want of shelter for boats, this mode of life is rendered in this place awfully perilous. In 1813 fifty fishermen were lost in the last-mentioned bay, entirely owing to the want of any rendezvous, when the squall came on. The safest, best, and largest harbour on this line, is Killybegs: here several hundred sail might anchor safely, but could not put to sea hence in west or south-west winds. The fishery along this coast has latterly decayed, and is not likely to be arrested in its melancholy decline, without either the countenance and assistance of government, or of the lauded proprietors of the county.

The roads in Donegal are, in most places, unfit for carriages; and the traffic of the country is carried on generally by horses, with sacks and baskets. No mail-coach, as yet, passes through any part of this great district. The coast road should be all remade: a new line is wanted from the Rosses, by the Giddore River, to Gortahork; and also from the same place to Fintown, by Aragib Mountain. In fact, without coast improvements, the population will find it difficult to procure subsistence; and with the required road

improvements, a market would be found for the overplus of food obtained by the improved harbours, at the same time that civilisation would advance much more rapidly. Donegal abounds in valuable mineral substances; it has been visited by Dr. Berger, Dr. Stokes, and Sir Charles Giesecke. The surface may be termed both boggy and mountainous; the former part useless, from a scanty population and want of drainage; the latter unapproachable from want of roads. There is a valuable lead mine, at full work, near Kildrum. At Muckish there exists a rich bed of silicious sand. Iron ore is found in Aranmore, Muckish, and other places. Coals are found at Dromore, Ards, and Glanelly, and slate near Ballyshannon and Letterkenney. Veins of primitive limestone and marble, fit for statuary, appear at Fintown; sienite, and porphyritic sienite, are had here in great abundance, besides several species of limestone. Dykes are of frequent occurrence, and consist principally of trap and greenstone. There is but little trade of any description existing here. Linen is made by the cottagers, and sold to the travellers from Derry, Sligo, and Strabane. Kelp is made along the coast; and the fisheries, now in a very low state, might be rendered a great blessing to the poor and peaceable inhabitants of this large county, by the adoption of a few of Mr. Nimmo's very beautiful designs for coast improvements.

There are some remarkable natural beauties and curiosities in Donegal: the pass of Bunsmore is the most sublime of the first description; and M'Swine's Gun the most singular of the second. The climate, from its latitude and exposure to the Atlantic, is both colder and more damp than most of the other northern counties; yet longevity is said to be one of its attributes: the last census returns upwards of twenty persons in the county as having attained the age of 100, and several as having reached the unusually extended age of 115 years. The chief towns are Lifford, Letterkenney, Raphoe, Ballyshannon, Rathmelton, Killybegs, Buncrana, Ballintra, Dunfallyghy, &c. The chief, or county town is Lifford, situated on the river Finn. The assizes for the county are held here, but from its awkward situation, upon the boundaries of the county, and its proximity to Strabane, it has never risen to the importance to which shire-towns are entitled; the population scarcely amounts to 1000 persons. Letterkenney is well situated for supplying the county with imports, but Rathmelton much better. The town of Ballyshannon, the property of Packenham Conolly, Esq., is situated at the embouchure of the river Erne. Here is the famous salmon fishery, the produce of which is all exported to London, carefully packed in ice. The fall of Ballyshannon is a beautiful object, and always supplied with a great body of water from Lough Erne. The harbour of Ballyshannon is obstructed by two bars; but, when they are passed, there is safe lying for small vessels in the pool below the waterfall. This harbour is much in want of improvement, and a navigation from Loch Erne to the sea is an obvious want. The Erne, the Finn, and the Guybarra, are the principal rivers in the county; but

* lakes and mountain pools are very numerous. Lough Derg is rendered famous in story by the pilgrimages to St. Patrick's Purgatory, on one of its islands, annually performed by multitudes from every part of Ireland; and Lough Esk is noted for the production of excellent char fish. There are few counties in Ireland possessing greater interest, and at the same time less known to the public, than Donegal.

DONEGAL TOWN, in the barony of Tyrhugh, county of Donegal, and province of Ulster, is about 140 miles from Dublin. It is a post, market, and fair town. Here is a beautiful remnant of the military antiquities of Ireland, O'Donnell's castle, erected in the twelfth century, and at this day singularly perfect. The ruins of a monastery, founded in 1474, by Owen Rowe, stand at the distance of half a mile from the town.

DONERAIL, a borough of Ireland, in Cork, seated on the Awbeg, near some quarries of beautiful variegated marble. It sent two members to parliament before the Union. It is nineteen miles north-east of Cork, and 115 south-west of Dublin.

DONGALA, DANGALA, or DANKALA, as it is called by the Arabs, is a town of Africa, in Nubia, seated on the east bank of the Nile. The streets are said to be half-deserted, being filled up with sand brought down by the waters from the mountains. The castle is large but not strong; but an account of it by Porcet, dated at the close of the seventeenth century, is the last we have seen. Persons of rank here go bareheaded, their hair being disposed in tresses, and their whole attire consisting in a rude vest without sleeves. The pride of Dongala is in its horses, which are as beautiful as their riders are skilful. Since the expulsion of the Mamelukes from Egypt, those of that body which effected their escape, have taken possession of Dongala, and established a species of petty kingdom there. Their number, however, does not exceed 500, with 3000 or 4000 slaves. Dongala is 150 miles north of Sennar, and 690 south of Cairo.

DONJON, *n.s.* Now corrupted to *dungeon*, from low Lat. *dominionum*, according to Menage. The highest and strongest tower of the castle, where prisoners were kept: as in Chaucer. It is now used of subterraneous prisons.

The grete toure, that was so thicke and strong,
Which of the castle was the chief *dungeon*,
Wherein the knights were in prison,
Was evin joynant to the garden-wall,
Ther as this Emely had her playeing. Chaucer.

DONNE (John), D. D., a poet and divine of the seventeenth century. His parents were of the Romish religion, and used their utmost efforts to keep him firm to it; but his early examination of the controversy between the church of Rome and the Protestants, at last determined him to choose the latter. He travelled into Italy and Spain, where he learnt their languages to perfection. Soon after he returned to England Sir Thomas Egerton, keeper of the great seal, appointed him his secretary; in which post he continued five years. Marrying privately Anne, the daughter of Sir George Moore, then chancellor of the garter, he was dismissed from his place, and thrown into prison: but he was

afterwards reconciled to Sir George by the good offices of Sir Francis Wolley. In 1612 he accompanied Sir Robert Drury to Paris, and during this time many of the nobility solicited the king for some secular employment for him. But king James, who took pleasure in his conversation, had engaged him in writing his *Pseudo-Martyr*, printed at London in 1610; and was so highly pleased with that work, that in 1614 he prevailed upon him to enter into holy orders; appointed him one of his chaplains, and procured him the degree of D. D. from the University of Oxford. In 1619 he attended the earl of Doncaster in his embassy into Germany. In 1621 he was made dean of St. Paul's, and vicar of St. Dunstan's, in London; the advowson of it having been given to him long before by Richard earl of Dorset. By these and other preferments, he was enabled to be charitable to the poor, and to make good provision for his children. He wrote besides the above, 1. Devotions upon emergent occasions. 2. The Ancient History of the Septuagint, translated from the Greek of Aristæus, in 4to. 3. Three volumes of sermons, folio. 4. A considerable number of poems, and other works. He died in 1631; and was interred in St. Paul's cathedral, where a monument was erected to his memory. His writings show him to have been a man of wit and learning; but his chief talent lay in satire; though it savors more of the coarse style of Juvenal, than of the elegant humor of Horace.

DONNE (Benjamin), a celebrated mathematician, was born in 1729, at Bideford, in Devonshire, where his father and brother Abraham were eminent teachers of the mathematics. Benjamin succeeded his father, but afterwards removed to Bristol, where he died in 1798. He was master of mechanics to his late majesty, and published—1. Mathematical Essays, 8vo., 1759. 2. A Map of Devonshire, from an actual survey, made by himself. 3. The Accountant and Geometrician, 8vo. 4. The British Mariner's Assistant, 8vo. 5. Essays on Trigonometry, 8vo. 6. An Epitome of Natural Philosophy, 12mo. 7. A Treatise on Mechanical Geometry, 12mo.

DONNINGTON, or DUNNINGTON, a town of England, in the county of Lincoln, with a good trade in hemp and hemp-seed, and a port for barges, by which goods are conveyed to Boston and the Washes. It has lately been much improved. Through the fens, a firm rampart of earth of considerable breadth has been constructed, which forms a convenient road to Sempringham. The church is a convenient building: in the lower part of the steeple is a stone, on which are the remains of a Roman inscription, unintelligible, with the exception of the date of the year. It has a weekly market on Saturday; and is eleven miles W. S. W. of Boston, and 110 north of London.

DOODLE, *n.s.* A cant word, says Johnson, perhaps corrupted from do little: *jameant*. A trifler; an idler.

DOOM, *v. a. & n. s.* Sax. dome, deman;
DOOM'S-DAY, Teut. *thum*, to DREM,
DOOMS'MAN, which see. To judge;
DOOMS'-DAY-BOOK. destine; hence to coin-

mand judicially, denounce; and the sentence, determination, or judgment given. Doomsday is the day of future and universal judgment. For doom's-day-book, see DOMESDAY-BOOK.

Be thou consenting to thin adversarie soone, while thou art in the waye with him, lest peradventure thin adversarie take thee to the *domesman* and the *domesman* take thee to the minstre, and thou be sent in to prisoun. *Wiclif. Matt. v.*

He that etith and drynkith unworthile, etith and drynkith *doom* to him, not wiseli demynge the bodi of the lord. *Id. 1 Cor. xi.*

Have I a tongue to *doom* my brother's death,
And shall that tongue give pardon to a slave? *Shakespeare.*

Revoke thy *doom*,
Or whilst I can vent clamour from my throat,
I'll tell thee thou dost evil. *Id. King Lear.*

Search Windsor Castle, elves, within and out:
Strew good luck, cuphes, on every sacred room,
That it may stand till the perpetual *doom*. *Id.*

Men, wives, and children stare, cry out, and run,
As it were *doomsday*. *Id. Julius Cæsar.*

The Danes also brought in a reckoning of money by ores, per oras, which is mentioned in *doomsday-book*. *Canden.*

His business gives him not leave to think of his conscience, and when the time, or term of his life is going out, for *dooms-day* he is secure; for he hopes he has a trick to reverse judgment. *Bp. Earle.*

They may serve for any theme, and never be out of date until *doomsday*. *Browne's Vulgar Errors.*

Him through malice fallen,
Father of mercy and grace! thou didst not *doom*
So strictly, but much more to pity incline. *Milton.*

Minos, the strict inquisitor, appears,
And lives and crimes, with his assessors, hears;
Round in his urn the blended balls he rowls,
Absolves the just, and *dooms* the guilty souls. *Dryden's Æneid.*

Our souls, not yet prepared for upper light,
Till *doomsday* wander in the shades of night—
This only holiday of all the year,
We privileged in sunshine may appear. *Id.*

In the great day, wherein the secrets of all hearts shall be laid open, no one shall be made to answer what he knows nothing of: but shall receive his *doom*, his conscience accusing or excusing him. *Locke.*

I have no will but what your eyes ordain;
Destined to love, as they are *doomed* to reign. *Granville.*

From the same foes, at last, both felt their *doom*;
And the same age saw learning fall, and Rome. *Pope.*

Indeed, as there is a difference in constitutions, some rest well after these meals; it costs them only a frightful dream and an apoplexy, after which they sleep till *doomsday*. Nothing is more common in the newspapers, than instances of people, who, after eating a hearty supper, are found dead a-bed in the morning. *Franklin.*

In groundless hope, and causeless fear,
Unhappy man! behold thy *doom*;
Still changing with the changeful year,
The slave of sunshine and of gloom. *Johnson. Winter's Walk.*

When to the supper-hall we moved along,
Why was I *doomed* to face her in the throng!
With what provoking kindness did she stand,
And loose her arm from his to press my hand,

And beg with well feigned sympathy to know
Of head-aches which I felt three months ago. *Dr. T. Brown.*

The very knowledge that he lived in vain,
That all was over on this side the tomb,
Had made Despair a smilingness assume,
Which, though 'twere wild,—as on the plundered wreck

When mariners would madly meet their *doom*
With draughts intemperate on the sinking deck,—
Did yet inspire a cheer, which he forbore to check. *Byron.*

DOON, or Loch Doon, anciently called Dohn, a lake of Scotland, six miles long, in the south-east part of the district of Kyle, in Ayrshire. There is an island in it, with an old fort called Balloch Castle. Also the name of a river of Scotland, which issues from Loch Doon, and, running north-west, divides the district of Kyle from that of Carrick. After a course of various meanderings for twenty-four miles, it falls into the Frith of Clyde, a little south of Ayr. It abounds with salmon, trout, pikes, and eels.

DOOR, *n. s.* } Goth. *dore*; Sax. *dora*;
DOORCASE, } Teut. *thur*; Dan. *doer*; per-
DOORKEEPER, }haps from Gr. *Oupa à Oua*,
to enter; Minshew. The gate of a house or room; hence entrance of any kind; passage; and by metonymy, a house. To lay at the doors of any one is to impute; to charge upon him any thing.

Petir stode at the *dore* withoutforth: therfore the tothir disciple that was knowun to the bisschop wente out and seide to the woman that kepte the *dore* and broughte yu petir, and the damysel kepere of the *dore* seide to petir wher thou art also of this mannys disciplis. *Wiclif. Jon. xviii.*

The praiser stint of Arcite the strong,
The rings on the temple *dore* they rong,
And eke the *dores* clatten full fast,
Of which Arcite somewhat him agast. *Chaucer.*

All the castle quaked from the ground,
And every *door* of free-will open flew. *Spenser. Faerie Queene.*

Since my own *doors* refuse to entertain me,
I'll knock elsewhere. *Shakespeare.*

The indispensable necessity of sincere obedience, shuts the *door* against all temptations to carnal secularity. *Hammond.*

He that hath given the following assistances to thee, desires to be even a *doorkeeper* in God's house, and to be a servant to the meanest of God's servants. *Taylor's Preface.*

In the side a *door*
Contrived; and of provisions laid in large,
For man and beast. *Milton's Paradise Lost.*

A seditious word leads to a broil, and a riot unpunished is but next *door* to a tumult. *L'Estrange.*

Lay one piece of flesh or fish in the open air, and another of the same kind and bigness within *doors*. *Bacon's Natural History.*

For without rules, there can be no art, any more than there can be a house without a *door* to conduct you in. *Dryden.*

In any of which parts if I have failed, the fault lies wholly at my *door*. *Id. Dufresnoy, Preface.*

Should he, who was thy lord, command thee now,
With a harsh voice and supercilious brow,
To servile duties, thou would'st fear no more;
The gallows and the whip are out of door.

Dryden. Persius.

His imaginary title of fatherhood is out of doors,
and Cain is no prince over his brother.

Locke.

Lambs, though they are bred within doors, and
never saw the actions of their own species, push at
those who approach them with their foreheads.

Addison's Spectator.

The making of frames for doorcases, is the framing
of two pieces of wood athwart two other pieces.

Mocon.

Martin's office is now the second door in the street,
where he will see Parnel.

Arbutnot.

A shrewd observer once said, that in walking the
streets on a slippery morning, one might see where
the good-natured people lived, by the ashes thrown
on the ice before the doors.

Franklin.

Love ends with hope; the sinking statesman's door,
Pours in the morning worshipper no more.

Johnson. Vanity of Human Wishes.

DOOSIACK, or Jullalabad, the capital of
the province of Seistan, Persia, is situated in an
open country, at the distance of eight or nine
miles from the river Helmund, or Hetermund.
It consists of about 2000 houses. Here is a
good bazaar, and around are the ruins of a more
extensive ancient city, which appears to have
been built of half-burnt brick. The modern
town, more commonly called Julalabad, is gov-
erned by a prince of an ancient and independent
family, who styles himself king of Seistan.

DO'QUET, *n. s.* A paper containing a war-
rant. See Dock.

Before the institution of this office, no *doquet* for
licence to alien, nor warrant for pardon of alienation
made, could be purchased without an oath.

Bacon's Office of Alienation.

DORAK, or Felahi, a town of the province
of Kuzistan, Persia, situated on two branches
of the river Jerahi. It is surrounded by mud
walls, two miles in circuit, sixteen feet thick,
and flanked at intervals, by round towers. The
palace of the seik occupies a large area, but is a
mean edifice, and in a decaying state. Dorak
is celebrated for the manufacture of Arabian
cloaks. There are few houses within the walls,
as most of the inhabitants prefer residing under
the shade of the date trees, in the suburbs.
Population 8000. Seventy-five miles south of
Shuster.

DORAN, a town of Arabia, in Yemen, the
residence of the chief or governor of the district
Bellad Aries. It is situated on the declivity of
a mountain, and was once surrounded by a wall
with three gates. Twenty-eight miles south of
Sana.

DORCAS. See CAFRA.

DORCHESTER, an ancient, neat, and well
built town of England, the capital of Dorsetshire.
It is seated on the river Frome, on a Roman road,
and adorned with a fine terrace walk, planted with
trees. It has three parish churches, with a court
house where the county assizes are held; and is
governed by a mayor, twelve aldermen, a recorder,
and twenty four council-men. It has long been

famous for its excellent ale. The streets are
broad and well paved. It has two markets on
Wednesday and Saturday, and sends two mem-
bers to parliament. The manufactures are serge
and broad cloth. It lies eight miles north of
Weymouth, fifty-three east of Exeter, and 120
west by south of London.

DORCHESTER, a town in Oxfordshire, seated on
the Tame, over which it has a bridge, three quar-
ters of a mile above its junction with the Thames.
It had five churches before the Norman conquest.
It is ten miles south-east of Oxford, and forty-
nine W. N. W. of London.

DORCHESTER, a county of Maryland, in North
America. It is thirty-three miles long from east
to west, and twenty-seven broad. Its produce is
chiefly wheat, corn, and lumber. Cambridge is
the chief town.

DORCHESTER, a town of the United States of
America, in Grafton county, New Hampshire,
seventeen miles north-east of Dartmouth.

DORCHESTER, a township of the United States,
in Norfolk county, Massachusetts. It is two
miles south by east of Boston, and is about six
miles long, and three and a half broad. The
chief manufactures are paper, chocolate, snuff,
leather, and shoes.

DORCHESTER, a town of the United States, in
Cumberland county, New Jersey, seventeen
miles east of Fairfield.

DORCHESTER NECK, a peninsula of Massa-
chusetts, on the coast of the township, in Norfolk
county; the north-east point of which approaches
within half a mile of Castle Island, and its
north-west point within half a mile of the south
part of Boston. During the American war forts
were erected on the heights, and the township
suffered greatly.

DORDOGNE, a department of France, com-
prehending part of the ci-devant province of
Perigord, bounded on the north-east by that of
the Upper Vienne, on the east by those of the
Lot and Correze, on the south by that of the Lot
and Garonne, on the west by those of the Gi-
ronde and the Lower Charente, and on the north-
west by that of the Charente. Perigueux is the
capital. Its superficial extent is about 3600
square miles, and the population 425,000, of
whom 8500 are Protestants. It was at first
divided into nine districts, but now consists of
the five arrondissements of Perigueux (the ca-
pital), Bergerac, Sarlat, Ribereac, and Nontron.
The south of the department, particularly the
banks of the Dordogne, the Vezere, and the Ile,
is fruitful; but the north is mountainous, and
covered with wood; the deficiency of corn being
supplied by chestnuts and potatoes. There are
a few manufacturing establishments in various
places, viz. for hardware, paper, glass, and pot-
tery. Wine, oil, and cattle, form the chief
articles of export. Of wine 150,000 hogshheads
are accounted an average vintage; the cattle and
sheep are numerous.

DORDOGNE, a considerable river of France,
which rises about seven miles north-west of Besse,
in the department of the Puy-de-Dome. After
forming the limit of the departments of the Puy-
de-Dome and the Correze, it runs through an
extensive tract, and falls into the Garonne, at

Bourg, about fifteen miles below Bourdeaux. Here the united stream takes the name of the Gironde. The course of the Dordogne is above 200 miles, during which it receives a great number of smaller rivers, the principal of which are the Vezere and Ile. The tide flows as high up as Castillon, about twenty-five miles from the confluence with the Garonne.

DORIA (Andrew), a celebrated patriot of Genoa, born in 1466. He entered into the service of Francis I. of France; but preserved that spirit of independence so natural to a sailor and a republican. When the French attempted to render Savona, long the object of jealousy to Genoa, its rival in trade, Doria remonstrated against the measure in a high tone; which, being represented by the malice of his courtiers in the most odious light, irritated Francis to that degree, that he ordered his admiral, Barbesieux, to sail to Genoa, then in the hands of the French troops, to arrest Doria, and to seize his galleys. This rash order being communicated to Doria, he retired with all his galleys to a place of safety; and, while his resentment was thus raised, closed with the offers of the emperor Charles V.; returned his commission, with the collar of St. Michael, to Francis, and hoisted the Imperial colors. To deliver his country, weary alike of the French and Imperial yoke, from the domination of foreigners, was now Doria's highest ambition; and the favorable moment soon offered. Genoa was afflicted with the pestilence, the French garrison was greatly reduced, and ill paid, and the inhabitants were disposed to second his views. He sailed to the harbour with thirteen galleys, landed fifty men, and made himself master of the gates and the palace, with very little resistance. The French governor, with his feeble garrison, retired to the citadel, but was quickly forced to capitulate; when the people ran together, and levelled the citadel with the ground. It was now in Doria's power to have rendered himself the sovereign of his country; but, with a magnanimity of which there are few examples, he assembled the people in the court before the palace, disclaimed all pre-eminence, and recommended to them to settle the form of government they chose to establish. The people, animated by his spirit, forgot their factions, and fixed that form of government which subsisted till the revolution in 1797, with little variation. This event happened in 1528. Doria lived to a great age, respected and beloved as a private citizen, and is still celebrated among his countrymen by the most honorable of all appellations, 'The father of his country, and the restorer of its liberty.'

DORIC, *adj.* Lat. *dorus*; Fr. *dorique*. The ancient Dorians.

Love warms our fancy with enlivening fires,
Reines our genius, and our verse inspires;
From him Theocritus, on Enna's plains,
learn'd the wild sweetness of his *Doric* strains.

Littleton.

DORIC DIALECT, one of the five dialects which prevailed among the Greeks. It was first used by the Lacedæmonians, and particularly those of Argos; thence it passed into Epirus, Libya,

Sicily, and the islands of Rhodes and Crete. In this dialect, Archimedes and Theocritus wrote, who were both Syracusans, as well as Pindar. The Doric dialect is properly the manner of speaking peculiar to the Dorians, after their recess near Parnassus and Asopus; and which afterwards came to obtain among the Lacedæmonians, &c. Some even distinguished between the Lacedæmonian and Doric; but, in reality, they were the same; setting aside a few particulars in the language of the Lacedæmonians; as shown by Rulandus, in his treatise *De Lingua Græca ejusque Dialectis*, lib. v. To these authors we might add Archytas of Tarentum, Bion, Callinus, Simonides, Bacchylides, Cypselas, Alcman, and Sophron, as writers in the Doric dialect. Most of the medals of the cities of Græcia Magna, and Sicily, use the Doric dialect in their inscriptions, e. g. AMBPAKIQTAN, AΠOΛΔQNATAN, AXEPONTAN, AXYPITAN, HPAX, AEQTAN, TPAXINQN, OEPMITAN, KATAONIATAN, KOPIATAN, TAYPOMENITAN, &c. Which shows the countries wherein the Doric dialect was used. The general rules of this dialect are thus given by the Port-royalists:

D's Hra, d'ω grand, d's, d'o, & d' * l' a fait le Dore.
D's fait ηρα; d'ω, ω; & d'ω av fait encore.
Oste i de l' infini: & pour le singulier
Se sert au feminin du nombre pluriel.

But they are much better explained in the fourth book of Rulandus; where he even notes the minuter differences of the dialects of Sicily, Crete, Tarentum, Rhodes, Lacedæmon, Laconia, Macedonia, and Thessaly.

DORIC MODE, in music, the first of the authentic modes of the ancients. Its character is to be severe, tempered with gravity and joy; and is proper upon religious occasions, as also to be used in war. It begins D, *la, sol, re*. Plato admires the music of the Doric mode, and judges it proper to preserve good manners as being masculine; and on this account allows it in his commonwealth. The ancients had likewise their subdoric or hypodoric mode, which was one of the plagal modes. Its character was to be very grave and solemn: it began with *re*, a fourth lower than the Doric.

DORIC ORDER, the second of the five orders of architecture. It is usually placed upon the Attic base, though originally it had none. See **ARCHITECTURE**. The most considerable ancient monuments of this order, are the theatre of Marcellus at Rome, wherein the capital, the height of the frize, and its projecture, are much smaller than in the modern architecture; and the Parthenon, or temple of Minerva, at Athens, in which the short and massy columns bear upon the pavement without a base; and the capital is a simple torus, with its cincture, and a square, plain, and solid abacus.

DORIS, in ancient geography, a country of Greece, between Phocis, Thessaly, and Acarnania. It received its name from Dorus, the son of Deucalion, who made a settlement there. It was called Tetrapolis, from its four cities, viz. Pindus or Dryopis, Erineum, Cytinium, and Borium. To these four some add Lileum and Carphia, and therefore call it Hexapolis. The

name of Doris has been common to many parts of Greece. The Dorians in the age of Deucalion inhabited Phthiotis, which they exchanged for Histiotis, in the age of Dorus. From thence they were driven by the Cadmeans, and came to settle near the town of Pindus. Thence they passed into Dryopis, and afterwards into Peloponnesus. Hercules having re-established Agimius king of Phthiotis or Doris, who had been driven from his country by the Lapithæ, the grateful king appointed Hyllus, the son of his patron, to be his successor, and the Heraclidæ marched from that part of the country to recover Peloponnesus. The Dorians sent many colonies into different places, which bore the same name as their native country. The most famous of these is in Asia Minor, of which Halicarnassus was once the capital. This part of Asia Minor was called Hexapolis, and afterwards Pentapolis.

DORIS, in entomology, a genus of insects, belonging to the order of vermes testacea. The body is oblong, flat beneath; creeping: mouth placed below: vent behind, surrounded with a fringe: two feelers, retractile. There are several species: particularly *D. argo*, the lemon doris, has an oval body, convex, marked with numerous punctures, of a lemon color; the vent beset with elegant ramifications. It inhabits different parts of our seas, and is called about Brighton the sea lemon.

DORIS, in mythology, the daughter of Oceanus and Tethys, wife of Nereus and mother of the Nereides.

DORKING, a market town of Surry, situated in the midst of beautiful hills. The church is collegiate, and has a square tower, near the centre, with eight bells, and a set of chimes. Besides a convenient workhouse, here are some commodious alms-houses, on a pleasant heath, called Cotman Dean. A great traffic is carried on in meal and lime; and this town is noted for its breed of poultry, which is singular from their having five fingers in each claw. Capons bred here, often weigh seven or eight pounds each, out of their feathers. In the neighbourhood are several corn-mills, and in the suburbs are many elegant seats. The custom of Borough-English prevails in this manor, by which the youngest son is heir to a copyhold estate. This practice is supposed to be derived from the ancient custom of the lord of the manor having a right to claim a lodging with every bride on her wedding night. Market on Thursday. Eight miles south from Epsom, and twenty-three S. S. W. from London.

DORMANT, *adj.* } Fr. *dormant*, from
DORMITIVE, *n. s.* } Lat. *dormio*, to sleep.
DORMITORY, *n. s.* } Sleeping; hence private;
DOR'TOUR, } concealed. Dortour and
DORTURE. } dormitory, a place to
sleep in; and hence a burial place. Dormitive,
a soporific.

His deth saw I by revolation,
Sayde this frere, at home in our dortour.

Chaucer. *Cent. Tales.*

There were other dormant musters of soldiers
throughout all parts of the realm, that were put in
readiness, but not drawn together.

Bacon's *War with Spain.*

He led us to a gallery like a *dorture*, where he
shewed us along the one side seventeen cells, very
neat. *Bacon.*

Prayer is the only *dormitive* I take to bedward, and
I need no other laudanum than this to make me
sleep; after which I close mine eyes in security,
content to take my leave of the sun, and sleep unto
the resurrection. *Sir T. Browne.*

He a dragon! if he be, 'tis a very peaceful one:
I can insure his anger is *dormant*; or, should he seem
to rouse, 'tis well lashing him, and he will sleep like
a top. *Congreve's Old Bachelor.*

With this radius he is said to strike and kill his
prey, for which he lies, as it were, *dormant*, till it
swims within his reach. *Grew's Museum.*

Query,—Whether churches are not *dormitories* of
the living, as well as of the dead. *Swift.*

It would be prudent to reserve these privileges
dormant, never to be produced but upon great occa-
sions. *Id.*

The places where dead bodies are buried, are in
Latin called *cæmeteria*, and in English *dormitories*.
Ayliffe's Parergon.

Old *dormant* windows must confess
Her beams; their glimmering spectacles,
Struck with the splendor of her face,
Do the office of a burning-glass. *Cleveland.*

Naked mourns the *dormitory* wall,
And Jones and Boyle's united labours fall.
Pope's Dunciad.

Rooms that have thorough lights are left for enter-
tainment, and those that have windows on one side
for *dormitories*. *Mortimer.*

Many vegetables during the night do not seem to
respire, but to sleep like the *dormant* animals and
insects in winter. *Darwin.*

DORMANT, in heraldry, is
used for the posture of a lion,
or any other beast, lying along
in a sleeping attitude with the
head on the fore paws; by
which it is distinguished from
the couchant, where though the
beast is lying, yet he holds up his head; as
gules, a lion dormant, name Aylesworth.

DORMOUSE, *n. s.* *Dormio* to sleep, and
mouse. A small animal which passes a large
part of the winter in sleep.

Come, we all sleep, and are mere *dormice* flies,
A little less than dead: more dullness hangs
On us than on the moon. *Ben Jonson's Catiline.*

After they have lain a little while, they grow as
drowsy as *dormice*, unless they are roused.

Collier on Thought.

DORN, *n. s.* From German, *dorn*, a thorn.
The name of a fish; perhaps the same as the
thornback.

The coast is stored both with shell-fish, as scallops
and sheathfish; and flat, as turbot, *dorns*, and holly-
but. *Carew.*

DORNIAN, or DORNEM, a town of Wirtem-
berg, in the Black Forest, in Suabia, and con-
taining about 1050 inhabitants. It was burned
down by lightning in 1718, but was soon after
rebuilt. In the neighbourhood are the ruins of
three castles. It is forty miles south-west of
Stuttgart.

D'ORNICK, *n. s.* Of *Deornick* in Flanders, where first made. A species of linen cloth used in Scotland for the table.

DORNOCH, the county town of Sutherland, in a parish of the same name, on the Frith of Dornoch. It has five fairs; was made a royal borough in 1628; has a provost, four bailies, dean of guild, and treasurer; and joins with Tain, Dingwall, Wick, Kirkwall, and Cromarty, in electing a representative in parliament.

DOROBAT, a town of Arabia, in the capital of a district in the country of Yemen, situated on the crest of a mountain. Here is a remarkable prison excavated from the rock, wherein malefactors are secured by chains of considerable length. It is twelve miles west of Taas.

DOROGOBUSII, a town of European Russia, in the government of Smolensko, on the Dnieper. It is a place of great trade, and was burnt by the French, in 1812, in their retreat from Moscow. Forty-six miles E. N. E. of Smolensko.

DORONICUM, leopard's bane: a genus of the polygamia superflua order, and syngenesia class of plants; natural order forty-ninth, compositæ. Receptacle naked, the pappus simple; scales of the calyx in a double row, longer than the disc. The seeds of the radius naked without any pappus. There are six species; of which the

DORONICUM PARDALIANCHES, with obtuse heart-shaped leaves, is worthy of notice. It grows naturally in Hungary, and on the Helvetian mountains; but is frequently preserved in the English gardens. It has thick fleshy roots, which divide into many knobs or knees, sending out strong fleshy fibres which penetrate deep into the ground; from these arise in the spring a cluster of heart-shaped leaves, which are hairy, and stand upon foot-stalks: between these arise the flower-stalks, which are channelled and hairy, nearly three feet high, putting out one or two smaller stalks from the side. Each stalk is terminated by one large yellow flower. The plant multiplies very fast by its spreading roots; and the seeds, if permitted to scatter, will produce plants wherever they happen to fall; so that it very soon becomes a weed in the places where it is once established. It loves a moist soil and shady situation. The roots were formerly used in medicine as alexipharmics and purifiers of the blood, but their operation was so violent that they are now entirely laid aside.

DORPAT, or **DORP**, a town in Livonia, European Russia, in the government of Riga. It is situated on the small river Embach or Einbach, on the high road to St. Petersburg, and its annual fair is of great importance. A university has been established here since 1802, with a revenue of from £10,000 to £15,000 sterling. It has a library, museum, and botanic garden, liberally endowed. The environs are very agreeable. Dorpat is an ancient town. In 1704 it was taken and burned by the Russians, and in 1775 was consumed by accidental fire. Population 4500. Sixty-five miles south-west of Narva, 120 N. N. E. of Riga, and 132 south-west of St. Petersburg.

To **DORR**, *v. n.* Teut. *tor*, stupid. To deafen or stupefy with noise. This word I find only in *Skiuner*, says Dr. Johnson.

DORR, *n. s.* So named probably from the noise which he makes. A kind of flying insect, remarkable for flying with a loud noise.

Some insects fly with four wings, as all the vagimpennous, or sheath-winged, as beetles and dorrs.

Browne's Vulgar Errors.

The *dorr* or hedge-chaffer's chief marks are these: his head is small, like that of the common beetle; this, and his eyes black; his shoulder-piece, and the middle of his belly also black; but just under the wing-shells spotted with white. His wing-shells, legs, and the end of his tail, which is long and flat-pointed of a light chesnut; his breast, especially, covered with a downy hair.

Grew's Museum.

DORSEL, *n. s.* } From *dorsum* the back.
DO'RSER. } A pannier; a basket or bag, one of which hangs on either side a beast of burden, for the reception of things of small bulk. It is corruptly spoken, and perhaps written, dossel.

DORSET, a township of Vermont, in Bennington county, bounded by those of Rupert on the west, Manchester on the south, and Danby on the north.

DORSETSHIRE, a county of England, is bounded on the north by Wiltshire and Somersetshire, on the east by Hampshire, on the west by Devonshire and part of Somersetshire, and on the south by the British Channel. It is a maritime county, lying between 50° 30' and 51° 6' N. lat., and 1° 58' and 3° 18' W. long. Across the centre, from north to south, it measures about thirty-six miles; and from east to west about fifty miles. It is said to contain in all about 512,154 acres. The political divisions of the county consist of divisions, hundreds, boroughs, liberties, and tithings. There are nine divisions, thirty-four hundreds, twenty-four market towns, 248 parishes, and four sea-port towns. This county is in the diocese of Bristol, and is divided into five deaneries. It is included in the western circuit, and the assizes are now held at Dorchester. According to Ptolemy and other writers, Dorsetshire under the Romans was inhabited by the Durotriges or Morini; British words implying maritime people, or dwellers on the sea-shore. The Saxon invaders gave the name of Dor-setta to this county, a word compounded of British and Saxon, and signifying the same as the Roman appellations. When the island was divided into Roman provinces, this county became part of Britannia Prima; and, on the establishment of the Saxons, it was included in the kingdom of Wessex. The varied beauties of this county, the mildness of its climate, and the value of its natural productions, have given to it the appellation of 'The Garden of England.' This character, however, is disputed by Mr. Stevenson, in his excellent *View of the Agriculture of the county*, which, he remarks, can scarcely be deemed to be so mild in its temperature, or so early in its seasons, as its latitude would lead us to expect. The fact is evident that the climate of Dorsetshire has undergone a very material alteration; and the air may now, as the same author remarks, be considered dry and salubrious rather than mild and bland; and the seasons, except in spots very sheltered or possessed of a very warm soil, are not nearly so

forward as they are in other parts of England not so far southward.

This county, in respect to soil, is naturally divided into three principal districts, viz. chalky loams, gravelly sand, and clay, or various soils on a clay basis. The chalky district commences on the borders of Somersetshire, near Crewkerne in that county, and runs in a very narrow slip towards the interior of the county, as far as the town of Eversholt, where it suddenly widens, and spreads considerably to the north of Dorchester. It then again abruptly contracts between Piddleton, south, and Bingham's Melcombe, north; but immediately once more extending itself, branches out more than half the breadth of the whole county, and extends into the county of Wilts and the borders of Hampshire. This district contains about 160,759 acres. The sand district, occupying about 85,157 acres, approaches the borders of the British Channel; and, commencing a little east of Dorchester, forms a crescent, the east horn of which terminates near Ringwood in the county of Hampshire. The clayey soils are found in different parts, west, north, and south of the county, but particularly on the northern borders, and in the western districts near Devonshire. This district contains altogether about 117,331 acres.

Of the rivers of this county we may notice the Frome, the Hooke or Owke, the Ivel, the Piddle, the Stour, the Char, the Eype, and the Wey. These three last are the rivers of Dorsetshire bordering upon Devonshire. The celebrated watering-place which is formed by the combined towns of Melcombe Regis and Weymouth, as Mr. Skrine observes, graces the exit of the Wey to the sea, remarkable for its grand semicircular beach, and its excellent as well as level sands. These advantages, and the preference often given to this place by the royal family, have raised it into high consideration; splendid rows of houses being formed, with a superb esplanade in front of them, towards the coast, for a great extent, where they command the whole of the bay, bounded by great chalky cliffs, and backed by the Dorsetshire downs. The pier of Weymouth stretches out beneath an opposite rock, crowned with its garrison, which defends the harbour from the south and west winds, offering a convenient refuge to shipping, and possessing no small portion of trade. The village and high church of Wyke Regis occupy the highest point of this ridge of hills on the west, immediately opposed to the vast protruding mass of Portland Island. The Char and the Eype, which come in succession before the Wey, have no striking points; except that Charmouth, at the exit of the former, on the great western road, is preferred by some, as a bathing-place, to Lyme, which is far more beautifully situated in its neighbourhood. The Eype, joined by the Brit from Bournemouth, and another stream westward of it, falls into the sea in Bridport Harbour, a few miles below that town. These rivers all descend from the Dorsetshire downs, and their course is nearly southward. The most considerable river is the Frome, rising, like the rest, in that vast tract of downs which divides it from Somersetshire; its two channels

uniting in a pleasant bourn at Maiden Newton, from whence it pursues a south-east course to Dorchester; fed afterwards by various streams from the hollows in the downs in the south, and, meeting the Piddle from the north as it turns more and more eastward to reach Wareham, it forms the great expanse of water constituting Poole Harbour. The country through which this river takes its course is but thinly inhabited, and bare of wood; but the range of downs that extend parallel with the latter part of its course, separating its vale from the coast, is formed by Nature in the boldest manner, containing many tumuli and ancient encampments, with the singular curiosity of one perfect Roman amphitheatre near Dorchester, within view of the old fortress of Maiden Castle. Dorchester may be called a pleasant town from the neatness of its streets, and, above all, from the avenues and planted walks by which it is environed and approached, after the manner of many French towns, which have an increased effect in the midst of so bare a country. Wild heaths succeed to the downs before the Frome reaches the sea; and Poole Harbour is a very extensive sheet of water, bounded towards the south-west by the Isle of Purbeck, in which the towers of Corfe Castle make a considerable figure. Poole is a flourishing port on its north shore. The Stour finds its source in six streams at Stourton in Wiltshire, three of which are in the park of Stourhead. Though perhaps somewhat less than the Frome, this is certainly by far the pleasantest of the Dorsetshire streams, forming in its passage the charming dell beneath the cliff of Brianstone. The vicinage of this river in particular, and indeed Dorsetshire in general, is noted for a profusion of fine seats, and a race of noblemen and country gentlemen who exercise the splendid and captivating hospitality of past ages, yet uncontaminated by the encroachment of manufactures. This beautiful river yields trout, eels, and tench; and the author now quoted, Mr. Hutchins, remarks that the sea on the Dorsetshire coast abounds with sturgeons, turbot, mackerel, plaice, soles, basses, whittings, congers, porpoises, lobsters, red and gray mullet, thornbacks, piper or gurnet, trill or scollop, shrimps, prawns, and oysters. The rivers furnish salmon, pike, carp, gudgeons, perch, &c. The Bay of Weymouth opens immediately below Portland; and that tract of Dorsetshire called the Isle of Purbeck stretches out on the opposite side to the south-east, terminating in the point called St. Alban's Head. The range of cliffs which bound this coast, as well as the shoals called The Race of Portland, are extremely dangerous to shipping, and wrecks are very frequent here in stormy seasons. The Cove of Lulworth presents an occasional refuge to small vessels, but its entrance is so narrow as to render it of little use. Immediately behind it, Lulworth Castle occupies a charming elevation, and exhibits a grand baronial pile, in the midst of some ornamented grounds, commanding the sea with good effect, through a gap in the rocks. In the centre of the Isle of Purbeck, Corfe Castle displays its ruined towers on a high eminence with great majesty; and this pleasant district is inhabited

by several respectable families, whose seats make a handsome appearance; the Grange being the most conspicuous. Turning round the point of Purbeck, towards the north, the Bay of Strudland fronts the east, within which is the great expanse of Poole Harbour, marked with several islands, and distinguished by the port of Poole.

Mr. Hutchins remarks of the mineral waters, that 'they are chalybeate at Farrington, Aylwood, and Corfe; sulphureous at Sherford, Morden, Nottingham, and Sherborne; salt at Chilcombe; and petrifying at Sherborne and Botherwood, near Winborne-Minster.' There are no canals in this county, though Mr. Stevenson says that a navigable one is intended to pass from Somersetshire by Chardstock and Dorchester to the sea, near Beer and Seaton, in the county of Devon. The principal produce of Dorsetshire are its fine sheep, its extensive mac-karel fishery, and the celebrated stone quarries in the peninsula or isle of Portland. There are no metallic mines nor coals of any value. The 'pebbly desert,' called the Chesil Bank, is, as Dr. Maton remarks, one of the most extraordinary ridges or shelves of pebbles in Europe, and perhaps the longest, except that of Memel in Polish Prussia. Its length is supposed to be about seventeen miles; its breadth in some places near a quarter of a mile.

Dorsetshire sends thirteen members to parliament: viz. three for the county, two for Dorchester, two for Poole, one for Lyme Regis, two for Weymouth and Melcombe Regis, one for Bridport, one for Shaftesbury, and one for Wareham.

This county has produced among other eminent persons, Anthony Ashley Cooper, Earl of Shaftesbury—Christopher Pitt, a very ingenious poet and divine, born at Blandford, in 1699, died 1748—the learned and celebrated Bishop Stillingfleet—Dr. Thomas Sydenham, one of the most learned and rational physicians of his time, who died 1689—Sir James Thornhill, nephew to the above, an eminent painter—The celebrated Archbishop Wake—The Rev. Samuel Wesley, father to the celebrated founders of Methodism—Thomas Creech, the poet—Matthew Prior, &c. &c.

The principal manufactory in this county is that of flax and hemp, near Bridport and Bournemouth. These produce twine, string, and cordage in general; also nets, sacking, bags, &c. There are also several woollen manufactories, as also for twisting and making up raw silk into skeins. Shirt-buttons are manufactured at Shaftesbury; and malting and brewing are carried on at Wareham, Dorchester, &c.

DORSIFEROUS, *adj.* } *Lat. dorsum* and
DORSIPAROUS. } *Servo, or pario.*

Having the property of bearing or bringing forth on the back. It is used of plants that have the seeds on the back of their leaves, as fern; and may be properly used of the American frog, which brings forth young from her back.

DORSTENIA, *contrayerva*, a genus of the monogynia order and tetrandria class of plants; natural order fifty-third, scabridæ: receptacle common, monophyllous, and carnosus; the seeds lying singly in the carnosous substances. There are eleven species, all low herbaceous plants,

growing in the warm countries of America. The root is used in medicine. It is full of knots, an inch or two in length, about half an inch thick; externally of a reddish-brown color, and pale within; long, tough, slender fibres shoot out from all sides of it, which are generally loaded with small round knots. The root has a peculiar aromatic smell, and a somewhat astringent, warm, bitterish taste, with a light and sweetish kind of acrimony when chewed. The fibres have little taste or smell; the tuberos part, therefore, should only be chosen. Contrayerva is one of the mildest of alexipharmics, and is a useful diaphoretic. Its virtues are extracted both by water and rectified spirit, and do not arise by evaporation with either. The plants cannot be propagated in this country without the greatest difficulty.

DORSUM, the back, in anatomy, comprehends all the posterior parts of the body, from the neck to the buttocks. See **ANATOMY**.

DORT, or **DORDRECHT**, a city of the Netherlands, in the department of Delft, South Holland. It is seated in a small island, formed by the rivers Meuse, Merue, Rhine, and Linghe. The Meuse, on which it stands, gives it a good harbour, and separates it from the islands of Ysselmonde and Ablas. It is divided from Beyerland by a canal. The harbour is very commodious for the merchandise which comes down the Rhine and the Meuse. Its strength consists in being surrounded with water, its walls being old and decayed. Dort is well built with brick, and had formerly the exclusive right of coining money. The church of Notre Dame is a good building, the tower lofty, and furnished with musical chimes. There is another church, dedicated to St. Nicholas, built in 1568. It had likewise, before the revolution, several religious houses for monks and nuns; and the town house is a fine building. It is at present the staple town for wines, particularly Rhenish, though its exclusive privileges in this respect are abolished. It was detached from the main land in 1421, on the 17th November, by a flood occasioned by the breaking down of the dyke, which overwhelmed seventy villages, and about 100,000 persons. However, by time, and the industry of the inhabitants, a great part of the land is recovered. It has two principal canals, namely, the New and Old Haven, by which heavy-loaded vessels may enter into the city. Over the Old Haven is a large bridge, well built with brick. Dort was almost reduced to ashes in 1457, there being then consumed 2000 houses, with the halls, hospital, and church of Notre Dame. The company of tradesmen, and some other communities, elect the magistrates, and name one part of the members of the city council. In former times, Dort was the residence of the counts of Holland; and, on the foundation of the Dutch republic, it became the first in rank of the towns of Holland at the States-general.

This city is famous for the meeting of the clergy, called the synod of Dort, in which the Calvinists obtained a sentence against the Arminians, who were called Remonstrants. The dispute between the contending parties occasioned disorders, skirmishes, and murders, in

most of the principal cities. Those ministers, who would not subscribe to the decree of the synod, were banished, of whom there were above 100. An important object of commerce here, at present, is the timber brought in large floats down the Rhine, and either exported to England, Spain, and Portugal, or prepared for different uses in the saw-mills which skirt the town. Here are several excellent docks for ship-building, and a brisk trade is carried on in the yarn and linen, as well as in the salt manufacture. The salmon-fisheries here established are also productive.

The brothers, De Witt, were sons of the burgo-master of this place; and the celebrated Vos-sius was once superintendent of the college here. Population about 20,000. Dort lies eleven miles south-east of Rotterdam, and thirty-seven west of Amsterdam.

DORT, SYNOD OF, a national synod, summoned by authority of the states-general, the provinces of Holland, Utrecht, and Overijssel excepted, and held at Dort in 1618. The most eminent divines of the United Provinces, and deputies from the churches of England, Scotland, Switzerland, Bremen, Hessaia, and the Palatinate, assembled on this occasion, in order to decide the controversy between the Gomarists or Calvinists, and Arminians; the latter were declared corrupters of the true religion. But the authority of this synod was far from being universally acknowledged either in Holland or in England. The provinces of Friesland, Zealand, Utrecht, Guelderland, and Groningen, could not be persuaded to adopt their decisions; and they were opposed by king James I. and archbishop Laud, in England. The reformed churches in France, though at first disposed to give a favorable reception to the decisions of this famous synod, in process of time espoused doctrines very different from those of the Gomarists; and the churches of Brandenburg and Bremen would not suffer their doctors to be tied down to the opinions and tenets of the Dutch divines. The liberty of private judgment, with respect to the doctrines of predestination and grace, which the spirit that prevailed among the divines of Dort seemed so much adapted to discourage and suppress, acquired new vigor in consequence of the arbitrary proceedings of this assembly.

DORTMUND, a rich, populous, and once imperial city of Germany, in the circle of Westphalia, and territory of Nassau-Dillenburg, to which it was ceded in 1802; but it was ceded to Prussia in 1815. It is pretty large, but not well built. Formerly it was one of the Hanse Towns. Its territory was also formerly a county, and had lords of its own; but since 1504 it has been possessed entirely by the city. Here are four Lutheran churches, one Catholic, a Dominican and a Franciscan monastery, a nunnery, three hospitals, and a provincial academy. Population 4000. It is seated on the Emster, forty miles north-east of Cologne.

DORYPHORI; from *δορυ*, a spear, and *φερω*, to bear; an appellation given to the life-guard men of the Roman emperors. They were held in such estimation as frequently to have the command of armies conferred on them. It was

usual also for chief commanders to have their doryphori or life-guards to attend them.

DOSE, *v. n.* Fr. *dose*; Ital. Teut. Span. Port. and Lat. *dosis*, from Gr. *δοσις* à *διδοναι*, to give. A given quantity of medicine, or any other thing; hence any thing nauseous.

No sooner does he peep into
The world, but he has done his doe;
Married his punctual dose of wives,
Is cuckolded, and breaks, or thrives. *Hudibras.*

The too vig'rous dose too fiercely wrought,
And added fury to the strength it brought.

Dryden's Virgil.

If you can tell an ignoramus in power and place
that he has a wit and understanding above all the
world, I dare undertake that, as fulsome a dose as you
give him, he shall readily take it down. *South.*

In a vehement pain of the head he prescribed the
juice of the thapsia in warm water, without mending
the dose. *Arbutnot.*

We pity or laugh at those fatuous extravagants,
while yet ourselves have a considerable dose of what
makes them so. *Granville.*

DOSITHEUS, the chief of a faction among the Samaritans, mentioned by Origen, Epiphanius, Jerome, and other Greek and Latin fathers. But the learned are not at all agreed as to the time wherein he lived. St. Jerome, in his Dialogue against the Luciferians, places him before our Saviour; in which he is followed by Drusus, who, in his answer to Serrarius, places him about the time of Sennacherib, king of Assyria. But Scaliger will have him posterior to our Saviour's time. And Origen intimates him to have been contemporary with the apostles; where he observes, that he endeavoured to persuade the Samaritans that he was the Messiah foretold by Moses. He had many followers; and his sect was still subsisting at Alexandria at the time of the patriarch Eulogius, as appears from a decree of that patriarch published by Phocius. In that decree, Eulogius accuses Dositheus of injuriously treating the ancient patriarchs and prophets, and attributing to himself the spirit of prophecy. He makes him contemporary with Simon Magus, and accuses him of corrupting the Pentateuch in divers places, and of composing several books directly contrary to the law of God. Archbishop Usher takes Dositheus to have been the author of all the changes made in the Samaritan Pentateuch, which he argues from the authority of Eulogius. But all we can justly gather from the testimony of Eulogius is, that Dositheus corrupted the Samaritan copies since used by that sect; but that corruption did not pass into all the copies of the Samaritan Pentateuch now in use among us, many of which vary but little from the Jewish Pentateuch. And in this sense, we are to understand that passage in a Samaritan chronicle, where it is said, that Dousis, i. e. Dositheus, altered several things in the law of Moses. The author of that chronicle, who was a Samaritan by religion, adds, that their high priest sent several Samaritans to seize Dousis and his corrupted copy of the Pentateuch. Epiphanius takes Dositheus to have been a Jew by birth, and to have abandoned the Jewish party for that of the Samaritans. He imagines him likewise

to have been the author of the sect of the Sadducees; which is inconsistent with his being later than our Saviour; and yet the Jesuit Serrarius makes Dositheus the master of Sadoc, from whom the Sadducees are derived. Tertulian observes, that Dositheus was the first who dared to reject the authority of the prophets, by denying their inspiration. But he charges that as a crime peculiar to this sectary, which in reality is common to the whole sect, who never allowed any but the five books of Moses to be divine.

DOSSIL, *n. s.* Corrupted from *dorsel*, something laid upon the part. A pledget; a nodule or lump of lint to be laid on a sore.

Her complaints put me upon dressing with such medicaments as basilicon, with præcipitate, upon a dossil. *Wiscman.*

DOT, *v. a., v. n. & n. s.* Derived by Skinner from *Ger. dotter*, the white of an egg; and interpreted by him a grume of pus. It has now no such signification, and seems rather corrupted from *jot* a point. A small point or spot made to mark any place in a writing. To mark with specks; to make dots or spots.

DOTAL, *adj.* *Lat. dotalis.* Relating to the portion of a woman; constituting her portion; comprised in her portion.

Shall I, of one poor dotal town possess,
My people thin, my wretched country waste,
An exiled prince, and on a shaking throne,
Or risk my patron's subjects, or my own?

Garth's Ovid.

NOTE, *v. n.* } *Goth. dotla; Fr. dot-*
DO'TAGE, *n. s.* } *ter, or radoter; Belgic,*
DO'TARD, *n. s.* } *doten; to be dozing. To*
DO'TED, *adj.* } *have the mind impaired*
DO'TER, *n. s.* } *by age or otherwise; to*
DO'TINGLY, *adv.* } *have extreme or foolish*
fondness; often used with *on* or *upon*. Doted is stupid: dotage is a state of imbecility or decayedness of mind; excessive fondness. Dotard and doter, he who is thus imbecile.

A sword is upon the liars, and they shall dote; a sword is upon her mighty men, and they shall be dismayed. *Jer. i. 36.*

His senseless speech and doted ignorance
The prince had marked well. *Spenser.*

Dotard, said he, let be thy deep advise,
Seems that through many years thy wits thee fail,
And that weak old hath left thee nothing wise,
Else never should thy judgment be so frail.

Færie Queene.

Unless the fear of death make me dote,
I see my son. *Shakspeare. Comedy of Errors.*
I have long loved her, and bestowed much on her,
followed her with a doting observance. *Shakspeare.*

If in black my lady's brow be deckt,
It mourns that painting and usurping air
Should ravish doters with a false aspect;
And therefore is she born to make black fair. *Id.*

O vanity,

How are thy painted beauties doted on,
By light and empty idiots! *Ben Jonson.*

The soul in all hath one intelligence,
Though too much moisture in an infant's brain,
And too much driness in an old man's sense,
Cannot the prints of outward things retain:

Then doth the soul want work, and idle set;
And this we childishness and dotage call. *Davies.*

No, no; I know the world too well to dote upon it.
Bp. Hall. Letter from the Tower.

What should a bald fellow do with a comb, a dumb doter with a pipe, or a blind man with a looking-glass?
Burton.

Our doters upon red and white are incessantly perplexed by the incertainty both of the continuance of their mistress's kindness, and of the lasting of her beauty. *Boyle.*

All the beauties of the court besides
Are mad in love, and dote upon your person. *Denham*

Time has made you dote, and vainly tell,
Of arms imagined in your lonely cell:
Go, be the temple and the gods your care;
Permit to men the thought of peace and war.

Dryden's Æneid.

That he, to wedlock dotingly betrayed,
Should hope in this lewd town to find a maid!

Id. Juvenal.

We dote upon this present world, and the enjoyments of it; and 'tis not without pain and fear, and reluctance, that we are torn from them, as if our hopes lay all within the compass of this life. *Burnet.*

The sickly dotard wants a wife,
To draw off his last dregs of life. *Prior.*

When an old woman begins to dote, and grow chargeable to a parish, she is turned into a witch, and fills the country with extravagant fancies.

Addison's Spectator.

O death all eloquent! you only prove
What dust we dote on, when 'tis man we love. *Pope.*

Some, for renown, or scraps of learning dote,
And think they grow immortal as they quote. *Young.*

In vain their gifts the bounteous seasons pour,
The fruit autumnal and the vernal flower,
With listless eyes the dotard views the store,
He views and wonders that they please no more.

Johnson. Vanity of Human Wishes.

A strict accountant of his beads,
A subtle disputant on creeds;
His dotage trifled well:
Yet better had he neither known
A bigot's shrine, nor despot's throne.

Byron.

DO'TTARD, *n. s.* This word seems to signify a tree kept low by cutting; or is perhaps a false spelling of dotard, and means any thing decayed.

For great trees, we see almost all overgrown trees in church-yards, or near ancient buildings, and the like, are pollards and dottards, and not trees at their full height. *Bacon.*

DOTTEREL, *n. s.* From dote. The name of a bird that mimics gestures.

We see how ready apes and monkeys are to imitate all motions of man; and in catching of dotterels, we see how the foolish bird playeth the ape in gestures. *Bacon.*

DOUAY, a city of France, in the department of the North (of which it was for some time the capital), and ci-devant French Flanders. It has a fine arsenal, a foundry for cannon, and a military and artillery school. The fort of Scarpe, on the river of that name, within cannon-shot, serves for a citadel. It has three famous colleges, incorporated of late into one; and the great squares in the centre of the city, and the principal church, are worthy of notice. It was

erected into a university by Philip II. of Spain, who founded in it a seminary for English Roman Catholics in 1569. In 1667 it was taken from the Spaniards by Louis XIV. in person. The allies, under the duke of Marlborough, took it in 1710; but it was retaken by the French in 1711, after the suspension of arms between Great Britain and France. During the late wars it was the scene of several operations. It has a canal communication with the Deule, and contains 18,000 inhabitants, many of whom are employed in the manufactures of linen, cotton, lace, and thread. It is fifteen miles north-west of Cambray, and eighty-three N.N.E. of Paris.

DOUB'LE, *v. a. & v. n.*

DOUB'LE-BITING, *adj.*

DOUB'LE-DEALER, *n. s.*

DOUB'LE-DIE, *v. a.*

DOUB'LE-FOUNDED, *adj.*

DOUB'LE-HANDED,

DOUB'LE-HEADED,

DOUB'LE-LOCKED,

DOUB'LE-MINDED,

DOUB'LE-MINDEDNESS, *n. s.*

DOUB'LE-PLEA,

DOUB'LE-QUARREL,

DOUB'LER,

DOUB'LE-SHINING, *adj.*

DOUB'LE-TONGUED,

DOUB'LY, *adv.*

to twice the quantity; to turn back or about: as a substantive, twice the number; very strong beer; a trick or artifice. Doubleness is the state of being double; duplicity. The compounds seem obvious in their meaning.

The prestis that ben wel gouvernour is he thei had worthi to double onour, moost thei that traueilen in word and teching. *Wiclif. i. Tymo. 5.*

If the thief be found, let him pay double.

Exodus.

Thou shalt double the curtain in the tabernacle.

Id.

A double-minded man is unstable in all his ways.

James.

The deacons must be grave, not double-tongued, not given to much wine, nor greedy of filthy lucre.

1 Tim.

He was like a maister or a pope:

Of double worsted was his semicope,

That round was as a belle out of the presse,

Somewhat he lisped for his wantonnesse.

Chaucer. Prol. to Cant. Tales.

He oft finds med'cine who his grieve imparts,
But double griefes afflict concealing harts,
As raging flames who striveth to suppress.

Spenser. Faerie Queene.

If you think well to carry this as you may, the
doubleness of the benefit defends the deceit from reproof.

Shakspeare.

Rumour doth double voice and echo

The numbers of the feared. *Id. Henry IV.*

I' the presence

He would say untruths, and be ever double

Both in his words and meaning.

Id. Henry VIII.

Here's a pot of good double, neighbour: drink
and fear not your man.

Id. Henry VI.

Thou shalt not be the worse for me; there's gold.
—But that it would be double-dealing, Sir I would
you could make it another. *Id. Twelfth Night.*

Sailing along the coast, he doubled the promontory
of Carthage, yet famous for the ruins of that proud
city. *Knolles.*

Great honours are great burthens; but on whom
They are cast with envy, he doth bear two loads:
His cares must still be double to his joys,
In any dignity. *Ben Jonson's Catiline.*

It is a curiosity also to make flowers double, which
is effected by often removing them into new earth;
as, on the contrary part, double flowers, by neglecting,
and not removing, prove single.

Bacon's Natural History.

Under the line the sun crosseth the line, and
maketh two summers and two winters: but in the
skirts of the torrid zone it doubleth and goeth back
again, and so maketh one long summer. *Id.*

Here the double-founded stream

Jordan, true limit eastward.

Milton.

And if one power did not both see and hear,
Our sights and sounds would always double be.

Davies.

Jarres concealed are half reconciled; which, if
generally known, 'tis a double task, to stop the breach
at home, and men's mouths abroad.

Fuller.

Double-dealers may pass muster for awhile; but all
parties wash their hands of them in the conclusion.

L'Estrange.

Our foe's too proud the weaker to assail,

Or doubles his dishonour if he fail.

Dryden.

He saw proud Arcite and fierce Palemon

In mortal battle doubling blow on blow;

Like lightning flamed their falchions to and fro.

Id.

Now we have the Cape of Good Hope in sight,
the trade-wind is our own, if we can but double it.

Id.

Who knows which way she points?

Doubling and turning like a hunted hare

Find out the meaning of her mind who can. *Id.*

Throw Egypt's by, and offer in the stead,

Offer—the crown on Berenice's head:

I am resolved to double till I win.

Id. Tyrannio Love.

Reverend, fat, old gouty friar,

With a paunch swoln so high, his double chin

Might rest upon it.

Id. Spanish Friar.

But most their looks on the black monarch bend,
His rising muscles and his brawn commend;

His double-biting ax, and beamy spear,

Each asking a gigantic force to rear. *Id. Fables.*

For much she feared the Tyrians double-tongued,

And knew the town to Juno's care belonged.

Id. Virgil.

Yes, I'll to the royal bed,

Where first the mysteries of our love were acted,

And double-die it with imperial crimson.

Id. and Lee.

This power of repeating or doubling any idea we
have of any distance, and adding it to the former, as
often as we will, without being ever able to come to
any stop or stint, is that which gives us the idea of
immensity.

Locke.

All things being double-handed, and having the
appearances both of truth and falsehood, where our
affections have engaged us, we attend only to the
former.

Glanville's Scepis.

In all the four great years of mortality above men-
tioned, I do not find that any week the plague in-
creased to the double of the precedent week above
five times.

Graunt's Mortality.

He was

Among the rest that there did take delight
To see the sports of *double-shining* day. *Sidney.*

'Tis observed in particular nations, that within the
space of three hundred years, notwithstanding all
casualties, the number of men *doubles*.

Burnet's Theory.

Haply at night he does with horror shun
A widowed daughter, or a dying son :
His neighbour's offspring he to-morrow sees,
And *doubly* feels his want in their increase.

Prior.

He bought her sermons, psalms, and graces,
And *doubled* down the useful places. *Id.*

He immediately *double-locked* his door, and sat down
carefully to reading and comparing both his orders.

Tutler.

These men are too well acquainted with the chase,
to be flung off by any false steps or *doubles*. *Addison.*

Our poets have joined together such qualities as
are by nature most compatible; valour with anger,
meekness with piety, and prudence with dissimulation :
this last union was necessary for the goodness
of Ulysses; for, without that, his dissimulation might
have degenerated into wickedness and *double-dealing*.

Broome's View of Epic Poetry.

I am not so old in proportion to them as I formerly
was, which I can prove by arithmetick; for then I
was *double* their age, which now I am not. *Swift.*

So keen thy hunters, and thy scent so strong,
Thy turns and *doublings* cannot save thee long. *Id.*

The sum of forty thousand pounds is almost *double*
to what is sufficient. *Id. Drap. Letters.*

Double-plea is that in which the defendant alledges
for himself two several matters, in bar of the action
whereof either is sufficient to effect his desire in de-
barring the plaintiff. *Cowell.*

Double-quarrel, is a complaint made by any clerk
or other to the archbishop of the province, against an
inferiour ordinary, for delaying justice in some cause
ecclesiastical. The effect is, that the archbishop di-
rects his letters, under the authentical seal, to all
clerks of his province, commanding them to admonish
the said ordinary within nine days to do the justice
required, or otherwise to cite him to appear before
him or his official; and lastly to intimate to the said
ordinary, that if he neither performs the thing en-
joined, nor appears at the day assigned, he himself
will proceed to perform the justice required. And this
seems to be termed a *double-quarrel*, because it is most
commonly made against both the judge, and him at
whose petition justice is delayed. *Id.*

Man is frail,

Convulsions rack his nerves, and cares his breast ;
His flying life is chased by ravening pains,
Through all his *doubles*, in the winding veins.

Blackmore.

Lilies are by plain direction
Emblems of a *double* kind ;
Emblems of thy fair complexion
Emblems of thy fairer mind. *Cotton.*

The double rich scarlet nonsuch is a large *double-*
headed flower, of the richest scarlet colour. *Mortimer.*

Every man hath a weak side. Every wise man
knows where it is, and will be sure to keep a *double*
guard there. *Mason.*

Since hope but soothes to *double* my distress,
And every moment leaves my little less.

Johnson's London.

Far and wide

Temple and tower went down, nor left a site :—
Chaos of ruins ! who shall trace the void,
O'er the dim fragments cast a lunar light,
And say, ' here was, or is, ' where all is *doubly* night ?
Byron.

DOUBLE EMPLOYMENT, in music, a name given
by M. Rameau to the two different manners in
which the chord of the subdominant may be
regarded and treated, viz. as the fundamental
chord of the sixth superadded, or as the chord of
the great sixth, inverted from a fundamental chord
of the seventh. In reality, the chords carry
exactly the same notes, are figured in the same
manner, are employed upon the same chord of
the tone, in such a manner, that frequently we
cannot discern which of the two chords the au-
thor employs, but by the assistance of the subse-
quent chord, which resolves it, and which is dif-
ferent in these different cases. To make this
distinction, we must consider the diatonic pro-
gress of the two notes which form the fifth and
the sixth, and which, constituting between them
the interval of a second, must one or the other
constitute the dissonance of the chord. Now
this progress is determined by the motion of the
bass. Of these two notes, then, if the superior
be the dissonance, it will rise by one gradation
into the subsequent chord, the lower note will
keep its place, and the higher note will be a su-
peradded sixth. If the lower be the dissonance,
it will descend into the subsequent chord, the
higher will remain in its place, and the chord will
be that of the great sixth. See the two cases of
the double employment in Rousseau's Musical
Dictionary.

DOUBLE FICHE, or DOUBLE FICHY, in heraldry,
the denomination of a cross, when the extremity
has two points; in contradistinction to *fiché*,
where the extremity is sharpened away to one
point.

DOUBLE OCTAVE, in music, an interval com-
posed of fifteen notes in diatonic progression,
and which, for that reason is called a fifteenth.
' It is,' says Rousseau, ' an interval composed of
two octaves, called by the Greeks *disdiapason*.'

DOUBLET, *n. s.* from double. The inner
garment of a man; the waistcoat; so called
from being double for warmth, or because it
makes the dress double.

What a pretty thing a man is, when he goes in his
doublet and hose, and leaves off his wit !

Shakspeare.

His *doublet* was of sturdy buff,
And though not sword, yet cudgel-proof.

Hudibras.

Two; a pair.

' Those *doublets* on the sides of his tail seem to add
strength to the muscles which move the tail fins.

Cruik's Museum.

It is common enough to see a countryman in the
doublet and breeches of his great grand-father.

Addison on Italy.

They do but mimic ancient wits at best,
As apes our grandsires, in their *doublets* drest.

Pope.

DOUBLET, among lapidaries, implies a coun-
terfeit stone composed of two pieces of crystal,

and sometimes glass softened, together with proper colors between them; so that they make the same appearance to the eye as if the whole substance of the crystal had been tinged with these colors. The impracticability of imparting tinges to the body of crystals, while in their proper and natural state, and the softness of glass, which renders ornaments made of it greatly inferior in wear to crystal, gave inducements to the introduction of coloring the surface of crystal wrought in a proper form, in such a manner, that the surfaces of two pieces so colored being laid together, the effect might appear the same as if the whole substance of the crystal had been colored. The crystals, and sometimes white transparent glass so treated, were called doublets; and at one time were greatly in use, on account of the advantages, with respect to wear, such doublets had, when made of crystal, over glass, and the brightness of the colors which could with certainty be given to counterfeit stones this way, when colored glass could not be procured, or at least not without a much greater expense. Doublets have not indeed the property which the others have, of bearing to be set transparent, as is frequently required in drops of ear-rings and other ornaments: but when mounted in rings, or used in such manner that the sides of the pieces where the joint is made cannot be inspected, they are, when formed of crystal, preferable to the colored glass; and the art of managing them is therefore, in some degree, of the same importance with that of preparing glass for counterfeiting gems; and is therefore properly an appendage to it, as being entirely subservient to the same intention.

DOUBLETS, a game on dice within tables; the men, which are only fifteen, being placed thus. Upon the size, cinque, and quatre points, there stand three men apiece; and upon the trey, deuce, and ace, only two. He that throws highest has the benefit of throwing first, and what he throws he lays down, and so does the other: what the one throws, and has not, the other lays down for him, but on his own account; and thus they do till all the men are down, and then they bear. He that is down first, bears first; and will doubtless win the game, if the other throws not doublets to overtake them: which he is sure to do, since he advances or bears as many as the doublets make, viz. eight for two fours.

DOUBLING, among hunters, is applied to a hare, which is said to double, when she keeps in plain fields, and winds about to deceive the hounds.

DOUBLING, in the manege, a term used of a horse, who is said to double his reins, when he leaps several times together to throw his rider.

DOUBLING, in the military art, is the putting two ranks or files of soldiers into one. Thus, when the word of command is, Double your ranks, the second, fourth, and sixth ranks march into the first, third, and fifth, so that the six ranks are reduced to three, and the intervals between the ranks become double what they were before.

DOUBLING UPON, in naval tactics, the act of enclosing any part of a hostile fleet between two fires, or of cannonading it on both sides. It is

usually performed by the van or rear of that fleet which is superior in number, taking the advantage of the wind, or other circumstances, and tacking or veering round the van or rear of the enemy, who will thereby be exposed to great danger, and can scarcely avoid being thrown into general confusion.

DOUBLOON', *n. s.* Fr. A Spanish coin containing the value of two pistoles.

DOUBS, a department of France, bounded on the north by those of the Upper Saone and Upper Rhine; on the south-west by the department of Jura, and on the north-west by that of Upper Saone. It comprehends part of the ci-devant province of Franche Comté. Besançon is the capital.

DOUBT, *v. a., v. n. & n. s.* } Fr. *douter*
DOUBTER, *n. s.* } from Lat. *dubi-*
DOUBTFUL, *adj.* } to, i. e. *duo* and
DOUBTFULLY, *adv.* } co, *ito*, to go.
DOUBTFULNESS, *n. s.* } To hold ques-
DOUBTING, *n. s.* } tionable or in
DOUBTINGLY, *adv.* } danger; to fear;
DOUBTLESS, *adj. & adv.* } suspect; dis-
trust; fill with distrust and fear. As a neuter verb, to question: be in uncertainty; hesitate; waver; suspect; sometimes taking *of*. As a substantive it means, uncertainty; difficulty of determination; suspension of mind, as well as the causes of it; and the effects, danger and fear. Doubtless is, without doubt. The examples will make the other derivatives plain.

But axe he in faith, and *doute* nothing, for he tha *doutith* is lyk to a waive of the see which is mowed and borun aboute of wynd. *Wiclif. James i.*

I desire to be present with you now, and to change my voice; for I stand in doubt of you. *Gal. iv. 20.*

Knowing how *doubtfully* all allegories may be construed, and this book of mine being a continual allegory, I have thought good to discover the general intention. *Spenser.*

Even in matters divine, concerning some things, we may lawfully *doubt* and suspend our judgment, inclining neither to one side or other; as, namely, touching the time of the fall both of man and angels. *Hooker.*

Christ promiseth his Spirit shall be in him to whom he giveth it a spring of water running unto eternal life; also that he witnesseth them which believe in him already to be passed all *doubt* and death, and to be presently in eternal life.

MS. Notes of Bradford the Martyr

Friendship is a thing so rare, as it is *doubted* whether it be a thing indeed or but a word.

Sir P. Sidney.

The virtues of the valiant Caratach,
More *doubt* me than all Britain.

Beaumont and Fletcher.

Our *doubts* are traitors,
And make us lose, by fearing to attempt
The good we oft might win. *Shakespeare.*

Methinks I should know you, and know this man;
Yet I am *doubtful*. *Id. King Lear.*

Doubting things go ill, often hurts more
Than to be sure they do. *Id. Cymbeline.*

He did ordain the interdicts and prohibitions which we have to make entrance of strangers, which at that time was frequent, *doubting* novelties and commixture of manners. *Puer n.*

In handling the right of a war, I am not willing to intermix matter *doubtful* with that which is out of *doubt*; for, as in capital causes, wherein but one man's life is in question, the evidence ought to be clear; so much more in a judgment upon a war, which is capital to thousands. *Id.*

Whatsoever a man imagineth *doubtfully*, or with fear, must needs do hurt, if imagination have any power at all; for a man representeth that oftener that he feareth, than the contrary. *Id. Natural History.*

Solyman said he had hitherto made war against divers nations, and always had the victory, whercof he *doubted* not now also.

Knolles's History of the Turks.

What fear we then, why *doubt* we to incense His utmost ire? *Milton.*

He from the terror of this arm so late
Doubted his empire. *Id. Paradise Lost.*
Thus they their *doubtful* consultations ended. *Milton.*

We have sustained one day in *doubtful* fight,
What heaven's high Lord had powerfuller. *Id.*

I *doubt* not to make it appear, to be a monstrous
felly to deride holy things. *Tillotson.*

All their desires, deserts, or expectations, the Conqueror had no other means to satisfy, but by the estates of such as had appeared open enemies to him, and *doubtless* many innocent persons suffered in this kind. *Hale's Common Law.*

Nor did the goddess *doubtfully* declare
Her altered mind, and alienated care. *Dryden.*

At first the tender blades of grass appear,
And buds, that yet the blast of Eurus fear,
Stand at the door of life and *doubt* to clothe the year. *Id.*

Those who have examined it, are thereby got past
doubt in all the doctrines they profess. *Locke.*

In arguing, the opponent uses as comprehensive and equivocal terms as he can, to involve his adversary in the *doubtfulness* of his expressions; and therefore the answerer, on his side, makes it his play to distinguish as much as he can. *Id.*

Let no man, while he lives here in the world,
doubt whether there is any hell or no, and thereupon live so, as if absolutely there were none. *South.*

In *doubtful* cases, reason still determines for the safer side; especially if the case be not only *doubtful*, but also highly concerning, and the venture be a soul and an eternity. *Id.*

Doubtless many men are finally lost, who yet have no men's sins to answer for but their own. *Id.*

Can we conclude upon Luther's instability, because in a single notion, no way fundamental, an enemy writes that he had some *doubtings*? *Atterbury.*

The king did all his courage bend
Against those four which now before him were,
Doubting not who behind him doth attend. *Daniel.*

This is enough for a project, without any name; I
doubt more than will be reduced into practice. *Swift.*

Most of his philosophy is in broken sentences, delivered with much *doubtfulness*. *Baker on Learning.*

To teach vain wits a science little known,
To admire superior sense, and *doubt* their own. *Pope.*

Doubtless, oh guest! great laud and praise were
mine,
If after social rites and gifts bestowed,
I stained my hospitable hearth with blood. *Id. Odyssey.*

Though *doubtfulness* or uncertainty seems to be a
medium between certain truth and certain falsehood

in our minds, yet there is no such medium in things
themselves. *Watts.*

Hippocrates commends the flesh of the wild sow
above the tame; and no *doubt* but the animal is more
or less healthy, according to the air it lives in.

Arbuthnot on Aliments.

Should reason guide thee with her brightest ray,
And pour on misty *doubt* resistless day;
Yet hope not life from grief or danger free,
Nor think the doom of man reversed for thee.

Johnson. Vanity of Human Wishes.

If I were to form a judgment from experience rather
than theory, I should *doubt* much whether the capa-
city for, or even the possession of, a seat in parliament,
did really convey much of power to be properly called
political. *Burke.*

But dreadful is their doom, when *doubt* has driven
To censure Fate and pious Hope forego:
Like yonder blasted boughs by lightning riven,
Perfection, beauty, life, they never know;
But frown on all that pass, a monument of woe. *Beattie.*

Here Cocks heroic burn with rival rage,
And Quails with Quails in *doubtful* fight engage;
Of armed heels and bristling plumage proud,
They sound the insulting clarion shrill and loud. *Darwin.*

Well was taught my brow that pride serene
Which looks no triumph where no *doubt* had been;
That easy scorn, all tranquil as before,
Which speaks no insult, and insults the more;
And with calm air, the surest to torment,
Steals angry Spite's last torment, to resent. *Dr. T. Brown.*

DOUBTING, the act of withholding our assent from any proposition on suspicion that we are not able peremptorily to decide between the reasons for and against it. Doubting is distinguished by the schoolmen into two kinds, *dubitatio sterilis*, and *dubitatio efficax*. The former is that where no determination ensues: in this manner the Sceptics and Academics doubt, who withhold their assent from every thing. See *SCPTICS*, &c. The latter is followed by judgment, which distinguishes truth from falsehood; such is the doubting of the Peripatetics and Cartesianes. The last in particular perpetually inculcate the deceitfulness of our senses, and tell us that we are to doubt of every one of their reports, till they have been examined and confirmed by reason. On the other hand the Epicureans teach, that our senses always tell truth; and that if we go ever so little from them we come within the province of doubting.

DOUBTING, in rhetoric, a figure wherein the orator appears some time fluctuating, and undetermined what to do or say. Tacitus furnishes us with an instance of doubting, almost to a degree of distraction, in those words of Tiberius written to the senate: *Quid scribam, P. S. aut quomodo scribam, aut quid omnino non scribam hoc tempore, dii me dæque pejus perdat quam perire quotidie sentio, si scio.*

DOUCET, *n. s. Fr. doucet*. A custard. This word I find only in Skinner and Ainsworth, says Dr. Johnson. The *Archælog*, vol. xv., mentions it frequently as a part of the diet of Charles I. when duke of York.

DOUCINE, in architecture, a moulding, concave above and convex below, serving commonly

as a cymatium to a delicato corniche. It is likewise called Gula.

DOUCK'ER, *n. s.* *Colymbus*; from *To douck*, corrupted from *To duck*. A bird that dips in the water.

The colymbi, or *douckers*, or loons, are admirably conformed for diving, being covered with thick plumage, and their feathers so slippery that water cannot moisten them.

DOVE, *n. s.* } Goth. *dufa*; Sax. *duu*,
DOVE'COTE, } Swed. *dufwa*; Arm. *dube*;
DOVEHOUSE, } perhaps from Heb. דור, to
DOVE-LIKE, *adj.* } murmur (Parkhurst), or
DOVE-TAILED, *adj.* } from Gr. *deuo*, to purify;
for the Lat. *columba*, a dove, is formed from *κολυμβειν*, a diver. A bird of the *COLUMNA* genus, which see: a dove-cote and dovehouse both mean a habitation for doves.

And whanne Jhesus was baptisid, anon he wente up fro the watir, and lo hevenges were opened to him: and he saw the Spirit of God comynge downe as a dove and comynge on him. *Wiclif. Matt. iii.*

So shews a snowy dove trooping with crows,
As yonder lady o'er her fellows shows.

Shakspeare. Romeo and Juliet.

Like an eagle in a dove-cot, I
Fluttered your Volscians in Corioli;
Alone I did it. *Id. Coriolanus.*

Let, Love! thou'rt blinder than thyself in this,
To vex my dove-like friend for my amiss,
And when one sad truth may expiate
Thy wrath, to make her fortune run my fate.

Donne.

Pamphlets are the weekly almanacks, shewing what weather is in the state, which, like the doves of Aleppo, carry news to every part of the kingdom.

T. Ford. 1647.

The dove is sent forth, a fowl both swift and simple.
She, like a true citizen of the ark, returns.

Bp. Hall. Contemplations.

Thou from the first

Wast present, and with mighty wings outspread,
Dove-like, sat'st brooding on the vast abyss,

And mad'st it pregnant. *Milton.*

The hawk sets up for protector, and makes havoc in the dove-house.

L'Estrange.

When a man is made up wholly of the dove, without the least grain of the serpent in his composition, he becomes ridiculous in many circumstances of life, and very often discredits his best actions. *Addison.*

He made an administration so chequered and speckled; he put together a piece of joinery so crossly indented and whimsically dove-tailed; a cabinet so variously inlaid; such a piece of diversified mosaic; such a tessellated pavement without cement, &c.

Burke. Character of Lord Chatham.

Dove, in geography, a river of England, in Derbyshire, which rises in the Peak, divides that county from Staffordshire, and falls into the Trent, four miles north of Burton.

DOVE-DALE, one of the most romantic spots in Derbyshire, where the Dove runs in a chasm between precipitous rocks. It is situated near Ashborn.

DOVER, a cinque-port, sea-port, and market town of Kent, is a place of considerable historical and topographical interest. Camden and others suppose it to derive its name from the British word *Dwfyrrha*, which signifies a steep place: the Saxons called it *Dorfa*, and Antoninus, in his Itinerary, *Dubris*. It is probable that the Roman town stood on the south side of the Dour, and

VOL. VII.

that the Watling Street entered it near the old Biggen-gate.

That the ancient Britons possessed it as a military post, anterior to the Roman conquest, is also extremely probable: and that the Romans fortified and adapted it to their system of tactics is universally admitted. The old tradition, quoted and confirmed by Mr. King in his *Munimenta Antiqua*, vol. ii., is, that 'Arviragus, the British chief, here fortified himself, when he refused to pay the tribute imposed by Julius Cæsar; and that here, afterwards, king Arthur also held his residence.' Darrell, in his *History of Dover Castle*, has given currency to another tradition, which assigns the foundation of this fortress to Cæsar: and Lambard quotes Lidgate and Rosse, as saying, that 'they of the castle kept till this day certain vessels of olde wine and salte, which they affirme to be the remayne of suche provision as he (Cæsar) brought into it.' Cæsar's own narrative, however, would lead us to no such conclusion. He speaks of being repulsed by the inhabitants of this part of Kent; and most probably landed, in his first expedition, at Deal. The Roman writers, indeed, do not affect to speak of him as having made any conquest here, but merely as having led the way into Britain:

Territa quasitis ostendit terga Britannis.

The fortifications, and all the works we can now trace of the Romans, upon the hill, near Dover, are bounded by the deep ditch, and it will be a vain attempt to search after any military works of that people in the castle beyond it. The form of the camp, the ditch, the parapet, and the octagon building, all point out the hand of the Roman engineer and architect. It was common for them, where the ground would admit of it, to make their camp in the form of a parallelogram, with the angles rounded off, and to secure it with a deep ditch and a high parapet: and this appears to have been the original plan of the Roman camp on this hill, before it was altered, either by the Saxons or the Normans. The former, at an early period, became masters of Dover; and, soon after their conversion to Christianity, the ancient church within the walls of the castle is said to have been consecrated by St. Augustine, at the request of king Ethelbert, whose son and successor, Eadbald, founded a college near it for secular canons. In the reign of Edward the Confessor, if not before, the great earl Goodwin was governor of the castle, and is said to have strengthened it by new fortifications. It is well known that William the Norman, when he was contriving the conquest of England, refused to permit earl Harold to depart from Rouen, until he had bound him by a solemn oath to deliver up, after Edward's death, 'the castle of Dover, with the well of water in it.'

Domesday Book informs us that, 'in the time of king Edward, Dover paid £18, of which sum Edward had two parts, and the earl Goodwin the third part of one moiety, and the canons of St. Martin the other. The burgesses have furnished the king with twenty ships once in each year for fifteen days, and in each ship were twenty-one men; this they had done because he had freed them from sac and soc. Whoever constantly resided in the town, and paid custom to the

king, was quit of toll throughout England. All these customs were in use there when king William came into England.' For several succeeding centuries, Dover Castle was regarded as the 'key and barrier of the whole kingdom;' and, in every civil broil, the possession of this fortress was eagerly sought. Henry II., on his arrival from Normandy, rebuilt the keep, and fortified the castle, on the Norman plan, so that its strength was materially increased. Louis, the dauphin, besieged it when he landed to assist the barons, in the reign of king John; but was repulsed with great loss, by Hubert de Burgh, then governor.

In the civil wars of the seventeenth century, it was seized for the parliament, by a merchant named Drake, who, on the night of August 1st, 1642, took it by surprise, with the aid of ten or twelve men only. He contrived, by the means of ropes and scaling ladders, to lead his party to the top of the cliff on the sea-side, which, being considered as inaccessible, was left unguarded. After these commotions had subsided, this ancient pile was, for upwards of a century, left to moulder into ruins; though, in 1745, barracks had been built here sufficiently large to contain a regiment of soldiers. The wars of the French revolution, however, and the many threats of invasion then thrown out, occasioned a great alteration in the defences of this coast; and Dover Castle has been put in modern times into a respectable state of defence.

It at present consists of an immense mass of almost every kind of fortification; and is divided into two courts, a lower and an upper, defended into by deep, broad, and dry ditches, from which communications with the inner towers have been made by subterraneous passages. The buildings occupy nearly the whole summit of the eminence which bounds the south-east side of the deep valley in which Dover stands; the lower court is surrounded by an irregular wall, excepting on the side next the sea, where a considerable part of the cliff, with the remainder of the wall, was thrown down by an earthquake on the 6th of April, 1680. This wall is called the curtain, and is flanked, at unequal distances, by a variety of towers of different shapes, semi-circular, square, polygonal, &c., the workmanship of different ages. The oldest of them, which is on the eastern side of the castle, bears the name of earl Goodwin. Nine of the other towers are stated to have been built in Norman times, and to have derived their names from Sir John de Fiennes, and the eight approved warriors whom he had selected to assist in the defence of this fortress. These towers, according to their relative situation on the wall, beginning from the cliff on the western side, are: 1. The Old, or Canons' tower, which anciently had a drawbridge and battery. 2. A pentagonal tower, originally named after its first commander Albrancis, but afterwards Rokesley tower, from one of its captains. 3. Chilham, or Calderscot tower, built by Fulbert de Lucy, lord of the manor and castle of Chilham. 4. Hurst. 5. Arsic, or Sayes. 6. Gatton tower. These three were named after adjacent manors appropriated to their repairs. 7. Peveril, Beauchamp, or Marshal's tower, so

successively called after William de Peveril and Hugh de Beauchamp, ancient commanders, and the marshalmen who had the superintendence of military stores, &c. 8. Port, or Portli's tower, which took its name from William de Porth, and was also called Gasting's, from one of its captains; but now bears the name of Mary's tower, from queen Mary, by whom it was re-built. 9. Fiennes tower, as it was originally named, after Sir John Fiennes, now more generally called New-gate, to distinguish it from the ancient entrance; and Constable's tower, from its having been the occasional residence of the constable or governor of the castle. 10. Clopton's tower, built by Edward IV., and deriving its name from the lord of a manor assigned for its repair. 11. Godsfoc tower, so called from an ancient commander. 12. Crevequer's, Craville's, or the earl of Norfolk's tower, a work of great magnificence, which has a subterraneous passage leading to a vault of vast extent, and strongly defended. 13. Fitz-William's, or St. John's tower, which derived its former name from Adam Fitz-William, to whom, for his valor at the battle of Hastings, the conqueror gave the scarf from his own arm, and its latter name from lord St. John, who held the lands allotted to it. 14. Averanche's, or Maunsel's tower, a fine remain of Norman workmanship, so named from Averanche, an ancient commander of this castle, and his successor Maunsel, who was lord warden of the cinque-ports in the reign of Henry III. 15. Veville, or Pincester tower, so called from two of its commanders, the latter of whom assisted Hubert De Burgh in the defence of the castle against the Dauphin. 16. Earl Goodwin's tower, built by that nobleman when governor of the castle. The upper court, like the lower one, is surrounded by a strong wall and various towers; and near the centre stands the spacious keep, erected in the beginning of Henry III.'s reign. This building is in fine preservation, and is constructed on a similar plan to those built by bishop Gundulph, and particularly to that at Rochester. It is now used as a magazine, the roof having been rendered bomb-proof. On the eastern side of this court are three towers, which derive their names from Gilbert de Mami-not, or Mainmouth, who was one of the knights that accompanied the conqueror to England, and was appointed marshal of this castle by John de Fiennes: these towers command the whole vallum and ascent leading to the principal entrance to this court; near the south angle of which is another entrance, by a gate called Palace, or Subterranean Gate.

The new works recently formed for the defence of this fortress consist of different batteries, furnished with a very formidable train of artillery, casemates dug in the solid chalk-rock, magazines, covered-ways, and various subterranean communications and apartments for soldiery: the latter are sufficiently spacious for the accommodation of about 2000 men, and, with their inhabitants, form a very curious spectacle: light and air are conveyed into them by well-like apertures cut in the chalk, and by other openings in the face of the cliffs. A new road has also been made, under the direction of the Board of Ordnance, from the town to the top of the hill, where it

joins the Deal road, in a direction to be commanded by the batteries. A branch from this road turns to the right nearly opposite Gatton Tower, and enters the castle by a new bridge and gate. Near the edge of the cliff stands a piece of brass ordnance, twenty-four feet long, cast at Utrecht in 1544, and called Queen Elizabeth's Pocket Pistol.

Dover Castle occupies altogether about thirty-five acres of ground: the hill on which it stands is very steep and rugged on the side of the town and harbour; and towards the sea it is a complete precipice of upwards of 320 feet from its base on the shore. But it is commanded by higher eminences both to the north-west by west and south west. Like other royal castles, it was formerly both extra-parochial and extra-judicial; but, as several of the ancient franchises are either lost or disused, the civil power has of late years been exercised within its limits, independently of any control from the warden. At the renewal of the war, in 1803, the heights on the western side of the town were strongly fortified, agreeably to the modern system, and a new military road leading to them made. Other fortifications here are Archcliff Fort, at the extremity of the pier, and Amherst Battery, at the north Pier-head: these, acting in conjunction with the heights and castle, entirely command the road to the town.

The harbour of Dover was evidently at one time considerably more inland, particularly towards the north-east. At what period the ancient haven became useless is not known, but it was a flourishing harbour in Edward the Confessor's time. A round tower was built on the south-west side of the present harbour, A.D. 1500, to protect the shipping from the violence of the south-west winds: to this tower it is said the vessels were moored by rings; and the haven was called Little Paradise. In 1533 Sir J. Thompson, then holding the living, first projected a pier at Dover, which was begun at Archcliff, on the south-west side of the bay, and carried out directly eastward into the sea, to an extent of 131 rods. The bottom was laid with vast stones, of twenty tons weight, brought from Folkstone by water. The king himself came several times to Dover to view the works, and is stated by Harris to have expended about £20,000 on this pier. Attempts were made in the two following reigns to forward the work, but no effectual advance was made till the time of Elizabeth, to whom Sir Walter Raleigh presented a memorial, stating that 'no promontory, town, or haven, in Christendom, is so placed by nature and situation, both to gratify friends and annoy enemies, as this town of Dover.' An immense quantity of beach thrown up by the sea, had formed a bar across the harbour in her reign, which totally impeded the passage. The queen therefore now granted the town the free exportation of 30,000 quarters of wheat, 10,000 quarters of barley, and 4000 tons of beer, in aid of the expense; and for the same purpose a duty of 3*d.* per ton was laid on every vessel passing this port above twenty tons burden: this duty produced about £1000 annually in 24 and 25 Eliz. Its repairs have been since provided for by several grants and acts of parliament. Agreeably to

the idea of captain Perry, in his report after a survey in 1718, several jetties have been erected towards the east, to prevent the encroachments of the sea. In 1737 the mole or cross wall was faced with Portland stone, and several flood-gates or sluices were constructed in it. When the tide had receded from the mouth of the outer harbour the immense back-water, confined by these sluices, was conveyed through them, to dislodge the beach that accumulates at its entrance. During a violent storm, in 1802, several rods of the north-pier head were beaten down by the fury of the waves. This was immediately rebuilt, in a most substantial manner, under the inspection of Mr. James Moon, the present harbour-master. A dry dock, and several other extensive and important works, have also been completed under the direction of this able and ingenious gentleman. The back-water, which formerly lost its force in passing through the outer harbour, is now earned round it, in cast-iron culverts or tunnels, seven feet in diameter, to the extremity of the south-pier head, where it branches off in directions, and effectually removes the beach from the entrance of the harbour, during the spring tides. These works were accomplished by Mr. Moon in 1822. The depth at spring tides is now between eighteen and twenty feet, and at neap tides about fourteen; so that ships of 400 or 500 tons may enter in safety.

The town of Dover was formerly defended by a strong embattled wall, which included a space of about half a mile square, and in which were ten gates; though not a trace of the wall or gates now remains, except of the foundation in some places. From the hills above, the town has an interesting appearance. It extends in contrary directions, to the east, south-west, and north, three long streets meeting at one point in the centre. There were formerly six parishes, each of which had its distinct church; four of these edifices have long been destroyed, with the exception of some parts of those of St. Nicholas and St. Martin-le-Grand; and the town is now divided into the two parishes of St. Mary the Virgin, and St. James the Apostle. Great part of the priory buildings still remains: a Maison Dieu,

hospital, on the left of the entrance to the town, was endowed by Hubert de Burgh, the great justiciary of England, about the beginning of the reign of Henry III.; after the dissolution, this was converted by queen Mary into an office for virtualising the navy, to which use it was appropriated up to the close of the late war. In times of war, all ships in the downs, belonging to the royal navy, are supplied hence by vessels engaged for that purpose.

St. Mary's, the principal church of modern times, is a spacious and curious edifice, in length about 120 feet, in breadth fifty-five, consisting of a nave and aisles, with a tower at the west end. It is said to have been built by the priory and convent of St. Martin, in the year 1216. The west front is of Norman architecture, as are also the first three arches and their supporting columns on each side of the nave. Two years after the dissolution, this church, which had previously belonged to the Maison Dieu, was given to the parishioners by Henry VIII., who was then at

Dover; and every house-keeper, paying scot and lot, has now a right to vote in the election of a minister. The other church, St. James's, is an irregular structure, and its interior, which is kept particularly neat and clean, displays its origin to have been Norman: it has a square tower, built in arches, directly over the centre of the north aisle, and the pulpit is placed under it.

This town is governed by a mayor, twelve jurats, and thirty-six common-council-men; from the latter of whom a town-clerk and chamberlain are annually chosen. The mayor was formerly elected by the resident freemen, in St. Mary's church, on the 8th of September, the nativity of the Virgin. The two members of parliament were also chosen in St. Mary's church by the whole body of freemen, resident and non-resident, in number about 2300. But in 1826 these elections were removed by act of parliament to the town hall, or to hustings erected in the market place. Freedom is acquired by birth, servitude, marriage, and burghage tenure: the franchise obtained by marriage ceases at the death of the wife, and that by tenure at the alienation of the freehold.

Both in times of peace and war the trade of Dover is extensive; this being the principal place of embarkation for the continent. From thirty to forty vessels, exclusive of packets, are employed in the passage to the opposite shores: some are from sixty to seventy tons burden each; and have been considered as the handsomest sloops in the kingdom. They have frequently reached Calais, with a favorable wind, in three hours: the shortest passage ever known was two hours and forty minutes. Several steam vessels are now also employed in the passage to the continent, which, as well as his majesty's steam packets stationed here, well sustain the honor of the ports for elegant accommodations. In the year 1778 an act was obtained for the better paving, cleansing, lighting, and watching the town; and, in 1822, an act was passed to light it with gas, which has been very completely carried into effect: so that Dover may now be said to be, on the whole, well paved and lighted.

Dover is distant seventy-two miles from London, sixteen from Canterbury, twenty-two from Margate, and eighty-eight from Brighton. It has two weekly markets, viz. on Wednesday and Saturday; the latter being the principal. There is an annual fair, which begins on the 22d day of November, and continues three market days. The number of persons of all ranks passing through the town, is generally very great. Including the garrison of Dover Castle, and the heights, together with those districts of other parishes which form a part of the town, the population may, with much probability, be fixed at from 16,000 to 18,000. It has of late become a favorite watering place. Numerous lodging houses have been erected, and fitted up in an elegant style, for the accommodation of visitors, and many others are in progress. During the bathing season, musical promenades are established at Ratchell's King's Arms Library and Assembly Rooms, and at Warren's Marine Library. The former is an extensive and elegant structure, and was finished in 1826. No place can boast of local attractions more numerous (and

which want of space alone compels us thus to pass over), or prospects more interesting. Shakspeare's beautiful description of the cliff that bears his name, on the south-west of the harbour, is well known.

DOVER, a considerable township of the United States, in Stafford county, New Hampshire; incorporated in 1633. It is situated on the south side of Cochecto River, about four miles above its junction with Salmon Fall River, which together form the Piscataqua. Ten miles south by east of Rochester.

DOVER, a large township of New Jersey, in Monmouth county, between Shrewsbury and New Stafford, extending from the sea to the county line.

DOVER, a township of Massachusetts, in Norfolk county, incorporated in 1650. It lies fifteen miles southward of Boston.

DOVER, the metropolis of Delaware state, in Kent county, on the south-west side of Jones Creek, about four miles and a half north-west from its mouth, in the Delaware; twelve miles from Duck Creek; forty-eight from Wilmington; and seventy-six S. S. W. of Philadelphia. This town has a lively appearance, and drives on a considerable trade with Philadelphia, chiefly in flour.

DOVER, a small town in York county, Pennsylvania, seated on the Fox Run.

DOVER, STRAITS OF, the narrow channel between Dover and Calais, which separates Great Britain from the French coast. Britain is supposed by many to have been once peninsulated, the present straits occupying the site of the isthmus which joined it to Gaul. 'No certain cause,' says Mr. Pennant, in his *Arct. Zool.* Vol. 1. *Introd.* p. ii., 'can be given for the mighty convulsion which tore us from this continent; whether it was rent by an earthquake, or whether it was worn through by the continual dashing of the waters. The correspondency of strata,' he adds, 'on part of the opposite shores of Britain and France, leaves no room to doubt but that they were once united. The chalky cliffs of Blancenez between Calais and Bologne, and those to the westward of Dover, exactly tally: the last are vast and continued; the former short, and the termination of the immense bed. Between Bologne and Folkstone (about six miles from the latter) is another memorial of the junction of the two countries; a narrow submarine hill, called the Rip-raps, about a quarter of a mile broad, and ten miles long, extending eastwards towards the Goodwin Sands. Its materials are boulder-stones, adventitious to many strata. The depth of water on it, in very low spring tides, is only fourteen feet. The fishermen from Folkstone have often touched it with a fifteen feet oar; so that it is justly the dread of navigators. Many a tall ship has perished on it, and sunk instantly into twenty-one fathoms of water. In July, 1782, the *Belleisle* of sixty-four guns struck, and lay on it during three hours; but, by starting her beer and water, got clear off.' These celebrated straits are only twenty-one miles wide in the narrowest part: from the pier at Dover to that of Calais twenty-four. It is said that their breadth is diminishing, and that they are two miles narrower than

they were in ancient times. An accurate observer for fifty years remarks, that the increased height of water, from a decrease of breadth, has been apparent even in that space. The depth of the channel at a medium, in the highest spring tides, is about twenty-five fathoms; the bottom either coarse sand or rugged scars, which have for ages unknown resisted the attrition of the currents. From the straits both east and west is a gradual increase of depth through the channel to 100 fathoms, till soundings are totally lost. The spring tides in the straits rise on an average twenty-four feet, the neap tides fifteen. The tide flows from the German Sea, passes the straits, and meets, with a great rippling, the western tide from the ocean, between Fairleigh near Hastings and Bologne; a proof that, if the separation of the land was effected by the seas, it must have been by the overpowering weight of those of the north.

DOUGH, *n. s.*

DOUGH'BAKED, *adj.* } Goth. and Scotch *deigh*;
Sax. *dah*; Welsh and
DOUGH'Y, *adj.* } Arm. *tous*; Belg. *deigh*;

from *dyghen*, to increase, because dough increases, and causes other things to increase, by fermentation.—Minshcu. Mr. Tooke insists that it is the past participle of the Sax. *deapan*, to moisten or wet. Unbaked bread or pastry; dough-baked, is unfinished, still dough, as in the similar phrase of Shakspeare: doughy, unsound; soft; weak.

The kyngdom of heven is lyk to sour *dough*, whiche a woman took and hidde in three mesuris of mele, til it were all sowed. *Wiclif. Matt. xiii.*

My cake is *dough*, but I'll in among the rest;
Out of hope of all, but my share of the feast.

Shakspeare.

Your son was misled with a snipt taffata fellow there, whose villainous saffron would have made all the unbaked and *doughy* youth of a nation in his colour. *Id.*

For when, through tasteless flat humility,

In *doughbaked* men some harmlessness we see,

'Tis but his phlegm that's virtuous, and not he.

Donne.

Surely, if they would have been as good husbands of their cattle, as they were of their *dough*, they might have had enough to eat without need of murmuring: for if their back-burden of *dough* lasted for a month, their herds might have served them many years.

Bp. Hall. Contemplations.

When the gods moulded up the paste of man,
Some of their *dough* was left upon their hands,
For want of souls, and so they made Egyptians.

Dryden.

You that from pliant paste would fabricks raise,
Expecting thence to gain immortal praise,
Your knuckles try, and let your sinews know
Their power to knead, and give the form to *dough*.

King.

DOUGHT'Y, *adj.* Sax. *bolhtig*; Goth. *dught*, virtue. Brave; noble; eminent. Often used ironically.

Such restless passion did all night torment

The flattering courage of that fairy knight,

Devising how that *doughty* tournament

With greatest honour he achieve might.

Faerie Queene.

If this *doughty* historian hath any snout or conscience left, he ought to beg pardon. *Sillingleet.*

She smiled to see the *doughty* hero slain;

But, at her smile, the beau revived again. *Pope.*

DOUGLAS (John), bishop of Salisbury, a native of Scotland, was born in 1721. He received his early education at Glasgow, whence he removed to Baliol College, Oxford, where he obtained a fellowship, and proceeded to the degree of master of arts, October 14th 1743. He accumulated the degrees of bachelor and doctor in divinity, May 6th, 1758. Not long after his entering into holy orders he obtained the rectory of Eaton Constantine in Shropshire, on the presentation of the earl of Bradford. In 1717 William Lauder, a native of Edinburgh, and a man of considerable talents and learning, excited general attention by publishing a paper, to which he gave the title of an Essay on Milton's Use and Imitation of the Moderns; the design of which was to prove that our great epic poet had made free with the works of some obscure Latin poets of modern date, in the composition of his immortal poem of Paradise Lost. Mr. Douglas published a detection of Lauder's forgeries in a letter to the earl of Bath, entitled, Milton Vindicated from the Charge of Plagiarism, brought against him by Mr. Lauder. In this masterly pamphlet the learned critic proves, that the passages which had been cited by Lauder from Masenius, Staphorstius, Taubmannus, and other obscure writers, had been interpolated by the forger himself, who had also foisted into his quotations entire lines from Hog's Latin translation of Paradise Lost, into which no examiner but Mr. Douglas had been inquisitive enough to look. The detection of this infamous fraud was so complete, that Lauder acknowledged it, and published a letter in which he assigned the reasons for his conduct, and his pretended contrition for the offence. Soon after the impostor published another attack on the character of Milton, charging him with having made additions to the Icon Basilicæ of King Charles I. for the purpose of injuring that unfortunate monarch's reputation. This foul calumny, which was soon made manifest, rendered Lauder so infamous that he quitted the kingdom, and died some years after in the island of Barbadoes. In his next literary work Mr. Douglas detected the pretensions of Archibald Bower, the author of the Lives of the Popes, whose story is too long for this place. In 1751 our author published his principal work; entitled, Criterion, or a Discourse on Miracles; in which he settles the distinction between true and false miracles in a masterly manner. And of all the answers to the sophistry of David Hume, except that of Dr. Campbell, this may be safely pronounced the clearest and most convincing. In 1757 the author was presented to a prebendal stall in the cathedral of Durham, in which he took his degree of doctor in divinity. In 1762 he was made canon of Windsor, on the promotion of Dr. Keppel to the bishopric of Exeter. His next elevation was to the episcopal bench on the death of Dr. Edmund Law, bishop of Carlisle, in 1783. From that see bishop Douglas was translated to Salisbury, on the removal of Dr. Barrington to Durham, in 1791. Bishop Douglas was one of the first members of the celebrated beef-steak club, rendered so famous by Goldsmith's hu-

morous poem, entitled *Retaliation*. By the appointment of the lords of the admiralty, he arranged the journals and papers of captain Cook for publication, and he prefixed to the work a most admirable and perspicuous introduction. He died in 1807, and was buried in the collegiate chapel at Windsor.

DOUGLAS (Gavin), bishop of Dunkeld in Scotland, the third son of Archibald earl of Angus, was born in 1474. Where he was educated, is not known; but it is certain he studied theology; which did not, however, estrange him from the muses; for he employed himself at intervals in translating into beautiful verse the poem of Ovid, *de Remedio Amoris*. The advantages of foreign travel, and the conversation of the most learned men in France and Germany, to whom his merit procured him the readiest access, completed his education. His first preferment was to be provost of the collegiate church of St. Giles in Edinburgh; a place at that time of great dignity and revenue. In 1514 the queen regent appointed Douglas abbot of Aberbrothock, and soon after archbishop of St. Andrew's; but her power not being sufficient to establish him in that dignity, he relinquished his claim in favor of his competitor Foreman, who was supported by the pope. In 1515 he was by the queen appointed bishop of Dunkeld; and was soon after confirmed by Leo X. Nevertheless it was some time before he could obtain peaceable possession of his see. The duke of Albany, who in this year was declared regent, opposed him because he was supported by the queen; and, in order to deprive him of his bishopric, accused him of acting contrary to law in receiving bulls from Rome. On this accusation he was committed to the castle of Edinburgh, where he continued in confinement above a year; but the regent and the queen being at last reconciled, he obtained his liberty, and was consecrated bishop of Dunkeld. In 1517 he attended the duke of Albany to France; but returned soon after to Scotland. In 1521, the disputes between the earls of Arran and Angus having thrown the kingdom into violent commotion, he retired to England, where he became intimately acquainted with Polydore Virgil the historian. He died in London of the plague in 1522; and was buried in the Savoy. His most celebrated work was entitled *Thirteen Bukes of Eneades*, of the famous poet Virgil, translated out of Latin verses into Scottish metre, every buke having its particular prologue. Imprinted at London 1553, in 4to; and reprinted at Edinburgh 1710, in folio. He undertook it at the desire of lord Henry Sinclair, a munificent patron of arts in those times; and he completed it in eighteen months. It is said also that he compiled an historical treatise, *De Rebus Scoticis*.

DOUGLAS (Sylvester Baron Glenbervie) was of a noble family in Aberdeenshire, and born May 24th, 1743. He entered as a member of one of the English inns of court, and was called to the bar, where he received a silk gown. His first political situation was that of secretary to the earl of Westmoreland, when lord-lieutenant of Ireland. In 1800 he was appointed governor of the Cape of Good Hope, but relinquished

that situation the same year, and was created baron Glenbervie of Kincardine. In 1801 he was appointed joint paymaster-general of the forces; and in 1803 surveyor-general of the king's woods and forests. His lordship died at Cheltenham, May 2d, 1823. Lord Glenbervie published *An Account of the Wines of Hungary*, in the *Philosophical Transactions* for 1773; *History of the Cases of Controverted Elections*, 4 vols. 8vo.; *Reports of Cases determined in the Court of King's Bench*, 2 vols. 8vo.; *Ricciardetto*, a humorous poem, translated from the Italian of Fortiguerra, with an introduction, 1822.

DOUGLAS, a town in a parish seated on the river above Lanark, thirty-seven miles south-west of Edinburgh. Its ancient castle was burnt about forty years ago, but an elegant new seat is built on its site. Two cotton-works were erected in it, in 1791, when it contained 674 inhabitants.

DOUGLAS, the capital of the Isle of Man. It has lately increased both in trade and buildings. The harbour, for ships of a tolerable burden, is the safest in the island, and is much mended by a fine mole that has been built on the eastern side. Population about 3000.

DOUGLAS, a township of Massachusetts, the southernmost in Worcester county, having the state of Rhode Island on the south, and that of Connecticut on the south-west. It is very rocky, and lies sixteen miles south of Worcester, and forty-seven south-west of Boston. It was incorporated in 1746, and named in honor of William Douglas, M.D. of Boston, a native of Scotland, and a considerable benefactor to the town.

DOUGLAS, CAPE, a promontory on the north-west coast of North America, which forms the west side of the entrance into Cook's River, opposite Point Bode, which forms the east side. It is a very lofty promontory, and its elevated summit appears above the clouds, forming two exceedingly high mountains. Long. 206° 10' E., lat. 53° 56' N.

DOUGLAS ISLAND, an island between Admiralty Island and the west coast of America. It is about twenty miles long, and six miles broad in the middle; but becomes narrow towards each end; eastward it terminates in a sharp point. The channel between this island and the mainland is generally choked up with ice.

DOULEIA, *δουλεία*, in antiquity, a punishment among the Athenians, by which the criminal was reduced to the condition of a slave. It was never inflicted upon any but the *αριμοι*, sojourners and freed servants.

DOVRAFIELD, the highest range of mountains in the Scandinavian peninsula, which, with another chain, divides the kingdom of Norway into north and south. Its highest peak is upwards of 8000 feet above the level of the sea. It derives its name from the village of Dovre.

DOURO, or DUERO, a river of Spain, which rising on the borders of Arragon, and flowing westward, traverses more than half the width of the peninsula. It receives a number of streams from the mountains of Biscay and Leon to the north, and from those of Old Castile to the south. In part of its course, it forms the bound-

dary between Spain and the province of Tras los Montes in Portugal. In the lower part of its course it runs wholly in Portugal, and forms a line of separation between Beira and the northern provinces. It finally discharges itself into the Atlantic, a little below Oporto. The banks of this river were the scene of various movements of the English and French armies in 1812 and 1813, previous to the battles of Salamanca and Vittoria.

To DOUSE, *v. a. & v. n.* Gr. *δύω*; but probably it is a cant word formed from the sound. To put over head suddenly in the water. To fall suddenly into the water.

It is no jesting trivial matter,
To swing in the' air, or douse in water.

Hudibras.

DOUW (Gerhard), a celebrated painter, born at Leyden in 1613. At the age of fifteen he became a disciple of Rembrandt, and continued with him three years. From Rembrandt he learned the true principles of coloring, and obtained a complete knowledge of the chiaro-scuro; but to that knowledge he added a delicacy of pencil, and a patience in working up his colors to the highest degree of neatness, superior to any other master. His pictures are usually of a small size, with figures so exquisitely touched, so transparent, so wonderfully delicate, as to excite astonishment as well as pleasure. He designed every object after nature, and with an exactness so singular, that each figure separately appears perfect in respect to color, freshness, and force. Of his patience Sandrart gives a remarkable instance. Having once, in company with Bamboccio, visited Douw, they took particular notice of a broom he was then painting, and, expressing their surprise at the excessive neatness of that minute object, Douw told them he should spend three days more on that broom, before he should account it complete. In a family picture of Mrs. Spiering, the same author informs us, that the lady sat five days for the finishing one of her hands that leaned on an arm-chair. Few, therefore, would sit to him for their portraits; so that he indulged himself mostly in works of fancy, on which he could employ as much time as suited his inclination. Douw died in 1674, aged sixty-one. He is doubtless the most wonderful in his finishing of all the Flemish masters. His pictures are also remarkable, not only for retaining their original lustre, but for having the same beautiful effect at any distance. In the gallery at Florence there is a night-piece by candle-light, which is exquisitely finished; and, in the same apartment, a mountebank attended by a number of figures, which it seems impossible either sufficiently to commend or to describe.

DOWAGER, *n. s.* Fr. *douairiere*. A widow with a jointure. A title also given generally to widows of rank.

She lingers my desires,
Like to a stepdame or a dowager,
Long wintering on a young man's revenue.

Shakespeare.

Catharine no more
Shall be called queen; but princess dowager,
And widow to prince Arthur. *Id. Henry VIII.*

Widows have a greater interest in property than either maids or wives; so that it is as unnatural for a dowager as a freeholder to be an enemy to our constitution.

Addison.

DOW'DY, *n. s. & adj.* From *dowd*, or *dew-hood*; *dew* a nurse, and *hood* a cap. An awkward ill-dressed woman: slatternly.

Laura, to his lady, was but a kitchen wench; Dido, a *dowdy*; Cleopatra, a gipsy; Helen and Hero, slidings and harlots. *Shakespeare. Romeo and Juliet.*

The bedlam train of lovers use
T' inance the value, and the faults excuse;
And therefore 'tis no wonder if we see
They doat on *dowdies* and deformity. *Dryden.*

No housewifery the *dowdy* creature knew;
To sum up all, her tongue confessed the shrew.

Gay.

Let *dowdies* simper, and let humpkins stare,
The strolling pageant hero treads in air.

Churchill.

DOW'ER, *n. s.* Fr. *douaire*, from Lat. *donare*, expletive of *do*, *dare*, to give. The portion given with a wife, or for a wife; the settlement on a widow; hence endowment: generally; gift.

Ask me never so much *dowery* and gift, and I will give according as you shall say unto me; but give me the damsel to wife. *Gen. xxxiv. 12.*

Returne from whence ye came, and rest awhile,
Till morrow next, that I the elfe subdew,
And with Sansfoyes dead *dowry* you endew.

Spenser. Faerie Queene.

And ask no other *dowry* but such another jest.

Shakespeare.

Will you with those infirmities she owes,
Unfriended, new adapted to our hate,
Dowered with our curse, and strangered with our oath,
Take her, or leave her? *Id. King Lear.*

Thy *dowerless* daughter, king, thrown to my chance,
Is queen of us, and ours, and our fair France. *Id.*

His patrimonial territories of Flanders were in *dower* to his mother-in-law. *Bacon's Henry VII.*

Our first mother Eve bequeathed this *dowry* to her daughters, that they should be our helpers to sin.

Bp. Hall. Contemplations.

What spreading virtue, what a sparkling fire,
How great, how plentiful, how rich a *dower*,
Dost thou within this dying flesh inspire! *Davies.*

Thine own hand

An hundred of the faithless foe shall slay,
And for a *dowre* a hundred foreskins pay.

Cowley.

I could marry this wench for this *dowre*. *Sidney.*

His wife brought in *dower* Clizia's crown,
And in herself a greater *dower* alone. *Dryden.*

The king must die, that I may make you great,
And give a crown in *dowry* with my love.

Id. Spanish Friar

His only daughter in a stranger's power;
For very want, he could not pay a *dower*? *Pope.*
Rich, though deprived of all her little store,
For who can seize fair virtue's better *dower*?

Melmoth.

Yes, when he shines in gold

Girl, you but grasp your *dowry*. *Byron.*

DOWER, DOTARIUM, DOARIUM, or DOS, is the estate, for life, which a widow acquires in a certain portion of her husband's real property, after his death, for the maintenance of herself and the education of her children.

The custom of dower is derived from the Germans, amongst whom it was a rule, that a woman should have no marriage portion, but that the husband should allot a part of his property for her use, in case she survived him. Thus Tacitus, in his treatise, *De Moribus Germanorum*, sect. 18, says, '*Dotem non uxor marito, sed uxori maritus offert.*' The Saxons, also, were acquainted with it, as appears from the laws of King Edmond; by which a widow was entitled to a moiety of her husband's property for her life. And no alteration seems to have been made in this custom at the conquest, nor indeed until the reign of Henry II.; when, according to Glanville, every man was bound, both by the civil and ecclesiastical law, to endow his wife, at the time of marriage, either of all his lands, generally, or of some particular part thereof: if endowed generally, the wife was entitled to her *dos rationabilis*, which was one third part of her husband's freehold; if specially, to the particular land named, provided it did not amount to more than a third. Similar regulations with respect to dower are contained in the *Grand Coutumier* of Normandy.

The following are the five different kinds of dower which once existed, but the first two only are now in use. 1. *Dower by the common law.* This entitles the widow, after the death of her husband, to the enjoyment, during her life, of a third part of all the lands and tenements of which he was seized in fee simple or fee tail at any time during the coverture. This right is not prejudiced by the husband's conveyance of such lands, even though the wife join therein (unless a fine or recovery be used, as stated subsequently in this article), nor by his disposing of the same by will. 2. *Dower by custom* is where a widow becomes entitled to a certain portion of her husband's lands in consequence of some local and peculiar custom. Thus, by the custom of gavelkind (a tenure by which a great part of the land in Kent is still held), she is entitled to a moiety of the lands held by her husband in that tenure: and by the custom of some boroughs she is entitled to all the tenements that were her husband's. Copyhold lands are not at common law subject to dower; but, by the custom of most manors, the widows of copyholders are entitled to a certain part, and sometimes to the whole, of the copyhold lands of which their husbands die possessed. This kind of dower is generally called the widow's free bench.

The species of dower now out of use are, 3. *Dower ad ostium ecclesie*, which was where the husband, at the church door, after the marriage, endowed his wife with the whole or a certain portion of his lands. 4. *Dower ex assensu patris*, in which species the husband being heir apparent of his father, with his consent, endowed the wife, at the church door, with a part of the lands of the father. And, 5. *Dower de la plus beale*. This was merely a consequence of tenures by knight-service, and was abolished by the statute of 12 Car. II., when those tenures were converted into socage.

As to the persons entitled to dower.—Alien women are not generally capable of acquiring dower: an alien queen is, however, an exception

to this rule; and, by an act passed in the reign of Henry V. (not printed among the statutes but contained in Rot. Parl. vol. iv. 128-130), all alien women, who from thenceforth should be married to Englishmen, by license from the king, are enabled to have their dower. Naturalisation also removes this disability; as does also denization, so far as relates to the lands of which the husband was seized when his alien wife was created a denizen, but not to any of which he was seized before, and which he had then parted with. Jewesses also, as long as they continue of that religion, cannot be endowed. With the above exceptions every woman, who has attained the age of nine years, is by the common law entitled to dower; but she may be deprived thereof in the several ways following. 1. By the attainder of the husband for treason; but not for misprision of treason or felony. 2. By the attainder of herself for treason or felony, unless afterwards pardoned, in which case her capacity to be endowed is restored as fully as if it had never been lost. 3. By divorce *à vinculo matrimonii*: it must be observed that a divorce, *à mensâ et thoro* will not deprive the wife of dower, such divorce being merely a permission to the parties to live separate, and not a dissolution of the marriage. 4. By elopement from the husband, and living with an adulterer: but if the former be afterwards voluntarily reconciled, and suffer his wife to dwell with him, the incapacity will be removed. 5. By withholding the title-deeds of the property from the heir at law. 6. By joining with the husband in levying a fine or suffering a common recovery of his lands: but this will only prevent her from claiming dower out of the lands comprized in the fine or recovery. Also, by the custom of London, a married woman may bar herself of dower by a bargain and sale acknowledged before the lord mayor, or the recorder, and one alderman, and enrolled in the court of hustings: in this case the wife must be examined separately from her husband as to her consent. 7. The last and most usual mode, now in practice, of barring dower, is a jointure settled on the wife before marriage. See JOINTURE.

DOWTLAS, n.s. A coarse kind of linen

Dowlas, filthy *dowlas*; I have given them away to bakers' wives, and they have made boulders of them.

Shakspeare.

DOWLAS HEAD, a cape of Ireland, on the coast of Kerry, in Munster. Near this are several large caves, one of which has its entrance so low as hardly to admit of a boat with a man standing up in it; but, further in, the roof is as high as that of a Gothic cathedral, and has a fine echo.

DOWLETABAD, a district of Hindostan, in the nizâm's dominions, in the province of Aurungabad, situated between the nineteenth and twentieth degrees of north latitude, and extending along the north side of the Godavery.

DOWLETABAD, **DEOGHUR**, or **DEOGHUR**, a town and strong fortress in the province of Aurungabad, deemed by the natives impregnable. It stands on the summit of a mountain, surrounded with other enclosures, of which that on the plain contains a large town. The two lower forts are overtopped by the upper, and com-

manded by it. In 1595 Dowletabad surrendered to Ahmed Nizam Shah, of Ahmednuggur, and on the fall of his dynasty it was taken possession of by Mallek Amber, an Abyssinian slave, who was reckoned one of the ablest generals and financiers of his age. His successors reigned until 1634, when it was taken by the Moguls during the reign of Shah Jehan, and the capital transferred to the neighbouring town of Gurka, or Kerkhi, since named AURUNGABAD, which see.

DOWN, *n. s.* } Bel. *dons*; Swed. *dun*;
DOWN'ED, *adj.* } Dan. *duin*. The softest part
DOWN'Y, *adj.* } of a bird's plumage; hence
applied to the soft fibres of plants, and any thing remarkably soft or soothing.

By his gates of breath
There lies a *downy* feather, which stirs not :
Did he suspire, that light and weightless down,
Perforce must move. *Shakspeare.*
Banquo ! Donalbain ! Malcolm ! awake !
Shake off this *downy* sleep, death's counterfeit,
And look on death itself. *Id. Macbeth.*
There be plants that have prickles, yet have a *downy*
or velvet rind upon their leaves, as stock-gillyflowers
and coltsfoot; which down or nap consisteth of a
subtile spirit, in a soft substance.

Bacon's Natural History.
Like scattered *down*, by howling Eurus blown,
By rapid whirlwinds from his mansion thrown.

Sandys.
Give me flattery,
Flattery the food of courts, that I may rock him,
And lull him in the *down* of his desires. *Beaumont.*
Virtue is the roughest way,
But proves at night a bed of *down*. *Wotton.*
Leave, leave, fair bride ! your solitary bed,
No more shall you return to it alone ;
It nurseth sadness : and your body's print,
Like to a grave, the yielding *down* doth dint. *Donne.*

We tumble on our *down*, and court the blessing
Of a short minute's slumber. *Derham's Sophy.*
In her hand she held
A bough of fairest fruit, that *downy* smiled,
New gathered, and ambrosial smell diffused. *Milton.*

A side breeze from westward waits their sails to fill,
And rests in those high beds his *downy* wings. *Dryden.*

I love my husband still ;
But love him as he was when youthful grace,
And the first *down* began to shade his face. *Id.*
A tender weakly constitution is very much owing
to the use of *down* beds. *Lacke.*

Thou bosom softness, *down* of all my cares !
I could recline my thoughts upon this breast
To a forgetfulness of all my griefs,
And yet be happy. *Southern's Oroonoko.*
On thy chin the springing beard began
To spread a doubtful *down*, and promise man. *Prior.*

What pain to quit the world, just made their own,
Their nest so deeply *downed*, and built so high !
Too low they build who build beneath the stars. *Young.*

Belinda still her *downy* pillow prest,
Her guardian sylph prolonged the balmy rest. *Pope.*

How much do they mistake, how little know
Of kings and kingdoms, and the pains which flow
From royalty, who fancy that a crown,
Because it glistens, must be lined with *down*. *Churchill.*

How long shall sloth usurp thy useless hours,
Unnerve thy vigour, and enchain thy powers ;
While artful shades thy *downy* couch inclose,
And soft solicitation courts repose ?

Dr. Johnson's Poems.

For the preservation of the immature seed nature
has used many ingenious methods ; some are wrapped
in *down*, as the seeds of the rose, bean, and cotton-
plant ; others are suspended in a large air-vessel, as
those of the bladder-sena, staphylæa, and pea.

Darwin.

DOWN, *v. a. v. n. n. s., adj.* } Saxon *dun* ;
adv. prep. & interj. } Erse, *dune* ; a-
hill. The sub-
DOWN'CAST, *adj.* } stantive has
DOWN'FALL, *n. s.* } here originatel
DOWN'FALLEN, *adj.* } the other use
DOWN'GYVED, *adj.* } of the work,
DOWN'HILL, *n. s. & adj.* } and still retains
DOWN'LOOKED, *adj.* } in Sussex, and
DOWN'LYING, *n. s.* } in some other
DOWN'RIGHT, *adj. & adv.* } parts of Eng-
DOWN'SITTING, *n. s.* } land, its primi-
DOWN'TRODDEN, *part. adj.* } tive meaning.
DOWN'WARD, *adj. & adv.* } To *down* is
DOWN'WARDS, *adv.* } used by Sidney for to subdue ; beat downwards.
As a neuter verb it signifies, to descend ; be re-
ceived. As an adjective, dejected ; and sometimes
firm ; positive (figuratively). As a preposition,
it means along or towards a lower point. As an
adverb, on or tending to the ground ; below the
horizon, answering and opposed to up ; also from
former to later times, and from higher to lower
station or repute. As an interjection, it encou-
rages to, or pronounces, degradation or destruc-
tion. Downcast is, bent towards the ground.
Downfal, ruin ; calamity. Downgyved, hanging
down like fetters. Downright is, plain ; open ;
or, as we say, by a similar figure, straight-
forward ; direct ; unqualified. The meaning of
the other compounds is apparent.

And now the axe is put to the roote of the tree,
therfor every tre that makith not good fruyt schal be
kit *down* and schal be cast into the fyr.

Wiclif. Mat. 3.

Let them wander up and *down* for meat, and
grudge if they be not satisfied. *Psaln lix 15.*

Thou knowest my *downsitting* and mine upspring ;
thou understandest my thoughts afar off. *Id. cxxxix. 2.*

Then thought the prince all peril sure was past,
And that he victor onely did remayne,
No sooner thought, then that the carle as fast
Gan heap huge strokes on him, as ere he *down* was
cast. *Spenser.*

How goes the night, boy ?
—The moon is *down* ; I have not heard the clock,
And she goes *down* at twelve. *Shakspeare. Macbeth.*
Down, down to hell, and say I sent thee thither. *Shakspeare.*

Go, some pull *down* the Savoy ; others to the inn
of courts : *down* with them all. *Id.*

Why dost thou say king Richard is deposed ;
Darest thou, thou little better thing than earth,
Divine his *downfall* ? *Id. Richard II.*

Lord Hamlet, with his stockings loose,
Ungartered and *downgyved* to his ancles. *Shakspeare.*

Elves away !
We shall chide *downright* if I longer stay. *Id.*

A ring the count does wear,
That *downward* hath succeeded in his house,
From son to son, some four or five descents. *Id.*

Mahomet puts his chief substance into certain boats,
to be conveyed *down* the river, as purposing to fly.
Knolles.

An admonition from a dead author, or a caveat
from an impartial pen, will prevail more than a *down-*
right advice, which may be mistaken as spoken ma-
gisterially. *Bacon.*

I would rather have a plain *downright* wisdom,
than a foolish and affected eloquence.

Ben Jonson's Discoveries.
Lord of much riches, which the use renowns :
Seven thousand broad-tailed sheep grazed on his
downs. *Sandys.*

The idolatry was direct and *downright* in the peo-
ple, whose credulity is illimitable.

Browne's Vulgar Errors.
No bread will *down* with them, save that which
the earth yields ; no water but from the natural wells
or rivers. *Bp. Hall. Contemplations.*

To come from all things to nothing, is not a descent
but *downfall* ; and it is a rare strength and con-
stancy, not to be maimed at least. *Id.*

We can naturally like no view of ourselves, unless
we look *downwards*, to teach us what humble admirers
we ought to be of our own value. *Butler.*

He shared our dividend o' the crown,
We had so painfully preached *down* ;
And forced us, though against the grain,
To have calls to preach it up again. *Huotbras.*

A giant's slain in fight,
Or mowed o'erthwart, or cleft *downright.* *Id.*
Whom they hit, none on their feet might stand,
Though standing else as rocks : but *down* they fell
By thousands. *Milton's Paradise Lost.*

But first I mean
To exercise him in the wilderness,
There he shall first lay *down* the rudiments
Of his great warfare. *Milton.*

Not all the fleecy wealth
That both enrich those *downs* is worth a thought,
To this my errand, and the care it brought. *Id.*

Look *downward* on that globe, whose hither side,
With light from hence, shines. *Id.*

It is *downright* madness to strike where we have no
power to hurt. *L'Estange.*

Down sinks the giant with a thundering sound,
His pond'rous limbs oppress the trembling ground.
Dryden.

But now they cry, *down* with the palace, fire it,
Pull out the 'usurping queen. *Id.*

My wily nurse by long experience found,
And first discovered to my soul its wound ;
'Tis love, said she ; and then my *downcast* eyes,
And guilty dumbness witnessed my surprize. *Id.*

Heavy the third, and stiff, he sinks apace ;
And though 'tis *downhill* all, but creeps along the race.
Id.

Jealousy, suffused with jaundice in her eyes,
Discolouring all she viewed, in tawny dressed ;
Downlooked, and with a cuckoo on her fist. *Id.*

When Aurora leaves our northern sphere,
She lights the *downward* heaven, and rises there.
Id.

A *downright* scholar is one that has much learning
in the ore, unwrought and untried, which time and
experience fashions and refines. *Bp. Earle.*

It has been still preached up, but acted *down* ; and
dealt with as the eagle in the fable did with the oyster,

carrying it up on high, that by letting it fall, he might
dash it in pieces. *South.*

We have seen some, by the ways by which they
had designed to rise uncontrollably, to have directly
procured their utter *downfall.* *Id.*

The hidden beauties seemed in wait to lie,
To *down* proud hearts that would not willing die.
Sidney.

On the *downs* we see, near Wilton fair,
A hastened hare from greedy greyhound go. *Id.*
Wanton languishing borrowed of her eyes, the
downcast look of modesty. *Id.*

A man falling *down* a precipice, though in motion,
is not at liberty, because he cannot stop that motion
if he would. *Locke.*

If he be hungry more than wanton, bread alone will
down ; and if he be not hungry, 'tis not fit he should
eat. *Id.*

Hills are ornamental to the earth, affording plea-
sant prospects to them that look *downwards* from them
upon the subjacent countries. *Ray on the Creation.*

Hills afford pleasant prospects ; as they must needs
acknowledge who have been on the *downs* of Sussex.
Id.

There are few, very few, authors, that will own
themselves in a mistake, though all the world see
them to be in *downright* nonsense. *Taiter.*

There is not a more melancholy object in the
learned world, than a man who has written himself
down. *Addison.*

Thy *downcast* looks, and thy disordered thoughts,
Tell me my fate : I ask not the success
My cause has found. *Id. Cato.*

It is then (in old age) we have nothing to manage,
as the phrase is ; we speak the *downright* truth, and
whether the rest of the world will give us the privi-
lege or not, we have so little to ask of them, that we
can take it. *Steele.*

What remains of the subject, after the decoction,
is continued to be boiled *down*, with the addition of
fresh water, to a sapid fat. *Arbuthnot on Aliments.*

And the first steps a *downhill* greensward yields.
Congreve.

As you lift up the glasses, the drop will ascend
slower and slower, and at length rest, being carried
downward by its weight as much as upwards by the
attraction. *Newton.*

O happy plains, remote from war's alarms,
And all the ravages of hostile arms !
And happy shepherds ! who, secure from fear,
On open *downs* preserve your fleecy care. *Gay.*

To compass this, his building is a town,
His pond an ocean, his parterre a *down.* *Pope.*

What would this man ? Now upward will he soar,
And, little less than angel, would be more ;
Now looking *downwards*, just as griev'd appears
To want the strength of bulls, the fur of bears. *Id.*

Religion seems not in danger from *downright*
atheism, since rational men must reject that for want
of proof. *Rogers.*

Who shall dispute what the reviewers say ?
Their word 's sufficient ; and to ask a reason,
In such a state as theirs, is *downright* treason.
Churchill.

'This structure in some degree obtains in the eso-
phagus or throat of cows, who by similar means con-
vey their food first *downwards* and afterwards up-
wards by a retrograde motion of the annular muscles
or cartilages, for the purpose of a second mastication
of it. *Darwin.*

A more unsafe and uncertain rule could hardly
be laid *down*, than this of estimating property accord-
ing to its value at some remoter period of our history.
Sir S. Romilly.

Gazing on his Trojan bride,
 With some remorse within for Hector slain
 And Priam weeping, mingled with deep passion
 For the sweet *downcast* virgin, whose young hand
 Trembled in his who slew her brother. *Byron.*

Around her form a thin robe twining,
 Nought concealed her bosom shining;
 Through the parting of her hair,
 Floating darkly *downward* there,
 Her rounded arm showed white and bare.

Id. Siege of Corinth.

DOWN, in commerce, the fine feathers from the breasts of several birds, particularly of the duck kind. That of the eider duck, see *ANAS*, is the most valuable. These birds pluck it from their breasts, and line their nests with it. We are told that the quantity of down found in one nest more than filled the crown of a hat, yet weighed no more than three quarters of an ounce. Three pounds of this down may be compressed into a space scarcely bigger than one's fist; yet is afterwards so dilatable as to fill a quilt five feet square. That found in the nests is most valued, and termed live down; it is infinitely more elastic than that plucked from the dead bird, which is little esteemed.

DOWN, a county in the north of Ireland, containing a bishopric of the same name, founded in the fifth century: it contains eight baronies, and one lordship, is fifty miles in length, by forty in breadth, having a surface of 364,118 plantation acres. Down is thickly inhabited by resident gentry, and is extensively engaged in the manufacture of linen. The towns of this county are some of the most comfortable and elegant in Ireland. The surface is rather hilly: the prevailing rock, slate; the soil clay loam, and occasionally sand. A group of lofty granite mountains in the south occupies an area of about ninety square miles, between Newry and Dundrum Bay: in these mountains beryls, not unlike emeralds, are frequently found, and sold in London at high prices. The Sliebh Croob group, in the centre of the county, is also a granitic region. Sand-stone is also met with, but limestone scarcely at all. If we except the above mentioned districts, this county may be said to be wholly under tillage or pasture. The chief towns are Bangor, Donaghadee, Hillsboro' (the residence of the marquis of Downshire), Rostrevor, a picturesque bathing village, Bannbridge, Downpatrick, the assizes town; and Newry, a handsome flourishing town, in the lordship of that name. There are several valuable fishing stations on the sea-coast of this county, from Bangor to Carlingford. Dundrum Bay affords good trawling-ground: Strangford Lough has hitherto been avoided, from a supposed intricacy of navigation, and from being represented as a bar-harbour; but it has been shown by Mr. Nimmo that Strangford Lough is the safest harbour on the coast, at the same time that he has detected the existence of a rock in the entrance, called the Buller Pladdy, hitherto unknown. Carlingford harbour is obstructed by two bars, Cranfield and Stalken: this harbour requires a new chart. A pier has lately been erected at Ardglass, at the public expense, and another at Killough, by the proprietor, lord Bangor.

Granite is found in two great districts of Down, the Mourne and Sliebh Croob groups. Slate is also abundant, and it is probable that, at their junction, valuable mines will yet be discovered. Lead mines have been opened near Newton-Ardes, Portaferry, and Castlewellsan, but not yet worked to any extent. Copper is found at Rostrevor, Portaferry, and Clonliff. Slate, of superior quality, is raised at Ballywalter and Doonamah: limestone at Cultra and Moira; and several quarries of blackish marble are successfully worked in this last-mentioned district. Pearls, of some value, are often found in the rivers Bann and Lagan. This county is rich in remains of antiquity; here are stone altars and cromliachs; the giant's ring; raths and mounds of singular formation: round towers stood at Drumboe and Downpatrick, and many beautiful ecclesiastical buildings, though now almost ruined, bear testimony to the ancient learning and piety of this county; the remains of thirty-six are still discoverable. Amongst the natural curiosities, the chief are the caves of Ardglass and Ballycam. Many military antiquities also exist here: several of the finest castles were erected, during the civil wars, by colonel Monck.

DOWNHAM, a town of Norfolk, ten miles south of Lynn, famous for its butter; there being nearly 1000 firkins bought here every Monday, and sent up the river Ouse to Cambridge; from whence it is conveyed to London in the Cambridge waggons, and hence called Cambridge butter. The church is a neat building, situate on a rising ground; the ascent to it on the north-west is by a flight of brick steps; and on the south by a gradual ascent, ornamented with a row of lime-trees. In the vicinity of this church were formerly several religious foundations, particularly a priory of Benedictine monks. Downham has a market on Saturday, and is seated on the Ouse; thirty-five miles north-east of Cambridge, and eighty-four north by east of London. Long. 0° 20' E., lat. 54° 40' N.

DOWNINGS, a post town of Pennsylvania, in Chester county, on the east side of Brandywine Creek; thirty-three miles west by north of Philadelphia, and nearly seven north-west of Westchester.

DOWNPATRICK, the assizes town of the county of Down, in Ireland: it is ninety-two miles from Dublin, is a borough, post, and fair town. Here St. Patrick is said to have been interred, along with St. Bridget and St. Columb. There are several monastic ruins in the vicinity, also St. Patrick's well, still supposed to possess very singular healing virtues, and used as Holy-well, in Flintshire, both for partial and total immersion. This town has a handsome court-house; a capacious jail, lately erected; a diocesan school; an establishment for the support of clergymen's widows; Southwell's hospital; a poor school; and meeting-houses for Presbyterians and Methodists. The staple is linen.

DOWNS, a celebrated road for ships, extending six miles along the east coast of Kent, between North and South Foreland; where both the outward and homeward-bound ships frequently make some stay; and squadrons of men

of war rendezvous in time of war. It affords excellent anchorage; and is defended by the castles of Deal, Dover, and Sandwich, as well as by the Goodwin Sands.

DOWNTON, or **DUNKTON**, an ancient borough in Wiltshire, which sent two members to parliament. It retained this privilege until 1832, when it was disfranchised by the first and second clauses in the Reform Bill. Its chief trade is in malt, paper, leather, laces, &c. It has a neat church, the tower of which has been raised about thirty feet, at the expense of the earl of Radnor. Here is a good free-school, chiefly supported by the produce of the fairs, and also a well-regulated workhouse. It is seated on the Avon, six miles south-east of Salisbury, and eighty-four W.S.W. of London. Lon. 1° 36' W., lat. 51° 0' N.

DOXOLOGY, *n. s.* Δόξα and λόγος. A form of giving glory to God.

David breaks forth into these triumphant praises and doxologies, Blessed be the Lord God of Israel, who has kept me this day from shedding blood, and from avenging myself with my own hand. *South.*

Little did Athanasius imagine, that ever it would have been received in the Christian church, to conclude their books with a *doxology* to God and the blessed virgin. *Stillingsfleet.*

Doxology, an hymn used in praise of the Almighty, distinguished by the title of greater and lesser. Both the doxologies have a place in the church of England, the former being repeated after every psalm, and the latter used in the communion service.

Doxology, **THE GREATER**, or the angelic hymn, was of great note in the ancient church. It began with these words, which the angels sung at our Saviour's birth, Glory be to God on high, &c. It was chiefly used in the communion service, and in private devotions.

Doxology, **THE LESSER**, was anciently only a single sentence, without response, running in these words, Glory be to the Father, and to the Son, and to the Holy Ghost, world without end, Amen. Part of the latter clause, As it was in the beginning, is now, and ever shall be, was inserted some time after the first composition. Some read this ancient hymn, Glory be to the Father, and to the Son, with the Holy Ghost: others, Glory be to the Father, in or by the Son, and by the Holy Ghost. This difference of expression occasioned no disputes in the church, till the followers of Arius began to make use of the latter as a distinguishing character of their party, when it was entirely laid aside by the Catholics, and the use of it was sufficient to bring any one under suspicion of heterodoxy. The doxology was used at the close of every solemn office. The western church repeated it at the end of every psalm. Many of their prayers were also concluded with it, particularly the solemn thanksgiving or consecration prayer at the eucharist. It was also the ordinary conclusion of their sermons.

DOXY, *n. s.* A whore; a loose wench. A diminutive of Duck, which see.

When daffodils begin to pure,
With heigh! the doxy o'er the dale.

Shakespeare.

DOYEN (François), a celebrated painter, born at Paris in 1720, was, while a boy, continually disfiguring his school-books with sketches. Some of these being seen by an amateur, he persuaded the parents of the lad to place him under C. Vanloo, and at twenty years of age he contended for the prize of the academy and gained it. By virtue of this he went to Rome, where he attached himself principally to the works of Annibal Caracci, but became equally enamoured, afterwards, of the style of Pietro da Cortona. On his return to Paris he employed himself two years on a large picture of the death of Virginia. His principal object was to gain the approbation of Vanloo. But that artist had been prejudiced against him, and it was with difficulty he could be prevailed upon to look at it. At last, after regarding it silently for some time, he embraced Doyen affectionately, and applauded the performance every where. From this time Doyen rose rapidly into fame. One of his best paintings was a representation of winter, of which there is an engraving. He visited Petersburg at the invitation of the Empress Catharine, and was chosen professor of the academy of painting there, where he died in 1806.

DOZE, *v. n.* & *v. a.* } Sax. dræ; Dutch
DOZINESS, *n. s.* } dæcs; Teut. dosen;
DO'ZY, *adj.* } Swed. dasa. See **DAZE**.

To slumber; sleep lightly; become confused or drowsy. The active verb signifying to stupify, make dull, seems derived from the neuter verb: doziness is sleepiness; and figuratively stupidly; dozy, drowsy.

He was now much decayed in his parts, and with immoderate drinking *dozed* in his understanding.

Charendon.
There was no sleeping under his roof; if he happened to *dose* a little, the jolly cobbler waked him.

L'Estrange.
It has happened to young men of the greatest wit to waste their spirits with anxiety and pain, so far as to *daze* upon their work with too much eagerness of doing well. *Dryden.*

The yawning youth, scarce half awake, essays
His lazy limbs and dozy head to raise. *Id.*

A man, by a violent fit of the gout in his limbs, finds a *doziness* in his head, or a want of appetite.

Locke.
How to the banks, where bards departed *daze*,
They led him soft. *Pope's Dunciad.*

DOZEN, *n. s.* Fr. douzaine; Teut. dutzend; Ital. Span. and Port. *dozzena*; probably a corruption of Lat. *duodecim*. Twelve, taken collectively. Dr. Johnson says, it is seldom used but on light occasions. But see the definition of Locke: its convenience in fact has occasioned it to be in constant use in modern times, both on serious as well as light occasions.

We cannot lodge and board a *doxen* or fourteen gentlewomen, but we keep a bawdyhouse straight.

Shakspeare.
That the Indian figs bear such huge leaves, or delicate fruit, I could never find; yet I have travelled a *dozen* miles together under them. *Raleigh.*

We have more words than notions, and half a *doxen* words for the same thing. Sometimes we put a new signification to an old word, as when we call a piece a gun. *Selden.*

By putting twelve units together, we have the complex idea of a *dosen*. *Locke.*

The number of dissenters was something under a *dosen* with them. *Swift.*

DRAAIYA, or **DRĒHYEH**, a well-built town of Arabia, the capital of the Wahabees sect. It is represented as 160 leagues south-east of Jerusalem. It is situated at the base of lofty mountains, in a fertile country.

DRAB, *n. s.* Sax. *ḏrabbe*, lees. A whore; a strumpet.

If your worship will take order for the *drabs* and the knaves, you need not fear the bawds. *Shakespeare.*

Cursed be the wretch so venal and so vain,
Paltry and proud as *drabs* in Drury-lane. *Pope.*

DRABA, in botany, a genus of the siliculosa order, tetradynamia class of plants; natural order thirty-ninth, siliquosæ. The silicula is entire, and oval oblong with the valves a little plain, parallel to the partition: there is no styl. There are sixteen species; of which the one chiefly worthy of notice is the *D. verna*, or early whitlow grass. It has naked stalks with leaves a little serrated. The blossoms are white, and at night the flowers hang down. It grows on old walls and dry banks. It is one of the earliest flowering plants we have, and is good to eat as a salad. Goats, sheep, and horses eat it: cows are not fond of it; swine refuse it.

DRABRICIUS (Nicholas), a celebrated enthusiast, born in Moravia in 1537. He was admitted minister in 1616; but, on account of the severe edicts against the Protestants, he retired to Hungary in 1629. He then commenced woollen-draper; and, when about fifty years of age, assumed the prophetic office, and had his first vision on the 23d February, 1638, by which he was promised in general great armies from the north and east, which should crush the house of Austria. In 1654 Drabricius was restored to his ministry, and had more visions than ever, which he communicated to his coadjutor Comenius, that he might publish them to all nations. Comenius, fearing that if he did not print them he should disobey God, and if he did he would be exposed to the ridicule of men, printed them, but would not distribute the copies, and entitled the book *Lux in Tenebris*. Some say Drabricius was burnt as a false prophet; others, that he died in Turkey.

DRABLER, in the sea language, a small sail in a ship, which is the same to a bonnet, that a bonnet is to a course, and is only used when the course and bonnet are too shoal to clothe the mast. See **BONNET** and **COURSE**.

DRABLING, in angling, is a method of catching barbel. Take a large line of six yards; which, before fastening it to the rod, must be put through a piece of lead, that, if the fish bite, it may slip to and fro, and that the water may something move it on the ground; bait with a lob-worm well secured, and so by its motion the barbel will be enticed into the danger without suspicion. The best places are in running water, near piles, or under wooden bridges, supported with oaks floated and slimy.

DRABS, in the salt works, a kind of wooden boxes for holding the salt when taken out of the

boiling pan, the bottoms of which are made shelving or inclining forwards, that the briny moisture of the salt may drain off.

DRAC, an imaginary being, formerly much dreaded by the country people in many parts of France. The dracs were supposed to be malicious, or, at least, tricksome demons; said to lay gold cups and rings over the surface of pits and rivers, as baits to draw women and children in.

DRACÆNA, in botany, a genus of the monogynia order, and hexandria class of plants: con. sexpartite and erect; the filaments a little thicker about the middle; the berry trilocular and monospermous. Species, one only, a native of the West Indies.

DRACHM, *n. s.* } Fr. *dragme*; Span. and
DRAM, *n. s.* & *v. n.* } Port. *druma*; Lat. *drachma*; Arab. *drahm*; Gr. *δραχμή*; Heb. *דרמן*, from *דָּרַךְ*, a way, *מָנָה*, to spend; i. e. as much as would be expended by a traveller.—Or, says Parkhurst, because anciently equal to six *οβολοι*, or bars of iron, that a man could grasp in his hand, thus deriving it from the verb *δρασσω*, *δεδραγμαi*, to clutch. A coin; a weight; the eighth part of an ounce; a small definite quantity; a dose. The verb is sometimes used, vulgarly, for to drink drams.

True be it said, whatever man it said,
That love with gall and honey doth abound;
But if the one be with the other weighed,
For every *drum* of honey therein found,
A pound of gall doth over it redound. *Spenser.*

I could do this, and that with no rash potion,
But with a lingering *drum*, that should not work
Maliciously like poison. *Shakespeare. Winter's Tale.*

See here these movers, that do prize their honours
At a cracked *drachm*. *Id. Macbeth.*

The trial being made betwixt lead and lead, weighing severally seven *drams* in the air, the balance in the water weigheth only four *drams* and forty-one grains, and abateth of the weight in the air two *drams* and nineteen grains: the balance kept the same depth in the water. *Bacon.*

No hallowed oils, no gums I need,
No new-born *drams* of purging fire,
One rosy drop from David's seed
Was words of seas to quench thine ire:
O, precious ransom! which, once paid,
That consummation est was said. *Wotton.*

He that has not religion to govern his morality, is not a *drum* better than my mastiff-dog. *Selden.*

If there had been but any *drachm* of good nature in these Hebrews, they had relented.

Bp. Hall. Contemplations.

No *drum* of judgment with thy force is joined,
Thy body is of profit, and my mind.

Dryden's Fables.

Every *drum* of brandy, every pot of ale that you drink, raiseth your character. *Swift.*

A second see, by necker manners known,
And modest as the maid that sips alone;
From the strong fate of *drams* if thou get free,
Another Durfy, Ward! shall sing in thee. *Pope.*

DRACO, a celebrated lawgiver of Athens. When he exercised the office of archon, he made a code of laws for his fellow-citizens, wherein all crimes were made capital; and even idleness was punished with death as well as murder. These laws were at first enforced, but they were after-

wards neglected on account of their extreme severity; and Solon totally abolished them, except that one which punished a murderer with death. The respect of Draco's admirers proved fatal to him. When at Ægina, he appeared on the theatre, he was received with repeated applause; and the people, according to the custom of the Athenians, showed their respect by throwing their garments upon him. This was done in such profusion, that Draco was soon hid under them, and smothered. He lived about A.A.C. 624.

DRACO. See **ASTRONOMY.**

DRACO, the dragon, in zoo ogy, a genus belonging to the order of amphibia reptilia; the characters of which are: it has four legs, a cylindrical tail, and two membranaceous wings, radiated like the fins of a fish, by which he is enabled to fly, but not to any great distance at a time. There are two species, both harmless creatures, feeding on flies, ants, and small insects, viz. 1. *D. prepos*, with the wings fixed to the fore-legs. It is a native of America. 2. *D. volans*, the flying dragon, with the wings entirely distinct from the fore-legs. It is found in America and the East Indies.

DRACO VOLANS, in meteorology, a fiery exhalation, frequent in marshy and cold countries. It is most common in summer; and though principally seen playing near the banks of rivers, or in boggy places, yet sometimes mounts up to a considerable height in the air; its appearance being that of an oblong, sometimes roundish, fiery body, with a long tail. It is entirely harmless, frequently sticking on the hands and clothes of people without injuring them.

DRACOCEPHALUM, dragon's head, a genus of the gymnospermia order, and didynamia class of plants: cor. throat inflated, upper lip concave. There are thirteen species, most of them herbaceous, annual, or perennial, plants, from eighteen inches to three feet high, garnished mostly with entire leaves, and whorled spikes of small monopetalous and ringent flowers of a blue, white, or purple color. They are all easily propagated by seeds, which may be sown either in spring or autumn. They require no culture but to keep them clear from weeds.

DRACONARIUS, Gr. *δρακοναριος*, and *δρακοντιοφορος*, in antiquity, dragon-bearer. The Persians, Parthians, Scythians, &c., bore dragons on their standards; whence the standards themselves were called dracones. See next article. The Romans borrowed the custom from the Parthians; or, as Casaubon has it, from the Dacæ; or, as Codin, from the Assyrians. The Roman emperors carried it to Constantinople.

DRACONES, among the Romans, were figures of dragons, painted in red, on their flags, as appears from Ammianus Marcellinus: but among the Persians and Parthians they were like the Roman eagles, figures in full relief; so that the Romans were frequently deceived, and took them for real dragons.

DRACONTIUM, in botany, dragons; a genus of the polyandria order, and gynandria class of plants; natural order second, piperitæ. The spathe is cymbiform, or shaped like a boat; the spadix covered all over: CAL. none; petals

five; berries polyspermous. There are five species, all natives of the Indies. *D. pertusum*, with leaves having holes, and a climbing stalk. It is a native of most of the West-India islands, and has trailing stalks which put out roots at every joint, that fasten to the trunks of trees, walls, or any support which is near them, and thereby rise to twenty-five or thirty feet. This plant is easily propagated by cuttings; which if planted in pots filled with poor sandy earth, and plunged into a hot-bed, will soon put out roots; but the plants are so tender, that they must be preserved in a stove.

DRACUNCULI, in medicine, small long worms which breed in the muscular parts of the arms and legs, called Guinea worms. This distemper is very common in Guinea, and particularly among the natives: Kempfer found it so also at Orinuz, upon the Persian Gulph, and likewise in Tartary; but this distemper is not so frequent any where as on the Gold Coast, at Anamaboe, and Cormantin. The worm is white, round, and uniform, very much resembling white round tape, or bobbin. It lodges between the interstices and membranes of the muscles, where it insinuates itself, sometimes exceeding five ells in length. It occasions no great pain at the beginning; but at such times as it is ready to make its exit, the part adjoining to the extremity of the worm, where it attempts its exclusion, begins to swell, throb, and be inflamed; this generally happens about the ankle, leg, or thigh, and seldom higher. The countries where this distemper is in any degree prevalent, are very hot and sultry, liable to great droughts, and the inhabitants make use of stagnating and corrupted water, in which it is very probable that the ova of these animalcula may be contained; for such white people as drink this water, are troubled with the disease as well as the negroes. Surgeons seldom attempt to extract this worm by making an incision; but as soon as they perceive the tumor rise to a competent bulk, they endeavour to bring it to a suppuration, with all convenient expedition; and then the head of the worm discovers itself, which they secure, by tying it to a bit of stick or cotton, that it may not draw itself up again: thus they continue to roll it round the stick, sometimes one inch, sometimes two or more, each day, taking care not to break the worm, for it would be very difficult to recover the end of it again; and an abscess would be formed, not only at the suppurated part, but likewise through the whole winding of the muscles, where the dead putrefying worm remains, which generally occasions very obstinate ulcers. During the extraction of the worm, the patient should be plied with bitter aloetic and other anthelmintic medicines, in order to dislodge the worm the sooner from his tenement. When the worm is totally extracted, the remaining ulcer may be treated in the same manner as other common ulcers; nor does any farther inconvenience remain in the parts of which it had possession. To prevent their forming again, wash the parts with wine, vinegar, alum, nitre, or common salt, or with a strong lixivium of oak-ashes, and afterwards anoint them with an ointment of the common kind used

for scorbutic eruptions, with a small mixture of quicksilver.

DRACUNCULUS, in botany. See ARUM.

DRACUT, a township of the United States, in the north part of Middlesex county, on the bank of the Merrimack, opposite Patucket Falls. It lies thirty miles north by west of Boston, and twenty-eight south-west of Exeter, in New Hampshire.

DRAD, *adj.* for dread, or the part. passive of *To DREAD*, which sec. Terrible; formidable.

The utmost sand-breach they shortly fetch,
Whilst the *drad* danger does behind remain.

Færie Queene.

DRAFF, *n. s.* } Sax. *drof*; Dutch, *druf*;

DRAFFY, *adj.* } from Saxon, *drabbe*. Filth; offal. See DRAB.

Not a jest had they to keep their auditors from sleep but of swill and *druff*. Yes; now and then the servant put his hand into the dish before his master, and almost choked himself, eating slovenly and ravenously to cause sport.

Surrey.

We do not act, that often jest and laugh:

'Tis old, but true, still swine eat all the *draugh*.

Shakspeare.

You would think I had a hundred and fifty tattered prodigals lately come from swinkeeping, from eating *druff* and husks.

Shakspeare. Henry IV.

'Twere simple fury, still thyself to waste

On such as have no taste;

To offer them a surfeit of pure bread

Whose appetite is dead!

No, give them grains their fill;

Husks, *druff*, to drink and swill. *Ben Jonson.*

Here rather let me drudge, and earn my bread,

Till vermin, or the *druff* of servile food,

Consume me. *Milton's Agonistes.*

Refuse; sweepings. Perhaps improper.

Younger brothers but the *druff* of nature. *Dryden.*

DRAG, *v. a., v. n. & n. s.* } Goth. *draga*;

DRAG'-NET, *n. s.* } Belgic, *trecken*;

Sax. *dragan*; Lat. *traho*; Gr. *δραγνν*. To draw; to pull onwards; to draw that which is weighty or burdensome; hence to pull about with violence or ignominy: as a neuter verb, to hang down so as to sweep or trail on the ground. A drag-net is a net which is drawn along the bottom of the water.

They shall surpriso

The serpent, prince of air, and *drag* in chains

Through all his realm, and there confounded leave.

Milton.

Who, that had seen and heard Saul breathing out threatenings, and executing his bloody cruelties upon the church of God; *dragging* poor Christians to their judgments and executions; would not have given him up for a man branded for hell?

Bp. Hall.

The constable was no sooner espied but he was reproached with disdainful words, beaten and *dragged* in so barbarous a manner, that he hardly escaped with his life.

Clarendon.

You may in the morning find it near to some fixed place, and then take it up with a *drag-hook*, or otherwise.

Walton.

He triumphs in St. Austin's opinion; and is not only content to *drag* me at his chariot-wheels, but he makes a shew of me.

Stillingfleet.

Some fishermen, that had been out with a *drag-net*, and caught nothing, had a draught towards the evening, which put them in hope of a sturgeon at last.

L'Estrange.

Dragnets were made to fish within the deep,
And casting-nets did rivers' bottoms sweep.

May's Virgil.

'Tis long since I, for my celestial wife,
Loathed by the gods, have *dragged* a lingering life.

Dryden.

From hence are heard the groans of ghosts, the pains
Of sounding lashes, and of *dragging* chains. *Id.*

The creatures are but instruments in God's hand: the returning our acknowledgments to them is just the same absurdity with theirs who burnt incense to the *drag*, and sacrificed to the net.

Rogers.

While I have any ability to hold a commerce with you, I will never be silent; and this chancing to be a day that I can hold a pen, I will *drag* it as long as I am able.

Swift.

Can I, who loved so well,

To part with all my bliss to save my lover,

Oh! can I *drag* a wretched life without him?

Smith.

The *drag* is made somewhat like a low car: it is used for the carriage of timber, and then is drawn by the handle by two or more men.

Maxon's Mech. Exerc.

A door is said to *drag*, when, by its ill hanging on its hinges, the bottom edge of the door rides in its sweep upon the floor.

Id.

Whatsoever old Time, with his huge *dragnet*, has conveyed down to us along the stream of ages, whether it be shells or shellfish, jewels or pebbles, sticks or straws, sea-weeds or mud, these are the ancients, these are the fathers.

Watts.

Warburton attacks the revival of Shakspeare's text with a gloomy malignity, as if he were *dragging* to justice an assassin or incendiary.

Johnson.

We can only lament their fate, and still more that of a sailor, who is often *dragged* by force from his honest occupation, and compelled to imbrue his hands in perhaps innocent blood.

Franklin.

Thou wast the veriest slave in days of yore,

That ever *dragged* a chain, or tugged an oar.

Cowper.

Here, sheltering from the sons of murder,

The hares *drag* their tired limbs no further. *Beattie.*

DRAG, in sea language, is a machine consisting of a sharp, square, iron ring, encircled with a net, and commonly used to take the wheel off from the platform or bottom of the decks. The word is also used for whatever hangs over the ship in the sea, as shirts, coats, or the like; boats, when towed, or whatever else may retard the ship's way when she sails.

DRAG'GLE, *v. a. & v. n.* From drag. To make or become dirty, by dragging on the ground

His *dragging* tail hung in the dirt,

Which on his rider he would flirt. *Hudibras.*

He wore the same gown five years, without *drag* gling or tearing.

Swift.

You'll see a *dragged* damsel, here and there,

From Billingsgate her fishy traffick bear.

Gay'sTrivia.

DRAGOMAN, or DROGMAN, a term of general use through the east for an interpreter, whose office is to facilitate commerce between the orientals and occidentals. These are kept by the ambassadors of Christian nations residing at the Porte for this purpose. The word is formed from the Arabic *targemen* or *targiman*, of the verb *taragem*, 'he has interpreted.' From *dra-*

roman the Italians formed dragomano, and, with a nearer relation to its Arabic etymology, turciman; whence the French and our trucheman, as well as dragoman and drogman

DRAGON, *n. s.*

DRAGONET, *n. s.*

DRAGON-FLY, *n. s.*

DRAGONISH, *adj.*

DRAGON-LIKE, *adj.* } French, Ital., Span.
and Port. *dragon*;
Saxon, dracan; Lat.
draco; Gr. δράκων, } from δερκεν, seeing,
because the dragon is said to be possessed of a keen and watchful eye.—Minsheu. A real or supposed flying serpent; hence a fierce animal or man, and a fierce kind of fly: dragonet is a diminutive of dragon.

He caught the *dragon*, the elde serpent, that is the duel and sathanas, and he boond hym bi a thousand gheuris. *Wiclif. Apoc. xx.*

And ever as he rode, his hart did earne

To prove his puissance in battell brave

Upon his foe, and his new force to learne;

Upon his foe, a *dragon* horrible and stearne.

Spenser. Faerie Queene.

Or in his womb might lurk some hidden nest

Of many *dragonets*, his fruitful seed. *Id.*

I go alone,

Like to a lonely *dragon*, that his fen

Makes feared and talked of more than seen.

Shakspeare.

He fights *dragonlike*, and does achieve

As soon as draw his sword. *Id. Coriolanus.*

The body of the cantharides is bright-coloured; and it may be, that the delicate coloured *dragon-flies* may have likewise some corrosive quality.

Bacon's Natural History.

Take *dragonsblood*, beat it in a mortar, and put it in a cloth with aqua vitæ, and strain them together.

Peachum.

And you, ye *dragons*! of the scaly race,

Whom glittering gold and shining armours grace;

In other nations harmless are you found,

Their guardian genii and protectors owned. *Rowe.*

On spiery volumes there a *dragon* rides;

Here, from our strict embrace, a stream he glid's.

Pope.

Dragonsblood is a resin, so named as to seem to have been imagined an animal production. *Hill.*

So, borne on brazen talons, watched of old
The sleepless *dragon* o'er her fruits of gold. *Darwin.*

DRAGON, in botany. See ARUM.

DRAGON, in zoology. See DRACO.

DRAGON, WILD. See ARTEMISIA.

DRAGON, or DRAGON-FISH, in ichthyology. See CALLIONYMUS.

DRAGON FLY. See LIBELLULA.

DRAGON GUM, or GUM TRAGACANTH. See ASTRAGALUS.

DRAGONS-BLOOD, a gummi-resinous substance brought from the East Indies, either in oval drops wrapped up in flag leaves, or in large masses composed of smaller tears. It is said to be principally obtained from the *dracæna draco*, the *ptero carpus draco*, and several other vegetables. The fine dragon's blood of either sort breaks smooth, free from any visible impurities, of a dark red color, which changes, upon being powdered, into an elegant bright crimson. Several artificial compositions, colored with the true dragon's blood, or Brasil wood, are sometimes sold for this commodity. Some of these dissolve like gums in water; others crackle in the fire without proving inflammable; whilst the genuine

sanguis draconis readily melts and catches flame, and is not acted on by watery liquors. It totally dissolves in pure spirit, and tinges a large quantity of the menstruum of a deep red color. It is likewise soluble in expressed oils, and gives them a red hue, but less beautiful than that communicated by anchusa. This drug, in substance, has no sensible smell or taste; when dissolved, it discovers some degree of warmth and pungency. A solution of dragon's blood in spirit of wine is used for staining marble, to which it gives a red tinge, which penetrates more or less deeply according to the heat of the marble during the time of application. But as it spreads at the same time that it sinks deep, for fine designs the marble should be cold.

DRAGON'S HEAD. See DRACOCEPHALUM.

DRAGON'S HEAD AND TAIL, caput and cauda draconis, in astronomy, are the nodes of the planets; or the two points in which the ecliptic is intersected by the orbits of the planets, and particularly that of the moon; making with it angles of 5° 18'. One of these points looks northward, the moon beginning then to have north latitude, and the other southward, where she commences south. Thus her deviation from the ecliptic seems, according to the fancy of some, to make a figure like that of a dragon, whose belly is where she has the greatest latitude; the intersection representing the head and tail, from which resemblance the denomination arises. But these points abide not always in one place, but have a motion of their own in the zodiac, retrograde-wise 3' 11" per day; completing their circle in eighteen years 225 days; so that the moon can be but twice in the ecliptic during her monthly period, but at all other times she will have a latitude or declination from the ecliptic. About these points of intersection all eclipses happen. They are usually denoted by these characters Ω dragon's head, and ♀ dragon's tail.

DRAGON TREE. See DRACONTIUM.

DRAGON WORT. See ARTEMISIA.

DRAGOON, *v. a. & n. s.* Fr. *dragon*. Supposed to have been derived from dragon, 'because mounted on horseback with lighted match, he seemeth like a fiery dragon' (Preface to Dr. Meyrick's Ancient Armour); or from the Latin *draconarii*, horse-soldiers who bore dragons for ensigns. See the article. The verb is derived from the noun.

Two regiments of *dragoons* suffered much in the late action. *Tatler.*

In politicks I hear you're staunch,

Directly bent against the French.

Deny to have your free-born foe

Dragooned into a wooden shoe. *Prior.*

Will the famished wretch who has braved your bayonets be appalled by your gibbets? When death is a relief, and the only relief it appears that you will afford him, will he be *dragoon*ed into tranquillity?

Byron.

DRAGOONS are divided into brigades as the cavalry: and each regiment into troops; each troop having a captain, lieutenant, cornet, quarter-master, two sergeants, three corporals, and two drums. Some regiments have hautboys. They are very useful on any expedition that

requires despatch; for they can keep pace with the cavalry, and do the duty of infantry: they encamp, generally, on the wings of the army, or at the passes leading to the camp; and sometimes they are brought to cover the general's quarters; they march in front and rear of the army. The first regiment of dragoons raised in England was in 1681, and called the regiment of dragoons of North Britain. In battles or attacks they generally fight sword in hand after the first fire. Their arms are, a sword, firelock, and bayonet, to which pistols are now generally added.

DRAGOONING, a term that has been used to express the horrible persecution and oppression inflicted on the French Protestants under Louis XIV. after the revocation of the edict of Nantes. By these means the Protestants in Montauban alone were, in four or five days, stripped of above a million of money. Their dining-rooms were turned into stables; and the owners of the houses where the military were quartered were treated with every possible indignity and cruelty, without intermission. At Negreplesse, a town near Montauban, they hung up Isaac Favin, a Protestant citizen of that place, by his arm-pits, and tormented him a whole night, by pinching and tearing off his flesh with pincers. They made a great fire round a boy of about twelve years old, who, with hands and eyes lifted up to heaven, cried out, 'My God, help me!' And when they found the youth resolved to die rather than renounce his religion, they snatched him from the fire just as he was on the point of being burnt. In several places the soldiers applied red-hot irons to the hands and feet of men and breasts of women. At Nantes they hung up several naked women by their feet, and others by their arm-pits, and thus exposed them to public view. They bound to posts mothers that gave suck, and let their sucking infants lie languishing in their sight for several days and nights, crying, mourning, and gasping for life. Some they bound before a great fire, and, being half roasted, let them go. Amidst a thousand hideous cries and blasphemies, they hung up men and women on hooks in chimneys by the hair, and feet, and suffocated them with wisps of wet hay. Some they tied under the arms with ropes, and plunged them again and again into wells: but we cannot proceed in these shocking details. If any to escape these barbarities endeavoured to save themselves by flight, they pursued them into the fields and woods, where they were hunted down like wild beasts, and prohibited at the same time from departing the kingdom, upon pain of confiscation of their effects.

DRAGUIGNAN, a town of France, the capital of the department of the Var, Provence, is situated in a fertile plain, on the river Pis. The bishops of Frejus had formerly a palace here. The town is the seat of the courts of provincial justice, and has a public library. There is little trade, and the manufactures are coarse cloth, soap, oil, and sugar of lead, the two last being made in considerable quantities. The wine raised on the sides of the neighbouring hills is remarkable for its strength. The general trade is by no means considerable. Population

VOL. VII.

about 5000. Thirty-five miles north-east of Toulon.

DRAIN, *v. a. & n. s.* } Fr. *trainer*; Teut.

DRAIN *AGE*. } *trancer*, part. of verb
drygan, Sax. to expel; and therefore to dry,
according to Mr. Tooke; or from *drechnigean*, to
strain, says Mr. Todd. To draw off; to empty
of a fluid gradually; to make dry: as a sub-
stantive, it means the channel, or course of the
water or fluid taken off. Drainage is the act or
system of draining.

The fountains *drain* the water from the ground ad-
jacent, and leave but sufficient moisture to breed moss.

Bacon.

In times of dearth it *drained* much coin of the
kingdom, to furnish us with corn from foreign parts.

Id. to Villiers.

Sinking waters, the firm land to *drain*,

Filled the capacious deep, and formed the main

Roscommon.

The royal babes a tawny wolf shall *drain*.

Dryden.

While cruel Nero only *drains*

The mortal Spaniard's ebbing veins,

By study worn, and slack with age,

How dull, how thoughtless is his rage! *Prior.*

Had the world lasted from all eternity, these comets
must have been *drained* of all their fluids. *Cheyne.*

When wine is to be bottled wash your bottles, but
do not *drain* them. *Swift's Directions to the Butler.*

Whilst a foreign war devoured our strength, and
drained our treasures, luxury and expences increased
at home. *Atterbury.*

That boy was blest,

Whose infant lips have *drained* a mother's breast.

Gay.

By oppression's woes and pains!

By your sons in servile chains!

We will *drain* our dearest veins,

But they shall be—shall be free! *Burns.*

Strike up the dance, the cava bowl fill high,

Drain every drop!—to-morrow we may die.

Byron.

In cases which arise from springs, as well as those
which are produced by the stagnation of surface water,
it will frequently be necessary, in order to effect their
drainage, to have one or more deep open cuts, brought
up in a proper direction from the lowest point at which
the water can be discharged.

Dr. A. Rees.

DRAINS, in the fen countries, are certain
large cuts or ditches of twenty or thirty, nay
sometimes forty feet wide, carried through the
marshy ground to some river or other place,
capable of discharging the water out of the fen
lands. To clear wet and boggy lands of their
superfluous moisture, is an art of the highest
importance, not only to the agriculture, but to
the health of a country; yet it is only of late
years that the principles of this art became well
understood, and opened the way for many im-
provements. Dr. James Anderson of Edin-
burgh, in his *Essays on Agriculture*, seems to
have been the first who treated the subject sci-
entifically; but before quoting his ingenious
introductory observations, it may be remarked,
that land becomes charged with moisture from
two causes: 1. From water collected in the
higher grounds, and filtrating among the different
beds of gravel and other porous materials,
forming springs below, and flowing over the
surface, or stagnating underneath it. 2. From

rain or water lodging and becoming stagnant on the surface, from the clayey or impervious nature of the soil or superior stratum. The first of these is the cause of bogs, swamps, and morasses, and is the most difficult to remedy. Dr. Anderson says, 'springs are formed in the bowels of the earth, by water percolating through the upper strata where that is of a porous texture, which continues to descend downwards till it meets with a stratum of clay that intercepts it in its course; where, being collected in considerable quantities, it is forced to seek a passage through the porous strata of sand, gravel, or rock, that may be above the clay, following the course of these strata till they approach the surface of the earth, or are interrupted by any obstacle which occasions the water to rise upwards, forming springs, bogs, and the other phenomena of this nature; which, being variously diversified in different circumstances, produce that variety of appearance in this respect that we often meet with. This being the case, we may naturally conclude that an abundant spring need never be expected in any country that is covered to a great depth with sand, without any stratum of clay to force it upwards, as is the case in the sandy deserts of Arabia, and the immeasurable plains of Libya: neither are we to expect abundant springs in any soil that consists of a uniform bed of clay from the surface to a great depth; for it must always be in some porous stratum that the water flows in abundance; and it can be made to flow horizontally in that, only when it is supported by a stratum of clay, or other substance that is equally impermeable by water. Hence the rationale of that rule so universally established in digging for wells, that if you begin with sand, gravel, &c. you need seldom hope to find water till you come to clay; and, if you begin with clay, you can hope for none in abundance till you reach to sand, gravel, or rock. It is necessary that the farmer should attend to this process of nature with care, as his success in draining bogs, and every species of damp and spouting ground, will in a great measure depend upon his thorough knowledge of this,—his acuteness in perceiving in every case the variations that may be occasioned by particular circumstances—and his skill in varying the plan of his operations according to these. As the variety of cases that may occur in this respect is very great, it would be a very tedious task to enumerate the whole, and describe the particular method of treating each; I shall therefore content myself with enumerating a few particular cases, to show in what manner the principles above established may be applied to practice.'

Let fig. 1. Plate Dogs and DRAINS represent a perpendicular section of a part of the earth, in which *AB* is the surface of the ground, beneath which are several strata of porous substances, which allow the water to sink through them till it reaches the line *CD*, that is supposed to represent the upper surface of a solid bed of clay; above which lies a stratum of rock, sand, or gravel. In this case, it is plain, that when the water reaches the bed of clay, and can sink no farther, it must be there accumulated into a body; and seeking for itself a passage, it flows

along the surface of the clay, among the sand or gravel, from *D* towards *C*; till at last it issues forth, at the opening *A*, a spring of pure water. If the quantity of water that is accumulated between *D* and *C* is not very considerable, and the stratum of clay approaches near the surface; in that case, the whole of it will issue by the opening at *A*, and the ground will remain dry both above and below it. But if the quantity of water is so great, as to raise it to a considerable height in the bed of sand or gravel, and if that stratum of sand is not discontinued before it reaches the surface of the ground, the water, in this case, would not only issue at *A*, but would likewise ooze out in small streams through every part of the ground between *A* and *a*; forming a barren patch of wet, sandy, or gravelly ground upon the side of a declivity, which every attentive observer must have frequently met with. To drain a piece of ground in this situation is perhaps the most unprofitable task that a farmer can engage in; not only because it is difficult to execute, but also because the soil that is gained is but of very little value. However, it is lucky, that patches of this kind are seldom of great breadth, although they sometimes run along the side of the declivity in a horizontal direction for a great length. The only effectual method of draining this kind of ground, is to open a ditch as high up as the highest of the springs at *a*, which should be of such a depth as not only to penetrate through the whole bed of sand or gravel, but also to sink so far into the bed of clay below as to make a canal therein sufficiently large to contain and carry off the whole of the water. Such a ditch is represented by the dotted lines *aez*: but as the expense of making a ditch of such a depth as this would suppose, and of keeping it afterwards in repair, is very great, it is but in very few cases that this mode of draining would be advisable; and never, unless where the declivity happens to be so small, as that a great surface is lost for little depth, as would have been the case here if the surface had extended in the direction of the dotted line *ad*. But supposing that the stratum of clay, after approaching toward the surface at *A*, continued to keep at a little depth below ground; and that the soil which lay above it was of a sandy or spongy nature, so as to allow the water to penetrate it easily; even supposing the quantity of water that flowed from *D* to *C* was but very inconsiderable, instead of rising out at the spring *A*, it would flow forward along the surface of the clay among the porous earth that forms the soil, so as to keep it constantly drenched with water, and of consequence render it of very little value. Wetness arising from this cause, is usually of much greater extent than the former: and, as it admits of an easy cure, it ought not to be one moment delayed; as a ditch of a very moderate depth opened at *A*, and carried through a part of the stratum of clay (as represented by the dotted lines *Akf*), would intercept and carry off the whole of the water, and render the field as dry as could be desired. It is, therefore, of very great consequence to the farmer, accurately to distinguish between these two cases, so nearly allied to each other in appearance; and, as this can be easiest done by boring, every one

who has much ground of this kind ought to provide himself with a set of boring irons, which he will likewise find use for on other occasions. I might here enumerate a great variety of cases which might be reduced to the same head with the foregoing: but as any attentive reader may, after what has been said, be able easily to distinguish these, I shall only in general observe, that every soil of a soft and porous texture, that lies upon a bed of hard clay, whatever its situation in other respects may be, will in some measure be subject to this disease. And, if it is upon a declivity of any considerable length, the undermost parts of the field will be much damaged by it, unless ditches are thrown up across the declivity, at proper distances from one another, to intercept the water in its descent. It may not likewise be improper here to observe, that in cases of this nature, unless where the soil is of a very great depth, the malady will always be increased, by raising the ridges to a considerable height; as will appear evident by examining fig. 2; in which the line AB represents the surface of a field of this nature, and CD the surface of the bed of clay. Now, if this field were raised into high ridges, as at FFF, so that the furrows EEE descended below the surface of the clay, it is plain, that all the water that should sink through the middle of the ridge, would run along the surface of the clay till it came to the sides of the ridge LLLLLL, which would thus be kept continually soaked with water. Whereas, if the ground had been kept level, as in the part of the field from G to H, with open furrows II, at moderate distances from each other, the water would immediately sink to the clay, and be carried off by the furrows, so as to damage the soil far less than when the ridges are high. If the soil is so thin as that the plough can always touch the clay, the ridges ought to be made narrow and quite flat, as from G to H: but if there is a little greater depth of soil, then it ought to be raised into ridges of a moderate height, as from H to B, so as to allow the bottom of the furrow to reach the clay: but neither is this necessary where the soil is of any considerable depth. I have seen some industrious farmers, who, having ground in this situation, have been at the very great expense of making a covered drain in each furrow. But, had they rightly understood the nature of the disease, they never would have thought of applying such a remedy; as must appear evident at first sight to those who examine the figure. The success was what might be expected from such a foolish undertaking. These observations, it is hoped, will be sufficient as to the manner of treating wet, sandy, or porous soils. I now proceed to take notice of such as are of a stiff, clayey nature, which are often very different in appearance, and require a different treatment from these. Suppose that (in fig. 3) the stratum of sand or gravel DC should be discontinued, as at E, and that the stratum above it should be of a coherent clayey nature. In this case, the water that flowed towards E, being there pent in on every side, and being accumulated there in great quantities, it must at length force a passage for itself in some way; and pressing strongly upon the upper surface, if any

one part is weaker than the rest, it there would burst forth and form a spring (as suppose at A). But if the texture of every part of this stratum were equally strong, the water would squeeze through many small crannies, and would ooze out in numberless places, as between A and F, so as to occasion that kind of wetness that is known by the name of a spouting clayey soil. The cure, in this case, is much more easily effected than in any of the former; for if a ditch of a considerable size is opened, as at A, towards the lowermost side of the spouting ground, so deep as to penetrate through the upper stratum of clay, and reach to the gravel, the water will rise up through it at first with very great violence, which will gradually decrease as the pressure from the water behind is diminished; and when the whole of the water accumulated in this subterraneous reservoir has run off, there being no longer any pressure upon the clay above it, the whole soon becomes as dry as could be desired, and continues so ever afterwards, if the ditch is always kept open. This I speak from experience, having rendered some fields of this kind that were very wet, quite dry by this method of treating them. It will hardly be necessary for me here to put the farmer upon his guard, to be particularly careful in his observations, that he may distinguish between the wetness that is produced from this cause, and that which proceeds from the cause before mentioned; because the treatment that would cure the one would be of no use at all to the other. The attentive observer likewise will readily perceive, that if any field that is wet from this cause admits of being ploughed, it will be in equal danger of being hurt by being raised into high ridges, with the other kind of damp ground before mentioned. For, as the depth of earth above the reservoir would be smaller in the deep furrows than any where else, there would, of consequence, be less resistance to the water in that place, so that it would arise there in greater abundance. And if, in this case, a farmer should dig a drain in each furrow, as a considerable quantity of water would rise into them, in some cases the ground might be improved, or even quite drained thereby, especially if they should have accidentally reached the gravel in any one place; although at an expense much greater than was necessary. I take notice of this circumstance, in some measure to prevent the prejudice, that some inattentive observers might entertain, against what was said before of this method of draining, from their having accidentally seen some fields that may not have been bettered by it.

'Bogs,' continues the doctor, 'are only a variety of this last-mentioned kind of wet ground; and therefore ought, in general, to be drained after the same manner with them. Clay is a substance that strongly resists the entrance of water into it: but when it is long drenched with it, it is, in process of time, in some measure, dissolved thereby, loses its original firmness of texture and consistence, and becomes a sort of semi-fluid mass, which is called a bog; and as these are sometimes covered with a strong scurf of a particular kind of grass, with very matted roots, which is strong enough to bear a

small weight without breaking, although it yields very much, it is in these circumstances called a swaggle. But, whatever be the nature of the bog, it is invariably occasioned by water being forced up through a bed of clay, as just now described, and dissolving or softening, if you will, a part thereof: I say only a part; because whatever may be the depth of the bog or swaggle, it generally has a partition of solid clay between it and the reservoir of water under it, from whence it originally proceeds: for if this were not the case, and the quantity of water were considerable, it would meet with no sufficient resistance from the bog, and would issue through it with violence, and carry the whole semi-fluid mass along with it. But this would more inevitably be the case if there was a crust at the bottom of the bog, and if that crust should ever be broken, especially if the quantity of water under it were very considerable: and as it is probable, that in many cases of this sort, the water slowly dissolves more and more of this under crust, I make no doubt, but that in the revolution of many ages a great many eruptions of this kind may have happened, though not deemed of sufficient importance to have the history of them transmitted to posterity. Of this kind, although formed of a different substance, I consider the flow of the Solway moss, in Northumberland, to have been; which, upon the 10th of November, 1771, burst its former boundaries, and poured forth a prodigious stream of semi-fluid matter, which in a short time covered several hundred acres of very fine arable ground. Nor will any one, who is acquainted with the nature of moss, who knows its resemblance to clay, in its quality of absorbing and retaining water, and its very easy diffusibility therein, be surprised at this; as, from all these properties, it is much better adapted for forming an extensive bog, and therefore in greater danger of producing an extensive devastation by an eruption of the water into it, than those that are formed of any kind of clay whatever. If the bog or swampy ground is upon a declivity, the ditch ought to be carried across the field about the place where the lowest springs arise. But if the surface of the ground is level, or nearly so, as between A and B, fig. 4, and the springs break out in several places, *q q q q q*, so as to form soft quagmires, interspersed through the whole of the field, it will be of little consequence in what part the drain is opened; for if it be dug up so deep as to allow the water to rise in it with freedom, it will issue through that opening, and the field will be left perfectly dry. But as it may frequently happen that the stratum of gravel should be at a considerable depth beneath the surface of the earth, and as it may be sometimes even below the level of the place into which the drain must be emptied, it might sometimes be extremely difficult to make a ditch so deep as to reach the bed of sand or gravel. But it is lucky for us that this is not absolutely necessary in the present case; as a drain of two or three feet deep, as at D, will be equally effectual with one that should go to the gravel. All that is necessary in this case, is to sink pits P in the course of the drain, at a moderate distance from

one another, which go so deep as to reach the gravel; for, as the water there meets with no resistance, it readily flows out at these openings, and is carried off by the drain without being forced up through the earth; so that the ground is left entirely dry ever after. I have likewise drained several fields in this way; and, as I have generally found the appearance pretty much alike, I shall, for the information of the inexperienced reader, give a short account of them. If you attempt to make your pit in one of these soft quaggy places where the water is found in great abundance, you will meet with very great difficulty in forming it; for, as the substance of which it is composed is soft, it will always flow into the hole as fast as you dig it; on which account I would advise, not to attempt to make the pit in the swaggle, but as near it in the solid earth as you conveniently can. However, if it is pretty firm, and of no great extent, it is sometimes practicable to make a pit in the soft bog at the driest time of the year. This I have sometimes practised, which gave me an opportunity of observing the nature of these bogs more perfectly than I otherwise should have had. In the trials of this kind that I have made, this soft quaggy ground has seldom been above three or four feet deep, below which I have always found a stratum of hard tough clay usually mixed with stone; and so firm, that nothing but a mattock or pick-axe could penetrate it; and, as this is comparatively so much drier than the ground above it, an inexperienced operator is very apt to imagine that this is the bottom that he is in search of. In digging through this stratum you will frequently meet with small springs oozing out in all directions; some of them that might fill the tube of a small quill, and others so small as to be scarcely perceptible; but, without regarding these, you must continue to dig on, without intermission, till you come to the main body of the reservoir, if I may so call it, that is contained in the rock, gravel, or sand; which you will generally find from two to four feet below the bottom of the swaggle, and which you will be in no danger of mistaking when you come to it: for, if there has been no opening made before that in the field, as soon as you break the crust immediately above the gravel or rock, the water bursts forth like a torrent; and, on some occasions, rises like a jet d'eau to a considerable height above the bottom of the ditch; and continues to flow off with great impetuosity for some time, till the pent up water being drained off, the violent boiling up begins to subside, and the strength of the current to abate; and, in a short time, it flows gently out like any ordinary spring;—allowing it to remain in this state, the quaggy earth begins to subside, and gradually becomes firmer and firmer every day; so that, in the space of a few months, those bogs which were formerly so soft as hardly to support the weight of a small dog, become so firm, that oxen and horses may tread upon them without any danger of sinking, at the very wettest season of the year. I have had a field of this nature, that, by having only one such pit as I have now described opened in it, was entirely drained to the distance of above 100 yards around it in every direction. But as it is possible that the stratum in which the water

runs may be in some places interrupted, it will be in general expedient to make several of these pits, if the field is of great extent; always carrying the drain forward through the lowermost part of the field, or as near the quag as you conveniently can; and sinking a pit wherever you may judge it will be most necessary. But, if the stratum of gravel is not interrupted, there will be no violent burst of water at opening any of these after the first, as I have frequently experienced. To keep these wells from closing up after they are made, it is always expedient to fill them up with small stones immediately after they are made, which ought to rise to the height of the bottom of the drain. I have often imagined, that the expense of digging these pits might be saved by boring a hole through this solid stratum of clay with a large wimble made on purpose; but, as I never experienced this, I cannot say whether or not it would answer the desired end exactly. If the whole field that is to be drained consists of one extensive bog, it will require a long time before the whole work can be entirely finished, as it will be impossible to open a drain through it till one part of it is first drained, and becomes solid ground. In a situation of this kind, the undertaker, after having opened a drain to convey the water from the lowest part of the bog, must approach as near to the swampy ground as he can, and there make his first pit; which will drain off the water from the nearest parts of the bog. When this has continued open for some time, and that part of the bog has become so solid as to admit of being worked, let him continue the ditch as far forward through it as the situation it is in will admit of, and there sink another pit, and proceed gradually forward in the same manner; making cross cuts where necessary, till the whole be finished. In this manner, may any bog or track of spouting ground of this nature, be rendered dry at a very inconsiderable expense; and, as there can be no other method of draining ground of this sort effectually, I recommend the study of it to the attention of every diligent farmer who may have occasion for it. Let him first be extremely cautious in examining all the circumstances of his particular fields, that he may be certain which of the classes above enumerated it may be ranked with; and, when he is perfectly sure of that, he may proceed without fear, being morally certain of success. There is, however, one kind of damp ground not yet particularly specified, that I have purposely omitted taking notice of till this time, as I have never had any opportunity of examining particularly into the nature of it, nor of ascertaining, by experience, what is the most proper method of treating it. The soil I have now particularly in my eye, consists of a deep strong clay that does not vary its nature even on the surface, but in as far as manures may have rendered it more friable and tender; the color usually inclines to a reddish cast, and, for the most part, it is situated upon the side of some declivity. This bed of clay reaches to a great depth, without any variation, and is intermixed with a considerable quantity of small round stones. Many soils, of the sort now described, are apt to be continually moist and full of water during the winter season;

but when the dry weather of summer sets in, the moisture is diminished, and the surface becomes hard; and it is rent into many large gaps which allow free admission to the sun and air, so as to scorch up almost every plant that is sowed upon it; and, as these soils are usually in themselves naturally fertile when drained, it were to be wished that some method could be discovered, that would be less expensive than what is usually practised with regard to some soils of this kind in Essex; where they make covered drains of two feet and a half deep, running diagonally through the whole field, at the distance of twenty feet from each other.*

In the *Georgical Essays*, T. B. Bayley, Esq. of Hlope, near Manchester, gives the following directions for making covered drains:—First make the main drains down the slope or fall of the field. When the land is very wet, or has not much fall, there should, in general, be two of these to a statute acre; for the shorter the narrow drains are, the less liable they will be to accidents. The width of the trench for the main drains should be thirty inches at top, but the width at the bottom must be regulated by the nature and size of the materials intended to be used. If the drain is to be made of bricks ten inches long, three inches thick, and four inches in breadth, then the bottom of the drain must be twelve inches; but if the common sale bricks are used, then the bottom must be proportionably contracted. In both cases there must be an interstice of one inch between the bottom brick and the sides of the trench, and the vacuity must be filled up with straw, rushes, or loose mould. For the purpose of making these drains I order my bricks to be moulded ten inches long, four broad, and three thick, which dimensions always make the best drains. The method I pursue in constructing my main drains is as follows: when the ground is soft and spongy, the bottom of the drain is laid with bricks placed across. On these, on each side, two bricks are laid flat, one upon the other, forming a drain six inches high and four broad, which is covered with bricks laid flat. When the bottom of the trench is found to be a firm and solid body, as clay, or marle, the bottom of the drain does not then require being laid with bricks. In that case the sides are formed by placing one brick edge-ways, instead of two laid flat. This latter method is much cheaper, and in such land equally durable with the other. When stones are used instead of bricks, the bottom of the drain should be about eight inches in width. And here it will be proper to remark, that, in all cases, the bottom of the main drains must be sunk four inches below the level of the narrow ones, even at the point where the latter fall into them. The main drains should be kept open till the narrow ones are begun from them, after which they may be finished; but before the earth is returned upon the stones or bricks, it will be advisable to throw in straw, rushes, or brush-wood, to increase the freedom of the drain. The small narrow drains should be cut at the distance of sixteen or eighteen feet from each other, and should fall into the main drain at very acute angles, to prevent any stoppage. At the point where they fall

in, and eight or ten inches above it, they should be made firm with brick or stone. These drains should be eighteen inches wide at top, and sixteen at bottom.' See plate DOGS and DRAINS. Fig. 3, represents a field with drains, laid out according to Mr. Bayley's method. The black lines represent the main drains, and the dotted lines represent the narrow drains communicating with the former from all parts of the field.

About the same time that Dr. Anderson had reduced the system of draining to scientific principles in Scotland, Mr. Joseph Elkington, of Princethorpe, in Warwickshire, appears to have made some similar discoveries in England. The priority, indeed, is claimed by Dr. Anderson, but as each party has his merits, and as the public is, doubtless, highly indebted to both, we shall not presume to decide upon this point. The great object of Mr. Elkington's system is the draining of lands rendered wet by waters confined beneath the surface, and attempting to rise in the manner of springs. Among these, bogs or morasses are the chief. Having attempted, a considerable number of years ago, to drain a piece of ground of this kind on his farm at Princethorpe, by making a trench of five feet deep, but without success, he thought it might be of use to know, what kind of strata lay under the trench. Accordingly, he forced an iron crow, of about an inch and a half in diameter, three feet down, and upon taking it out, was agreeably surprised, to find a great quantity of water burst forth, and run down the trench. This led him to think of applying an auger, an instrument fitter for the purpose of boring, which, upon trial, he found equalled his expectations; and, by continuing the same plan with the auger, he at last drained all the wet parts of his farm, which were numerous, and had proved destructive to his sheep, by inducing the rot. When a morass is to be drained, his first object is to ascertain the direction in which the trench is to be dug. The substance of his rules for this, as laid before the Board of Agriculture in 1796, are these: 1. To obtain as much knowledge as possible respecting the strata in the neighbourhood. 2. To direct the trench so as to hit the bottom of the bed, which occasions the mischief, and the particular spot where the main spring lies. 3. If there are various beds through which the water issues, to prefer the stone one for draining the whole; and to make the trench from six to eight yards from the tail of the bed, where the rock ends, because in limestone, and other rocks, the tail, as it is technically termed, is harder than any other part of the rock; but a few yards above it, it is softer, and the water is more accessible. The tail of these beds may often be found jutting out in a point. 4. To direct the trench in a line with the bottom of the hill; as it makes the best separation between the upland and meadow enclosures, where the spring can be best intercepted. The trench, however, must be carried in or near the line of the spring; for, if it diverges to any distance, all chance of reaching the spring by tapping is over, and the labor of digging it probably lost. 5. To make a new trench, rather than to tap the spring in any old brook, or run of water. 6, and lastly, having fixed on the line

of direction, and marked out the trench, to begin at the bottom or lowest level, carrying the trench gradually up. The fall of the water need not be above a few inches in 100 yards. The auger, which must often be used for tapping, need not exceed two inches in diameter. Mr. Elkington bored a hole with one, to the depth of thirty feet, which threw up water equal to three hog-heads in a minute, and completely drained all the neighbourhood. In such cases, farther operations in draining are unnecessary. In other cases, the trench being once made, and the spring cut off, by tapping, or otherwise, it remains only to determine, whether it is to be kept open or covered. Fig. 5 serves to exemplify on a large scale the advantages which result from the arrangement of drains indicated by A B C D. The section of a hill at fig. 6 is furnished with outlets to carry off the water or supply springs at various heights. Thus A is supplied by the loose strata at the top of the hill. B and D are supplied by the bed beneath, while by the aid of a pipe at C we procure a continuously flowing spring, the water being insulated in its passage through the intermediate strata.

On the drainage of *mixed* and *varied* soils of the clayey kind, we have the following useful observations in Mr. Loudon's *Encyclopedia of Agriculture*:—'The business of draining is here,' he remarks, 'considerably more tedious and difficult than where the superficial and internal parts have greater regularity. In such sorts of lands, as all the different collections of water are perfectly distinct from each other, by means of the beds of clay that separate them, each collection becomes so much increased, or accumulated, in the time of heavy rains, that they are filled quite to the level of the surface of the clay by which they are surrounded; when the water getting a free passage, as it would over the edges of a bowl or dish, overflows and saturates the surface of that bed of clay in such a manner, as to render it so perfectly wet and sour, that its produce becomes not only annually more and more scanty, but the soil itself more sterile and unproductive. From the sand-beds, in such cases, having no communication with each other, it must evidently require as many drains as there are beds of this kind, in order fully to draw off the water from each of them. A drain or trench is therefore recommended to be cut from the nearest and lowest part of the field intended to be drained, up to the highest and most distant sand-bank in such a line of direction as, if possible, to pass through some of the intermediate sand-beds, and prevent the labor and expense of making longer cuts on the sides, which would otherwise be requisite.

Where the different beds of sand and clay are of less extent, and lie together with greater regularity, they can be drained in a more easy manner with less cutting, and of course at less expense. Below the layers or beds of sand and clay that lie, in this manner, alternately together, and nearly parallel to each other, is generally a body of impervious clay, which keeps up the water that is contained in the sand, and which, being constantly full, renders the adjacent clay moist; and in wet-seasons runs or trickles over

it. As, in these cases, the principal under-stratum of clay is rarely above four or five feet below the surface, a drain is advised to be cut to that depth through the middle of the field, if it have a descent from both sides; but if it decline all to one side, the drain must be made in that place, as the water will more readily discharge itself into it; and unless the field be of great extent, and have more depressions or hollows in it than one, one drain may be quite sufficient for the purpose, as, by crossing the different beds that retain the water, it must take it off from each of them. A principal difficulty in draining ground of this nature, and which renders it impracticable by one drain, is when the direction of the alternate layers, or beds of clay and sand, lie across the declivity of the land, so that one drain can be of no other service than that of conveying away the water after it has passed over the different strata, and would naturally stagnate in the lowest part of the field, if there was no other passage for it. Where the land lies in this way, which is frequently the case, it will therefore be necessary, besides the drain in the lowest part, to have others cut up from it in a slanting direction across the declivity, which by crossing all the different veins, or narrow strata of sand, may be capable of drawing the water from each of them. In forming the drains in these cases, it is recommended that, after laying the bottom in the manner of a sough, or in the way of a triangle, it be filled some way up by small stones, tough sods being applied, the green side downwards, upon them before the mould is filled in. But, where stones cannot be readily procured, faggots may be employed in their place, where they are plentiful: the under part of the drain being laid, or coupled, with stones, so as to form a channel or passage for the conveyance of the water that may sink through the faggots, and for the purpose of rendering them more durable; as where the water cannot get freely off, which is generally the case where there is not an open passage made of some solid material, it must, by its stagnation, soon destroy the faggots, and choke up the drain.

‘The mode of draining *retentive* soils, is materially different from that which has been described above. Many tracts of level land are injured by the stagnation of a superabundant quantity of water in the upper parts of the surface materials, which does not rise up into them from any reservoirs or springs below. The removal of the wetness in these cases may, for the most part, be effected without any very heavy expense. From the upper or surface soil, in such cases, being constituted of a loose porous stratum of materials, to the depth of from two to four or five feet, which has a stiff retentive body of clay underneath it, any water that may come upon the surface from heavy rains, or other causes, readily filtrates and sinks down through it, until it reaches the obstructing body of clay which prevents it from proceeding; the consequence of which is, that the porous open soil above is so filled and saturated with water, as to be of little utility for the purpose of producing crops of either grain or grass. Land situated in this way, is frequently said by farmers to be wet-

bottomed. In order to remove this kind of wetness, it seldom requires more than a few drains, made according to the situation and extent of the field, of such a depth as to pass a few inches into the clay, between which, and the under surface of the porous earth above, there will obviously be the greatest stagnation, and consequently, collection of water, especially where it does not become much visible on the surface. In these cases there is not any necessity for having recourse to the use of the boring instrument, as there is no water to be discharged from below. When the field to be drained has only a slight declination, or slope, from the sides towards the middle, one drain cut through the porous superficial materials into the clay, in the lowest part of the ground, may be sufficient to bring off the whole of the water detained in the porous soil. This effect may likewise be greatly promoted, by laying out and forming the ridges so as to accord with the direction of the land, and by the use of the plough or spade in removing obstructions, and deepening the furrows. In such situations, where the drain has been formed in this manner, the water will flow into it through the porous surface materials, as well as if a number of small trenches were cut from it to each side, as is the practice in Essex and some other parts of the country; but which is often an unnecessary labor and expense. The drain made in the hollow may frequently serve as a division of the field, in which case it may be open; but in other circumstances it may be more proper to have it covered. Where a field of this description has more than one hollow in its surface, it will obviously be requisite to have more than one main drain; but when it is nearly level, or only inclines slightly to one side, a trench or drain along the lowest part, and the ridges and furrows formed accordingly, may be sufficient for effecting its drainage. There may, however, be cases, as where a field is large and very flat, in which some side-cuts from the principal drain may be necessary, which must be made a little into the clay, and as narrow as they can be wrought, and then filled up with stones or other suitable materials.’

‘What is called the *Essex method* of draining in ploughed springy lands, where the surface soil is tenacious, is described by Kent, and consists in substituting small under-drains for open furrows; or in some cases having a small under-drain beneath every other or every third furrow. These drains lead to side or fence ditches, where they discharge themselves.’ For draining of mines, see *Mining*.

Drains may be conveniently classed, as Mr. Loudon observes, under, 1. Drains of conveyance simply; and 2. Drains of conveyance and collection. The most complete drain of conveyance is a large pipe of metal, masonry, or brickwork: and the most complete collecting drain, one formed with a channel built on the sides, and covered with flat-stones, with a superstratum of round stones or splinters, diminishing to the size of gravel as they rise to the surface, and there covered with the common soil. As the best constructions, however, are not always practicable. the following are a few leading sorts

adapted for different situations. (We are indebted to Mr. Loudon for this selection).

For drains of conveyance, there are the walled or box drain, the barrel drain, the walled or the triangular drain, and the arched drain, fig. 1.

Fig. 1.

Fig. 2.

Drains of collection are formed of stone, brick, gravel, cinders, wood, spray, straw, turf, and earth alone.

The boxed and rubble drain, fig. 2, is a drain of conveyance and collection. The common rubble drain is formed of rough land-stones of any sort, not exceeding six or seven inches in diameter, thrown in the bottom, with smaller ones over, and, if to be had, gravel or ashes at top. On this is laid a thin layer of straw or haum of any kind, and the remainder is filled up with the surface soil.

The brick drain is formed in a great variety of ways, either from common bricks and bats in imitation of the boxed and rubble, or rubble drain; or by the use of bricks made on purpose, of which there are great variety. Draining tiles to be used with effect as collecting drains, should always be covered a foot in depth, or more, with stones or gravel.

The gravel or cinder drain is seldom made deep, though, if the materials be large, they may be made of any size. In general they are used in grass lands; the section of the drain being an acute-angled triangle, and the materials being filled in, the smallest uppermost, nearly to the ground's surface.

The wood drain is of various kinds. A very sufficient and durable construction consists of poles or young fir-trees stripped of their branches and laid in the bottom of the drain lengthways. They are then covered with the branches and spray. Another form is that of filling the drain with faggot-wood, with some straw over. A variety of this mode is formed by first setting in cross stakes to prevent the faggots from sinking; but they are of no great use, and often occasion such drains to fail sooner than common faggot drains, by the greater vacuity they leave after the wood is rotten. In some varieties of this drain the brush-wood is first laid down alongside the drain, and formed by willow, or other ties, into an endless cable of ten or twelve inches in diameter, and then rolled in, which is said to form an excellent drain with the least quantity of materials, and to last a longer time than any of the modes above mentioned. Some cut the brush-wood into lengths of three or four feet, and place them in a sloping direction with the root end of the branch in the bottom of the drain; others throw in the branches at random, with little preparation, and cover them with

spray, straw, or rushes, and finally the surface soil.

The spray drain is generally like the gravel drain, of small size, and formed like it, with an acute angled bottom. In general, the spray is trod firmly in; though in some cases it is previously formed into a cable, as in the brush-wood drain. Drains of this sort are much in use in grass lands, and when the spray of larch-wood, heath, or ling can be got, they are of great durability. The straw drain, when reeds, rushes, and bean straw is used, is sometimes made like the spray drain, by pressing the loose material down, or forming a cable; but in general the straw is twisted into ropes as big as a man's leg, by the aid of a machine, and three or more of these laid in the bottom of a triangular drain, with or without the protection of three turves.

The turf drain,

fig. 3, may be made of any convenient depth, but it must be at least the breadth of a turf at bottom. The drain being dug out as if it were to be filled with stones or any ordinary material;

Fig. 3.

the operator next, with a spade three inches wide, digs a narrow channel along its centre *a*, clearing it out with the draining scoop; and over this the turves, *b*, are laid without any other preparation, or any thing put over them but the earth that was excavated. This is found to be a very cheap, and, considering the materials, a surprisingly durable method of draining; answering, in pasture-fields especially, all the purposes that the farmer can expect to derive from drains constructed with more labor, and at a much greater expense. They are said to last frequently twenty years and upwards; but the period which it can be supposed they will continue to prove effectual, must depend on the nature of the soil, and the current of water.

The triangular sod drain is thus made: when the line of drain is marked out, a sod is cut in the form of a wedge, the grass side being the narrowest, and the sods being from twelve to eighteen inches in length. The drain is then cut to the depth required, but is contracted to a very narrow bottom. The sods are then set in with the grass side downwards, and pressed as far as they will go. As the figure of the drain does not suffer them to go to the bottom, a cavity is left, which serves as a watercourse; and the space above is filled with the earth thrown out.

The hollow furrow drain is only used in sheep-pastures. Wherever the water is apt to stagnate, a deep furrow is turned up with a stout plough. After this, a man with a spade pares off the loose soil from the inverted sod, and scatters it over the field, or casts it into hollow places. The sod thus pared, and brought to the thickness of about three inches, is restored to its original situation, with the grassy side uppermost, as if no furrow had been made. A pipe or opening is thus made beneath it, two or three in-

ches deep in the bottom of the furrow, which is sufficient to discharge a considerable quantity of surface water, which readily sinks into it. These furrows, indeed, are easily choked up by any pressure, or by the growth of the roots of the grass; but they are also easily restored, and no surface is lost by means of them.

Pipe drains of turf are sometimes formed where the surface soil is a strong clay, as it is only turves from such a surface that are sufficiently durable. A semicylindrical spade is used to dig the turves, the ground pian of which presents a series of semicircles or half pipes. The drain being dug out to the proper depth, one turf is laid in the bottom, and another being placed over it completes the pipe. The same sort of pipe drain has been formed out of solid beds of clay, and has served for a time to convey water. As collecting drains, of course, they can be of little or no use. This mode of draining appears to have been first practised by Hannah, an ingenious farmer in Wigtownshire. Headopted it for the purpose of conveying water through running sand, in which only a pipe drain will last for a moderate time. After a number of years the clay turves were found effective in conveying away the water, and preventing the running away of the sandy sides of the drain.

DRAKE, *n. s.* Swed. *andrake*, from *drake*, a male; or *duckrake*, duck, and Goth. *reke*, a warrior or fighter, says Mr. Thomson; 'from the noise it makes,'—Minsheu. The male of a duck; an old piece of ordnance.

Two or three shots, made at them by a couple of *drakes*, made them stagger. *Clarendon.*

Mourn, sooty coots, and speckled teals,
Ye fisher herons, watching eels;
Ye duck and *drake*, wi' airy wheels
Circling the lake. *Burns.*

DRAKE, in ornithology. See ANAS.

DRAKE (Sir Francis), the renowned English admiral, was the son of Edmund Drake, a sailor, and born near Tavistock, in Devonshire, in 1545. He was brought up under the care of Sir John Hawkins, who was his kinsman; and, at the age of eighteen, was purser of a ship trading to Biscay. At twenty, he made a voyage to Guinea; and, at twenty-two, was made captain of the *Judith*. In that capacity he was in the harbour of St. John de Ulloa, in the gulf of Mexico, where he behaved most gallantly in the actions under Sir John Hawkins, and returned with him to England with great reputation. He next projected a design against the Spaniards in the West Indies; which he no sooner published, than he had volunteers enough ready to accompany him. In 1570 he made his first expedition with two ships; and in 1571 with one only, in which he returned safe, if not with such advantages as he expected. He made another expedition in 1572, wherein he gained considerable booty. In these expeditions he was much assisted by a nation of Indians, who then were engaged in war with the Spaniards. The prince of these people was named Pedro, to whom Drake presented a cutlass from his side, which he saw the chieftain greatly admired. Pedro, in return, gave him four large wedges of gold; which Drake

threw into the common stock, saying, 'That he thought it but just that such as bore the charge of so uncertain a voyage on his credit, should share the utmost advantage that voyage produced.' Then, embarking his men with all the wealth he had obtained, which was very considerable, he bore away for England, where he arrived in August, 1573. His success in this expedition, joined to his honorable behaviour towards his owners, gained him a high reputation: and the use he made of his riches, a still greater. For, fitting out three stout frigates at his own expense, he sailed with them to Ireland; where, under Walter, earl of Essex, the father of the famous unfortunate earl (see DEVEREUX), he served as a volunteer. After the death of his noble patron, he returned into England, where Sir Christopher Hatton introduced him to queen Elizabeth. He now proposed a voyage into the South Seas, through the Straits of Magellan, which was what hitherto no Englishman had ever attempted. The project was well received at court: the queen furnished him with means; and his own fame quickly drew together a sufficient force. The fleet with which he sailed, on this extraordinary undertaking, consisted only of five vessels, small when compared with modern ships, and no more than 164 able men. He sailed on the 13th December, 1577: on the 25th fell in with the coast of Barbary, and on the 29th with Cape Verd. On the 13th March he passed the equinoctial, made the coast of Brasil on the 5th April, and entered the river de la Plata, where he lost the company of two of his ships; but meeting them again, and taking out their provisions, he turned them adrift. On the 29th May he entered the port of St. Julian's, where he continued two months, for the sake of laying in provisions; on the 20th August he entered the Straits of Magellan, and on the 25th September passed them, having then only his own ship. On the 25th November he came to Macao, which he had appointed for a place of rendezvous in case his ships separated; but captain Winter, his vice-admiral, having repassed the Straits, returned to England. Thence he continued his voyage along the coasts of Chili and Peru, taking all opportunities of seizing Spanish ships, and attacking them on shore, till his men were sated with plunder; and then, coasting America to the height of 48°, he endeavoured to find a passage that way back into our seas, but could not. However, he landed, and called the country New Albion, taking possession of it in the name of queen Elizabeth; and, having careened his ship, set sail from thence, on the 29th September, 1579, for the Moluccas. He is supposed to have chosen this passage round, partly to avoid being attacked by the Spaniards at a disadvantage, and partly from the lateness of the season, whence dangerous storms and hurricanes were dreaded. On the 13th October he fell in with certain islands inhabited by the most barbarous people he had met with in his voyage: on the 4th November he had sight of the Moluccas; and, coming to Ternate, was well received by the king. On the 10th December he made Celebes, where, the 9th January following, his ship unfortunately ran upon a rock, from which, how-

ever, he got off. On the 16th March he arrived at Java Major, and on the 25th, began to think of returning home. He doubled the Cape of Good Hope on the 15th June, having then on board fifty-seven men, and but three casks of water. On the 12th July he passed the line, reached the coast of Guinea on the 16th, and there watered. On the 11th September he made the island of Tercera, and on the 3d November entered the harbour of Plymouth. This voyage round the world was performed in two years and about ten months. Shortly after his arrival, the queen going to Deptford, went on board his ship, where, after dinner, she conferred on him the order of knighthood, and declared her approbation of all he had done. She likewise gave directions for the preservation of his ship, that it might remain a monument of his own and his country's glory. This celebrated ship, which had been laid up many years at Deptford, at length decaying, it was broke up, and a chair, made out of the planks, was presented to the university of Oxford. In 1585 he sailed with a fleet to the West Indies, and took the cities of St. Jago, St. Domingo, Carthagen, and St. Augustin. In 1587 he went to Lisbon with a fleet of thirty sail; and having intelligence of a fleet assembled in the bay of Cadiz, which was to have made part of the Armada, he with great courage entered that port, and burnt there upwards of 10,000 tons of shipping, which he afterwards merrily called 'burning the king of Spain's beard.' In 1588, when the Armada from Spain was approaching our coasts, Sir Francis Drake was appointed vice-admiral under Charles lord Howard of Effingham, high admiral of England, where fortune favored him as remarkably as ever; for he made prize of a very large galleon, commanded by Don Pedro de Valdez, who was reputed the projector of this invasion; and who surrendered, as soon as he learned it was Drake who summoned him. This Don Pedro remained about two years Sir Francis Drake's prisoner in England; and, when he was released, paid him for his own and his captains' freedom, a ransom of £3,500. Drake's soldiers were well recompensed with the plunder of this ship, for they found in it 55,000 ducats of gold, which were divided among them. In 1589 Sir Francis Drake commanded, as admiral, the fleet sent to restore Don Antonio, king of Portugal; the command of the land forces being given to Sir John Norris: but they were hardly got to sea, before the commanders differed, and so the attempt proved abortive. The war with Spain continuing, a more effectual expedition was undertaken by Sir John Hawkins and Sir Francis Drake, against their settlements in the West Indies, than had hitherto been made during the whole course of it: but the commanders here again not agreeing about the plan, this also did not turn out successfully. All difficulties, before these two last expeditions, had given way to the skill and fortune of Sir Francis Drake; which probably was the reason why he did not bear these disappointments so well as he otherwise would have done. A strong sense of this is supposed to have thrown him into a melancholy, which occasioned a bloody flux; and of this he

died on board his own ship, near the town of Nombre de Dios, in the West Indies, on the 28th January, 1595-6. His death was lamented by the whole nation. In the twenty-seventh parliament of queen Elizabeth, he was elected Burgess for the town of Bossiney, alias Tintagel, in the county of Cornwall; and for Plymouth in Devonshire, in the thirty-fifth of the same reign. This town had very particular obligations to him: for, in 1587, he undertook to bring water into it, through the want of which, till then, it had been grievously distressed; and he performed it by conducting thither a stream from springs eight miles distant in a straight line; for, in the manner he brought it, the course of it runs upwards of twenty miles.

DRAKE (James), an English physician and author, born at Cambridge in 1667, and educated at that university, where he took his degrees. In 1704 he published a pamphlet, entitled *The Memorial of the Church of England*, which gave such offence that a proclamation was issued for discovering the author, which obliged him to keep concealed for some time. He was afterwards prosecuted for the publication of a newspaper, entitled *Mercurius Politicus*; and, although he was acquitted, it is supposed that the vexation threw him into a fever, of which he died in 1707. Besides the above, he published a *System of Anatomy*, 3 vols. 8vo; a *Translation of Herodotus*; a play, called the *Sham Lawyer*, &c.

DRAKE, in geography, a harbour of California, so called after the celebrated Sir Francis Drake, who discovered and took possession of the peninsula.

DRAKENSTEIN, a district in the territory of the Cape of Good Hope. The division which goes by the general name of 'Stellenbosch and Drakenstein' includes a large portion of the Cape territory. See *STELLENBOSCH*; but the term Drakenstein is peculiarly applied to two beautiful and extensive valleys situated about thirty or forty miles from Cape Town, at the foot of lofty mountains. They are called the valleys of Great and Little Drakenstein, and are to the north-east of the district of Stellenbosch, sheltered by lofty mountains, and watered throughout by the Berg and its minor streams. The subdivision of Little Drakenstein is enclosed by the larger valleys, and the two together supply a large portion of the wine of the Cape. West of this valley is the village of Paarl, surrounded by a fine tract of land, and distinguished by a vast mass of granite, surmounted with a number of large round stones, like the pearls of a necklace. Mr. Anderson, Captain Cook's surgeon, describes it as at least half a mile in circumference, and appearing in its highest part 'to equal the dome of St. Paul's church. It is one uninterrupted mass, or stone,' he adds, 'if we except some fissures, or rather impressions, not above three or four feet deep, and a vein which runs across near its north end. It is of that sort of stone called by mineralogists *saxum conglutinatum*, and consists chiefly of pieces of coarse quartz and glimmer, held together by a clayey cement. But the vein which crosses it, though of the same materials, is much compacter. This vein

is not above a foot broad or thick, and its surface is cut into little squares or oblongs, disposed obliquely, which makes it look like some artificial work. But I could not observe whether it penetrated far into the large rock or was only superficial.' Cook's Voyages, vol. v. p. 109. The same gentleman described this remarkable stone, at length, in a letter to Sir Joseph Pringle, which is inserted in the Philosophical Transactions, vol. lxxviii. part. I. p. 102, and sent home a specimen of it which induced Sir William Hamilton to suppose it to have been raised by a volcanic explosion. Mr. Barrow considers this a perfectly gratuitous assumption, and describes it as of similar materials with the other mountains of the colony, viz. aggregates of quartz and mica; the first in large irregular masses, and the latter in black lumps resembling short, mixed with pieces of felspar, and bound together by a clayey iron ore. The pearl and the diamond he speaks of as two distinct central points of the summit, of which the latter is the higher block, and shaped like a cone. The pearl is inaccessible on three sides, and rises about 400 feet from its base on the summit of the mountain, where it measures in circumference, according to this writer, a full mile. The sloping northern side, by which it is ascended, is upwards of 1000 feet in length, and nearly covered with a species of green lichen. Towards the summit it is split by two deep clefts crossing at right angles, in which grow a number of beautiful aloes, and several cryptogamous plants.

In the side of the mountain numerous species of the protea, particularly the mellifera, mingle with the lively green of the wild olive, and the elegant and almost endless tribe of heaths for which the colony is so remarkable, and some of which have here the growth and appearance of considerable trees. The fruit of this olive is too acrid for use, but the wood is close grained, and is said to bear a fine polish. The mellifera yields a saccharine juice in the bottom of its flowers, which is considered as an excellent stomachic by the inhabitants of the district, and is occasionally boiled down with preserves, in the place of sugar. They call it the sugar-tree. The scenery of this spot in the autumn is exquisitely beautiful.

At the north, or upper end of the valley of Drakenstein, are the divisions of Dall Josephat, Waggon-maker's Valley, and Groenberg. The latter being a projecting eminence that bounds the valley northward, and participating in the fruitful character of the surrounding scene. Corn, vines, and fruits adorn its sides,—all of good quality; and the finest peaches and oranges of the colony grow in the two little dales at its feet. Little Drakenstein, the Paarl village, Franche Hook, and the three last subdivisions, northward, embrace all the divisions of this remarkable valley.

The oaks in this valley commonly reach from twenty to thirty feet in height in the stem, and measure from ten to eighteen feet in circumference; many are larger; they appear to grow more freely and naturally in the degree of shelter they here find from the violent winds: the tops are not so bent as in the neighbourhood of Cape

Town, nor is the grain of the wood, when cut, so irregular and twisted. The whole valley is well inhabited, so that few wild animals appear in the day-time; but hyenas, wolves and jackals descend from the mountains at night. Game abounds in the thick shrubbery; particularly the düiker (the diver or plunger) and the griesbock or grizzled deer; nor is the steenbok, once so plentiful as to be supposed to have given name to the neighbouring drosdy, wholly driven from the northern hills. The düiker stands about two feet and a half high, and measures upwards of three feet in length; his color is a dusky brown, and the male has black straight horns, about four feet long, and nearly parallel. The female is without horns. The griesbock is rather smaller, and of a grizzled brown color; in every other respect it is of similar appearance with the düiker. Both these animals commit considerable depredations on the young branches of the vine. Hares are numerous in the valley; common and red-winged partridges (which are as tame as poultry) quails, snipes, widgeons, and other species of wild ducks. In the mountains, both northward and eastward, are found the reebok, and the klip-springer, as he is called, or rock-leaper, the fleetest animal, perhaps, and the most formed for agility, of any in the world. His cloven hoofs are each divided into two segments, and jagged at the edges, so that he will adhere, like an insect, to the smoothest and steepest parts of the rocks. His color is a cinereous gray, and his hair is used as the best stuffing for mattresses, chairs, and saddles. No dog has any chance of keeping up with this animal, but he is easily shot as he leaps from rock to rock. The Paardeberg, or Horse Mountain, and Rickbeek's Casteel or Castle, form a continuation of the Paarl Mountain, northward. Here the zebra, Kolben's 'wild ass,' or horse, formerly abounded; at present neither horses nor cattle are reared here, except for agricultural purposes. See CAPE OF GOOD HOPE.

DRAMA, *n. s.* Fr. *drame*; Lat. DRAMATIC, *adj.* } *drama*; Gr. *ῥαμα*, a DRAMATICAL, } scene, from *ῥαο*, DRAMATICALLY, *adv.* } act. A poem representing action, or in DRAMATIST, *n. s.* } which actions are supposed to be carried on, not related. A dramatist is the author of a drama.

Many rules of imitating nature Aristotle drew from Homer, which he fitted to the *drama*; furnishing himself also with observation from the theatre, when it flourished under Æschylus, Euripides, and Sophocles. Dryden.

Ignorance and errors are severely reprehended, partly *dramatically*, partly simply. Id.

I hope to make it appear, that, in the great dramatic poem of nature, is a necessity of introducing a God. Bentley.

The whole theatre resonnds with the praises of the great dramatist, and the wonderful art and order of the composition. Burnet's Theory.

There is a kind of *drama* in the forming of a story, and the manner of conducting and pointing it, is the same as in an epigram. Steele.

To distress them as nothing human ever was distressed; to deliver them as nothing human ever was delivered, is the business of a modern dramatist. Johnson.

Johnson.

In short, his idea is to *dramatise* the penal laws, and to make the stage a court of ease to the Old Bailey.
Sheridan.

DRAMA. The drama is, for the greater part, as Dr. Johnson has defined it, an adaptation of poetry to fictitious representation and dialogue. But it is not confined to any single form that language may have assumed. The works of our greatest dramatist are interspersed occasionally with prose; and the sources of the influence of the dramatic art over our minds lie deep in the constitution of our nature. Neither are the scenic representations of our theatres essential to a just perception of the beauties, or a full resignation of the mind to the power, of this enchanting art. They are but the trappings that occasionally adorn, but often impede its progress. Man, in the lowest stages of civilisation, exhibits rude and barbarous attempts to arrive at the pleasure which the drama is calculated to impart. The inhabitants of China, and even of the islands of the South Sea, secluded from the influence of European example, participate in amusements resembling, in species, those of the theatre: and we observe in the earliest pastimes of children, imitations and representations of the conduct of their elders and superiors. They not only indulge in the mimicry of objects immediately before them, but frame out for themselves fancied similitudes of things, of which they can only have very partial knowledge. They 'pipe and they dance;' they 'mourn and they weep,' in early dramas: thus eagerly going out of themselves towards objects which have acquired a hold on the imagination and the heart. The Hindû theatre is extensive and various. Dramas bearing internal and almost indubitable evidence of being at least 500 years old (if not twice that age), could be adduced in proof of the early excellence of the Hindûs in that species of composition.

But it is to ancient Greece and her rhapsodists, tragedians, and comedians, that we must look, historically, for the origin of this art. The modern distinction between the province of the epic and the dramatic poet, was, in the rise of those pursuits, unknown. In the impassioned recitations of the rhapsodist, in the journeyings and declamations of Homer, they were mingled; while, in the orgies of Bacchus, the historians of the dramatic art are accustomed to trace its first distinct appearance. It was customary, at the feasts of this deity, to sacrifice a he-goat, that animal being supposed to be peculiarly obnoxious to the god, in consequence of the injuries the vine received from its bite. On these occasions, religious hymns were chanted in honor of the festive god, and rustic poets and reciters contended for the prize of victory. The compositions, at first produced on these occasions, were merely lyrical. To relieve the singer, however, and vary the gratification of the audience, interlocutors were soon introduced, who filled up the pauses of the song with short narratives of some heroic event. Thespis and Phrynichus added a little to this idea, by making one entire story occupy, in continuation, all the pauses of the song. In consequence of this improvement, the odes became subordinate, in some degree, to the narration, and

seemed to interrupt it at intervals. Dialogue, however, was still unknown; and, as far as this is considered essential to the dramatic art, to Æschylus must be given the praise of its invention.

This distinguished poet was born, as it is generally stated, in the 69th, but on better authority, in the 63d Olympiad. Bacchus, it is said, appeared to him in a dream, in his early youth, and commanded him to write tragedies. It is far better established that he was a general in the battle of Marathon, fought in the year before Christ 490; and that he was, like the father of the British drama, Shakspeare, an actor in his own plays. Before his time the Greeks had no regular theatre. The faces of the performers being stained with the lees of wine, they exhibited themselves in the cart of Thespis, a kind of mountebank stage. To this succeeded a theatre of wood; and to that, a more permanent building of stone.

But the improvement of the *chorus*, in the ancient tragedy, was the most important of the alterations which it owed to Æschylus. This consisted of hymns sung in honor of Bacchus, as we have intimated, and constituted, at first, the principal part of the performance. It gradually, however, diminished in importance, as the true character of the drama became developed; but Æschylus first gave it that peculiar and complicated form which is so characteristic of the Greek plays. He found it composed of a body of musicians whose lyrical performances were entirely independent of the incidents of the piece; but he makes them to sympathize with all that is transpiring on the stage, and, in effect, to become the echo of the feelings of the audience. He also divided the chorus, which was formerly directed by a single person, named the Coryphæus, who frequently spoke or sung alone, into two or more bands, who addressed and replied to each other. 'By this means,' as Sir Walter Scott observes, 'the two unconnected branches of the old Bacchanalian revels were combined together; and we ought rather to be surprised that Æschylus ventured, while accomplishing such a union, to render the hymns sung by the chorus subordinate to the action or dialogue, than that he did not take the bolder measure of altogether discarding that which, before his time, was reckoned the principal object of a religious entertainment.'

The ancient tragedy was principally concerned in the development of some great event, influencing the fortunes of a dynasty, or involving the fate of a nation. Exalted personages, the sport of a luckless destiny, hurled by the gods, or something above the gods, from the pinnacle of their greatness to the depths of wretchedness, gave to the representation a dark and gigantic interest, hurrying the mind irresistibly on through the widest extremes of mortal condition, and surprising the soul with fearful examples of instability in the things on which man relies with the proudest confidence. The modern drama, with more artificial contrivance and intricacy of plot, shakes the mind with quicker alternations of feeling, sustaining and perpetuating its emotions by the anxiety of suspense, the flutter of expectation, and the shock of discovery. The

scale of the theatre among the Greeks was proportioned to the magnificent conceptions of their dramatists, and had stages capable of exhibiting temples and palaces almost in their real magnitude and gigantic proportions. Neither did their decorations consist of tinsel ornaments, which could only glitter amidst a profusion of artificial lights, but were the genuine productions of the finest arts. The great events they celebrated took place beneath the cope of an unclouded sky, with which the scene was formed to harmonise. Neither expence nor labor was spared to make the representation perfect in its minutest circumstances; the mask and the buskin, though totally unsuited to our dramatic style, were the elegant appendages of that of Athens. The chief object to be attained was a magnificent ideal beauty.

Adverting now to the other branch of the art, Epicharmus, who flourished about B. C. 450, is the first name of any consideration in comic dramatic poetry. Philologists and philosophers have given us the derivation of the word *κωμῳδία*, comedy, from *κωμη*, a 'village,' and have explained the reason for this derivation; but they are unable to inform us who first introduced or invented the characters, the actors, and the prologues. Aristotle here confesses his incapacity: but he ultimately suggests the true allusion of the word *κωμῳδία*, and combats the absurd opinion of its being derived from *κωμος*, commensatio, 'a revel.' *Ὡς κωμῳδῆς, ἢκ ἀπο τῆ κωμᾶν λεχθέντας ἀλλὰ τῇ κατὰ κωμᾶς πλάνῃ, ἀτιμαζομένους ἐκ τῆ ἀστυς.* 'Comedians were so called from wandering in the *κωμας*, or villages, when disgracefully expelled from the city.' —*De Poet.* His language would induce us to infer that the comic followers of Thespis were not at all more respectable in the origin of the art, than in the estimation of many of the legislators and moralists of modern times, and ill sustained a comparison with the more dignified character and pursuits of the tragedians. Aristotle does not attempt a definition of comedy. It 'languished' from the first, he observes, 'for, the archon did not, till a late period, allow a chorus of comedians, but formerly they were volunteers;' and only conjectures that as the *Iliad* and *Odyssey* formed the materials of tragedy (for Æschylus confesses that his repasts consisted only of fragments from the banquet of Homer), so, in like manner, that the *Margites* of the bard of Chios bore the same analogy to comedy. What was the precise nature of this work, however, the Greek philosopher does not condescend to tell us; it is understood to have been a ludicrous and satirical poem at the expense of some half-learned pedagogue. The Greek comedy then was of slow progress, and had originally but feeble hold upon the public mind, as compared with the successful efforts of the early tragedians. For the lighter shades of human character, the peculiar levities, the characteristic traits of frivolity, upon which the whole structure of comedy is so dependent, were not observed, because they had not yet been elicited by circumstances, and exist but in a more artificial state of society. Neither comedy nor satire could have found originals to copy nor feelings to work upon in

the earlier ages of the world: the whole inhabitants of a district were divided mainly into two classes—those of the artisan and the soldier: and the simplicity and necessities of the one, and the bullying insolence of the other, were almost the only topics upon which the old comedy could descant. There was little subdivision of labor, and no subdivision of character, to furnish the Proteus-shapes of the modern comic muse.

In the old comedy of Greece the illustrious statesmen, generals, and public characters of the commonwealth were brought forward on the stage, and held up to ridicule by name before an applauding audience, until it was deservedly superseded by what is termed the middle comedy, which abolished the chorus, and compelled the poet to substitute for any real personages or characters, in whom he attempted to satirize the vices and follies of the times, disguised or fictitious names. This soon gave way in its turn to the new comedy, having for its object the ludicrous incidents and mortifications of private life. It included also some scenes which call forth pathetic emotion, and approached more nearly to the character of tragedy than had been admitted in the ancient comedies of Aristophanes. An agreeable intermediate species of composition was thus introduced, which became the foundation of the modern drama. The translations of Menander, in Plautus and Terence, give us the only remaining specimens of the new comedy.

Of the Roman tragedy the works of Seneca are the only existing remains. The alterations, indeed, which the Romans made in the dramatic art are of little importance to its history. They lessened the theatres; and the orchestra, or, as we should say, the pit of the theatre was no longer left vacant for the occasional occupation of the chorus, but was filled with senators, knights, and the more respectable citizens. The stage was thus brought more near to the eye of the better class of the audience. But an important revolution was effected among this great people in the rank and estimation in which actors were held. 'The ancient Romans,' says Augustin, 'accounting the art of stage-playing and the whole scene infamous, ordained that this sort of men should not only want the honor of other citizens, but also be disfranchised, and thrust out of their tribe by a legal and disgraceful censure, which the censors were to execute; because they would not suffer their vulgar sort of people, much less their senators, to be defamed, disgraced, or defiled with stage-players;' which act of theirs he calls 'an excellent true Roman prudence, to be enumerated among the Romans' praises.' Individual players, however, it is but just to add, rose to high public estimation. Cicero called the celebrated Roscius his friend; and Paris, the actor, preserved the life of Statius.

It has been admitted on all hands, that the progress of Christianity was unfavorable to the theatre. The primitive Christians regarded it with a double dislike: first, upon the account of its origin, as connected with heathen superstition; and, secondly, for 'the beastly and abominable license practised in the pantomimes, which, although they made no part of the regular drama,

were presented, nevertheless, in the same place, and before the same audience.'—'We avoid your shows and games,' says Tertullian, 'because we doubt the warrant of their origin. They savor of superstition and idolatry; and we dislike the entertainment, as abhorring the heathen religion on which it is founded.' Yet were these exhibitions never formally and legally abolished, even where Christianity became the religion of the state.

The Mysteries of the dark ages, like the orgies of Bacchus, first introduced a species of modern drama, mingled with superstitious rites. 'Whatever name they assumed,' says Sir Walter Scott, they 'were often so unworthy of the Christian religion, on which they were founded, that their being tolerated can be attributed only to the gross ignorance of the laity, and the cunning of the Catholic priesthood, who used them, with other idle and sometimes indecorous solemnities, as one means of amusing the people's minds, and detaining them in contented bondage to their spiritual superiors.' To these succeeded the Moralities, and the Romantic Dramas, cultivated so successfully in the sixteenth century in Spain, and upon the model of which the English drama suddenly arose to comparative perfection in the reigns of queen Elizabeth and James I.

We now, therefore, arrive at the modern distinction between the romantic and the classical drama; and, in the history of our own dramatical productions, these different kinds of composition are most strikingly exemplified.

Shakspeare stands alone and unrivalled among the poets who cultivated the former species. In his hands the art bounded as it were to a sudden and instantaneous perfection;—himself his own legislator and example;—freed from all external influence, and unfettered by any other rules, but those which great minds create for themselves;—and confessedly beyond the reach of imitation, not merely in respect of that poetic genius which carried him into the most sublime and pathless tracks of human thought, but of the form and fabric of his dramas.

The shape and modification of the other class were deduced from the canons of that French criticism which obtained a footing amongst us at the time of the Restoration, and constituted that secondary or reflected Greek tragedy, which, though frequently confounded with the ancient school, is at best but its type or shadow. Primarily, however, it took 'its form and pressure' from the unities, which, originating in a paraprismatic distortion of a passage in Aristotle, have held so despotic an influence over the dramatic writings of France. Its leading attributes are these:—a prologizing development of the story in the shape of a regular narrative recited by a subordinate agent, the immeasurably long speeches of the dialogue, and consequently the absence of rapid and vehement action. Add to this, the predominance of love over the destinies of the personages; a passion, 'according to Dryden, the great apologist of the school,' of such general concernment, that it delights to see its own image in a public entertainment.

Dr. Johnson well remarks upon this subject, 'He that, without diminution of any other excellence, shall preserve all the unities unbroken,

deserves the like applause with the architect who shall display all the orders of architecture in a citadel, without any deduction from its strength: but the principal beauty of a citadel is to exclude the enemy; and the greatest graces of a play are to copy nature, and instruct life.'

'The necessity of observing the unities of time and place,' says this great writer in his Preface to Shakspeare, 'arises from the supposed necessity of making the drama credible. The critics hold it impossible, that an action of months or years can be possibly believed to pass in three hours; or that the spectator can suppose himself to sit in the theatre, while ambassadors go and return between distant kings, while armies are levied, and towns besieged, while an exile wanders and returns, or till he whom they saw courting his mistress, should lament the untimely fall of his son. The mind revolts from evident falsehood, and fiction loses its force when it departs from the resemblance of reality.'

'From the narrow limitation of time necessarily arises the contraction of place. The spectator, who knows that he saw the first act at Alexandria, cannot suppose that he sees the next at Rome, at a distance to which not the dragons of Medea could, in so short a time, have transported him; he knows with certainty that he has not changed his place, and he knows that place cannot change itself; that what was a house cannot become a plain; that what was Thebes can never be Persepolis.'

'Such is the triumphant language with which a critic exults over the miseries of an irregular poet, and exults commonly without resistance or reply. It is time, therefore, to tell him, by the authority of Shakspeare, that he assumes as an unquestionable principle a position, which, while his breath is forming it into words, his understanding pronounces to be false. It is false, that any representation is mistaken for reality; that any dramatic fable, in its materiality, was ever credible, or, for a single moment, was ever credited. The objection arising from the impossibility of passing the first hour at Alexandria, and the next at Rome, supposes, that when the play opens, the spectator really imagines himself at Alexandria, and believes that his walk to the theatre has been a voyage to Egypt, and that he lives in the days of Antony and Cleopatra. Surely he that imagines this may imagine more. He that can take the stage at one time for the palace of the Ptolemies, may take it in half an hour for the promontory of Actium. Delusion, if delusion be admitted, has no certain limitation; if the spectator can once be persuaded that his old acquaintance are Alexander and Cæsar, that a room illuminated with candles is the plain of Pharsalia, or the bank of Granicus, he is in a state of elevation above the reach of reason, or of truth, and, from the heights of empyrean poetry, may despise the circumspections of terrestrial nature. There is no reason why a mind thus wandering in ecstasy should count the clock: or why an hour should not be a century in that calenture of the brain that can make the stage a field. The truth is, that the (judicious) spectators are always in their senses, and know, from the first act to the last, that the

is only a stage, and that the players are only players. They come to hear a certain number of lines recited with just gesture and elegant modulation. The lines relate to some action, and an action must be in some place; but the different actions that complete a story may be in places very remote from each other; and where is the absurdity of allowing that space to represent first Athens, and then Sicily, which was always known to be neither Sicily nor Athens, but a modern theatre?

‘By supposition, as place is introduced, time may be extended; the time required by the fable elapses for the most part between the acts; for, of so much of the action as is represented, the real and the poetical duration are the same. If, in the first act, preparations for war against Mithridates are represented to be made in Rome, the event of the war may, without absurdity, be represented, in the catastrophe, as happening in Pontus; we know that there is neither war, nor preparation for war; we know, that we are neither in Rome nor Pontus; that neither Mithridates nor Lucullus are before us. The drama exhibits successive imitations of successive actions; and why may not the second imitation represent an action that happened years after the first, if it be so connected with it, that nothing but time can be supposed to intervene? Time is, of all modes of existence, most obsequious to the imagination; a lapse of years is as easily conceived as a passage of hours. In contemplation we easily contract the time of real actions, and therefore willingly permit it to be contracted when we only see their imitation. It will be asked how the drama moves, if it is not credited? It is credited with all credit due to a drama. It is credited, whenever it moves, as a just picture of a real original; as representing to the auditor what he would himself feel, if he were to do or suffer what is there feigned to be suffered or to be done. The reflection that strikes the heart is not that the evils before us are real evils, but that they are evils to which we ourselves may be exposed. If there be any fallacy, it is not that we fancy the players, but that we fancy ourselves unhappy for a moment; but we rather lament the possibility, than suppose the presence of misery, as a mother weeps over her babe, when she remembers that death may take it from her. The delight of tragedy proceeds from our consciousness of fiction; if we thought murders and treasons real, they would please no more.

‘Imitations produce pain or pleasure, not because they are mistaken for realities, but because they bring realities to mind. When the imagination is recreated by a painted landscape, the trees are not supposed capable to give us shade, or the fountains coolness; but we consider how we should be pleased with such fountains playing beside us, and such woods waving over us. We are agitated in reading the history of Henry V. yet no man takes the book for the field of Agincourt. A dramatic exhibition is a book recited with concomitants that increase or diminish its effect. Familiar comedy is often more powerful on the theatre than in the page; imperial tragedy is always less. The humor of Petruccio may be heightened by grimace; but what

voice or what gesture can hope to add dignity or force to the soliloquy of Cato? A play read affects the mind like a play acted. It is therefore evident, that the action is not supposed to be real, and it follows, that between the acts a shorter or longer time may be allowed to pass, and that no more account of space or duration is to be taken by the auditor of a drama, than by the reader of the narrative, before whom may pass in an hour the life of a hero, or the revolutions of an empire.’

We cannot pursue, in detail, the claims of modern dramatists to distinction. Theatrical performances, and consequently theatrical writings, were from religious motives suspended during the life of Cromwell; but at the accession of Charles, the drama re-appeared with a licentiousness that has scarcely been equalled in any other age or country. No species of literature was more admired, or more debased, than this. Milton had, some years before, in his *Comus* and *Sampson Agonistes*, endeavoured to introduce the Grecian model, but his efforts were in vain. The profaneness and nauseous indecency which characterised the dramatical writings of Charles's time had not even the veil of refinement to render them less disgusting. Folly, absurdity, and a dereliction of all the ancient rules of the drama, and even of common sense itself, were visible on every side. From this account little abatement can be made during the remainder of the century.

The celebrated play of the *Rehearsal* produced indeed some effect; but a more considerable time was required, entirely to change the prepossessions of the age. Even Dryden himself, though a writer of great original powers, was infected with a full proportion of the faults of his contemporaries. We must not, however, regard, as barren of dramatical genius, a century which began in the life-time of Beaumont, Fletcher, Jonson, and even Shakspeare himself, and which afterwards gave birth to Otway, Lee, Dryden, and others, whose names are still deservedly celebrated in dramatical literature. But, in the eighteenth century, the drama became more regular in its composition, and less openly impure in its language and sentiments. Collier having collected together a variety of offensive passages from the writings of our dramatic authors, the public, not wholly dead to taste and decency, started with displeasure at the disgusting recital, and having perceived the hideousness of such passages in combination, determined no longer to tolerate them in detail. From this time, not even the genius of Congreve could reconcile them to gross impurity; so that, although much, very much, still remains which modesty can by no means approve, we have never reverted to that open licentiousness which our dramatists were at one time accustomed to display. The taste of the eighteenth century was farther evidenced by the rejection of rhyming plays, and a growing admiration for the works of Shakspeare. Bombast of language was no longer confounded with loftiness of idea, nor a series of puns or quibbles mistaken for the festivity of genuine wit.

Modern dramatic poetry may be considered as comprehending tragedy, comedy, and farce.

These are sufficiently distinguished by their general spirit and strain. While pity and terror, and the other strong passions, form the province of the tragic muse, the chief instrument of comedy and farce is ridicule. These last two species of composition are indeed so perpetually running into each other, that they can hardly be distinguished: it is true that what is now known by the name of farce, is too much inclined to the extravagance of ridicule; but the most commendable specimens of this kind of entertainment differ in nothing essential from proper comedy. 'Comedy proposes for its object,' says Dr. Blair, 'neither the great sufferings, nor the great crimes of men; but their follies and slighter vices, those parts of their character which raise in beholders a sense of impropriety, which expose them to be censured and laughed at by others, or which render them troublesome in civil society.'

'The subjects of tragedy are not limited to any age or country; but the scene and subject of comedy should always be laid in our own country, and in our own times. The reason is obvious; those decorums of behaviour, those lesser discriminations of character, which afford subject for comedy, change with the differences of countries and times; and can never be so well understood by foreigners as by natives. The comic poet, who aims at correcting improprieties and follies of behaviour, should catch the manners living as they rise. It is not his business to amuse us with a tale of other times; but to give us pictures taken from among ourselves; to satirize reigning and present vices; to exhibit to the age a faithful copy of itself, with its humors, its follies, and its extravagancies.'

'Comedy may be divided into two kinds: comedy of character, and comedy of intrigue. The former is the more valuable species; because it is the business of comedy to exhibit the prevailing manners which mark the character of the age in which the scene is laid: yet there should be always as much intrigue as to give us something to wish and something to fear. The incidents should so succeed one another, as to produce striking situations, and to fix our attention; while they afford at the same time a proper field for the exhibition of character. The action in comedy, though it demands the poet's care in order to render it animated and natural, is a less significant and important part of the performance than the action in tragedy; as in comedy it is what men say, and how they behave, that draws our attention, rather than what they perform or what they suffer. In the management of characters, one of the most common faults of comic writers is the carrying of them too far beyond life. Wherever ridicule is concerned, it is indeed extremely difficult to hit the precise point where true wit ends and buffoonery begins. When the miser in Plautus, searching the person whom he suspects of having stolen his casket, after examining first his right hand, and then his left, cries out, *Ostende etiam tertiam*. Show me your third hand, there is no one but must be sensible of the extravagance. Certain degrees of exaggeration are allowed to the comedian, but there are limits set to it by nature and good taste; and supposing the miser to be ever so much engrossed by his jealousy and

his suspicions, it is impossible to conceive any man in his wits suspecting another of having more than two hands.' See *POETRY*.

DRAMMEN, a town in the government of Christiania, Norway, consisting of two distinct places; Bragernaes and Stromsoe, situated the one on the north and the other on the south bank of the river Drammer, which here discharges itself into the gulph of that name. A brisk traffic is here carried on in timber and iron brought from the interior. The harbour admits only small vessels. Population of the whole place about 6000. Twenty miles south-west of Christiania.

DRANCE, a river of Switzerland, which runs through the lower Valais, and falls into the Rhone. In June, 1818, a dreadful calamity occurred here, from an accumulation of the waters of this river in the narrow valley of Bagnes. The fall of an enormous avalanche, or rather glacier, had blocked up the mouth of the valley, and the waters of the Drance were thus formed into a lake, acquiring additional height daily. The only expedient was to cut a canal through the top of the ice, to stop the farther accumulation of the water. This was accordingly done; and the water, flowing through the channel, fell during some days on the opposite side into the bed of this river, forming a magnificent cascade. On the 16th, however, the accumulated mass burst its narrow bounds, and overwhelming the lower valley, as far as the bed of the Rhine, swept away trees, cottages, and cattle, with a great number of the inhabitants of Champsec and Martigny.

DRAPE, *v. n.* } Fr. *drap*; low. Lat. *drap*.
DRA'PER, *n. s.* } *pus*. To make cloth: a dra-
DRA'PERY, } per is he who sells this use
DRA'PET. } ful commodity; and drapery cloth-work, and, in a particular sense, woollen cloth-work; hence the cloth itself when made, and the dress made of it. Hence also any kind of flowing dress, robes, or stuff. Drapet is used by Spenser as synonymous with drapery.

Thence she them brought into a stately hall,
 Wherein were many tables fair dispreed,
 And ready dight with *drapets* festival,
 Against the viands should be ministered.

Faerie Queene.

It was rare to set prices by statute; and this act did not prescribe prices, but stinted them not to exceed a rate, that the clothier might *drape* accordingly as he might afford.

Bacon.

He made statutes for the maintenance of *drapery*, and the keeping of wools within the realm.

Id. Henry VII.

If a piece of cloth in a *draper's* shop be variously folded, it will appear of differing colours.

Boyle on Colours.

The *draper* and mercer may measure her.

Hovel.

Poets are allowed the same liberty in their descriptions and comparisons, as painters in their *draperies* and ornaments.

Prior.

I could wish, for the sake of my country friends, that there was such a kind of everlasting *drapery* to be made use of by all who live at a certain distance from the town, and that they would agree upon such fashions as should never be liable to changes and innovations.

Addison.

The Bulls and Frogs had served the lord Strutt with *drapery* ware for many years.

Arbuthnot's History of John Bull.

Lights came at length, and men, and maids, who found

An awkward spectacle their eyes before !

Antonio in hysterics, Julia swooned,

Alfonso leaning, breathless, by the door,

Some half-torn *drapery* scattered on the ground,

Some blood, and several footsteps, but no more.

Byron.

DRAPER (Sir William), an English general, born at Bristol, where his father was collector of the customs. He received his education at Eton and King's College, Cambridge, after which he went to the East Indies, where he rose to the rank of colonel. In 1763 he took Manila, in conjunction with admiral Cornish ; but the fort was preserved from plunder, on condition of paying a ransom of 4,000,000 of dollars, which was never discharged. The commander was, however, created a knight of the Bath. In 1769 he was engaged in a controversy with Junius, in defence of his friend the marquis of Granby. In 1769 he was appointed lieutenant-governor of Minorca, and when that place surrendered to the enemy, he brought an accusation against general Murray, the governor, but after his trial general Draper was commanded by the court to make an apology to him. General Draper died at Bath in 1787.

DRASTICK, *adj.* *Δραστικός*. Powerful ; vigorous ; efficacious. It is used of a medicine that works with speed ; as jalap, scammony, and the stronger purges.

DRAVE. See **DRIVE**.

DRAVE, a large navigable river of Germany, which rises in the former archbishopric of Saltzburg, in the Tyrol, runs south-east through Stiria, and, after dividing Hungary from Slavonia, falls into the Danube at Esseck. Gold is sometimes obtained from its washings.

DRAUGH. See **DRAFT**.

DRAUGHT, *n. s.*

DRAUGHT-HORSE, } See **DRAW**.

DRAUGHT-HOUSE.

DRAUGHT, in architecture, or, as it is pronounced, *draft*, the figure of an intended building described on paper ; wherein are laid down, by scale and compass, the several divisions and partitions of the apartments, rooms, doors, passages, conveniences, &c., in their due proportion. It is exceedingly convenient, before a building is begun to be raised, to have draughts of the ichnography, or ground plot, of each floor : as also the form and fashion of each front, with the windows, doors, ornaments, &c., in an orthography, or upright. Sometimes the several fronts, &c., are taken, and represented in the same draught, to show the effect of the whole building : this is called a scenography, or perspective.

DRAUGHT, in medicine. See **POTION**.

DRAUGHT, in trade, called also *cloff* or *clouch* is a small allowance on weighable goods, made by the king to the importer, or by the seller to the buyer, that the weight may hold out when the goods are weighed again. The king allows 1 lb. draught for goods weighing not less than 1 cwt., 2 lbs. for goods weighing between 1 and 2 cwt., 3 lbs. for goods weighing between 2 and 3 cwt.,

Vol. VII.

4 lbs. from 3 to 10 cwt., 7 lbs. from 10 to 18 cwt., 9 lbs. from 18 to 30 or upwards.

DRAUGHT is also used sometimes for a bill of exchange, and commonly for an order for the payment of any sum of money due, &c. The person who gives the order is said to draw upon the other.

DRAUGHT HOOKS, large hooks of iron fixed on the cheeks of a cannon carriage, two on each side, one near the trunnion hole and the other at the train, distinguished by the name of fore and hind. Large guns have draught hooks near the middle transom, to which are fixed the chains that serve to keep the shafts of the limbers on a march. The fore and hind hooks are used for drawing a gun backwards or forwards, by men with strong ropes, called draught ropes, fixed to these hooks.

DRAUGHT HORSE, in farming, a sort of coarse made horse, destined for the service of a cart or plough.

DRAW, *v. a., v. n., & n. s.*

DRAFTMENT, *n. s.*

DRAUGHT, *n. s.*

DRAUGHT-HORSE,

DRAUGHT-HOUSE,

DRAWBACK, *n. s.*

DRAWBRIDGE,

DRAWE,

DRAWE,

DRAWING,

DRAWING-ROOM,

DRAWWELL.

Sax. dragan ; Teut.

trecken, from Lat.

traho, to pull ; i. e.

Gr. épaw, to do any

thing with violence.

See **DRAG**. To pull

in a particular di-

rection, or with

force sufficient to

overcome resist-

ance : hence to

lengthen, to force

generally, and to wrest or distort : hence also to attract, to extract, and to protract ; to let fluids run ; to inspire air ; to deduce or derive ; to trace in lines, or sketch ; and, metaphorically, to form in writing, or compose ; to collect ; to bring off or away from combat, legal dispute, or friendly contest (thus we speak of a 'drawn' battle, suit, or game) ; and, literally or metaphorically, to lead, seduce, entice, or persuade ; with their consequences, to gain, win, or receive. Of the various prepositions often added to the active verb, to draw off, and to draw up, seem the only idioms : the one is applied to liquors drained through a vent, and often means to empty, as in the brewhouse ; the other, to draw up, is to complete in writing, to compose in a formal manner. We cannot see the propriety of explaining *draw in*, *draw over*, &c., as different senses of the verb, any more than draw away, draw aside, or draw down : they are all but different applications of the same idea. As a neuter verb, to draw signifies to act as a weight or overcoming force, hence as a beast of burden ; to adhere, contract, come together ; advance towards ; to practise delineation ; take a lot, or card. As a substantive, 'a draw' is sometimes used for the act of drawing, and a lot, or the thing drawn. Dr. Johnson says, that to draw retains through all its varieties of use some shade of its original meaning, to pull ; and expresses 'a gradual, continuous, and leisurely action :' rather, we presume, overcoming force, and whatever time is necessary to make it effectual. Draught is the act or habit of drawing ; a thing, quantity, or number drawn ; hence, a quantity drunk, a prescribed quantity or dose of medi-

cine; a drain; and the quantity of water necessary to float a vessel; a representation, a picture. A draught-horse is one that habitually draws carriages; a draught-house, a house in which offal, or what is drawn off from general use, is deposited. A draw-back is what is claimed back or against an account, whether by way of discount, abatement of legal dues, or otherwise. A draw-bridge, one that can be withdrawn at pleasure; drawee is explained in the extract; a drawing-room is one into which company withdraws; and a draw-well, one that is furnished with means for drawing up water.

Therefore thei don alle her werkis, that thei be seen of men: for thei *drawen* abroad her falateries and magnifyen hemmes, and thei love the firste placis in soperis, &c. *Wiclif.*

And he wente and *drough* him to oon of the cyte-seynes of that cuntre, and he sente him into his toun to feede swyn. *Wiclif. Luk. xv.*

I will *draw* my sword; my hand shall destroy them. *Erodus xv.*

From the hewer of thy wood unto the draught of thy water. *Deut. xxix. 11.*

The liers in wait *draw* themselves along. *Judges xx. 37.*

Draw ye near hither all the chief of the people. *1 Sam.*

And they brake down the image of Baal, and brake down the house of Baal, and made it a *draughthouse*. *2 Kings.*

Whatsoever entereth in at the mouth goeth into the belly, and is cast out into the *draught*. *Matt. xv. 17.*

Now *draweth* cutte or that ye for ther turnne; He which that hath the shortest shal beginne.

Chaucer. Prol. to Cant. Tales.

The Irish will better be *drawn* to the English, than the English to the Irish government.

Spenser on Ireland.

I conceive the manner of your handling of the service, by drawing sudden *draughts* upon the enemy, when he looketh not for you. *Id.*

Whereas it is concluded, that the retaining diverse things in the church of England, which other reformed churches have cast out, must needs argue that we do not well, unless we can shew that they have done ill: What needed this wrest to *draw out* from us an accusation of foreign churches? *Hooker.*

I wish that both you and others would cease from *drawing* the scriptures to your fantasies and affections. *Whitgift.*

Go, *draw* aside the curtains, and discover The several caskets to this noble prince.

Shakspeare.

Clerk, *draw* a deed of gift. *Id.*

Go, wash thy face, and *draw* thy action: come, thou must not be in this humour with me. *Id.*

The poet

Did feign that Orpheus *drew* trees, stones, and floods; Since nought so stockish, hard, and full of rage, But musick, for the time, doth change his nature. *Id.*

For thy three thousand ducats here is six.

---If every ducat in six thousand ducats

Were in six parts, and every part a ducat,

I would not *draw* them, I would have my bond. *Id.*

For his sake

Did I expose myself, pure; for his love

Drew to defend him, when he was beset. *Id.*

What, art thou *drawn* amongst those heartless hinds? *Id.*

There is no more faith in thee than in a stoned prune; no more truth in thee than in a *drawn* fox. *Id.*

I'll raise such artificial sprights, As by the strength of their illusion Shall *draw* him on to his confusion. *Id. Macbeth.*

The wine of life is *drawn*, and the mere lees Are left this vault to brag of. *Id.*

This seems a fair deserving, and must *draw* me That which my father loses. *Id. King Lear.*

Some blood *drawn* on me would beget opinion Of my more fierce endeavour. *Id.*

With his other hand, thus o'er his brow, He falls to such perusal of my face, As he would *draw* it. *Id. Hamlet.*

Stand in some bye room, while I question my puny *drawer* to what end he gave me the sugar. *Id. Henry IV.*

Ulysses and old Nestor yoke you like *draft* oxen and make you plough up the wair. *Id. Troilus and Cressida.*

In process of time, and as their people increased, they *drew* themselves more westerly towards the Red Sea. *Raleigh.*

Geffrey of Roullion, at one *draught* of his bow, shooting against David's tower in Jerusalem, bronched three feetless birds called allierions. *Camden's Remains.*

There was no war, no dearth, no stop of trade or commerce; it was only the crown which had sucked too hard, and now being full, upon the head of a young king, was like to *draw* less. *Bacon's Henry VII.*

We see that salt laid to a cut finger, healeth it; so as it seemeth salt *draweth* blood, as well as blood *draweth* salt. *Baron.*

I have not yet found certainly, that the water itself by mixture of ashes, or dust, will shrink, or *draw* into less room. *Id. Natural History.*

When the fountain of mankind Did *draw* corruption, and God's curse, by sin, This was a charge that all his heirs did bind, And all his offspring grew corrupt therein. *Sir J. Davies.*

Having the art by empty promises and threats, to *draw* others to his purpose. *Hayward.*

Under colour of war, which either his negligence *draws* on, or his practices procured, he levied a subsidy. *Id.*

The English lords did ally themselves with the Irish, and *drew* them in to dwell among them, and gave their children to be fostered by them. *Davies.*

She had all magnetic force alone, To *draw* and fasten sundered parts in one. *Donne.* Let the *drawers* be ready with wine and fresh glasses; Let the waiters have eyes, though their tongues must be tied. *Ben Jonson's Tavern Acad.*

Half the buildings were raised on the continent, and the other half on an island, continued together by a *drawbridge*. *Carew's Survey of Cornwall.*

One injury *draws* on another.

The covetous man is a downright servant, a *draught-horse* without bells or feathers. *Cowley.*

Draw out with credulous desire, and lead At will the manick, resolute breast, As the magnetic hardest iron *draws*. *Milton.*

He ended; and the' archangel soon *drew* nigh,
Not in his shape celestial, but as man
Clad to meet man. *Id. Paradise Lost.*

Thus I called, and strayed I know not whither,
From where I first *drew* air, and first beheld
This happy light. *Id.*

Were it a *draught* for Juno when she bauquets,
I would not taste thy treasonous offer. *Milton.*

Have they invented tones to win
The women, and make them *draw* in
The men, as Indians with a female
Tame elephant inveigle the male? *Hudibras*

He affected a habit different from that of the times,
such as men had only beheld in pictures, which *drew*
the eyes of most, and the reverence of many, towards
him. *Clarendon.*

An army was *drawn* together of near six thousand
horse. *Id.*

The lord Bernard, with the king's troops, seeing
there was no enemy left on that side, *drew* up in a
large field opposite to the bridge. *Id.*

He had once continued about nine days without
drink, and he might have continued longer, if, by
distempering himself one night with hard study,
he had not had some inclination to take a small
draught. *Boyle.*

I took rectified oil of vitriol, and by degrees mixed
with it essential oil of wormwood, *drawn over* with
water in a limbeck. *Id. on Colours.*

The examination of the subtle matter would *draw*
on the consideration of the nice controversies that
perplex philosophers. *Id. on Fluids.*

Religion will requite all the honour we can do it,
by the blessings it will *draw* down upon us. *Tillotson.*

Upon the *draught* of a pond, not one fish was left,
but two pikes grown to an excessive bigness. *Hale.*

From the events and revolutions of these govern-
ments, are *drawn* the usual instructions of princes
and statesmen. *Temple.*

Several wits entered into commerce with the
Egyptians, and from them *drew* the rudiments of
sciences. *Id.*

I have cured some very desperate coughs by a
draught every morning of spring water, with a handful
of sage boiled in it. *Id.*

A general custom of using oxen for all sorts of
draught, would be perhaps the greatest improvement.
Id.

The brand, amid the flaming fuel thrown,
Or *drew*, or seemed to *draw*, a dying groan.
Dryden's Fables.

Draw out a file, pick man by man.
Such who dare die, and dear will sell their death.
Dryden.

The rest
They cut in legs and fillets for the feast,
Which *drawn* and served, their hunger they appease.
Id.

He has *drawn* a blank, and smiles. *Id.*
A curtain *drawn* presented to our view
A town besieged. *Id. Tyrannic Love.*

So Muley-Zeydan found us
Drawn up in battle, to receive the charge.
Dryden.

Translation is a kind of *drawing* after the life;
where every one will acknowledge there is a double
sort of a likeness, a good one and a bad. *Id.*

Her pencil *drew* what'er her soul designed,
And oft the happy *draught* surpassed the image in her
mind. *Id.*

With roomy decks, her guns of mighty strength,
Deep in her *draught*, and warlike in her length. *Id.*

In some similes, men *draw* their comparisons into
minute particulars of no importance.

Felton on the Classics.
The first conceit tending to a watch, was a *draw-
well*: the people of old were wont only to let down a
pitcher with a hand-cord, for as much water as they
could easily pull up. *Grev.*

People do not care to give alms without some se-
curity for their money; and a wooden leg or a wi-
thered arm is a sort of *draughtment* upon heaven for
those who choose to have their money placed to ac-
count there. *Mackenzie.*

Folly consists in the *drawing* of false conclusions from
just principles, by which it is distinguished from mad-
ness, which *draws* just conclusions from false princi-
ples. *Locke.*

When he finds the hardships of slavery outweigh
the value of life, 'tis in his power, by resisting his
master, to *draw* on himself death. *Id.*

Those elucidations have given rise or increase to
his doubts, and *drawn* obscurity upon places of scrip-
ture. *Id.*

There may be other and different intelligent beings
of whose faculties he has as little knowledge, or ap-
prehension, as a worm, shut up in one *drawer* of a
cabinet, hath of the senses or understanding of a
man. *Id.*

The Maltese harden the bodies of their children,
by making them go stark naked, without shirt or
drawers, till they are ten years old. *Id.*

I have, in a short *draught*, given a view of our ori-
ginal ideas, from whence all the rest are derived. *Id.*

It was the prostitute faith of faithless miscreants
that *drew* them in, and deceived them. *South.*

Every *draught*, to him that has quenched his
thirst, is but a further quenching of nature; a provi-
sion for rheum and diseases. *Id.*

A good inclination is but the first rude *draught* of
virtue; but the finishing strokes are from the will;
which, if well disposed, will by degrees perfect; if
ill disposed, will by the superinduction of ill habits
quickly deface it. *Id.*

Majesty in an eclipse, like the sun, *draws* eyes that
would not have looked towards it if it had shined out.
Suckling.

Philoclea found her, and to *draw out* more, said
she, I have often wondered how such excellencies
could be. *Sidney.*

Philoclea intreated Pamela to open her grief; who,
drawing the curtain, that the candle might not com-
plain of her blushing, was ready to speak. *Id.*

In private *draw* your poultry, clean your tripe,
And from your cels their slimy substance wipe.
King.

A man of fire is a general enemy to all waiters, and
makes the *drawers* abroad, and his footmen at home,
know he is not to be provoked. *Tatler.*

From the soft assaults of love
Poets and painters never are secure:
Can I, untouched, the fair one's passions move,
Or thou *draw* beauty, and not feel its power?
Prior.

Numbered ills, that lie unseen
In the pernicious *draught*: the word obscene,
Or harsh, which, once elanced, must ever fly
Irrevocable, the too prompt reply. *Id.*

His sword ne'er fell but on the guilty head;
Oppression, tyranny, and power usurped,
Draw all the vengeance of his arm upon 'em.

If we make a *drawn* game of it, or procure but moderate advantages, every British heart must tremble.

Id.

I shall say nothing of those silent and busy multitudes that are employed within doors in the *drawing* up of writings and conveyances.

Id.

Such a *draught* of forces would lessen the number of those that might otherwise be employed.

Id.

While near the Lucrine lake, consumed to death, I *draw* the sultry air, and gasp for breath, You taste the cooling breeze.

Id. on Italy.

They should keep a watch upon the particular bias in their minds, that it may not *draw* too much.

Id. Spectator.

Authors, who have thus *drawn off* the spirits of their thoughts, should lie still for some time, till their minds have gathered fresh strength, and by reading, reflection, and conversation, laid in a new stock of elegancies, sentiments, and images of nature.

Id. Freeholder.

Some might be brought into his interests by money; others *drawn over* by fear.

Id. on the War.

When the engagement proves unlucky, the way is to *draw off* by degrees, and not to come to an open rupture.

Collier.

Sucking and *drawing* the breast dischargeth the milk as fast as it can be generated.

Wiseman on Tumours.

I opened the tumour by the point of a lancet, without *drawing* one drop of blood.

Id. Surgery.

In poundage and *drawbacks* I lose half my rent; Whatever they give me, I must be content.

Swift.

Love is a flame, and therefore we say beauty is attractive, because physicians observe that fire is a great *drawer*.

Id.

The report is not unartfully *drawn*, in the spirit of a pleader, who can find the most plausible topics.

Id.

They slung up one of their hogsheds, and I drank it off at a *draught*; which I might well do, for it did not hold half a pint.

Gulliver's Travels.

Spirits, by distillation, may be *drawn* out of vegetable juices, which shall flame and fume of themselves.

Cheyne.

The arrow is now *drawn* to the head.

Atterbury.

Why *drew* Marseilles' good bishop purer breath, When nature sickened, and each gale was death?

Pope.

Shall Ward *draw* contracts with a statesman's skill?

Id.

They random *drawings* from your sheets shall take, And of one beauty many blunders make.

Id.

What you heard of the words spoken of you in the *drawing-room* was not true: the sayings of princes are generally as ill related as the sayings of wits.

Id.

Delicious wines the' attending herald brought; The gold gave lustre to the purple *draught*.

Id. Odyssey.

Now, sporting muse, *draw* in the flowing reins; Leave the clear streams awhile for sunny plains.

Gay.

Batter a piece of iron out, or as workmen call it, *draw* it out, till it comes to its breadth.

Moron.

With a small vessel one may keep within a mile of the shore, go amongst rocks, and pass over shoals, where a vessel of any *draught* would strike.

Ellis's Voyage.

The most occasion that farmers have, is for *draught* horses.

Mortimer's Husbandry.

The joiner puts boards into ovens after the batch is *drawn*.

Id.

Till rescued from the crowd beneath,

No more with pain to move or breathe,

I rise with head clate, to share

Salubrious *draughts* of purer air. *Shenstone.*

It is sweet to feel by what fine-spun threads our affections are *drawn* together.

Sterne.

The power of *drawing*, modelling, and using colours, is very properly called the language of art.

Sir J. Reynolds.

There is a court jargon, a chit-chat, a small talk, which turns singly upon trifles; and which, in a great many words, says little or nothing. It stands fools instead of what they cannot say, and men of sense instead of what they should not say. It is the proper language of levees, *drawing-rooms*, and ante-chambers.

Chesterfield.

Compliments of congratulation are always kindly taken, and cost one nothing but pen, ink, and paper. I consider them as *draughts* upon good breeding, where the exchange is always greatly in favour of the *drawer*.

Id.

As the subtle enemy of mankind takes care to *draw* men gradually into sin, so he usually *draws* them by degrees into temptation.

Mason.

Just when our *drawing-rooms* begin to blaze

With lights, by clear reflection multiplied

From many a mirror, in which he of Gath

Goliath, might have seen his giant bulk

Whole without stooping, towering crest and all,

My pleasures too begin.

Cowper.

Here, my friend, are the *drafts* of two deeds, which I wish to have your opinion on.—By one, she will enjoy eight hundred a-year independent while I live; and, by the other, the bulk of my fortune at my death.

Sheridan.

A bill of exchange is a written order for the payment of a certain sum of money at an appointed time. It is a mercantile contract in which four persons are mostly concerned, viz. 1. The *drawer*, who receives the value. 2. His debtor in a distant place, upon whom the bill is drawn, who is called the *drawee*, and who is to accept and pay it, &c.

Dr. Rees's Cyclopædia.

DRAWBACK, in commerce, certain duties, either of the customs or of the excise, allowed upon the exportation of some of our own manufactures; or upon certain foreign merchandises, that have paid duty on importation. The oaths of the merchants importing and exporting are required to obtain the drawback on foreign goods, affirming the truth of the officer's certificate on the entry, and the due payment of the duties: and these may be made by the agent of any corporation or company, or by the known servant of any merchant usually employed in making his entries and paying his customs. In regard to foreign goods entered outward, if less quantity or value be fraudulently shipped out than what is expressed in the exporter's certificate, the goods therein mentioned, or their value, are forfeited, and no drawback is allowed. Foreign goods exported by certificate in order to obtain the drawback, not shipped or exported, or relanded in Great Britain, unless in case of distress to save them from perishing, lose the benefit of the drawback, and are forfeited, or their value, with the vessel, horses, carriages, &c., employed in the relanding thereof; and the persons employed in the relanding them, or by whose privity they are relanded, or into whose hands they shall knowingly come, are to forfeit double the amount of the

drawback. Officers of the customs conniving at or assisting in any fraud relating to certificate goods, besides other penalties, are to forfeit their office, and suffer six months' imprisonment without bail or mainprize; as are also masters, or persons belonging to the ships employed therein. Bonds given for the exportation of certificate goods to Ireland must not be delivered up, nor drawback allowed for any goods, till a certificate under the hands and seals of the collector or comptroller, &c., of the customs be produced, testifying the landing. See CUSTOMS.

A DRAWBRIDGE may be made after several

different ways; but the most common are made with plyers, twice the length of the gate, and a foot in diameter. The inner square is traversed with a cross, which serves for a counterpoise; and the chains which hang from the extremities of the plyers, to lift up or let down the bridge, are iron or brass. In navigable rivers it is sometimes necessary to make the middle arch of bridges with two moveable platforms, to be raised occasionally, in order to let the masts and rigging of ships pass through. But this contrivance has fallen into disuse before our modern improvements in the construction of bridges.

DRAWING.

DRAWING is the art of representation by picture; or of delineating the appearances of things upon a plain surface, by means of lines, shades, and shadows, formed by various coloring materials. The art of *drawing*, or of delineating the boundaries, outlines, terminations, and forms of figures, may be considered as the basis of painting, and is of the greatest importance to every artist; for it is but labor lost, when the painter endeavours to conceal, by ingenious artifices of color, those details of form which are fundamentally incorrect, and incoherent. It is the groundwork of painting and of sculpture, and is equally essential in architecture.

DRAWING, so called *par excellence*, embraces all the higher qualities of the art, and demands a good eye, a fine taste, and a well-practised hand. It requires a knowledge of pictorial geometry, perspective, anatomy, proportion, both relative and exact, and practice. Sir Joshua Reynolds forcibly calls it, 'an armour, which upon the strong is an ornament and a defence; and upon the weak and mis-shapen, a load.' It leads to a facility in composing, and gives what is called a masterly handling of the chalk or pencil.

By every polished nation the study of this art has, at all times, been held in high esteem:—not only as affording a delightful employment in leisure hours, but from the more important consideration of its influence upon the mind and judgment, by forming the eye, and directing the intellect to habitual discrimination of dimension, regularity, proportion, and order; and we may add, that to those who, either from their birth or unforeseen circumstances, are denied a competent portion of the world's wealth, it presents a powerful motive for aspiration after excellence in the arts, which, if it deserve encouragement, rarely misses receiving it. The great masters of all ages are renowned for their skill in drawing, in the study and practice of which they were incessantly sedulous; nor did they cast off the portcrayon on assuming the brush, but first made various sketches of their intended compositions, then a correct finished drawing of the whole, after that larger and more correct drawings of every separate part;—they then painted the picture, and after all retouched and finished the figures from the life.

Among the greatest artists of ancient times,

Apelles, surnamed *the prince of painters*, is mentioned by ancient writers as the most eminent for the beauty of his drawing. After the revival of the arts in Italy, Michelangiolo Buonarrotti appears to have been the most learned and daring, and Raffaele the most correct and graceful. The Roman and Florentine schools, indeed, have excelled all others in this fundamental part of the art: of the former, Raffaele, Guilio Romano, Polydore, and their scholars; and of the latter, Michelangiolo, Leonardo da Vinci, and Andrea del Sarto, have been the most distinguished. In the Bolognese school, the Carracci, particularly Annibale, whose execution is wonderful, are particularly eminent. In the French school, Poussin, Le Sueur, and Le Brun; and in the English school, omitting living artists, Mortimer, West, Barry, and Gavin Hamilton, demand commendation.

The human figure, as it is the most difficult, should be the first object of the student. To accomplish this, he must begin by acquiring a facile management of his portcrayon and crayon, so as to delineate with correctness the effects of the outline, and of the light and shade of the object which he has before him. When these first rudiments of drawing are obtained, and the student can trace, with sufficient correctness, the elementary parts of the figure, as ears, eyes, hands, &c. (plates II. & IV.), he should then apply to the study of the human figure, after the antique, and after nature, in a philosophical manner.

The different styles of drawing or design may be arranged under the heads of *individual nature*, or that of common or familiar forms, with all the imperfections and peculiarities of the individual model; *select nature*, or that wherein the artist has composed or made a selection from the mass of individual models that he has had before him; and, thirdly, the *grand style*, the *gran gusto* of the Italians, the beau ideal of the French, the ideal beauty of the Greeks in which they are so much our masters.

The *individual style* is that in which the Dutch masters, our great Hogarth and Wilkie, and his school, are so excellent. The *select style* has been ennobled by Raffaele, and by the Carracci with their eclectic school; and, in the third style, none have surpassed the great sculptors of anti-

quity, particularly those who executed the majestic Apollo Belvedere, and the marvellous works called the Elgin marbles.

The progress of the young artist's studies in drawing or designing, ought to be founded upon a graduated scale. Individual nature, at the commencement of his studies; select, as he proceeds, and, when he attempts originality, idealized according to the precepts of Reynolds, and the practice of Phidias.

SECT. I.—OF THE PROPER MATERIALS AND INSTRUMENTS FOR DRAWING, AND THE MANNER OF USING THEM.

The first step towards attaining a proficiency in drawing, is the study of geometry and perspective. Geometry is the science of extension, quantity, or magnitude abstractedly considered, and demands the greatest attention from the scientific artist. Perspective is that branch of optics which teaches how to represent objects on a plain surface, in the manner wherein they appear under the peculiarities which arise from distance and height. A knowledge of these two branches of science may be said to form the fundamental part of drawing; and, when beginning, the learner must furnish himself with proper materials and instruments; such as black lead pencils of different degrees of hardness; crayons of black, white, and red chalk; crow or duck-quill pens; Indian ink or seppia: as also with drawing-boards, rules or straight edges, and compasses; drawing-boards for fastening the paper upon, so that it may not shift, and likewise for straining it, to prevent the colors, or the washes of tint, when laid wet upon the paper, from causing it to swell so as to dry uneven. The simplest of these latter requisites is made of a deal board glued together to its proper width and length, strengthened with a piece rabbeted on at each end, to prevent warping. The paper may be fixed down upon this board with pins, wafers, or sealing wax, or it may be strained with paste or glue in the following manner:—First wet the paper well with a sponge, omitting the edges, which should be turned up about half an inch in width on every side; apply a small quantity of good paste or glue all round on the under side, and press the paper down upon the board with a cloth, rubbing it well with your nail, or the smooth handle of a knife to secure it. In the process of drying, the paper, which had expanded and blistered up much when wet, will contract, and (the edges being fixed immovably) will strain quite flat and tight, and will be much fitter for drawing upon than when loose. But the best drawing boards are made with a frame and a moveable panel, upon which the paper is simply put wet, and then forced into the frame, where it is confined by wedges or keys at the back. This strains equally well, without the trouble of pasting, so that it may be dried at the fire; it also looks better.

The young student must accustom himself to hold the pencil or port-crayon further from the point than he does a pen in writing, which will give him a better command of it, and render his lines or delineations more free and bold.

For Indian ink or seppia drawings, the first

outlines are to be sketched in by the black lead pencil, so that any part which is not correct may be easily obliterated by the Indian rubber. When the sketch is as correctly done with the pencil as is in the student's power, he is then to draw carefully his outline with the crow or duck-quill pen, and diluted ink or seppia. After this he is to discharge the pencil lines, by rubbing it gently with the crumb of stale bread or Indian rubber. The pigment used for this purpose is either Indian ink, or seppia, which is a pleasanter warmer color, and softer in execution. By rubbing these up with soft water on a plate, or palette of earthen ware or marble, they may be made of any required degree of strength, and used in the quill or steel pen like common ink.

Having got the outline clear and correct, the next step is to shade the work properly, either by drawing fine strokes with the pen in a manner which is called hatching, and of which the first engravings were imitations, or by washing in the shadows, and softening them into the lights with camel-hair pencils, and tints of Indian ink or seppia. As to the rule and compasses, they are very rarely to be used, except in architectural or geometrical drawings, or in measuring the proportions of figures, after they are drawn, to prove whether they are correct or not; or, finally, in the delineation of fortifications and linear perspective. Chalks and crayons are managed in a similar manner, except that the lights and shades are drawn with the material dry, and hatched and softened into one another, in the same way.

SECT. II.—OF DRAWING LINES, SQUARES, CIRCLES, AND OTHER GEOMETRICAL FIGURES.

The first practice of a learner should be to draw straight and curved lines, with ease and freedom, upwards and downwards, inclined to the right and left, or in any required direction. To draw lines inclining to the right, or quite horizontal, he must hold his elbow close to his side as in writing; when perpendicular, the elbow must be removed to about seven inches from the side, and when inclined to the left, at a very considerable distance, according to the degree which the angle forms. A good practice, illustrative of this precept, is for the student to draw by hand a series of equilateral triangles, with a perpendicular line drawn from the apex; and a row of various-formed right angled triangles, with hypotenuses, bases, and perpendiculars of various dimensions. He should also learn to draw by hand, squares, circles, ellipses, and other geometrical figures: for as the alphabet or a knowledge of the letters of a language is an introduction to grammar, so is geometry to drawing.

The practice of drawing these simple elementary figures, till he becomes master of them, will enable him to imitate, with ease and accuracy, many forms both in nature and art, which are composed thereof. Four general precepts or rules may here be laid down: 1. Never let the student be in a hurry, but always make himself master of one figure before he goes on to another; the advantage, and even the necessity of this practice will appear to him as he proceeds. 2. He should accustom himself to draw all his figures

of a considerable size, which is the only method of acquiring a free and bold manner. 3. He should practice drawing till he has gained a tolerable command of his pencil, before he attempts to shade any figure or object of any kind whatever: and, 4. He should not aim at finishing perfectly any single part, before he has sketched out faintly, with light strokes of the pencil, the shape and proportion of the whole figure; correcting it afterwards wherever necessary.

SECT. III.—OF DRAWING EYES, EARS, FLOWERS, FRUITS, BIRDS, BEASTS, &c.

The learner should begin with drawing the outlines of eyes, ears, &c., as in plate II. with noses and parts of faces as in plate III., after either of the modes directed in section I. He may next proceed with flowers, fruits, birds, beasts, and the like; not only as it will be a more pleasing employment to those who do not aim at the severer beauties of the art, but as an easier task, particularly to young ladies, than the drawing of hands and feet, and other parts of the human body, which require not only more care, but greater exactitude and nicer judgment. Very few instructions are necessary upon this head. The best thing that a learner can do is, to furnish himself with good prints or drawings by way of examples, and copy them with great care and exactness. If it is the figure of a beast, let him begin with the forehead, and draw the nose, the upper and under jaw, and stop at the throat. Then he should return to the top of the head, and trace the ears, the neck, and the back; continuing the line till he has given the full shape of the rump and buttock. Then proceed to the chest and breast, mark out the legs and feet, and delineate the belly. And, lastly, as before directed in sect. I., when the learner has acquired some proficiency in the art, let him draw the outline as there instructed, and finish it with shadows, or with the proper colors after nature as directed in section XII. It would not be amiss, by way of ornament, to add a small sketch of a landscape, appropriate to the country of the animal, either by way of a vignette, or determined by a parallelogram like a picture; of these, and other subjects, the learner will find many examples among the plates of this work.

SECT. IV.—OF DRAWING LEGS, ARMS, HANDS, FEET, &c.

In the drawing of legs and arms, the learner will have very little more to do than to copy carefully the examples of arms given in plate IV., and of legs in plate V. But the actions and postures of the hands are so many and so various, that no certain rules can be given for drawing them, which will universally hold good. Yet, as the hands and feet are difficult to draw, it is very necessary to bestow some time and pains about them; carefully imitating their various postures and actions, so as not only to avoid all appearance of lameless and imperfection, but also to give them life and spirit. To arrive at this, great care, study, and practice are requisite, particularly in imitating at first, that is before beginning to draw from statues or from nature, the best prints or drawings that can be obtained

of hands and feet; examples of which are given in plates IV. and V. As to mechanical rules for delineating them by lines and measures, they are not only difficult and perplexing to the student, but are also contrary to the practice of the best masters. And here the general rule above mentioned must be applied, which is, to sketch out faintly, with light strokes, the general shape and proportion of the whole hand, with its action and turn; and after considering whether this first sketch be perfect, and altering it wherever it may be amiss, to proceed to the bending of the joints, the knuckles, the veins, and other small particulars, which, when the learner has obtained the whole shape and proportions of the hand or foot, will not only be more easily, but also more perfectly drawn.

SECT. V.—OF DELINEATING FACES.

The head is usually divided into four equal parts, namely, 1. from the crown of the head to the top of the forehead. 2. From the top of the forehead to the eye-brows. 3. From the eye-brows to the bottom of the nose. 4. From thence to the bottom of the chin. But this proportion, as may justly be inferred, is not invariable; these features being, in different men, often very different as to length, breadth, and shape: in a handsome well-turned face, however, it is nearly correct. In delineating a perfect face, therefore, the learner's first business must be to sketch slightly an oval or egg-like figure with its broadest hemisphere upwards; then to bisect it with a perpendicular line from the top to the bottom. Through the middle of this line he will draw a diametral one, directly across from one side to the other of the oval. On these two lines all the features of the face are to be delineated as follows: first divide the perpendicular line into four equal parts, the first of which is to be allotted to the hair of the head; the second is from the top of the forehead to the top of the nose between the eye-brows; the third is from thence to the bottom of the nose; and the fourth includes the lips and chin. The diametral line, or the breadth of the face, is always supposed to be the length of five eyes; it must therefore be divided into five equal parts, and the eyes placed upon it so as to leave exactly the length of one eye between them. This is to be understood only of a full front face as in plate I., for if it turn to either side, the distances are to be lessened on that side which turns from you, more or less in proportion. The top of the ear is to rise parallel to the eye-brows, at the end of the diametral line. The nostrils ought not to come further out than the corner of the eye in any face; and the middle of the mouth must always be placed on the perpendicular line. See plate I., DRAWING.

SECT. VI.—OF DRAWING HUMAN FIGURES.

When the student is tolerably perfect in drawing faces, heads, hands and feet, he may next attempt to draw the human figure at full length. He should begin by sketching the head; then draw a perpendicular line from the bottom of the head seven times its length, or as many heads as the figure is high from which he is drawing; for in general the length of the head is about one-eighth

part of the length of the figure. The best-proportioned figures of the ancients are seven heads and three quarters in height, but they vary as required by the different characteristics of the figure. If, therefore, the figure stands upright, as fig. A, plate VI., draw a perpendicular line from the top of the head to the heel, which must be divided into two equal parts. The bottom of the belly is exactly the centre of the figure. Then divide the lower part into two equal parts again; the middle of which is to be the middle of the knee.

The method of delineating the upper part of the figure is as follows:—Take off with the compasses the length of the face, which is about three-fourths of the length of the head; then set off the length of another face from the pit of the throat to the pit of the stomach; thence to the navel is another face in length, and thence to the lower rim of the belly is a third.

The entire line must then be divided into seven equal parts: against the end of the first division is the situation of the breasts; the second is the place of the navel; at the third mark out the privities; the fourth comes in the middle of the thigh; the fifth to the lower part of the knee; the sixth to the lower part of the calf; and the seventh to the bottom of the heel; the heel of the leg which supports the body being always under the pit of the throat.

As the essence of all good drawing consists in making a correct sketch at first, the student must be very accurate and careful in this stage of his business, rubbing out and sketching again till he is right in all the bearings and proportions; and finishing no one part perfectly till he finds the general sketch and character of the figure complete and good; and when it is all in, correctly to his mind, he may then proceed to the finishing of one part after another, with all the fidelity in his power.

Some artists, when they have a statue to copy, begin with the head, which they finish, and then proceed in the same manner to the other parts of the figure, perfecting as they go on: but this manner is generally unsuccessful; for, if they make the head in the least too large or too small, the consequence is a manifest disproportion between all the parts, occasioned by their not having sketched the whole proportionably at first. Let the more advanced student therefore remember that, in whatever he intends to draw, he should first sketch its several parts, measuring the distances and proportions between each with his finger or his pencil, without using the compasses, observing the precept of Du Piles 'to bear the compass in his eye,' and then to judge of its general effect by the eye which by degrees will be able to estimate truth and proportion, and will become his principal and best guide. Let him also observe, as a general rule, invariably to begin with the right hand side of the piece he is copying; for thus he will always have what he has done before his eyes, and the rest will follow more naturally and with greater ease. Whereas if he begin with the left side of the figure, his hand and arm will cover what he does first, and deprive him of the sight of it; by which means he will not be able to proceed with so much ease, pleasure, or certainty.

When these more mechanical parts are acquired, and their real measurements tolerably familiar, the student may proceed in respect to the order and manner of drawing the human figure, as follows:—First he should sketch the head; then the shoulders in their exact breadth, in relation to the head; then draw the trunk of the body, beginning with the arm-pits (leaving the arms for an after consideration), and so trace all the beautiful undulations which form the outline of the human body, down the hips on both sides; observing carefully the exact breadth of the waist. Then he should draw that leg upon which the body stands, and afterwards the other which is in repose: then the arms, and last of all the hands. He must carefully notice all the bowings and bendings that are in the figure; making the part which is opposite to that bending inwards correspond to its antagonist by swelling outwards.

For instance: if one side of the body bend in, the other must naturally swell out to be answerable to it: if the back bend in, the belly must swell out; if the knee bend out, the ham must bend in, and so on of every other joint in the body. In a word, he must endeavour to form all the parts of the figure with truth, and in just proportion; not one arm or one leg bigger or less than the other; nor broad Herculean shoulders with a weak and slender waist; nor raw and bony arms with thick and puffy legs; but preserving an harmonious agreement and keeping amongst all the members, and consequently a beautiful symmetry throughout the whole figure. When these rudiments of drawing the human figure are thus acquired, and the student can draw with sufficient correctness, he must next apply himself to its study after the antique and nature in a philosophical manner; studying OSTEOLOGY and ANATOMY as his surest directors. See those articles.

In copying after the antique, which should precede and always accompany that of drawing after nature, the following statues and sculptures are among the master-pieces of ancient art to which the student's attention is particularly directed, as subjects for his studies in chalk drawing or design: namely, first of all the remains of ancient art, those incomparable works known by the name of the Elgin marbles. Of these the figure called Theseus or Hercules, the Ilissus, the Cupid, and the wonderful fragment of the chest and shoulders of Neptune, stand pre-eminent among the naked ones: the colossal statue of Bacchus, the Fates, the Victory, the Canephora, and the Panathenaic procession among the dressed and every one of them—from the Metopes to the fragment of a toe—for various degrees and kinds of perfection in art. They were for more than 700 years the admiration of the ancient world, and, in the time of Plutarch, were regarded as inimitable for their grace and beauty.

The torso of the Belvedere, commonly called the torso of Michel Angelo, as being a considerable favorite with that great master, is another beautiful study for the young artist; as is also the Farnese Hercules, which is a standard master-piece of art. The Apollo Belvedere is

the most sublime of ancient statues, and presents a beautiful subject for the pencil. The Laocöon possesses splendid beauties of another character; and the Venus de Medicis is a perfect model of feminine beauty, grace, elegance, and sweetness, and is indeed the perfection of the female form. The Antinoüs of the Belvedere is a magnificent specimen of male youthful beauty, and the celebrated Gladiators are remarkable for their display of anatomical correctness.

When the student has mastered these, and imbued his mind with their beauties and proportions, he may commence drawing after nature, or from the living model; undertaking a course of anatomy and anatomical drawing, and an occasional return to the beauties of the antique, to prevent a too great mannerism and individuality of form.

SECT. VII.—OF THE PROPORTIONS AND MEASURES OF THE HUMAN BODY.

The centre, or middle part, between the extremities of the head and feet of a well-proportioned new-born child is in the navel, but that of an adult is in the os pubis; and the practice of di-

viding the measures of children into four, five, and six parts, of which one is given to the head, is made use of in the way of proportion both by painters and sculptors.

A child of two years of age is in general about five heads high, but, of four or five years old, nearly six; about the fifteenth or sixteenth year, seven heads are the proportion or measure, and the centre declines to the upper part of the pubis. Hence it appears that, as the growth of the body advances, there is a gradual approach to the proportion of an adult of nearly eight heads in the whole height; of which, as before mentioned, the head itself makes one.

Upon these principles the following table is constructed, exhibiting the proportions of a strong, and of a graceful man, and of a fine woman, as given by the ancients, measured from the originals at Rome, and published by J. J. Volpato and Raffaële Morghen. It is found in Elmes's Dictionary of the Fine Arts. The models are, the Farnese Hercules, the Belvedere Apollo, and the Medicean Venus, which may be classed as the Doric, the Ionic, and the Corinthian orders of human beauty.

The entire proportions of these celebrated statues are, in round numbers; the Hercules seven heads, three parts, seven minutes (four parts being equal to one head, and twelve minutes equal to one part). The Apollo seven heads, three parts, six minutes; and the Venus seven heads, three parts. The other most admired statues differ a little from these proportions—the Laocoön measuring (if erect) seven heads, two parts, three minutes; the Pyramus seven heads, two parts; the Antinoüs seven heads, two parts; the Grecian shepherdess seven heads, three parts, six minutes; and the Mirmillo eight heads; but all their various proportions are harmonious and agreeable, and in keeping with the characters of the figures they represent.

It is a leading principle, in which every person who is conversant in the arts of design agrees, that, without a perfect knowledge of the proportions of the human figure, nothing can be produced but absurdity and extravagance; and it is also universally admitted, that the ancient Greek and Roman sculptors attained the highest success in producing unexceptionable models.

The greatest modern artists, who have examined these antique statues with attention, admit, that several of the ancient sculptors have, in some degree, surpassed nature, no living man having been found so perfect in every part as some of their figures are. The opportunities for acquiring excellence, which they possessed, were indeed great: Greece abounded with models of beauty, strength, and elegance; and Rome being mistress of the world, every thing beautiful, rich, or curious was brought to it, from all parts. The motives which inspired them and their patrons were also powerful. Religion, glory, and interest, all united in their aid. They considered it a kind of religious duty to give to the figures of their gods so much beauty and grandeur, as to attract at once the love and veneration of the people. Their own glory was also concerned, particular honors being conferred on those who succeeded; and for their fortune they had no farther care to take of that, after arriving at a certain degree of celebrity.

SECT. VIII.—OF THE ATTITUDES OF THE HUMAN FIGURE.

If an artist be required to represent a powerful athletic figure, such as a Hercules or a Sampson, in a state of vigorous action, he must pay particular attention to the parts or limbs which are principally exerted in such action. If the figure be standing, the foot must be placed in a right line or perpendicular to the trunk or bulk of the body, so that the centre of

gravity may be placed in equilibrio. This point or centre is determined by the heel; or, if the figure be on tiptoe, then the ball of the great toe in the centre. The muscles of the leg which supports the body must be swelled, and their tendons drawn more to an extension than those of the other leg, which is only so placed as to receive the weight of the body like a buttress or a prop, towards that way to which the action inclines it.

For example, suppose Hercules is to be represented, aiming a blow with his club, at something before him, towards his left side. Then must his right leg be placed so as to receive the whole weight of his body, and the left merely touching the ground with the toes. In this case the external muscles of the right leg must be strongly marked; while those of the left leg must be represented more flaccid, and in repose; but, as the foot is extended, the muscles that compose the calf of the leg are extended also, as those of the right are compressed and tumefied. For if the leg or tibia is extended, then the extending muscles are most swelled; but if it be bent, then the bending muscles and their tendons appear most plainly.

The like may be observed of the muscles of the whole figure in general, if it be represented in vigorous action. The Laocoön furnishes an example of this muscular appearance being carried through the whole figure; while in the Antinoüs, the Apollo, the youthful Bacchus, and other figures where no energetic action is expressed, the muscles are expressed but faintly, as they appear through the skin in nature.

The clavicles, or collar bones, and the muscles in general, do not show themselves so strongly in the female as in the other sex, nor in youths as in adults. Nor will any action in which a female uses her utmost strength occasion such risings or indications of the muscles as they do in the stronger sex. The great quantity of fat under the skin of females so clothes their more delicate muscles as to prevent such a marked appearance.

SECT. IX.—OF THE EFFECTS OF THE EXERCITION OF THE MUSCLES.

The most obvious effects of the exertion of those muscles which chiefly demand the attention of the artist are the following: viz.

If either of the mastoid muscles (see the plate of muscles in Anatomy,) act, the head is turned to the contrarieside, and the muscle which performs that action appears very plainly through the skin.

If the arms be raised, the deltoid muscles placed on the shoulders, which perform that

action, swell, and make the extremities of the spines of the shoulder blades, called the tops of the shoulders, appear indented or hollow. The shoulder blades following the elevation of the arms, their bases incline at that time obliquely downwards. If the arms be drawn down, put forward, or pulled backwards, the shoulder-blades necessarily vary their positions accordingly. These particulars can only be learned by an attentive study of anatomy and of the living model; by which means the student becoming acquainted with the circumstances which attend every action he will be able to form an idea how they ought to be expressed.

When the cubit or fore-arm is bent, the biceps has its belly very much raised, as shown in the left arm. The like may be observed of the triceps when the arm is extended, as shown in the right arm.

The straight muscles of the abdomen appear very strong when arising from a recumbent posture. Those parts of the great serratus muscle which are received in the beginnings of the oblique descending muscle immediately below, are very much swelled when the shoulder on the same side is brought forwards; the serratus muscle then being in action in drawing the scapula forwards.

The long extending muscles of the trunk act alternately in walking. If the right leg bears the weight of the body, and the left is advancing as on tiptoe, the last-mentioned muscles of the back, on the left side, will be tumefied on the other side about the region of the loins, and so on the other side.

The trochanters, or outward and uppermost heads of the thigh bones, (see the skeleton in the plate of Anatomy,) vary in their positions in such a manner as that no precise observations can explain their several appearances; but a careful study of the living model, placed in action, must be carefully attended to. If either thigh be extended, as when the whole weight of the body rests on that side, the glutæus or buttock-muscle presents a very different appearance from what it offers at another time, or when in repose; but if the thigh be drawn backwards, that muscle becomes still more tumefied.

When the whole leg is drawn upwards and forwards, and at the same time the foot is inclined inwards, the upper part of the sartorius muscle appears, rising very strong. In other positions of the thigh that muscle makes a furrowing appearance in its whole progress.

If a man be on tiptoe, the extending muscles of the leg, which are situated on the fore-part of the thigh and those of the foot, which compose the calf of the leg, appears very strongly, and the long peroneus makes a considerable indentation or furrowing at that time in its progress on the outside of the leg. Many other remarks might be made on this subject; but an attentive study of nature will render them unnecessary. Indeed we beg leave to refer the reader for further illustration, to the plates and article ANATOMY.

SECT. X.—OF THE EFFECTS OF THE PASSIONS IN GENERAL.

When the student has thus made himself master of the various attitudes and muscular

exertions of the human body, it will be necessary for him next to study the effect of the passions upon the limbs and features. The passions, says Le Brun, are motions of the soul, either upon her pursuing what she judges to be for her good, or shunning what she thinks hurtful; and commonly, whatever causes emotions of passion in the soul, creates also some action in the body. It is therefore necessary for a painter to know which are the different passions of the soul, and how to delineate them.

Le Brun has been extremely happy in delineating many of the passions, and the young artist cannot study any thing better than the examples which he has left us of them; and of which we have given a copy in plate VI. However, as De Piles justly observes, it is absurd, as well as impossible, to pretend to give such particular demonstrations of them, as to fix their expression to certain strokes, which the painter should be obliged to use as essential and invariable rules. This, he very properly says, would be depriving the art of that excellent variety of expression which has no other principle than diversity of imagination, the extent of which is infinite. The same passion may be finely expressed several ways, each yielding more or less pleasure in proportion to the painter's understanding and the spectators' discernment.

Although every part of the face contributes towards expressing the sentiments of the heart, yet the eye-brow is the principal seat of expression, and that wherein the passions principally indicate themselves. It is certain, says Le Brun, that the pupil of the eye, by its fire and motion, very well shows the agitation of the soul, but then it does not express the kind or nature of such an agitation; whereas the motion of the eye-brow differs according as the passions change their nature. To express a simple passion, the motion is simple; to express a mixed passion, the motion is compound: if the passion be gentle, the motion is gentle; and if it be violent, the motion is so too.

We may observe farther, says he, that there are two kinds of elevation in the eye-brows: one, in which the eye-brows rise up in the middle—this elevation expresses agreeable sensations, and it is to be observed that then the mouth rises at the corners; the other, in which the eye-brows rise up at the ends, and fall in the middle; this motion indicates bodily pain, and then the mouth falls at the corners. In laughter, all the parts agree; for the eye-brows, which fall towards the middle of the fore-head, make the nose, the mouth, and the eyes follow the same motion. In weeping, the motions are compound and contrary; for the eye-brows fall towards the nose and over the eyes, and the mouth rises that way. It is to be observed also, that the mouth is the part of the face which more particularly expresses the emotions of the heart: for when the heart complains, the mouth falls at the corners; when it is at ease, the corners of the mouth are elevated, and when it has an aversion, the mouth is protruded and rises in the middle.

'The head,' says De Piles, 'contributes more to the expression of the passions, than all the

other parts of the body put together. Those separately can only show some few passions, but the head expresses them all. Some, however, are more peculiarly expressed by it than others: humility, by hanging it down; arrogance, by lifting it up; languor, by inclining it on one side; and obstinacy, when, with a still and resolute air, it stands upright, fixed, and stiff between the two shoulders. The head also best shows our supplications, threats, mildness, pride, love, hatred, joy, and grief. The whole face and every feature contribute something; especially the eyes, which, as Cicero says, are the windows of the soul. The passions which they more particularly discover are pleasure, languishing, scorn, severity, mildness, admiration, and anger; to which we may add joy and grief, if they did not proceed more particularly from the eye-brows and mouth: but when these two passions fall in also with the language of the eyes, the harmony will be wonderful.

But though the passions of the soul are most visible in the lines and features of the face, they often require the assistance also of the other parts of the body. Without the hands, for instance, all action is weak and imperfect; motions, which are almost infinite, create numberless expressions: it is by them that we desire, hope, promise, call, send back; they are the expressive instruments of threatening, prayer, horror, and praise; by them we approve, condemn, refuse, admit, fear, ask; express our joy and grief, our doubts, regrets, pains, and admiration. In a word, it may be said, as they are the language of the dumb, that they contribute not a little to speak a language common to all nations, which is the language of painting. But to say how these parts must be disposed for expressing the various passions is impossible, nor can any exact rules be given for it, both because the task would be infinite, and because every one must be guided in this by his own genius and the particular turn of his own studies.

SECT. XI.—OF THE PARTICULAR EFFECTS OF THE DIFFERENT PASSIONS ON THE FEATURES.

Notwithstanding the justice of the preceding observations of De Piles, yet Le Brun has given such an accurate description of the particular effects of the passions on the human features, as must be of essential service to all who wish to attain proficiency in any of the arts of design. We therefore subjoin it, not only as an illustration of his drawings, copied in plate VI. but as containing a set of general rules to the student for depicting the various passions of human nature.

1. *Attention*.—The effects of attention are to make the eye-brows sink, and approach the sides of the nose; to turn the eye-balls towards the object that causes it; to open the mouth, and especially the upper part; to decline the head a little, and to fix it without any other remarkable alteration. See plate VI. 1.

2. *Admiration*.—Admiration causes but little agitation in the mind, and therefore alters but very little the muscles of the face. Nevertheless the eye-brows rise, the eyes open a little more than ordinary; the eye-balls, placed equally be-

tween the eye-lids, appear fixed upon the object: the mouth half opens, but occasions no sensible alteration in the cheeks. Ibid. 2.

3. *Admiration combined with Astonishment*.—The motions that accompany this mixed expression are scarcely different from those of simple admiration; except, that they are more lively and more strongly marked. The eye-brows are more elevated, the eyes more open, the eye-balls removed farther from the lower eye-lid, and more steadily fixed: the mouth more open, and all the muscles in stronger action.

4. *Veneration*.—Admiration begets esteem, and esteem, in a high degree, produces veneration, which, when it has for its object something divine or beyond our comprehension, occasions the face to decline, and the eye-brows to bend downward. The eyes become almost closed and fixed, and the mouth is shut. These motions are gentle, and produce but little alteration in the other parts of the face. Ibid. 3.

5. *Rapture*.—Although rapture has occasionally the same object as veneration, only viewed in a different manner, yet its motions and characteristics are different. The head becomes inclined to the left side, the eye-balls and eye-brows rise directly up; the mouth half opens, and the corners are also a little turned up; while the other parts remain in the natural state. Ibid. 4.

6. *Desire*.—This passion brings the eye-brows together, and protruded towards the eyes, which are more open than ordinary. The eye-balls are inflamed, and place themselves in the middle of the eyes. The nostrils rise up, and contract themselves towards the eyes; the mouth opens, and the spirits, being in motion, give a lively glowing color to the whole countenance. Ibid. 5.

7. *Joy*.—Very little alteration is perceived in the faces of those who feel within themselves the sweetness of this passion, or of joy mixed with tranquillity. The forehead is smooth and serene; the eye-brows without motion, elevated in the middle; the eye pretty open, and with a laughing air; the eye-balls lively and shining; the corners of the mouth turned up a little; the complexion lively, and the cheeks and lips red. Ibid. 6.

8. *Laughter*.—That kind of laughter which is produced by joy mixed with surprise, makes the eye-brows rise towards the middle, and bend towards the nose; the eyes become almost closed, and are sometimes wet with tears, which make no alteration in the face. The mouth, half open, shows the teeth; the corners of the mouth, drawn back, cause a wrinkle in the cheeks, which swell so as to partially close the eyes; the nostrils open, and all the face is of a red color. Ibid. 7.

9. *Acute Pain*.—Acute pain occasions the eye-brows to approach one another, and to rise towards the middle; the eye-balls are concealed under the eye-brows, the nostrils rise and wrinkle the cheeks; the mouth half opens and is drawn back, and all the muscles of the face are agitated in proportion to the violence of the pain. Ibid. 8.

10. *Simple Bodily Pain*.—This degree of suffering produces proportionably the same motions as the last, but in a less violent degree. The eye-brows do not approach so close, nor rise so much; the

eye-balls appear to be fixed upon some object; the nostrils rise, but the wrinkles in the cheeks are less perceptible; the lips are farther apart towards the middle, and the mouth is half open.

11. *Sadness*.—The dejection which is produced by this affection of the mind, makes the eye-brows rise towards the middle of the forehead more than towards the cheeks. The eye-balls appear perturbed, the white of the eye becomes yellowish, the eye-lids are drawn down and a little swelled. All about the eyes becomes livid, the nostrils are drawn downwards, the mouth is half open, its corners being drawn down, the head carelessly droops on one of the shoulders, the face becomes of a heavy color, and the lips pale. Ibid. 9.

12. *Weeping*.—The alterations occasioned in the human countenance by weeping are very evident. The eye-brows sink down towards the middle of the forehead; the eyes are almost closed, and are wet and drawn downwards towards the cheeks. The nostrils swell, the muscles and veins of the forehead appear, the mouth is closed, and the sides thereof are drawn down making wrinkles on the cheeks: the under lip, pushed out, presses the upper one; all the face becomes wrinkled and contracted, and its color is red, especially about the eye-brows, the eyes, the nose, and the cheeks. Ibid. 10.

13. *Compassion*.—That lively attention to the misfortune of others, which is called compassion, causes the eye-brows to sink towards the middle of the forehead; the eye-balls to be fixed upon the object of its attention; the sides of the nostrils next the nose to be a little elevated, forming wrinkles in the cheeks; the mouth to be open; the upper lip to be raised and thrust forwards; the muscles and all the parts of the face to be depressed, and turned towards the object which excites the sentiment. Ibid. 11.

14. *Scorn*.—The motions of this feeling are lively and strong. The forehead becomes wrinkled, the eye-brows knit, the sides of them next the nose sunk down, and the others much risen. The eyes are widely open: and the eye-balls in the middle: the nostrils rise and are drawn towards the eyes, forming wrinkles in the cheeks. The mouth closes, its sides are drawn down, and the under lip is protruded beyond the upper. Ibid. 12.

15. *Horror*.—A despised object sometimes excites horror, and then the eye-brows become knit, and sink considerably more than in the last instance. The eye-balls, placed at the bottom of the eyes, are half covered by the lower eye-lids; the mouth is half open, but closer in the middle than in the sides, which, being drawn backwards, make wrinkles in the cheeks; the face becomes pale, the eyes livid, whilst the muscles and veins are strongly developed. Ibid. 13.

16. *Terror, or Fright*.—The violence of these sensations, which are not synonymous, although Le Brun has so classed them, as the former may be the result of certainty and durable, while the latter is sudden and often evanescent, alter all the middle parts of the face. The eye-brows rise in the centre, their muscles are strongly developed, swollen, pressed against each other, and depressed towards the nose, which is drawn up as well as

the nostrils. The eyes are very open, the upper eye-lid hidden by the eye-brow, the white of the eye encompassed with red, the eye-balls fixed toward the lower part of the eye; the lower part of the eye-lids swell and become livid, the muscles of the nose and cheeks enlarge, and the latter terminate in a point towards the sides of the nostrils. The mouth is very open, and its corners become very apparent; the muscles and veins of the neck stretch; the hair stands on end; the color of the face, that is, of the end of the nose, the lips, the ears, and round the eyes, becomes pale and livid; and all the muscles appear strongly marked. Ibid. 14.

17. *Anger*.—The effects of this passion show its nature. The eyes become red and inflamed; the eye-balls staring and sparkling; the eye-brows sometimes elevated, and at others depressed equally; the forehead much wrinkled, as also the space between the eyes. The nostrils open and enlarged; the lips compress, the under one rising over the upper, slightly opens the corners of the mouth, and gives the appearance of a cruel and disdainful grin. Ibid. 15.

18. *Hatred, or Jealousy*.—The expression of the two passions is so very similar that Le Brun classes them together. They wrinkle the forehead, and the eye-brows become depressed and knit; the eye-balls are half hidden under the eye-brows, and turn towards the object of hatred, appearing fiery and animated; the nostrils are pale, open, more marked than ordinary, and drawn backward so as to cause wrinkles upon the cheeks; the lips are so compressed as to show that the teeth are firmly closed; the corners of the mouth are drawn back, and much sunk; the color of the face becomes partly inflamed and partly yellowish, and the lips pale or livid. Ibid. 16.

19. *Despair*.—As despair is extreme, so are its expressions. The forehead becomes wrinkled from the top to the bottom; the eye-brows bend down over the eyes, and press each other on the sides of the nose; the eyes become fiery in their expression and full of blood; the eye-balls are disturbed, and concealed beneath the eye-brows, sparkling and wandering. The eye-lids are swollen and livid, the nostrils large, open and raised. The end of the nose turns down, the muscles, tendons, and veins, become swollen and stretched. The upper part of the cheeks becomes large; the muscles protrude; the mouth drawn backwards is more open at the sides than in the middle; the lower lip swells and turns outwards. The sufferers gnash their teeth, foam and bite their lips, which are pale, as is the rest of the face; the hair becomes straight and stands on end. Ibid. 17.

To these rules the student will do well to add Charles Bell's Anatomy of Expression, published expressly for artists upon the same subject; and, as has been so often insisted on, to pursue an attentive study of nature.

SECT. XII.—OF THE DISTRIBUTION OF LIGHT AND SHADE.

After the student has made himself master, in a tolerable degree, of drawing figures correctly in outline, his next endeavour should

be to shade them properly. It is this portion of the art which gives the desired effect of substance, form, distance, and distinction, to whatever bodies he endeavours to represent, whether animate, or inanimate.

The best rule for performing this is, to consider from what point, and in what direction, the light falls upon the objects which he proposes to delineate; and to make all his lights and shades fall according to that direction throughout the whole work. That part of the object must be lightest which has the light most directly opposed to it. If the light falls obliquely upon the picture, he must make that side which is opposite to the cause the lightest, and that side which is farthest from it the darkest. If he be drawing the figure of a man, and the light is placed above the head, then the top of the head will of course be the lightest, the shoulders will have the next degree of light, and the lower parts be less illumined as they are removed from the cause. That portion of the object, whether the figure be naked or dressed, or whether it be a building which stands farthest out or nearest to the eye, must be made lightest, because it is nearest to the light; which loses so much of its brightness by how much any part of the object recedes; because those parts which project, hinder the lustre and full brightness of the light from striking on the receding parts.

Titian used to say, that he knew no better rule for the distribution of light and shadow, or, as the Italian critics call this department of the art, *chiaro-scuro*, than the observations that may be drawn from the lights, shadows, and reflexes of a bunch of grapes. Satins and silks, and all other shining stuffs, have certain glancing reflections, exceedingly bright where the light falls strongest. The like is seen in armour, brass pots, or any other glittering metal, where a sudden brightness appears in the centre of the light, which discovers the shining nature of the body depicted. The principal light should be thrown on the principal figure, and an equal balance must be kept between the lights and shades throughout the whole.

The outlines must be faint and almost imperceptible in such parts as receive the light; but where the shades fall the outline may be stronger, but must never be too evident, as there is no such thing as outline in nature. Another effect of nature to be observed is, that as vision becomes weaker by distance, so must the objects appear more or less defined according to the places which they occupy in the picture; those which are very distant, faint and undefined; those which are nearer, and in the foreground, clear, strong, and accurately defined.

However, so much of this important portion of the art depends upon the artist's own feelings and perceptions, that better directions for its acquirement cannot be given, than to study with attention the works of those masters who are reckoned the most successful in its uses, and to follow them and their mistress—nature, as guides.

SECT. XIII.—OF DRAPERY.

Drapery is the art of clothing figures, and disposing the drapery or clothing properly

and elegantly upon them. In this department of the art many things are necessary to be observed. 1. The eye must never be left in doubt as to the object before it; but the shape and proportion of the limb, or portion of the figure, which is covered by the drapery, must appear to be beneath it; or at least so far as art and probability will permit. This is so material a consideration, that the best artists draw the naked figure first, and throw the drapery properly about it afterwards. 2. The drapery must not be too loose about the figure, but should so flow round and adhere to it, that the latter may seem unencumbered and have a free motion. 3. The draperies which cover those parts which are exposed to great light, must not be so deeply shaded as to seem to pierce them, lest by the too great darkness of their shades, the limbs should look as if they were broken. 4. The great folds must be drawn first, and then divided into lesser ones; and great care must be taken that they do not cross one another improperly. 5. Folds in general should be large and few; this must be guided, however, by the quality and quantity of the stuffs of which the drapery is composed. The quality of the persons depicted must also be considered in their drapery; if ancient legislators, orators, or philosophers, their robes should be large and ample; if clowns, countrymen, or slaves, short and of coarse materials; if ladies, or nymphs, light and soft. 6. The garments should be adapted to the body, whose motions they should follow, and the closer the garments sit to the body the narrower and smaller must be the folds. 7. Well-imagined folds give spirit to any kind of action, because their motion implies a motion in the principal limb, which seems to act forcibly upon them, and makes them more or less stirring as the action is more or less violent. 8. An artful complication of folds in a circular manner greatly assists the effects of foreshortening. 9. All folds consist of two shades and no more, which may be turned with the garment at pleasure, shadowing the nearer side deeply and the outer more faintly. 10. The shades in silk and fine linen are very thick and small, requiring little folds, and a light shadow. 11. Observe the motion of the air or wind, in order to draw the loose apparel all flying one way; and draw that part of the garment which adheres closest to the body, before you draw the looser part which flies off from it: lest by drawing the looser part first you should mistake the position of the figure; and thereby place it wrong. 12. Rich ornaments, when judiciously and sparingly used, will sometimes contribute to the beauty of draperies; but such ornaments are below the dignity of heavenly figures, whose grandeur should be derived from their characteristic forms and expressions, whether of countenance, attitude, or attire, rather than from the earthly vanity of rich stuffs or glittering ornaments. 13. Light and flying draperies are proper only to figures in rapid motion, or blown upon by the wind; but in a calm place, and free from violent action, their draperies should be large and flowing; that by their contrast, and the fall of their folds, they may bear the appearance of grace and dignity. See further under **PAINTING**.

SECT. XIV.—OF DRAWING LANDSCAPES, BUILDINGS, &c.

Of all the branches of art, this is the most generally useful and necessary; because it is what every man may have occasion for at one time or another. To be able, on the spot, to take the sketch of a fine building, a curious relic of antiquity, or a beautiful prospect of any curious production of art, or uncommon appearance in nature, is not only a desirable accomplishment, but an agreeable and useful amusement. Rocks, mountains, fields, woods, rivers, cataracts, cities, towns, castles, houses, fortifications, ruins, or whatsoever else may present itself to view on our journeys or travels, in our own or foreign countries, may be thus brought home and preserved for future use either in business or conversation. On this part, therefore, more than ordinary pains should be bestowed.

All drawing consists in measuring visible objects accurately with the eye. In order to facilitate this operation, the student should fancy, in his own mind, that the subject he is delineating is divided into squares of imaginary lines. We say imaginary lines, because though engravers and others, who copy with great exactness, divide both their copy and the original into an equal number of squares, yet this is a method not to be recommended; since it imposes shackles upon the learner, from which he will find it difficult to emancipate himself, particularly when he comes to draw from nature, where such artifices will not avail him.

When colors are used in drawing, they should be managed with caution and judgment; it being

disgusting to see colored or tinted drawings, wherein the reds, greens, and blues are laid without regard to truth or harmony. It may be urged, by those who execute them, that nothing is greener than grass, nor bluer than the sky; but it should be considered, that nature employs such a multitude of little shadows, and such an endless variety of different tints, intermixed with her broadest colors, that the harshness of the original hue, or local tint, is thereby corrected, and the effect of the whole very different from raw and unbroken color laid upon white paper.

Though the artist should have recourse to the study of nature, in preference to that of a master for a knowledge of coloring, yet it requires some judgment to know what part of nature is to be studied, and what to be avoided; in short, selection is necessary. The student, in coloring, should examine with attention, that of old walls broken and stained by time and weather; thatch, old tiles, rotten wood;—in short, all objects which are covered with moss, stains, and tints of various kinds; wherein he will find the principles of the picturesque and agreeable in coloring. Such things as these should be copied with every possible care, and all objection of a decided uniform color should be as carefully avoided. This has ever been the practice of the great masters who have excelled in this delightful part of the art; and examples of drawing landscapes from nature according to foregoing precepts have been often given.

To conclude, in order to attain any considerable proficiency in this sort of drawing, a knowledge of PERSPECTIVE is absolutely necessary. See that article.

DRAWING SLATE, in mineralogy, black chalk. Its color is grayish black. Massive. Lustre of the principal fracture, glimmering; of the cross fracture, dull. Fracture of the former slaty, of the latter fine earthy. Opaque. Streak same color and glistening. Very soft. Sectile. Easily frangible. It adheres slightly to the tongue. Specific gravity 2·11. It is infusible. Its constituents are—silica 64·06, alumina 11, carbon 11, water 7·2, iron 2·75. It occurs in beds, in primitive and transition clay-slate, also in secondary formations. It is found in the coal formation of Scotland, and in most countries. It is used in crayon-painting.

DRAWL, *v. n.* From draw. To utter anything in a slow, driveling way.

Then mount the clerks, and in one lazy tone
Through the long heavy page *drawl* on. *Popc.*

Now see him launched into the world at large;
If priest, supinely droning o'er his charge,
Their fleece his pillow, and his weekly *drawl*,
Though short, too long, the price he pays for all.

Cowper.

MRS. DAN. Then, I suppose, it must have been
Mr. Dangle's *drawling* manner of reading it to me.

Sheridan.

DRAW, *n. s.* } Sax. *dragan*, of the same
DRAW'CART, } origin as DRAW, which see.
DRAW'HORSE, } The car on which beer is
DRAW'MAN, } conveyed; the horse at-
DRAW'PLOUGH. } tached, and the driver.

A brace of *draymen* bid God speed him well,
And had the tribute of his supple knee. *Shakspear*
Have not coblers, *draymen*, and mechanicks
vernied as well as preached? Nay, have not they
preaching come to govern? *Sout.*

This truth is illustrated by a discourse on the
ture of the elephant and the *drayhorse*. *Tattle*

Let him be brought into the field of election up
his *draycart*, and I will meet him there in a tri-
phant chariot. *Addio*

When *drays* bound high, then never cross behind
Where bubbling yest is blown by gusts of wind.

Gay

The *drayplough* is the best plough in winter
mry clays. *Mortimer's Husbands*

I know too that, if stopped upon my route,
Where the green alleys windingly alaire,
Reeling with grapes red waggons choke the way,—
In England 't would be dung, dust, or a *dray*.

Byrr

DRAYTON (Michael), an eminent English poet, born of an ancient family in Warwickshire in 1563. His propensity to poetry was extremely strong from his infancy; and we find most of his principal poems published by the time he was about thirty years of age.—It appears from his poem of Moses's Birth and Miracle that he saw at Dover the famous Spanish armada, and it is not improbable that he was engaged in some military employment there. He was patronised by several persons of consequence; particularly by Sir Henry Goodere, Sir Walter As-

and the countess of Bedford; to the first of whom he owns himself indebted for a great part of his education, and by the second he was for many years supported. His poems are very numerous and elegant; the most celebrated one is the *Poly-Albion*, a chorographical description of England, with its commodities, antiquities, and curiosities, in metre of twelve syllables; which he dedicated to prince Henry, by whose encouragement it was written; and, whatever may be thought of the poetry, his descriptions are allowed to be exact. He died in 1631; and was interred in Westminster Abbey among the poets, where his bust is to be seen with an epitaph by Ben Jonson.

DRAYTON (William Henry), a statesman of the American revolution, and an able political writer, was born in South Carolina, in September 1742. In 1753 he went to England, and was placed in Westminster school; thence he removed, in 1761, to Oxford, where he continued nearly three years, when he returned to South Carolina. In 1771 he was appointed, by the British government, privy counsellor for the province, and became conspicuous by his defence of the rights of his country against the encroachments and irregularities of the crown officers and judges. In 1774 he accepted the office of an assistant judge of the province. When the continental congress was about to sit at Philadelphia, he wrote and published a pamphlet under the signature of Freeman—a production, of which Ramsay, in his History of South Carolina, observes, that 'it substantially chalked out the line of conduct adopted by the congress.' The lieutenant-governor suspended him from his place in the king's council, in consequence of his representation of American grievances, and the 'bill of American rights,' which he submitted to the congress in his pamphlet. As soon as the revolution began he became an efficient leader, and, in 1775, was chosen president of the provincial congress. In March of the following year he was elected chief justice of the colony, in which character he delivered to the grand jury political charges of the most energetic character. He published, besides, a pamphlet, refuting the suggestions in favor of lord Howe's plan of a reconciliation with the mother country. Independence—unqualified independence—was his constant advice. In the year 1777 Mr. Drayton was invested with full powers, as president of South Carolina, and, early in the following year, was elected a delegate to the continental congress. In this body he took a prominent part. His speeches and writings against the propositions of the three British commissioners were particularly celebrated. The congress employed him on various important missions. The censure which he pronounced upon major-general Charles Lee's conduct at the battle of Monmouth, caused that officer to challenge him. The reasons which he assigned for declining the duel are such as became a true patriot and honorable man. Mr. Drayton continued in congress until September, 1779, when he died suddenly at Philadelphia, in the thirty-sixth year of his age. His political resolution and sagacity, his literary attainments, his domestic virtues, and his polished manners, rendered him

valuable to his country, and dear to all his associates. He left behind a considerable body of historical materials, which his only son, John Drayton, revised and digested, and published at Charleston, in 1821, in two octavo volumes, under the title of *Memoirs of the American Revolution*, from its commencement to the year 1776, inclusive, as relating to the state of South Carolina, and occasionally referring to the states of North Carolina and Georgia.

DRA'ZEL, *n. s.* Perhaps corrupted from drossel, the scum or dross of human nature; or from Fr. *drossesse*, a whore. A low, mean, worthless wretch.

As the devil uses witches,
To be their cully for a space,
That, when the time's expired, the drazels
For ever may become his vassals. *Hudibras.*

DREAD, <i>n. s., v. a. & v. n.</i>	} Sax. <i>dred</i> , from Goth. <i>radur</i> , terror; or, as Mr. Todd suggests, from Icel. and Goth. <i>thra</i> , sadness. Extreme
DREAD'ER, <i>n. s.</i>	
DREAD'FUL, <i>adj.</i>	
DREAD'FULLY, <i>adv.</i>	
DREAD'FULNESS, <i>n. s.</i>	
DREAD'LESS, <i>adj.</i>	
DREAD'LESSNESS, <i>n. s.</i>	

fear, terror, awe; the cause of fear. The verb seems to be derived from the noun, and means to fear in a great degree; to be in fear: a dreader is one who lives in habitual dread: dreadful is terrible: dreadless, without fear or dread: the derivatives correspond in meaning.

And Zacarye seyng he was afraied: and drede fel upon him.

And the aungel sayde to him, Zacarye drede thou not: for thy preier is herd. *Wiclif.*

Not seruyng at ighe as plesynge to men, but in symplenesse of herte dredynge the Lord. *Id. Col. iii.*

The fear of you, and the dread of you, shall be upon every beast of the earth. *Genesis ix. 2.*

How dreadful is this place! *Genesis.*

Let him be your dread. *Isaiah.*

Quod he, to Athenes right now wol I fare;

Ne for no drede of deth shall I not spare

To see my lady, that I love and serve;

In hire presence I rekke not to sterue.

Chaucer. Cant. Tal. s.

Right, faithful, true he was in deed and word;

But of his cheere did seeme too solemne sad;

Yet nothing did he dread, but ever was ydrad

Spenser. Faerie Queene.

Think'st thou that duty shall have dread to speak,

When power to flatt'ry bows? To plainness honour

Is bound, when majesty to fully falls.

Shakspeare. King Lear.

It cannot be, but thou hast murdered him;

So should a murthrerer look, so dread, so grim.

Shakspeare.

The wicked heart never fears God, but thundering or shaking the earth, or raining fire from heaven; but the good can dread him in his very sun-shine; his loving deliverances and blessings affect them with awfulness. *Bp. Hall. Contemplations.*

Terrour seized the rebel host,

When, coming towards them, so dread they saw

The bottom of the mountains upward turned.

Milton.

From this descent

Celestial virtues rising will appear

More glorious and more dread than from no fall.

Id.

*Dreadful attraction! while behind those gapes
The unfathomable gulf where Ashur lies
Q'erwhelmed, forgotten!* *Id. on Luzzury.*

DREAM, *v. n., v. a. & n. s.* } Sax. *drom*;
DREAM'ER, *n. s.* } Goth. *drauma*;
DREAM'LESS, *adj.* } Belg. *droom*;

Teut. *traum*, from Lat. *dormio*; Heb. *חלום*, to sleep. To have a representation or imagination of things in sleep: hence, to imagine generally; to think vaguely or idly: as an active verb, to see in a dream. Dreamer has formerly meant an interpreter or master of dreams: dreamless is free from or without dreams. Dr. Johnson observes 'This word is derived by Meric Casaubon, with more ingenuity than truth, from *δραμα τῆ βῆς*, the comedy of life; dreams being, as plays are, a representation of something which does not really happen. This conceit Junius has enlarged by quoting an epigram:

‘*Σκηνὴ παρὸς ὃ βίος καὶ παίγνιον ἢ μάθε πᾶζειν,
Τὴν σπαδὴν μεταθεῖς, ἢ φέρε τὰς δούνας.*’

Behold this dreamer (Marg. master of dreams) cometh! *Gen. xxxvii. 19.*

Utterly these things be no *dremes* no japes, to throwe to hogges, it is lyfelych mete for children of trouth, and as they me betiden whan I pilgramed out of my kith in wintere. *Chaucer.*

We eat our meat in fear, and sleep
In the affliction of those terrible dreams
That shake us nightly. *Shakspeare. Macbeth.*

I have long dreamed of such a kind of man,
But, being awake, I do despise my dream. *Shakspeare.*

These boys know little they are sons to the king,
Nor Cymbeline dreams that they are alive. *Id.*

Sometimes he angers me
With telling of the moldwarp and the ant,
Of dreamer Merlin, and his prophecies. *Id.*

The savages of Mount Atlas, in Barbary, were reported to be both nameless and dreamless. *Camden's Remains.*

But, dearest heart! and, dearer image! stay;
Alas! true joys at best are dreams enough!
Though you stay here you pass too fast away,
For even at first life's taper is a snuff. *Donne.*

He sleeps but once, and dreams of burglary,
Bp. Hall's Satires, iv. 6.

The Macedon, by Jove's decree,
Was taught to dream an herb for Ptolemy. *Dryden.*

In dreams they fearful precipices tread;
Or shipwrecked, labour to some distant shore. *Id.*

Why does Anthony dream out his hours,
And tempts not fortune for a noble day? *Id.*

If our dreamer pleases to try whether the glowing heat of a glass furnace be barely a wandering imagination in a drowsy man's fancy, by putting his head into it, he may perhaps be wakened into a certainty. *Locke.*

Dreaming is the having of ideas, whilst the outward senses are stopped, not suggested by any external objects, or known occasion, nor under the rule or conduct of the understanding. *Id.*

They dream on in a constant course of reading, but not digesting. *Id.*

I dreamed that I was conveyed into a wide and boundless plain. *Tatler.*

VOL. VII

The man of sense his meat devours,
But only smells the peel and flowers;
And he must be an idle dreamer,
Who leaves the pie and gnaws the streamer. *Prior.*

He never dreamed of the deluge, nor thought that first orb more than a transient crust. *Burnet's Theory.*

Her midnights once at cards and hazard led,
Which now, alas! she dreams away in bed
And round her wait shocks, monkeys, and mockaws
To fill the place of fops and perjured beaux. *Gay.*

Life, like their bibles, coolly men turn o'er;
Hence unexperienced children of threescore,
True all men think of course, as all men dream;
And if they slightly think, 'tis much the same. *Young.*

If we can sleep without dreaming, it is well that painful dreams are avoided. If, while we sleep, we can have any pleasing dreams, it is, as the French say, tant gague, so much added to the pleasure of life. *Franklin.*

With woe I nightly vigils keep,
Beneath thy wan unwarining beam;
And mourn, in lamentation deep,
How life and love are all a dream. *Burns.*

It may therefore, perhaps be fairly said, that, in respect of any supposed tendency to scepticism, the evidence of history is full as strong against natural philosophy as against metaphysics; yet who ever dreamed of proscribing the natural sciences? *Bowdler.*

He came—oh Hope! he hastened to my seat;
I saw, and almost dreamed him at my feet,
Close by my side a gay attendant slave;
The glance, which thousands sought, to none he gave. *Dr. T. Brown.*

Tell me no more of fancy's gleam,
No, father, no, 'twas not a dream;
Alas! the dreamer first must sleep,
I only watched, and wished to weep;
But could not, for my burning brow
Throbb'd to the very brain as now. *Byron. The Giaour.*

DREAMS have been defined as those thoughts of which we are conscious, and those imaginary transactions in which we fancy ourselves engaged, when in the state of sleep. Scarcely any part of nature is less open to our observation than the human mind in this state. The dreamer himself cannot observe the manner in which dreams arise or disappear. When he awakes he has in general but a confused recollection of the circumstances of his dreams. Were we to watch over him with the most vigilant attention, we could not perceive what emotions are excited in his mind, or what thoughts pass through it, during his sleep. But though we could ascertain these phenomena, many other difficulties would still remain. What parts of a human being are active, what dormant, when he dreams? Why does he not always dream while asleep? Or why dreams he at all? Do any circumstances in our constitution, situation, and peculiar character, determine the nature of our dreams?

Without pretending to solve the above questions, we shall here give a brief view of those facts which have been ascertained concerning dreams. 1. In dreaming we are not conscious of being asleep. This is well known from a thousand circumstances. When awake, we often recollect our dreams; and we remember on such occasions,

that, while those dreams were passing through our minds, it never occurred to us that we were separated by sleep from the active world; except in those cases where we have a kind of double dream; i. e. when, after dreaming for some time, we dream that we have awaked from sleep, and told our dream. But during this second dream, and rehearsal of our former one, we are fully persuaded that we are awake, till, by awaking in reality, we are convinced that we were asleep all the time. We are also often observed to act and talk in dreaming, as if we were busily engaged in the intercourse of social life. 2. In dreaming we do not consider ourselves as witnessing or bearing a part in a fictitious scene; we seem not to be in a similar situation with the actors in a dramatic performance, or the spectators before whom they exhibit, but engaged in the business of real life. All the varieties of thought, that pass through our minds when awake, may also occur in dreams; all the images which imagination presents, in the former state, she is also able to call up in the latter; all the same emotions may be excited, and we are often actuated by equal violence of passion; none of the transactions, in which we are capable of engaging while awake, is impossible in dreams; in short, our range of action and observation is equally wide in the one state as in the other; nay often more so; for we may dream of flying, walking upon waters, and performing actions which we cannot perform when awake. 3. It is said that all men are not liable to dream. Dr. Beattie, in a very pleasing essay on this subject, relates, that he knew a gentleman who never dreamed except when his health was in a disordered state; and Locke mentions, that a person of his acquaintance was a stranger to dreaming till the twenty-sixth year of his age; when he began to dream in consequence of having a fever. These instances, however, are too few; and, besides, it does not appear that those persons had always attended, with the care of a philosopher making an experiment, to the circumstances of their sleep. They might dream, but not recollect their dreams on awaking; and they might both dream, and recollect their dreams immediately upon awaking, yet afterwards suffer them to slip out of their memory. But though it is by no means certain that any of the human race are, through the whole of life, absolute strangers to dreaming, yet it is well known that all men are not equally liable to dream. The same person dreams more or less at different times; and, as one person may be more exposed than another to those circumstances which promote this exercise of fancy, one person may therefore dream much oftener than another. The same diversity will naturally take place in this as in other accidents to which mankind are in general liable. 4. Though in dreams imagination appears to be free from all restraint, and indulges in the most wanton freaks, yet it is agreed that the imaginary transactions of the dreamer, if in health, generally bear some relation to his particular character in the world, his habits of action, and the circumstances of his life. The lover dreams of his mistress; the miser of his money; the philosopher renews his scientific researches in sleep with the same assi-

duity as when awake; and the merchant returns to balance his books, and compute the profits of an adventure, when slumbering on his pillow. And not only do the general circumstances of a person's life influence his dreams, but his passions and habits are nearly the same when asleep as when awake. A person whose habits of life are virtuous does not in his dreams plunge into a series of crimes; nor are the vicious reformed, when they pass into this imaginary world. The choleric man finds himself offended by slight provocations in his dreams, as well as in his ordinary intercourse with the world, and a mild temper continues pacific in sleep. 5. The character of a person's dreams is influenced by his circumstances when awake in a still more unaccountable manner. Certain dreams usually arise in the mind after a person has been in certain situations. Dr. Beattie relates, that he once, after riding thirty miles in a high wind, passed a part of the succeeding night in dreams beyond description terrible. The state of a person's health, and the manner in which the vital functions are carried on, have a considerable influence in determining the character of dreams. After too full a meal, or after eating of an unusual sort of food, a person has dreams of a certain nature. 6. In dreaming, the mind for the most part carries on no intercourse through the senses with surrounding objects. Touch a person gently who is asleep, he feels not the impression. You may awake him by a smart blow; but, when the stroke is not sufficiently violent, he remains insensible of it. We speak softly beside a person asleep without fearing that he will overhear us. His eyelids are shut; and even though light should fall upon the eye-ball, yet still his powers of vision are not awakened to active exertion, unless the light be so strong as to rouse him from sleep. He is insensible both to sweet and to disagreeable smells. It is not easy to try whether his organs of taste retain their activity, without awaking him: yet, from analogy, it may be presumed that these too are inactive. With respect to the circumstances here enumerated, it is indifferent whether a person be dreaming or buried in deep sleep. Yet there is one remarkable fact concerning dreaming which may seem to contradict what has been here asserted. In dreams we are liable not only to speak aloud in consequence of the suggestions of imagination, but some persons even get up and walk about and engage in little enterprises, without awaking. Now, as we are in this instance so active, it seems that we cannot be then insensible of the presence of surrounding objects. The sleep-walker is really sensible, in a certain degree, of the presence of the objects around him; but he does not attend to them with all their circumstances, nor do they excite in him the same emotions as if he were awake. He feels no terror on the brink of a precipice; and, in consequence of being free from fear, he is also without danger in such a situation unless suddenly awoke. This is one of the most inexplicable phenomena of dreaming. There is another fact not quite consonant with what has been above advanced. It is said that, in sleep, a person will continue to hear the noise of a cataract in the neighbourhood or regular strokes with a hammer, or any similar

sound sufficiently loud, and continued uninterruptedly from before the time of his falling asleep. And it is affirmed that he awakes on the sudden cessation of the noise. This fact is asserted on sufficient evidence: it is curious. Even when awake, if deeply intent on study, or closely occupied in business, the sound of a clock striking in the neighbourhood, or the beating of a drum, will escape us unnoticed; and it is therefore the more surprising that we should thus continue sensible to sounds when asleep. 7. Not only do a person's general character, habits of life, and state of health, influence his dreams; but those concerns in which he has been most deeply interested during the preceding day, and the views which have arisen most frequently to his imagination, very often afford the subjects of his dreams. When one looks forward with anxious expectation towards any future event, he is likely to dream either of the disappointment or the gratification of his wishes. If engaged through the day, either in business or amusements which he found exceedingly agreeable, or in a way in which he has been extremely unhappy, either his happiness or his misery is likely to be renewed in his dreams. 8. Though dreams have been regarded in almost all nations, at least in some periods of their history, as prophetic of future events, yet it does not appear that this popular opinion has been established on good grounds. Christianity, indeed, teaches us to believe that the Supreme Being may operate through this medium, and actually has operated on the human mind; and influenced at time the determinations of the will; as he did to Abimelech, Gen. xx. 3—6, and to Joseph, Matt. i. 20, and ii. 19, 22. The dreams of Joseph and Pharaoh; of his chief butler and baker; of Nebuchadnezzar and the prophet Daniel, &c., are also decisive on this point. Yet it is perfect folly to confound such miraculous dreams with those which the priesthood among heathen nations, or the vulgar among ourselves, have considered as prophetic. We know how easily ignorance imposes on itself, and what arts imposture adopts to impose upon others. We cannot trace any certain connexion between our dreams and those events to which the simplicity of the vulgar pretends that they refer. And we cannot, therefore, join with the vulgar and the superstitious in believing them really referable to futurity. 9. It appears that brutes are also capable of dreaming. The dog is often observed to start suddenly up in his sleep, in a manner which cannot be accounted for any other way than by supposing that he is roused by some impulse received in a dream. The same thing is observable of other brutes. That they should dream, is not an idea inconsistent with what we know of their economy and manners in general. We may, therefore, consider it as a pretty certain truth that many, if not all, of the inferior animals are liable to dream, as well as human beings. It appears, then, that in dreaming we are not conscious of being asleep; that to a person dreaming, his dreams seem realities: that though it be uncertain whether mankind are all liable to dreams, yet it is well known that they are not all equally liable to dream: that the nature of a person's dreams depends in

some measure on his habits of action, and on the circumstances of his life: that the state of the health too, and the manner in which the vital functions are carried on, have a powerful influence in determining the character of a person's dreams: that in sleep, and in dreaming, the senses are either absolutely inactive or nearly so: that such concerns as we have been very deeply interested in during the preceding day, are very likely to return upon our minds in dreams in the hours of rest: that dreams may be rendered prophetic of future events; and therefore, wherever we have such evidence of their having been prophetic as we would accept on any other occasion, we cannot reasonably reject the fact as absurd; but that they do not appear to have been actually such, in those numerous instances in which the superstition of nations, ignorant of true religion, has represented them as referring to futurity, nor in those instances in which they are viewed in the same light by many among ourselves. and, lastly, that dreaming is not a phenomenon peculiar to human nature, but common to mankind with the brutes.

We know of no other facts, that have been ascertained concerning dreaming, besides the above. But we are by no means sufficiently acquainted with this important phenomenon in the history of mind. We cannot tell by what laws of our constitution we are thus liable to be so frequently engaged in imaginary transactions, nor what are the particular means by which the delusion is accomplished. The delusion is indeed remarkably strong. One will sometimes fancy that he reads a book, and actually enter into the nature of the imaginary composition before him, and even remember, after he awakes, what he then knows, that he only fancied himself reading. Another will sometimes dream that he is at church, and hears a sermon delivered, which he would be incapable of composing when awake. Can this be delusion? If delusion, how, or for what purpose, is it produced? The mind, it would appear, does not, in sleep, become inactive like the body; or at least is not always inactive while we are asleep. When we do not dream, the mind must either be inactive, or the connexion between the mind and the body must be considered as in some manner suspended: and when we dream, the mind, though it probably acts in concert with the body, yet does not act in the same manner as when we are awake. It seems to be clouded or bewildered, in consequence of being deprived for a time of the service of the senses. Imagination becomes more active and more capricious; and all the other powers, especially judgment and memory, become disordered and irregular in their operations.

Various theories have been proposed to explain what appears most inexplicable in dreaming. The ingenious Mr. Baxter, in his treatise on the Immateriality of the Human Soul, endeavours to prove that dreams are produced by the agency of some spiritual beings, who either amuse or employ themselves seriously in engaging mankind in all those imaginary transactions with which they are employed in dreaming. This theory, however, is far from being plausible. It leads us entirely beyond the limits of our know-

ledge. It requires us to believe without evidence. It is unsupported by any analogy. It creates difficulties still more inexplicable than those which it has been proposed to remove. Till it appear that our dreams cannot possibly be produced without the interference of other spiritual agents, possessing such influence over our minds as to deceive us with fancied joys, and involve us in imaginary afflictions, we cannot reasonably refer them to such a cause. Besides, from the facts which have been stated as well known concerning dreams, it appears that their nature depends both on the state of the human body and on that of the mind. But were they owing to the agency of other spiritual beings, how could they be influenced by the state of the body? Wolfius, and after him M. Formey, have supposed, that dreams never arise in the mind, except in consequence of some of the organs of sensation having been previously excited. Either the ear or the eye, or the organs of touching, tasting, or smelling, communicate information somehow, in a tacit, secret manner; and thus partly rouse its faculties from the lethargy in which they are buried in sleep, and engage them in a series of confused and imperfect exertions. But what passes in dreams is often so very different from all that we do when awake, that it is impossible for the dreamer himself to distinguish whether his powers of sensation perform any part on the occasion. It is not necessary that imagination be always excited by sensation. Fancy, even when we are awake, often wanders from the present scene. Absence of mind is incident to the studious: the poet and the mathematician often forget where they are. We cannot discover from any thing that a person in dreaming displays to the observation of others, that his organs of sensation take a part in the imaginary transactions in which he is employed. In those instances, indeed, in which persons asleep are said to hear sounds, the sounds which they hear are also said to influence, in some manner, the nature of their dreams. But such instances are singular. Since it then appears, that the person who dreams is himself incapable of distinguishing, either during his dreams or by recollection when awake, whether any new impressions are communicated to him in that state by his organs of sensation; that even by watching over him, and comparing our observations of his circumstances and emotions, in his dreams, with what he recollects of them after awaking, we cannot, except in one or two singular instances, ascertain this fact; and that the mind is not incapable of acting while the organs of sensation are at rest, and on many occasions refuses to listen to the information which they convey; we may conclude, that the theory is groundless. Other physiologists tell us, that the mind, when we dream, is in a state of delirium. Sleep, they say, is attended with what is called a collapse of the brain; during which either the whole or a part of the nerves of which it consists, are in a state in which they cannot carry on the usual intercourse between the mind and the organs of sensation. When the whole of the brain is in this state, we become entirely unconscious of existence and the mind sinks into inactivity; when

only a part of the brain is collapsed, we are then neither asleep nor awake, but in a sort of delirium between the two. This theory, like the last, supposes the mind incapable of acting without the help of sensation: it supposes that we know the nature of a state, of which we cannot ascertain the phenomena; it also contradicts a known fact, in representing dreams as confused images of things around us, not fanciful combinations of things not existing together in nature or in human life. We must treat it likewise, therefore, as a baseless fabric. In the second edition of the *Encyclopædia Britannica*, a theory different from any of the foregoing was advanced. It was observed, that the nervous fluid, which is supposed to be secreted from the blood by the brain, appears to be likewise absorbed from the blood by the extremities of the nerves. It was argued that, as this fluid was considered as the principle of sensibility, therefore, in all cases in which a sufficient supply of it was not absorbed from the blood by the extremities of the nerves, the parts of the body to which those nerves belonged must be, in some degree, deprived of sensation. From these positions it was inferred, that, as long as impressions of external objects continue to communicate a certain motion from the sentient extremities of the nerves to the brain, so long we continue awake; and that, when there is a deficiency of this vital fluid in the extremities of the nerves, or when from any other cause it ceases to communicate to the brain the peculiar motion alluded to, we must naturally fall asleep, and become insensible of our existence. It followed that, in sleep, the nervous fluid between the extreme parts of the nerves and the brain must either be at rest, or be deficient, or be prevented by some means from passing into the brain; and it was concluded, that whenever irregular motions of this fluid were occasioned by any internal cause, dreaming was produced. Thus we might be deceived with regard to the operation of any of the senses; so as to fancy that we see objects not actually before us: that we hear sounds; that we taste, feel, smell, &c. The instances of visions which will sometimes arise, and as it were swim before us when awake, though our eyes be shut; the tinnitus aurium, which is often a symptom in nervous diseases; and the strange feelings in the case of the amputated limb, were produced in proof of this theory, and applied to confirm it.

Plausible as the above theory at first view may appear, it is not satisfactory. It is too much founded on supposition. The nature of the nervous fluid is but imperfectly known, and even its existence is not fully ascertained. All theories founded upon it must, therefore, be at best uncertain. Besides the suppositions made in this theory, of a partial privation and sensation, and efficiency of the vital fluid, as necessary to produce sleep, seem to infer that sleep is not consistent with a state of perfect health, which every body knows is contrary to fact. The Brunonian system of medicine appears to give rather a more satisfactory solution of the phenomena and causes of sleep, by ascribing them to the exhaustion of the excitability by the exciting powers. But, without trusting entirely to the

hypotheses of either system, we are persuaded, a theory of dreaming, if not perfectly satisfactory, at least less exceptionable than any of the above, may be drawn from merely attending to a simple fact that frequently takes place when we are awake. Every person must have observed, that when alone, and while his attention is not called to any particular subject, either by study, conversation, manual labor, sudden noise, or the objects around him, a kind of involuntary motion, so to speak, will take place in his ideas; and that, if he makes no voluntary exertion of mind to fix his attention upon one idea more than another, a rapid succession of very different ideas, some old and some recent, will occur in the course of a few minutes. Every person, who attends church regularly, or who has attended the lectures of an unentertaining public speaker, must be sensible, that such involuntary motions of his ideas have often taken place, when, either through the fault of the speaker, or that of the hearer, his attention has not been sufficiently fixed upon what was spoken. A person much addicted to study, and to the habit of fixing his ideas constantly upon one subject or another, may, perhaps, be less sensible of the involuntary motion we here allude to, than others; but let such a studious person be placed in a company where a trifling conversation is going on, and he will soon find himself in the situation here described. A current of ideas will rapidly intrude upon his mind, and carry off his attention from the trifles in which those around him are engaged; and thus subject him to what is commonly called absence of mind. And it will also be admitted that the most studious, as well as the most thoughtless, will sometimes find an idea of a long forgotten fact, sentiment, or circumstance, suddenly recurring to their minds, without any seeming cause. The inference we would draw from all these facts, to our present subject, is, that during sleep, a similar involuntary motion, or current of ideas, takes place; but that, in consequence of the fatigue occasioned by the labors of the day (no matter whether these operate by exhausting the excitability, or by occasioning a deficiency of the nervous fluid), the three chief powers of the mind--the will, the judgment, and the memory, are rendered in a considerable degree inactive; at least, in so far, that the will has no power over these faculties, while the imagination, rendered more active, as it would seem, by being freed from the control of both the will and the judgment, gives every new idea that occurs a visionary form; and thus creates a fresh and rapid succession of various images, according to the unlimited current of uncontrolled ideas that succeed each other. How this happens, perhaps, the human faculties will never be able to comprehend or explain; at least, till they shall be capable of explaining the connexion by which the soul and body are united, if, indeed, mankind shall ever attain to such a degree of perfection in physiology. But that dreams take their rise chiefly, if not solely, from the mere succession of ideas, dressed into form by the imagination, uncontrolled by the will or the judgment, appears to us to be an undoubted fact, though hitherto it would seem little, if at

all, attended to. And it appears to be a sufficient confirmation of this theory, that persons in good health, and engaged in active employments, most commonly dream of those matters wherein they are daily occupied; the uniform current of their ideas when awake, seldom taking any other direction during sleep; whereas, persons in a bad habit of body, or weak state of mind, and those who take little exercise, or who are not engaged in active business, have generally wild and extravagant dreams, and sometimes very disagreeable ones, of monsters, mad dogs, devils, deep pits, houses on fire, stormy oceans, and the like. In a word, when we consider the operations of our minds when awake, particularly of that active faculty, the imagination, how readily upon hearing, reading, or speaking of any person, place, action, or circumstance, it forms an idea in the mind of such person, place, &c., though, perhaps, many years have elapsed since we saw them, or even though we have never seen them, we need not be surprised, that the same active faculty should be able, when uncontrolled by the will and judgment, and but partially assisted by the memory, to raise up a series of images in succession, and thus to create an ideal world, and various ideal transactions in the mind.

The late Mr. Rennell, of Kensington, considers dreams to afford satisfactory proof that the mind can act without the intervention of the brain: upon this it has been well remarked, that we have not as yet sufficient data from which to estimate the degree of dependence of the former upon the latter, still we have no facts founded upon our present state of being, which can establish the total independence which he supposes. The proximate cause of sleep is undoubtedly corporeal, and, perhaps, consists in a certain inaptitude of the brain to receive the usual impulses of its immaterial tenant. When this inaptitude amounts to complete quiescence, the soul cannot display itself, because the instrument of its operations is in a state of repose. In such circumstances the sleep is profound, and no dreams take place. This repose or quiescence of the brain may be increased to absolute torpor for a season, as is seen in the hybernation of animals, and in those rare cases in the human species, where persons have remained for several hours, or even days, in a trance. When this torpor of the cerebral system abates, the immaterial principal is again enabled to resume its operations, owing to the renewed capabilities of the instrument. Thus, as the cause of sleep is corporeal, there are strong grounds for presuming that the cause of dreams is corporeal also. They occur oftenest when there is any irritation of the system in general, or of the brain in particular, hindering the complete repose of that part. When this irritation is great, as in general fever, accompanied with increased action of the blood-vessels within the head, sleep is often entirely prevented; or if it does take place, it is disturbed with frightful illusions. What is the precise state of the soul at such times, is a disputed point amongst metaphysicians. Perhaps, on so dark a subject, it may be allowable to hazard a conjecture, that the operations of the immaterial being are modified by the semi-

quiescence of the material organ, and that this want of correspondence between the agent and the instrument is the cause of the wild imaginations and false judgments that distinguish our dreams from our waking thoughts. Dreams, therefore, instead of proving the contrary, rather tend to show that the dependence of the immaterial upon the material part is perpetual and without exception, during the continuance of man's existence upon earth.

In whatever way we attempt to account for the manner, in which our powers of mind and body perform their functions in dreaming, we can, at least, apply to useful purposes the imperfect knowledge which we have been able to acquire concerning this series of phenomena. Our dreams are affected by the state of our health, by the manner in which we have passed the preceding day, by our general habits of life, by the hopes which we most fondly indulge, and the fears which prevail most over our fortitude when awake. From recollecting our dreams, therefore, we may learn to correct many improprieties in our conduct; to refrain from bodily exercises, or from meats and drinks that have unfavorable effects on our constitution; to resist, in due time, evil habits that are stealing upon us; and to guard against hopes and fears which detach us from our proper concerns, and unfit us for the duties of life. Instead of thinking what our dreams may forebode, we may, with much better reason, reflect by what they have been occasioned, and look back to those circumstances in our past life, to which they are owing. The sleep of innocence and health is sound and refreshing; their dreams delightful and pleasing. A distempered body, and a polluted or perturbed mind, are haunted in sleep with frightful, impure, and unpleasing dreams. The reader who is disposed to speculate farther on this subject, may consult Dr. Beattie's Essays, Hartley on Man, and the principal writers on physiology. We may add, some very beautiful fables have been written both by ancients and moderns in the form of dreams. The *Somnium Scipionis* is one of the finest of Cicero's compositions. In the periodical publications, which have diffused so much elegant and useful knowledge through Great Britain, the *Tatlers*, *Spectators*, *Guardians*, &c., we find a number of excellent dreams. Addison excelled in this way of writing. The public are now less partial to this species of composition than formerly. Dr. Beattie, in his valuable Essay on Dreaming, quotes a very fine one from the *Tatler*, and gives it due praise.

DREAM, *adj.* & *n. s.* } Sax. *dreorig*; Belg. *treuer*; from Goth. verb
DREARY, *adj.* }
DREARYHEAD, *n. s.* } *rygga*, to lament. All
DREAMT, } the substantives signify
DREAMTNESS. } sorrow, united with
fear: drear and dreary are, dismal; mournful; fearful.

The ill-faced owl, death's dreadful messenger;
The hoarse night raven, trumpet of doleful drear.

Spenser.

The messenger of death, the ghastly owl,
With dreary shrieks did also yell;
And hungry wolves continually did howl
At her abhorred face, so horrid and so foul.

Id. *Faerie Queene*.

But the good knight
Full of sad fears and ghastly dreariment,
When all this speech the living tree had spent,
The bleeding bough did thrust into the ground.
Spenser. *Faerie Queene*.

In urns and altars round,
A drear and dying sound
Affrights the flames at their service quaint. Milton.
Obscure they went through dreary shades, that led
Along the vast dominions of the dead. Dryden.
Towns, forests, herds, and men promiscuous
drowned,
With one great death deform the dreary ground.
Prior.

So with his dread Caduceus Hermes led
From the dark regions of the imprisoned dead,
Or drove in silent shoals the lingering train
To night's dull shore, and Pluto's dreary reign.
Darwin.

It struck even the besiegers' ear
With something ominous and drear,
An undefined and sudden thrill,
Which makes the heart a moment still.
Byron.

O luxury!
Bane of elated life, of affluent state,
What dreary change, what ruin, is not thine? Id.

DREDGE, *v. a.* & *n. s.* } Sax. *dragan*, to
DREDG'ER, *n. s.* } drag, of which word
(or of *drags*?) this word is a corruption. To gather into a particular kind of net: the net used: a dredger is one who uses such a net; and, perhaps from its net-like top, a box for scattering flour on meat, or amongst pastry; called also a dredging-box.

For oysters they have a peculiar dredge; a thick, strong net, fastened to three spalls of iron, and drawn at the boat's stern, gathering whatsoever it meeteth lying in the bottom. Carew.

The oysters dredged in the Lyne find a welcome acceptance. Id.

DREDGING, in civil engineering, is the art of removing mud, silt, or other depositions from the bed of rivers, canals, harbours, or docks; and is accomplished by various tools and descriptions of machinery.

The common dredging-boat or barge is worked by two or more men, by whom the gravel, or ballast, is taken up in a leather bag, the mouth of which is extended by an iron hoop, attached to a pole, of sufficient length to reach the bottom: in the small way, two men are employed to work each pole. The barge being moored, one of the men takes his station at the stern, with the pole and bag in his hand, the other stands in the head, having hold of a rope, tied fast to the hoop of the leather bag. The man at the stern now puts the pole and bag down, over the barge's side, to the bottom, in an inclined position. The hoop being farthest from the man in the head of the barge, and having a rope, one end of which is fast to the gunwale of the barge, he passes it twice or thrice round the pole, and then holds it tight: the man in the head now pulls the rope, fastened to the hoop, and draws the hoop and bag along the ground, the other allowing the pole to slip through the rope as it approaches the vertical position, at the same time causing such a friction, that the hoop digs into the ground, the leather bag receiving whatever passes through the

hoop : both men now assist in getting a bag into the barge, and delivering its contents. When the bag is large, several men are employed ; and, to increase the effect, a windlass, with wheel-work, is sometimes used. A chain or rope is brought to the winch from the spoon, through a block suspended from a small crane for bearing the spoon and its contents to the side of the boat, and bringing it over the gunwale to be emptied into it. The purchase rope is led upon deck by a snatch block in the proper direction for the barrel of the winch. From two to four men, can with this simple apparatus, lift from twenty to sixty tons in a tide, from a depth of from two and a half to three fathoms, when the ground is favorable. In this manner the convicts at Woolwich upon the Thames, have been long employed to perform the ballast-heaving, or dredging.

The *bucket dredging-machine*, whether worked by men, horses, or the steam-engine, is a great improvement on the above. The frame-work consists of two beams of timber, supported on a rod of iron with shores of wood ; on these the full buckets move upon iron rollers fixed to the timber, while the empty buckets, attached to and guided by an endless chain, form a curve in descending to the bottom ; as they respectively arrive they are intended to excavate or scoop up the silt or gravel from the ground. The operation of lowering and raising the frame once performed by crane-work, distinct from the machinery of the steam-engine, is now also accomplished by a power taken from it.

Plate DREDGING MACHINES, AA, fig. 1, is a frame of timber bolted to the starboard gunwale, to support a large horizontal beam BB, fig. 2 ; another similar frame is fixed up in the middle of the ship at D, fig. 2, and the end of the beam is sustained by an upright post bolted to the opposite gunwale ; the starboard end of the beam projects over the vessel's side, and has an iron bracket S fastened to it, to support one of the bearings for the long frame EE, composed of four timbers bolted together : the other end of the frame is suspended by pulleys *a, a* ; from a beam F fixed across the stern, the upper ends of the outside beams of the frame EE have each a stout iron bolted to them, which are perforated with two large holes to receive two short cast iron tubes, one fastened to the iron bracket S at the end of the beam B, and the other to a cross beam of the frame A ; these tubes act as the pivots of the frame E, upon which it can be raised or lowered by the pulleys *a, a* : they also contain bearings for an iron axis, on which a wheel or trundle O is fixed, containing four rounds. Another similar trundle P is placed at the bottom of the frame EE, and two endless chains *k, k*, pass round both, as is seen in the plan. Between every other link of the two chains, a bucket of plate iron *bbb* is fastened, and, as the chain runs round, the buckets bring up the soil ; a number of cast iron rollers *d, d*, are placed between the beams of the frame to support the chain and buckets as they roll up. Four rollers *c, c*, are also placed on each of the outside beams, to keep the chains in their places on the frame, that they may not get off to one side. The motion is conveyed to the chains by

means of a cast iron wheel at G in the plan, wedged on the end of the axis of the upper trundle O. The wheel is cast hollow, like a very short cylinder, and has several screws tapped through its rim, pointing to the centre, and pressing upon the circumference of another wheel enclosed within the hollow of the first, that it may slip round in the other, where any power greater than the friction of the screw is applied ; the internal wheel is wedged on the same shaft with a large cog-wheel *f*, turned by the small cog-wheel *g*, on the axis of the steam-engine. The steam-engine is one of that kind called high pressure, working by the expansive force of the steam only, without condensation ; *h* is the boiler containing the fire-place and cylinder within it ; *i* is one of the connecting rods, and *l* the fly wheel on the other end of the same shaft as the wheel *g*. The pulleys *a*, which suspend the chain frame, are reeved with an iron chain, the tackle full of which passes down through the ship's deck, and is coiled on a roller *m* in the plan, and represented by a circle in the elevation : on the end of the roller is a cog-wheel *p*, turned by the engine wheel *g* : the bearing of this wheel is fixed upon a lever, one end of which comes near that part of the steam-engine, where the cock, which regulates the velocity of the engine, is placed ; so that one man can command both lever and cock, and, by depressing that end of the lever, cause the wheel *p* to gear with *g*, and consequently be turned thereby, and wind up the chain of the pulleys ; *g* is a strong curved iron bar bolted to the vessel's side and gunwale, passing through an eye bolted to the frame E, to keep the frame to the vessel's side, that the tide or other accident may not carry it away.

A hopper or trough is suspended beneath the wheel *o*, by ropes from the beam B, into which the buckets *b, b, b*, empty the ballast they bring from the bottom ; the hopper conveys it into a barge brought beneath it ; this hopper is not shown in the plate, as it would tend to confuse parts already not very distinct. The motion of the whole machine is regulated by one man. The vessel being moored fast, the engine is started, and turns the chain of buckets : the engine tender now puts his foot upon a lever, disengages the wheel *p* from *g*, and by another takes off a gripe which embraced the roller *m*. This allows the end E of the frame to descend, until the buckets on the lower half of the chain drag on the ground, as shown in fig. 1, when he stops the further descent by the gripe, the buckets are filled in succession at the lower end of the frame, and brought up to the top, where they deliver their contents into the hopper before-mentioned : as they take away the ballast from the bottom, the engine tender lets the frame E down lower by means of the gripe lever, and keeps it at such a height that the buckets come up nearly full ; if at any time the buckets get such deep hold as to endanger the breaking of the chain or stopping the engine, the coupling-box at G before-described, suffers the steam-engine to turn without moving the chain of buckets, and the engine tender, pressing his foot upon the lever which brings the wheel *p* to gear with *g*, causes the roller *n* to be turned by the engine, and raise up the frame E, until

the buckets take into the ground the proper depth, that the friction of the coupling-box at G will turn the chain without slipping in any considerable degree. The steam-engine here described is of six-horse power, and will load a small barge with ballast in an hour and a half. Generally the excavated matters are required as ballast for shipping. Those of the Thames are sold to the colliers of Shield and Newcastle, at the rate of about a shilling per ton, and the ballast hills of those places are said to consist of these matters principally. They are also used for embanking and filling up behind piers, and those taken from the London docks are carried to the Osier Forelands on the banks of the river Lea, where they have already formed a valuable frontage for building. When dry they have also been used as brick-earth. When these matters are required to be transported by water to a distance, the receiving boat is made with two holds sloping towards the keel or bottom, for the purpose of lessening the width of the discharging apertures, which are shut with hatches, or hinged doors. These opening outwards, the pressure of the water prevents them from being opened until the time of arrival at the proper place; when chains attached to ring-bolts force them apart, and the whole contents of the boat escape.

The *Scouring* or *Dredging Basin* is a watertight compartment of a harbour, furnished with sluices, and designed to contain a quantity of tidal or river water, to be run off at pleasure. Where the command of head-water is sufficient, this is found the most effectual of all modes of disposing of loosened stuff. Most modern engineers have therefore included a scouring basin in their designs for tide harbours. The late Mr. Rennie reported that 400,000 tons of mud were annually discharged by the sewers of London into the river Thames. See *HARBOUR*.

DREGS, n. s. } Goth. *dregg*; Teut. *trus-*
DREG'GISH, adj. } *cen*; Lat. *feces*; Gr. *ρροζ*,
DREG'GY, adj. } *ρρογος*, refuse. (Used by Shakespeare in the singular, see below.) The sediments or lees of liquors; offal; refuse of any kind: *dreggy* is, containing dregs.

TROI. — What makes this pretty abrupton? What too curious *dreg* espies my sweet lady in the fountain of our love?

CRES. More *dregs* than water, if my fears have eyes.
Shakespeare. Troilus and Cressida.

The king by this journey purged a little the *dregs* and leaven of the northern people, that were before in no good affections towards him.
Bacon.

Fain would we make him author of the wine,
If for the *dregs* we would some other blame.

Davies.

Ripe grapes being moderately pressed, their juice may, without much *dreggy* matter, be squeezed out.

Boyle.

To give a strong taste to this *dreggy* liquor, they fling in an incredible deal of broom or hops, whereby small beer is rendered equal in mischief to strong.

Harvey on Consumptions.

Heaven's favourite thou, for better fates designed Than we, the *dregs* and rubbish of mankind.

Dryden.

What diffidence we must be under whether God will regard our sacrifice, when we have nothing to offer him but the *dregs* and refuse of life, the days of

loathing and satiety, and the years in which we have no pleasure.
Rogers.

Such run on poets, in a raging vein,
Even to the *dregs* and squeezings of the brain.

Pope.

This the chalice of the fornications of rapine, usury, and oppression, which was held out by the gorgeous eastern harlot; which so many of the people, so many of the nobles of the land, had drained to the very *dregs*.

Burke.

The body of your work is a composition of *dregs* and sediments, like a bad tavern's worst wine.

Sheridan.

His had been quaffed too quickly, and he found The *dregs* were wormwood; but he filled again,
And from a purer fount, on holier ground,
And deemed its spring perpetual; but in vain!
Still round him clung invisibly a chain
Which galled for ever.

Byron.

DREIN, v. n. See **DRAIN**. To empty. The same with drain; spelt differently perhaps by chance.

She is the sluice of her lady's secrets: tis but setting her mill a-going, and I can *drein* her of them all.

Congreve.

'Tis *dreined* and emptied of its poison now;

A cordial draught.

Southern.

DREINCOURT (Charles), a minister of the reformed church at Paris, was born at Sedan in 1595. He is best known in England by his Consolations against the Fears of Death, which was translated, and has been often printed. His third son, professor of physic at Leyden, was physician to the prince and princess of Orange before their accession to the crown of England. He died in 1660.

DRENCH, v. a. & n. s. } Saxon *dreancan*;
DRENCHER. } Goth. *drenca*, to immerse, moisten. To soak; steep; saturate with moisture; physic abundantly or violently: the substantives corresponding. A *drench* has been defined, 'physic for a brute.'

And he seide, come thou and Peter ghede down fro the boot and wakide on the wattris to come to Jhesus, But he sigh the wynd strong, and was afeid, and whanne he biganne to *drenche*, he criede and seide, lord make me saaf.

Wiclif. Matt. xiv.

Our garments being as they were *drenched* in the sea, hold notwithstanding their freshness and glosses.

Shakespeare.

In swinish sleep

Their *drenched* natures lie, as in a death.

Id. Macbeth.

Harry, says she, how many hast thou killed to-day? Give my roan horse a *drench*, says he; and answers, fourteen, an hour after.

Id. Henry IV.

Their counsels are more like a *drench* that must be poured down, than a draught which must be leisurely drank if I liked it.

King Charles.

Let such bethink them, if the sleepy *drench*

Of that forgetful lake benumb not still,

That in our proper motion we ascend.

Milton.

To-day deep thoughts learn with me to *drench*

In mirth, that after no repenting draws.

Id.

Now dam the ditches, and the floods restrain;
Their moisture has already *drenched* the plain.

Dryden.

A *drench* of wine has with success been used,
And through a horn the generous juice infused.

Id.

Too oft, alas! has mutual hatred *drenched*
Our swords in native blood. *Philips.*

* If any of your cattle are infected, speedily let both
sick and well blood, and *drench* them.

Mortimer's Husbandry.

If Gideon's fleece, which *drenched* with dew he
found,

While moisture none refreshed the herbs around,
Might fitly represent the Church, endowed
With heavenly gifts, to Heathens not allowed.

Cowper.

The one cast up upon that great book
Ycleped The Family Receipt Book;
By which she rules in all her courses,
From stewing figs to *drenching* horses.

Sheridan.

Ah me! neglected on the lonesome plain,
As yet poor Edwin never knew your lore,
Save when against the winter's *drenching* rain,
And driving snow, the cottage shut the door.

Beattie.

Then she wrung
His dewy curls long *drenched* by every storm.

Byron.

DRENT, *part.* Probably corrupted from
drenched, to make a proverbial rhyme to *brent*
or *burnt*.

What flames, quoth he, when I the present seeo
In danger rather to be *drent* than *brent*?

Faerie Queene.

DRESDEN, a handsome city of Germany, the capital of Saxony, is situated on both sides of the Elbe, at the influx of the Weisseritz. There is also a third division, lying on the Weisseritz, called Frederickstadt. It is approached in almost every direction by delightful avenues, leading through a rich and fertile country, and bounded by gentle acclivities. On entering the town, the noble bridge across the Elbe first strikes the eye of the spectator. It is built entirely of freestone, and is about 550 paces in length, consisting of nineteen arches. A delightful prospect spreads on every side. The streets of Dresden are clean, broad, and well paved and lighted. Its public buildings are eleven Lutheran churches, two Catholic, and one Calvinist; the more recent of the Catholic churches, built in the middle of the eighteenth century, is one of the finest ecclesiastical edifices in Germany. It has a flat roof cased with copper, and a tower 300 feet in height. But the late electoral, now the royal palace, is both an extensive repository of the fine arts, which the traveller should not omit to explore, and a magnificent, though irregular structure. It has a tower 355 feet in height, and a number of remarkable apartments, particularly the well known green vault, divided into eight rooms, paved with marble, and containing numerous statues, ivory work, silver plate, vases, and precious stones. Before the war of 1756 this collection was almost unrivalled. Augustus II. and his preceding electors had made the fine arts an object of their constant patronage; and to him this city is indebted for most of its modern improvements. Near the palace is the chancery, and a large building containing a valuable collection of paintings. The house of assembly for the diet of Saxony is an elegant building, as well as

the palaces called after the princes Anthony and Maximilian. In the suburbs are the Zwinger gardens, a promenade containing a valuable cabinet of natural history. The arsenal has a curious collection of early fire-arms. The castle, formerly belonging to the counts of Bruhl, is the great dépôt of the porcelain manufactures. Another remarkable edifice is the Dutch and Japanese palace, a square building, rising amidst groves and thickets, and containing the royal library, said to consist of 150,000 volumes, some valuable statues, and a beautiful collection of porcelain.

Here is a military school, and an academy for cadets of noble family. The charitable institutions, particularly the house of industry, are said to be well regulated. It finds employment for more than 3000 individuals. The manufactures are those of lace, jewellery, porcelain, earthenware, mirrors, tapestry, and plaited straw. There are several public gardens outside of the city, of which the largest, the royal garden, is occasionally enlivened with concerts. There is also in this neighbourhood a romantic spot, called the Planische Grund, a valley formed by steep rocks of granite, and watered by the Weisseritz. Vineyards extend along a hill in the direction of the castle of Pillnitz, the summer residence of the royal family, and remarkable for the coalition of 1792. In 1755 the population of Dresden was 63,000; in 1788, 53,000; in 1801, 48,000; in 1811, 45,000. This decrease is ascribed to the alarms and actual calamities to which Dresden has been exposed in the late wars of the continent; and, indeed, ever since Prussia ventured to cope with Austria. It was taken by the Prussians in 1745, and again in 1756; when it became the scene of war and of extreme distress. August 26th and 27th, 1813, the combined Austrian and Russian army advanced in great force from the Bohemian frontier, and attacked this city, but were obliged to retire. Dresden remained in the possession of the French until the scene of war was transferred to the neighbourhood of Leipzig; and the decisive battles in that situation obliged Buonaparte to evacuate Germany. Marshal St. Cyr was blockaded in it, and obliged to capitulate on the 6th of November, 1813.

Dresden was stripped of its walls in 1810 to repair the fortifications of Torgau. Since the peace it has been rapidly improving, and the population is now taken at 60,000. It is situated 100 miles south-west of Berlin.

DRESS, *v. a., v. n. & n. s.*

DRESS'ER, *n. s.*

DRESS'ING,

DRESS'ING-ROOM,

DREST, *part.*

Fr. *dresser*;
Ital. *drizzare*;
Teuton. *diriser*;
from Lat. *dirigo*;
Gr. *ἐπάσσει*, to
make ready. To clothe; robe; adorn. Hence to cover a wound with medicaments; to rectify; adjust and prepare, generally: used also in a particular sense for the trimming, currying, and rubbing horses, as well as breaking them in; and for preparing food for the table. As a neuter verb, it means to pay particular attention to dress; and among soldiers, to keep in line. As a substantive, it is synonymous with clothes, attire; and sometimes means skill; exactness in putting on dress. Dressing is synonymous with dress:

a dresser is one employed in dressing; and a useful kitchen-board on which food is dressed.

To give light to them that sitten in darkness, and in shadowe of deeth, to dresse our feet into the waye of pres.

When he dresseth the lamps, he shall burn incense.

Ereodus xxx.

Said he unto the dresser of his vineyard, Behold, these three years I come seeking fruit on this fig-tree, and find none.

Luke.

*Enforced to slepe, and for to take some rest
And to lye downe as soone as I my dreste
At Harwyche porte slumbryng as I laye
In myne hostes house called powers keye.*

Skelton.

*'Tis burnt, and so is all the meat.
What dogs are these! Where is the rascal cook?
How durst you, villains! bring it from the dresser,
And serve it thus to me that love it not?*

Shakspeare.

*Adam! well may we labour still to dress
This garden; still to tend plant, herb, and flower.*

Milton.

*Where was a fine room in the middle of the house,
handsomely dressed up, for the commissioners to sit in.*

Clarendon.

*Our infirmities are so many, that we are forced to
dress and tend horses and asses, that they may help
our needs.*

Taylor.

*The first request
He made was, like his brothers to be dressed;
And, as his birth required, above the rest.*

A steed

*Well mouthed, well managed, which himself did
dress;*

His aid in war, his ornament in peace.

Id.

*Few admired the native red and white,
Till poets dressed them up to charm the sight.*

Id.

*Thus the voluptuous youth, bred up to dress
For his fat grandsire some delicious mess,
In feeding high his tutor will surpass,
An heir apparent of the gourmand race.*

Id.

*She hurries all her hand-maids to the task;
Her head alone will twenty dressers ask.*

Id. Juvenal.

*A maple dresser in her hall she had,
On which full many a slender meal she made.*

Id.

*The mind loses its natural relish of real truth, and
is reconciled insensibly to any thing that can be
dressed up into any faint appearance of it.*

Locke.

*When you take down dishes, tip a dozen upon the
dresser.*

Swift's Directions to the Cook.

*Latin books might be found every day in his
dressing-room, if it were carefully searched.*

Swift.

*Lollia Paulina wore, in jewels, when dressed out,
the value of three hundred twenty-two thousand nine
hundred and sixteen pounds thirteen shillings and
four-pence.*

Arbuthnot.

*In time of my sickness another chirurgeon dressed
her.*

Wiscman.

*The second day after we took off the dressings, and
found an eschar made by the cathartic.*

Id. on Tumours.

*Full dress creates dignity, augments consciousness,
and keeps at distance an encroacher.*

Clarissa.

*A robe obscene was o'er his shoulders thrwn,
A dress by fates and furies worn alone.*

Pope's Stat.

*The men of pleasure, dress, and gallantry.
When you dress your young hops, cut away roots or
sprigs.*

Mortimer's Husbandry.

*A lady of genius will give a genteel air to her
whole dress by a well-fancied suit of knots, as a judi-*

*cious writer gives a spirit to a whole sentence by a
single expression.*

Gay.

Dress drains our cellar dry,

*And keeps our larder lean; puts out our fires;
And introduces hunger, frost, and woe,
Where peace and hospitality might reign.*

Cowper.

*And dear to love, to memory dear,
It brightens through the starting tear;
Like the glad bow, by fancy drest,
That beams on evening's watery vest.*

Bowdler.

*Soldiers dress by one another in ranks, the body
collectively dresses by some given object.*

James's Military Dictionary.

DRESSING, in surgery. See **SURGERY**.

DRESSING OF MEAT, by means of culinary fire, is intended to loosen the compages or texture of the flesh, and dispose it for dissolution and digestion in the stomach. The usual operations are roasting, boiling, and stewing. In roasting, it is observed, meat will bear a much greater and longer heat than either in boiling or stewing; and in boiling, greater and longer than in stewing. Roasting being performed in the open air, as the parts begin externally to warm, they extend and dilate, and so gradually let out part of the rarefied included air, by which means the internal succussions, on which the dissolution depends, are much weakened and abated. Boiling being performed in water, the pressure is greater, and consequently the succussions to lift up the weight are proportionably strong, by which means the coction is hastened; and even in this way there are great differences; for the greater the weight of water the sooner is the business done. In stewing, though the heat be much less than what is employed in the other methods, the operation is much more quick, because performed in a close vessel, and full; by which means the succussions are oftener repeated, and more strongly reverberated. Hence, the force of Papin's digester. Boiling, Dr. Cheyne observes, draws more of the rank strong juices from the meat, and leaves it less nutritive, but lighter, and easier of digestion; roasting, on the other hand, leaves it fuller of the strong nutritive juices, but harder to digest, and needing more dilution. Dr. Brown insists, that roasted meat is more easily digested, and every way fitter for a weak stomach than boiled. Strong and full grown animal food should be boiled, and the young and tender roasted.

DREVET (Peter), the elder and younger, two eminent French engravers. The father instructed, but was surpassed by his son, who was a member of the Royal Academy of painting and sculpture. His portraits are neat and elegant, but labored to the last degree. He particularly excels in representing lace, silk, fur, velvet, and other ornamental parts of dress. His historical prints, in point of neatness and exquisite workmanship, are scarcely to be equalled. His Presentation of Christ in the Temple, is reckoned the best of these. The following are also much valued: the Meeting of Abraham's Servant with Rebecca at the Well; and Abraham, with Isaac on the Altar, dated 1707; both large upright plates from A. Coypel. Among his portraits, the following are held in the highest estimation: M. Bossuet, bishop of Meaux, a whole-length

figure standing; and Samuel Bernard, a whole-length figure in a chair.

DREUX, a town of France, in the department of the Eure and Loire, and ci-devant province of Beauce. It is remarkable for its antiquities. It was taken by Henry II. of England in 1186, and by Henry V. in 1421. It is also remarkable for a battle fought in the neighbourhood, December, 1562, between the Papists and Protestants. Some derive its name from the Druids. It has two churches, St. Stephen's and Notre Dame, or the great church, which is well built. It has a cloth manufacture, and is seated on the river Blaise, at the foot of a mountain, forty-five miles west by south of Paris. Population 5500.

DRIE, *v. a.* Contracted perhaps from dribble. To crop; to cut off; to defalcate.

Merchants gains come short of half the mart;
For he who drives their bargains *dries* a part.

Dryden.

DRIABLE, *v. n. & v. a.* } Or drip, a di-
DRIABLET, *n. s.* } minutive of **DRIE**,
which see. To fall in drops; to throw down in drops. A driblet is a small sum of money

Believe not that the *dribbling* dart of love
Can pierce a complete bosom. *Shakespeare.*

Twelve long years of exile borne,
Twice twelve we numbered since his blest return;
So strictly wert thou just to pay,
Even to the *dribblet* of a day. *Dryden.*

Let the cook follow with a ladle full of soup, and
dribble it all the way up stairs.

Swift's Rules to Servants.

Semilunar processes on the surface owe their form
to the *dribbling* of water that passed over it.

Woodward on Fossils.

A *dribbling* difficulty, and a momentary suppression
of urine, may be caused by the stone's shutting up
the orifice of the bladder. *Arbuthnot on Aliments.*

That wee bit heap o' leaves an' stibble,

Has cost thee mony a weary nibble!

Now thou's turned out, for a' thy trouble,

But house or hald,

To thole the winter's sleety *dribble*,

An' cranreuch cauld! *Burns.*

DRIFT, *n. s., v. a. & v. n.* From drive. Impulse; prevailing influence or tendency; violent course: hence a snow-drift or violent shower, and a heap or stratum of any matter thrown together, or at random. The verb is derived from the substantive, and means, to draw; impel along; or throw into heaps.

The mighty trunk, half rent with rugged rift,
Tooth roll adown the rocks, and fall with fearful *drift*.
Faerie Queene.

Our thunder from the south
Shall rain their *drift* of bullets on this town.
Shakespeare.

Some log, perhaps, upon the waters swam,
An useless *drift*, which rudely cut within,
And hollowed, first a floating trough became,
And cross some riv'let passage did begin. *Dryden.*
A man being under the *drift* of any passion, will
still follow the impulse of it till something interpose,
and, by a stronger impulse, turn him another way.
South.

The main *drift* of his book being to prove, that
what is true is impossible to be false, he opposes no-
body. *Tillotson.*

The *drift* of the pamphlet is to stir up our compas-
sion towards the rebels. *Addison.*

This, by the stile, the manner, and the *drift*,
'Twas thought could be the work of none but Swift.
Swift.

The ready racers stand;
Swift as on wings of wind upborne they fly,
And *drifts* of rising dust involve the sky.
Pope's Odyssey.

Snow, no larger than so many grains of sand,
drifted with the wind in clouds from every plain.
Ellis's Voyage.

He wanders on
From hill to dale, still more and more astray,
Impatient flouncing through the *drifted* heaps.
Thomson.

'Prince, to these walls give access free
At all times for my friends and me.'
● Phrygius full well perceived her *drift*
Yet nobly ratified his gift. *Sheridan.*

DRIFT, in navigation, the angle which the
line of a ship's motion makes with the nearest
meridian, when she drives with her side to the
wind and waves, and is not governed by the
power of the helm; it also implies the distance
which the ship drives on that line. A ship's
way is only called drift in a storm; and then
when it blows so vehemently as to prevent her
from carrying any sail, or at least restrains her to
such a portion of sail as may be necessary to
keep her sufficiently inclined to one side, that
she may not be dismasted by her violent labor-
ing, produced by the turbulence of the sea.

DRIFT-SAIL, a sail used under water, veered
out right a-head by sheets, as other sails are. It
serves to keep the ship's head right upon the sea
in a storm, and to hinder her driving too fast in
a current.

DRILL, *v. a., v. n., & n. s.* Germ. and Dutch
drillen; Sax. *dirhan*, of the verb *thregian*, to turn;
from *durgh* or *turgh*, through. To pierce or bore;
hence to drain: as a neuter verb, it means to
flow gently, trickle; and hence, probably, to
cause so to flow; to conduct; to train. Drill is
used substantively for a boring instrument; a
dribbling brook; military exercise; and a kind of
monkey.

Springs through the pleasant meadows pour their
drills,
Which snake-like glide between the bordering hills.
Sandys.

My body through and through he *drilled*,
And Whacum by my side lay killed. *Hudibras.*

The foe appeared drawn up and *drilled*,
Ready to charge them in the field. *Id.*

The way of tempering steel to make gravers, *drills*,
and mechanical instruments, we have taught artificers.
Boyle.

Shall the difference of hair be a mark of a different
internal specifick constitution between a changeling
and a *drill*, when they agree in shape and want of
reason? *Locke.*

When by such insinuations they have once got
within him, and are able to *drill* him on from one
lewdness to another, by the same arts they corrupt
and squeeze him. *South.*

She has bubbled him out of his youth: she *drilled*
him on to five-and-fifty, and she will drop him in his
old age. *Addison.*

Drills are used for the making such holes as punches will not serve for; as a piece of work that hath already its shape, and must have an hole made in it.

Moxon.

When a hole is *drilled* in a piece of metal, they hold the drill-bow in their right hand; but, when they turn small work, they hold the drill-bow in their left hand.

Id.

Tell, what could *drill* and perforate the poles, And to the' attractive rays adapt their holes?

Blackmore.

Drilled through the sandy stratum every way, The waters with the sandy stratum rise.

Thomson.

Some *drill* and bore

The solid earth, and from the strata there

Extract a register, by which we learn,

That he who made it, and revealed its date

To Moses, was mistaken in its age.

Cowper.

DRILL-SOWING, a method of sowing grain or seed of any kind, so that it may all be at a proper depth in the earth, which is necessary to its producing healthful and vigorous plants. For this purpose a variety of drill ploughs have been invented and recommended; but from the expense attending the purchase, and the extreme complication of their structure, there is no instrument of this kind, as yet discovered, that has been brought into general use. This method, however, is greatly recommended in the Georgical Essays. See **HUSBANDRY**.

DRINK, *v. a., v. n., & n. s.*

DRINK'ABLE, *adj.*

DRINK'ER, *n. s.*

DRINK'MONEY,

DRUNK, *adj.*

DRUNK'ARD, *n. s.*

DRUNK'EN, *adj.*

DRUNK'ENLY, *adv.*

DRUNK'ENNESS, *n. s.*

Gothic *drecka*;

Sax. *drencan*; Teut.

and Belg. *trincken*,

perhaps from the

sound of drinking

from a cup.—Min-

sheu. To swallow

liquid; quench

thirst; hence to

feast; guzzle habitually; salute in drinking. As an active verb, it means to swallow; suck up; absorb; to act upon by drinking; and is used with the intensive particles *off, up, and in*: drink is liquid of any kind. Drinkable is proper or agreeable to drink: drinker is applied both to him who moderately as well as him who excessively drinks: drink-money, is money given to procure, or instead of, drink: drunk, and drunken, are the regular participial adjectives of drink: drunkard is one who habitually drinks to excess; and drunkenly, drunkenness, the corresponding adverb and substantive.

For Jon cam neither etynge ne *drynkynge*, and thei seyen he hath a devil. The son of man cam etynge and *drynkynge*; and thei seyen lo a man a gloutoun and a *drynhewe* of wyn, and a frend of puppicanes and of synful men.

Wiclif. Mat. xi.

And nyle ge be *drunken* of wyn in which is lecherie, but be ge fillid with the hooli goost.

Wiclif. Effesies v.

She said, *drink*, and I will give thy camels *drink* also; so I *drank*, and she made the camels *drink* also.

Gen. xxiv. 46.

Benhadad was *drinking* himself *drunk* in the pavilions.

1 Kings.

Withouten bake mete never was his hous

Of fish and flesh, and that so plenteous

It snowed in his hous of mete and *drinke*

Of alle deintees that men coude thiuke.

Chaucer. Prolog. to Cant. Tales.

Thou livest in bliss

That earthly passion never stains;

Where, from the purest spring,

The sacred nectar sweet

Is thy continual drink.

Spenser. The Mourning Muse.

Passion is the *drunkenness* of the mind, and therefore in its present workings not controllable by reason.

Spenser.

Come, we have a hot venison pasty to dinner: come, gentlemen, I hope we shall *drink* down all unkindness.

Shakespeare.

I take your princely word for those redresses.

—I gave it you, and will maintain my word;

And thereupon I *drink* unto your grace.

Id.

My ears have yet not *drunk* a hundred words

Of that tongue's uttering, yet I know the sound.

Id.

Then let the earth be *drunken* with our blood.

Id.

We will give you rare and sleepy *drinks*.

Id. Winter's Tale.

We came to fight you.—For my part, I am sorry it is turned to a *drinking*.

Id. Antony and Cleopatra.

Done in a state of inebriation.

When your carters, or your waiting vassals, Have done a *drunken* slaughter, and defaced The precious image of our dear Redeemer, You straight are on your knees for pardon, pardon.

Shakespeare.

My blood already, like the pelican,

Hast thou tapt out, and *drunkenly* caroused.

Id.

Some blood drawn on me would beget opinion

Of my more fierce endeavour. I've seen *drunkards*

Do more than this in sport.

Id. King Lear.

It were good for those that have moist brains, and are great *drinkers*, to take fume of lignum, aloes, rosemary, and frankincense, about the full of the moon.

Bacon.

Drunk men imagine every thing turneth round: they imagine that things come upon them; they see not well things afar off; those things that they see near hand, they see out of their place, and sometimes they see things double.

Id.

When God made choice to rear—

His mighty champion, strong above compare,

Whose *drink* was only from the liquid brook!

Milton.

O madness, to think use of strongest wines,

And strongest *drinks*, our chief support of health.

Id.

Drunkenness is the way to all bestial affections and sins.

Bp. Hall's Contemplations.

Cannot he that wisely declines walking upon the ice for fear of falling, though possibly it might carry him sooner to his journey's end, as wisely forbear *drinking* more wine than is necessary, for fear of being *drunk*, and the ill consequences thereof.

Lord Clarendon.

Every going off from our natural and common temper, and our usual severity of behaviour, is a degree of *drunkenness*.

Taylor's Rule of Holy Living.

The body being reduced nearer unto the earth, and emptied, he cometh more porous, and greedily *drin-eth* in water.

Browne's Vulgar Errors.

This was the morn when issuing on the guard, Drawn up in rank and file, they stood prepared Of seeming arms to make a short assay; Then hasten to be *drunk*, the business of the day.

Dryden.

On the other side, let a *drunkard* see that his health decays, his estate wastes; discredit and diseases, and the want of all things, even of his beloved *drink*, attends him in the curse he follows.

Locke.

The *drinker* and debauched person is the object of scorn and contempt. *South.*

One man gives another a cup of poison, a thing as terrible as death; but at the same time he tells him that it is a cordial, and so he *drinks it off*, and dies. *Id.*

He will drown his health and his strength in his belly; and, after all his *drunken* trophies, at length *drink* down himself too. *Id.*

We generally conclude that man *drunk*, who takes pains to be thought sober. *Spectator.*

We should for honour take
The *drunken* quarrels of a rake. *Swift.*

Pheonius! let acts of gods, and heroes old,
What ancient bards in hall and bower have told,
Attempted to the lyre, your voice employ;
Such the pleased ear will *drink* with silent joy.

Pope.
I *drink* delicious poison from thy eye. *Id.*

Brush not thy sweeping skirt too near the wall;
Thy heedless sleeve will *drink* the coloured oil. *Gay.*

Amongst *drinks*, austere wines are apt to occasion
foul eruptions. *Arbuthnot on Aliments.*

Peg's servants were always asking for *drink-money*.
Arbuthnot.

The Lacedemonians trained up their children to
hate *drunkenness*, by bringing a drunken man into
their company. *Watts on the Mind.*

It is not necessary to be *drunk* one's self, to relish
the wit of *drunkenness*. Do we not judge of the
drunken wit of the dialogue between Iago and Cassio
(the most excellent in its kind), when we are quite
sober? Wit is wit, by whatever means it is produced;
and, if good, will appear so at all times. I admit
that the spirits are raised by *drinking*, as by the com-
mon participation of any pleasure: cock-fighting or
bear-baiting will raise the spirits of a company, as
drinking does, though surely they will not improve con-
versation. I also admit, that there are some sluggish
men who are improved by *drinking*, as there are fruits
which are not good till they are rotten: there are such
men, but they are medlars. *Johnson.*

No eyes
But mine now *drink* this sight of loveliness;
I should be sole in this sweet solitude,
And with the Spirit of the place divide
The homage of these waters. *Byron.*

Would that I had died
Ere such a monster's victim I had been!
What may this midnight violence betide,
A sudden fit of *drunkenness* or spleen? *Id.*

DRINK is an essential part of our ordinary
food in a liquid form. See FOOD. The general
use of drink is, to supply fluid; facilitate solu-
tion; of course to assist the evacuation of the
stomach, and promote the progress of the alim-
ent through the intestines; for, by the con-
traction of the longitudinal fibres of the stomach,
the pylorus is drawn up, and nothing but fluid
can pass; which, by its bulk, makes a hurried
progress through the intestines, and so deter-
mines a greater excretion by stool, as less than
can be absorbed by the lacteals. Hence, a large
quantity of common water has been found pur-
gative; and, ceteris paribus, that aliment which
is accompanied with the largest proportion of
drink, makes the largest evacuation by stool.
Here a question has arisen, about where the fe-
culent part of the aliment is first remarkably

collected. It is commonly thought to be in the
great gut; but, undoubtedly, it often begins in
the ilium, especially when the drink is in a
small proportion, and when the progress of the
aliment is slow; for when the contents of the
guts are very fluid, they are quickly pushed on,
and reach the great guts before they deposit
their feculency. Another effect of drink is, to
facilitate the mixture of the lymph, reflux from
every part of the system, with the chyle. In the
blood-vessels, where all must be kept fluid in
order to proper mixture, drink increases the
fluidity, and gives tension, by its bulk. Hence,
drink contributes to sanguification, as sometimes
food gives too dense a nutriment to be acted
upon by the solids; and hence, also, drink pro-
motes the secretions. These are the effects of
drink in general; but the more liquid the food
is, it is the sooner evacuated, and less nourish-
ment is extracted. Hence, drink is, in some
degree, opposed to nourishment; and so, ceteris
paribus, those who use least drink are most nour-
ished. All these effects may be produced by
simple water; and it is said, that other liquors
are fit for drink in proportion to the water they
contain. Water, however, when used as drink,
is most commonly impregnated with vegetable
and farinaceous substances, which thus both
operate as drink and contribute to nourishment.
Sometimes we impregnate water with the subacid
fruits; and thus it acquires other qualities, of
considerable use in the animal economy. All
drinks may be reduced to two heads: first, pure
water, or where the additional substance gives
no additional virtue; second, fermented liquors.
The latter have not only the qualities of the
first, but also qualities peculiar to themselves.
Fermented liquors are more or less poignant
to the taste, and better calculated to quench
thirst. They are peculiarly adapted for stim-
ulating the mouth, fauces, and stomach, to
throw out the saliva and gastric liquor. By
their acescency they are fitted for some
beneficial purposes in certain states of the
system; by their fluidity they dilate viscid food;
though in this respect they answer no better than
common water. Carried into the blood-vessels,
in so far as they retain any saline property, they
stimulate the excretories, and promote urine and
sweat. Many physicians, in treating of fermented
liquors, have rejected their nutritious virtues,
which certainly ought to be taken into the ac-
count, though, by expediting the evacuation by
stool, they cause less of the nutritious parts of the
aliment to be taken up, and, by stimulating the
excretories, make these nutritious parts to rest for
a shorter time in the system. All these and many
other effects arise from fermented liquors. Their
acescency sometimes promotes the disease of
acescency, by increasing that of vegetables, acting
as a ferment, and so producing flatulency, par-
ging, cholera, &c. So that, with vegetable alim-
ent, as little drink is necessary, the most inno-
cent is pure water; and it is only with animal
food that fermented liquors are necessary. In
warmer climates, fermented liquors would seem
requisite to obviate alkaescency and heat. But
it should be considered, that, though fermented
liquors contain an acid, yet they also contain al-

cohol; which, though it adds stimulus to the stomach, yet is extremely hurtful in the warmer climates, and wherever alkalies prevail in the system. Nature in these climates has given men an inclination for water impregnated with acid fruits, e. g. sherbet: but this needs to be cautiously used, as in these countries they are apt to shun animal food, using too much of the vegetable, and often thus causing dangerous refrigerations, choleras, diarrheas, &c. It may be proper here to mention the chief heads on which the varieties of fermented liquors depend. 1st. They are owing to the quality of the subject, as more or less viscid; and to its capacity also of undergoing an active fermentation, although perhaps the more viscid are more nutritious. Hence the difference between ales and wines; by the first, meaning fermented liquors from farinacea, by the second, from the fruits of plants. It depends, 2dly, On the acerbity, acidity, nature, and maturation, of the fruit. 3dly. The variety depends on the conduct of the fermentation. In general, fermentation is progressive, being at first active and rapid, detaching the fixed air or gas sylvestre, at the same time acquiring more acid than before. These qualities of flatulency and acidity remain for some time: but, as the fermentation goes on, the liquor becomes more perfect, no air is detached, and alcohol is produced; so that fermented liquors differ according to the progress of the fermentation, and have different effects on the system. When fermentation is stopped before it comes to maturity, though naturally it proceeds in this way, yet, by addition of new ferment, it may again be renewed with a turbid intestine motion. In the inordinate quantities in which fermented liquors are occasionally drunk with a view of conviviality, they have a tendency to undermine the health, while they appear to fatten the body; occasioning dropsy and other fatal diseases. The strong ale so much drunk in the country certainly has had many victims, as well as fermented liquors of other kinds; but those beverages generally drunk at our meals under the name of beer and porter are certainly most wholesome, when free of acidity, and answer every salutary purpose in the animal economy. See DIGESTION.

DRINO, a river of European Turkey, in Albania, formed of the White Drino, which falls from Mount Boras, on the frontiers of Dalmatia and Servia, and the Black Drino, a much larger stream, which takes its rise on the northern declivity of the mountains of Sagori, and after passing through the lake of Ochrida, flows in a northerly direction till it meets the former. The united stream now runs due west, separating Albania from Dalmatia, and finally empties itself by seven mouths into the Adriatic, below Alessio, forming several islands, and the Gulf of Drino. It is navigable for large rafts for nearly 100 miles. On the banks are noble forests.

DRINO is also the name of another large river of European Turkey, which separates Bosnia from Servia, and falls into the Save below Drinovar.

DRIP, *v. n., v. a. & n. s.* } Dutch, *drippen*;
 DRIPPING, *n. s.* } Teuton. *dripen*;
 DRIPPINGPAN, *n. s.* } Dan. *dryppe*. See

Drop. To fall in drops, or let drops fall; in a particular sense, to let fat drop in roasting; that which falls in drops or small quantities. In this last sense drip is synonymous with dripping.

Let what was put into his belly, and what he drips, be his sauce. *Walton's Angler.*

His offered entrails shall his crime reproach,
 And drip their fatness from the hazle broach.

Dryden's Virgil.

The soil, with fattening moisture filled,
 Is cloathed with grass, and fruitful to be tilled;
 Such as in fruitful vales we view from high,
 Which dripping rocks, not rolling streams, supply.

Dryden.

The finest sparks, and cleanest beaux,
 Drip from the shoulders to the toes. *Prior.*

Her flood of tears

Seem like the lofty barn of some rich swain,
 Which from the thatch drips fast a shower of rain. *Swift.*

Shows all her secrets of house-keeping;
 For candles how she trucks her dripping. *Id.*

When the cook turns her back, throw smothering
 coals into the drippingpan. *Id.*

Water may be procured for necessary occasions
 from the heavens, by preserving the drips of the
 houses. *Mortimer.*

Though thy clime

Be sickle, and thy year most part deformed
 With dripping rains, or withered by a frost,
 I would not yet exchange thy sullen skies,
 And fields without a flower, for warmer France,
 With all her vines. *Cowper.*

There breathes a living fragrance from the shore,
 Of flowers yet fresh with childhood; on the ear
 Drops the light drip of the suspended oar,
 Or chirps the grasshopper one good-night carol more.

Byron. Child Harold.

And thou, ghastly Beldame!

Dripping with dusky gore, and trampling on
 The carcasses of Inde—away! away! *Byron.*

DRISSA, a town of the government of Witpepsk, European Russia, situated on the right bank of the Dwina, at the influx of the Drissa. Here was situated the entrenched camp, constructed by the Russians in 1812, to oppose the progress of the French, but abandoned on the approach of the latter. It is twenty miles W. N. W. of Polotzk, and 272 south of St. Petersburg.

DRIVE, <i>v. a. & n. s.</i>	} Sax. <i>driven</i> ; Swe- do-Goth. <i>drifwa</i> ; Teut <i>treiben</i> ; from Greek, <i>τρούω</i> . To chase; to push or impel with overcoming force;
DRIVER,	
DRIVING, <i>n. s.</i>	
DROVE, <i>n. s.</i>	
DROVEN, <i>part.</i>	
DROVER, <i>n. s.</i>	

opposed to draw or drag, in which that which draws or drags goes before; that which drives goes behind or follows the thing driven: hence to force or compel, generally; to aim at; to urge to greater speed; to regulate a carriage, or rather the horses, perhaps; to hurry on; to distress. A drove, from the preterite of drive, is a collective number of things or animals driven: hence a crowd or tumult of persons. Drove, the old past participle of drive. A drover, one who habitually drives animals, or feeds them to be driven to market. Spenser uses it for a boat driven 'along the stream.'

For the charite of Crist dryueth us, gossynge this
 thing, that if oon diede for alle, thanne alle weren
 deede. *Wiclif. 2 Cor. 1.*

But if questions ben of the word, and of names of
ghoure laws bise ghousilf, I will not be domesman
of these things, and he *droof* hem fro the doom place.

Id. Dedis. 18.

And the watchman told, saying, the *driving* is like
the *driving* of Jehu, the son of Nimshi, for he *driveth*
furiously.

Bible, 2 Kings ix. 20.

They were *driven* forth from among men.

Job xxx. 5.

He stoud and measured the earth : he beheld, and
drove asunder the nations.

Hab. iii. 6.

And fro the benche he *drove* away the cat,

And laid adoun his potent and his hat,

And eke his scrip, and set himself adoun.

Chaucer. Cant. Tales.

For the metre sake, some words in him sometime
he *driven* awry, which require straighter placing in
plain prose.

Ascham.

This kind of speech is in the manner of desperate
men far *driven*.

Spenser's State of Ireland.

To *drive* the deer with hound and horn

Earl Percy took his way.

Chery Chase.

The Romans did not think that tyranny was
thoroughly extinguished, till they had driven one of
their consuls to depart the city, against whom they
found not in the world what to object, saving only that
his name was Tarquin.

Hooker.

He from the many-peopled city flies ;

Contemns their labours, and the *driver's* cries.

Sandys.

They forthwith *drave* out their governour, and re-
ceived the Turks into the town.

Knolles's History.

Four rogues in buckram let *drive* at me.

Shakespeare. Henry IV.

Time *drives* the flocks from field to fold,

When rivers rage and rocks grow cold.

Shakespeare.

I *drave* my suitor from his mad humour of love
to a living humour of madness.

Id. As You Like It.

His thrice *driven* bed of down.

Shakespeare.

This is fought indeed ;

Had we so done at first, we had *droven* them home

With clouts about their heads.

Id.

The prince hath got your Hero.

— I wish him joy of her.

— Why, that 's spoken like an honest *drover* ; so they
sell bullocks.

Id. Much Ado About Nothing.

As a farmer cannot husband his ground so well, if
he sit at a great rent ; so the merchant cannot *drive*
his trade so well, if he sit at great usury.

Bacon.

The experiment of wood that shineth in the dark,
we have diligently *driven* and pursued ; the rather for
that, of all things that give light here below, it is the
most durable, and hath least apparent motion.

Id. Natural History.

They brought to their stations many *droves* of cat-
tle ; and within a few days were brought out of the
country two thousand muttuns.

Hayward.

Discontents *drave* men into slidings.

King Charles.

We have thus the proper notions of the four ele-
ments, and both them and their qualities *driven* up
and resolved into their most simple principles.

Digby on Bodies.

He *drave* them beyond Amon's flood,
And their sad bounds marked deep in their own blood.

Cowley.

Lost miserable if such unskilfulness make them
drive on their time by the periods of sin and death.

Taylor.

Lord Cottington, being master of temper, and of the
most profound dissimulation, knew too well how to

lead him into a mistake, and then *drive* him into cho-
ler.

Clarendon.

Thy flaming chariot-wheels, that shook

Heaven's everlasting frame, while o'er the necks

Thou *droust* of warring angels disarrayed.

Milton.

The sounds and seas, with all their finny *drove*,

Now to the moon in wavering morrice move.

Id.

A Spaniard is unacquainted with our northern
droves.

Browne.

Authors *drive* at these, as the highest elegancies,
which are but the frigidities of wit.

Id. Vulgar Errors.

He taught the gospel rather than the law,

And forced himself to *drive*, but loved to draw.

Dryden

Love, fixt to one, still safe at anchor rides,

And dares the fury of the winds and tides ;

But losing once that hold, to the wide ocean born,

It *drives* away at will, to every wave a scorn.

Id.

Fierce Boreas *drove* against his flying sails,

And rent the sheets.

Id. Eneid.

Perithous' dart *drove* on, and nailed him to the
wood.

Dryden.

Your Pasimond a lawless bargain *drove*,

The parent could not sell the daughter's love.

Id.

Fate has *driven* 'em all

Into the net.

Id. Don Sebastian.

Not the fierce *driver* with more fury lends

The sounding lash, and, ere the stroke descends,

Low to the wheels his pliant body bends.

Id. Virgil.

But if to fame alone thou dost pretend,

The miser will his empty palace lend,

Set wide with doors, adorned with plated brass,

Where *drives*, as at a city-gate, may pass.

Id. Juvenal.

The *drover*, who his fellow *drover* meets

In narrow passages of winding streets.

Id.

The wolves scampered away, however, as hard as
they could *drive*.

L'Estrange.

The one 's in the plot, let him be never so inno-
cent ; and the other is as white as the *driven* snow, let
him be never so criminal.

Id.

He, *driven* to dismount, threatened, if I did not the
like, to do as much for my horse as fortune had done
for his.

Sidney.

It is better to marry than to burn, says St. Paul ;
where we may see what *drives* men into a conjugal
life : a little burning pushes us more powerfully than
greater pleasures in prospect.

Locke.

The multitude or common rout, like a drove of
sheep, or an herd of oxen, may be managed by any
noise or cry which their *driver* shall accustom them to.

South.

There find a herd of heifers, wandering o'er
The neighbouring hill, and *drive* 'em to the shore.

Addison.

We have done our work, and are come within view
of the end that we have been *driving* at.

Id. on the War.

To *drive* the argument farther, let us inquire into
the obvious designs of this divine architect.

Chryme's Philos. Principles.

The trade of life cannot be *driven* without partners.

Collier.

The design of these orators was to *drive* some par-
ticular point, either the condemnation or acquittal.

Swift.

He builds a bridge, who never *drove* a pile.

Pope.

Thick as autumnal leaves, or *driving* sand,

The moving squadrons blacken all the strand.

Id. Iliad.

The foe rushed furious as he pants for breath,
And through his navel *drave* the pointed death. *Id.*
Or when the country floats with sudden rains,
Or *driving* mists deface the moistened plains,
In vain his toils the unskilful fowler tries,
While in thick woods the feeding partridge lies.

Gay.

First joyless rains obscure

Drive thro' the mingling skies with vapour foul,
Dash on the mountain's brow, and shake the woods
That grumbling wave below. *Thomson.*

Of plain sound sense life's current coin is made;
With that we *drive* the most substantial trade.

Young.

He that by the plough would thrive,
Himself must either hold or *drive*. *Franklin.*

May He who gives the rain to pour,
And wings the blast to blow,
Protect thee frae the *driving* shower, *
The bitter frost and snaw ! *Burns.*

DRIVING, among sportsmen, a method of taking pheasant pouts. The sportsman having found out the haunts of these birds, and fixed his nets there, he calls upon them together by a pheasant call, imitating the voice of the dam; after this he makes a noise with his driver, which will make them run a little way forward in a cluster; and this he repeats till he has made sure of them, by driving them into his nets.

DRIVING, in metallurgy, is said of silver, when, in the operation of refining, the lead being burnt away, the remaining copper rises upon its surface in red fiery bubbles.

DRIVING, in the sea language, is said of a ship, when an anchor being let fall will not hold her fast, nor prevent her falling away with the wind or tide. The best help in this case is to let fall more anchors, or to veer out more cable; for the more cable she has out, the safer she rides. When a ship is a-hull or a-try, they say she drives to leeward.

DRIV'EL, *v. n. & n. s.* } Goth. *drafta*; Icel.

DRIV'ELLER, *n. s.* } *drafta*, to talk wildly;
whence Teut. *ravelen*, to dote. To be weak;
foolish: hence to slaver like a child or idiot.
The substantive, drivell, saliva, is derived from the verb. A driveller is a dastard; fool; idiot.

This *drivelling* love is like a great natural, that runs lolling up and down to hide his bauble.

Shakespeare. *Romeo and Juliet.*

No man could spit from him, but would be forced to *drivel* like some paralytick, or a fool. *Grew.*

Besides the eternal *drivel*, that supplies
The dropping beard, from nostrils, mouth, and eyes.
Dryden.

I hate to see a brave bold fellow sotted,
Made sour and senseless, turned to whey, by love
A *driveling* hero, fit for a romance. *Id.*

What fool am I, to mingle that *drivel's* speeches
among my noble thoughts. *Sidney.*

I met with this Chremes, a *driveling* old fellow,
lean, shaking both of head and hands, already half
earth, and yet then most greedy of earth. *Id.*

I have heard the arrantest *drivellers* commended for
their shrewdness, even by men of tolerable judgment.
Swift.

All pay themselves the compliment to think
They, one day, shall not *drivel*: and their pride
On this reversion takes up ready praise. *Thomson.*

In life's last scene what prodigies surprise,
Fame of the brave, and follies of the wise !

From Marlborough's eyes the streams of *drivels* flow
And Swift expires a *driveller* and a show.
Johnson. Vanity of Human Wishes.

Ye writers of what none with *drivels* reads,
Footing it in the dance that fancy leads:
Ye novelists, who mar what ye would mend,
Sniveling and *driveling* folly without end.

Cooper.

DRIVERS, among sportsmen, a machine for driving pheasant pouts, consisting of good strong ozier wands, such as the basket-maker use, set in a handle, and twisted or bound with small oziars in two or three places. With this instrument the sportsman drives the young pout into his nets.

DRIZZLE, *v. a. & v. n.* } Goth. *drisulan*
DRIZZLY, *adj.* } Germ. *driseler*, for
Lat. *ros*; Gr. *δρῶσις*, dew. To shed or fall in
small drops: drizzly is shedding small rain.

And *drizzling* drops, that often do redound,
The firmest flint doth in continuance wear.

Spenser.

Her heart did melt in great compassion,
And *drizzling* tears did shed for pure affection.

Fuerie Quene.

When the sun sets, the air doth *drizzle* dew.
Shakespeare.

This day will pour down,
If I conjecture aught, no *drizzling* shower,
But rattling storm of arrows barbed with fire.

Milton.

This during winter's *drizzly* reign be done,
Till the new ram receives the exalted sun.

Dryden's Virgil.

The neighbouring mountains, by reason of their height, are more exposed to the dews and *drizzling* rains than any of the adjacent parts.

Addison on Italy.

But it perchance on some dull *drizzling* day
A thought intrude, that says, or seems to say,
If thus the important cause is to be tried,
Suppose the beam should dip on the wrong side;
I soon recover from these needless frights,
And God is merciful—sets all to rights. *Cowper.*

DROGDEN CHANNEL, a channel between the islands of Amak and Saltholm, and the only safe passage for ships of the line into the Baltic. It is about five miles in length, commencing opposite the road of Copenhagen, and there consisting of two channels, divided by a sand-bank. The inner, which is called Kongedyl (the royal passage), is commanded by the cannon of Copenhagen, and was the scene of the engagement 2d of April, 1801, between the Danes and English.

DROGHEDA, anciently called Tredagh, is a post, market, and fair town in Ireland, distant twenty-nine miles from Dublin. It is situated on the river Boyne, the natural boundary of the counties of Meath and Louth, and is in the county of the town of Drogheda; it is governed by a recorder, a mayor, two sheriffs, twenty-four aldermen, the sheriffs' peers, and fourteen representatives from the guilds. Drogheda was formerly a town of much consideration; the privilege of coinage was once granted to it, and in the reign of Edward IV. an act passed the Irish parliament, for the foundation of an university here, with like privileges as that of which act remains still unrepealed. *Id.*

this place ~~was~~ besieged by the rebels, but after suffering considerably, was at length gallantly relieved by Sir Henry Tichbourne. Cromwell afterward stormed and captured it, and left an everlasting remembrance of his sanguinary character here, in the massacre of its unarmed inhabitants: St. Lawrence's gate and tower are the chief remains of the ancient fortifications. About four miles from Drogheda, on the river Boyne, is the passage of Oldbridge, celebrated as being the scene of the memorable engagement between William III. and James II. in 1690, usually called the battle of the Boyne. A handsome obelisk is erected on the spot.

Drogheda returns one member to the imperial parliament. The principal public buildings are the Tholsel, a very elegant structure: the churches of St. Peter's and St. Mary's; five Roman Catholic chapels, and two meeting-houses. There are also large assembly-rooms, and a public reading-room. The gaol is a fine building, lately erected at an expense of £12,000. There is an infantry barrack in the town, and a magazine on a hill called Millmount, on the Meath side of the river. The principal trade of this place consists in the sale of dowlass, from twenty-six to thirty inches wide: sheeting of a superior quality was once the staple, but it has lost the reputation of manufacturing the best description of that article. Much corn is exported, and coal imported, which latter is conveyed by means of the Boyne navigation to Navan, whence the interior of Meath is conveniently supplied. The harbour of Drogheda is capable of much improvement: the great obstruction to the navigation is a bank called Tickel's Bed; by cutting through this, which could be done for a small sum, four feet water would be gained over the bar and up to the quay. There is but one bridge in Drogheda, and this is dangerously narrow. Amongst the valuable institutions are the classical school (one of very high character), founded by Sir Erasmus Smith; the blue school, supported by the corporation; an alms-house, affording shelter and partial support to twenty-four widows; an asylum for thirty-six clergymen's widows, to each of whom £26 annually are allowed: this is supported by bequests of primates Marsh and Bolter. There are many other valuable charities and institutions in this town. The export trade is tolerably flourishing, and to the establishment of steam-packets, which has already taken place, the harbour improvement above-mentioned only requires to be added, to make it the medium of importation to the midland counties.

DROIL, *n. s. & v. n.* A contraction of drivel. A drone; a sluggard: hence to work sluggishly or slowly; to plod.

Let such vile vassals, born to base vocation,
Drudge in the world, and for their living *droil*,
Which have no wit to live withouten toyle.

Spenser.

Desuetude does contract and narrow our faculties, so that we can apprehend only those things in which we are conversant; the *droiling* peasant scarce thinks there is any world beyond the neighbouring markets.

Government of the Tongue.

DROITWICH, a town of England, in the county of Worcester, containing three churches, and about 400 houses. It is noted for excellent white salt, made from the salt-springs in its neighbourhood; amounting to about 700,000 bushels a year. This town, anciently called Diertwich, from its wet dirty appearance, is seated on the navigable river Salwarp. It appears to have been a populous place in the reign of William the Conqueror, and has always been particularly celebrated for its immense salt-springs, whereof mention is made in Domesday-Book. A canal has been made from this town to the Severn, about three miles from Worcester, for the purpose of conveying the salt. It has a weekly market on Friday, and sends one member to parliament. The right of election is in two bailiffs, the recorder, and eleven burgesses, who are styled the corporation of the salt-springs of Droitwich. The bailiffs are the returning officers, and justices of the quorum: the recorder is also a justice of the peace. It is seven miles E. N. E. of Worcester, and 118 W. N. W. of London.

DROIL, *n. s., v. n., v. a. & adj.* } Fr. *drôle* ;
DROILER, *n. s.* } Arm. *drew*.
DROILERY, } A jester; buff-
DROILING, }-foon: hence
DROILHOUSE. } to play the
buffoon, or jester; to cheat; trick; and, as an
adjective, ridiculous; odd.

There is nothing so disagreeable in works of humour, as an insipid, unsupported vivacity, the very husks of *drollery*, bottled small beer, a man out-riding his horse, lewdness and impotence, a fiery actor in a phlegmatic scene, an illiterate and stupid preacher discoursing upon Urim and Thummim, and beating the pulpit cushion in such a manner, as though he would make the dust and the truth fly out of it at once.

Shenstone.

He is making an experiment by another sort of enemies, and sets the apes and *drollies* upon t.

Glanville.

Such august designs as inspire your imivies, used to be decided by *drolling* fantasticks, that have only wit enough to make others and themselves ridiculous.

Id.

As he was running home in all haste, a *droll* takes him up by the way.

L'Estrange.

Men that will not be reasoned into their sensus, may yet be laughed or *drolled* into them.

Id.

Let virtuosos insult and despise on, yet they never shall be able to *droll* away nature.

South.

The vulgar may swallow any sordid jest; any mere *drollery* or buffoonery; but it must be a finer and truer wit which takes with men of sense and good breeding.

Shaftesbury.

Italy may have the preference of all other nations for history painting; Holland for *drolls* and a neat finished manner of working; France for gay, jaunty, fluttering pictures; and England for portraits.

Spectator.

Democritus, dear *droll*! revisit earth,
And with our follies glut thy heightened mirth.

Prior.

Some as justly fame extols,
For lofty lines in Smithfield *drolls*.

Swift.

They hang between heaven and hell, borrow this christian's faith, and the atheist's *drollery* upon it.

Government of the Tongue.

Should the senate-house, where all our lawgivers assemble, be used for a theatre or *droll-house*, or for idle puppet shows? *Watts.*

DROME, a river of France, in Dauphiny, which rises near the entrance of the Val de Drome, on the borders of the department of the Upper Alps, and which, rapidly traversing the department of its own name from east to west, falls into the Rhone between Montelimart and Valence. It is partially navigable.

DROME, a department of France, so named from the foregoing river, comprehends the south-west part of Lower Dauphiny, and is bounded by the departments of the Isere, Upper Alps, Lower Alps, and Vaucluse: the Rhone bounds it on the west. It contains a population of 253,500, among whom there are 34,000 Protestants. The country is high, full of mountains and valleys, and is watered by the Rhone, the Isere, the Drome, and several inferior rivers. In the valley of the Rhone, the mulberry, the almond, the chestnut, walnut, and in some places the olive, are found to thrive; and though the climate is cold, wine is a staple production, particularly the kinds called *Hermitage* and *Vin de Nyons*. Corn is imported yearly to a considerable amount. The stock of cattle is not considerable, the pasturages being for the most part appropriated to the herds of Provence. Wood is in abundance. The manufactures are in the larger towns are linen, woollen, and cotton works. The exports consist of wine, silk, olive and nut oil, and almonds.

DROMEDARY, *n.* Fr. *dromadaire*; Ital. Span. and Port. *dromedario*; Lat. *dromedarius*; Gr. *δρομας*, from *δρομος*, a course, on account of the swiftness of its course. An animal of the *CAMELUS* species, which see.

Straw for the horses and *dromedaries* brought they unto the place. *1 Kings.*

Mules, after these camels and *dromedaries*,

And waggon's fraught with utensils of war. *Milton.*

A sort of camel so called from its swiftness, because it is said to travel a hundred miles a-day. *Dromedaries* are smaller than common camels, slenderer, and more nimble. *Cabinet.*

Or let me have the long

And patient swiftness of the desert-ship:

The helmless *dromedary*;—and I'll bear

Thy fiendish sarcasm with a saintly patience. *Byron.*

DROMORE, a town of Ireland, in the county of Down. It is a very ancient town, and the seat of a bishopric. The see was founded by St. Colman in the sixth century. It was refounded by king James I., who, by his charters (preserved in the rolls office), granted it very great privileges. Among other marks of royal favor, he distinguished the bishops of this see by the style of 'A. B., by Divine Providence bishop of Dromore;' whereas all other bishops in Ireland, except those of Meath and Kildare, are styled 'by Divine Permission.' Dromore lies seventeen miles east of Armagh, and fifteen south-west of Belfast.

DRONE, *n. s. & v. n.* } Belgic *droomigh*,
DRON'ISH, *adj.* } (sleepy).—Minsheu.

DRONEPIPE. } Sax. drane of drygan,
to expel. H. Tooke. Serenius says, of Sax.

droen, to murmur. The bee which makes no honey and only murmurs; hence also a murmuring noise; an idler; a sluggard. To drone is to live idly; to make a low humming noise: *dronish*, idle, lazy, sluggish.

There is a great number of noblemen among you, that are themselves as idle as *drones*; that subsist on other men's labour, on the labour of their tenants whom, to raise their revenues, they pare to the quick. *Sir T. More.*

The sad-eyed justice, with his surly hum,

Delivering o'er to executors pale

The lazy yawning *drone*. *Shakspeare. Henry V.*

Sit idle on the household hearth,

A burdensome *drone*, to visitants a gaze. *Milton.*

What have I lost by my forefather's fault!

Why was I not the twentieth by descent

From a long restive race of *droning* kings? *Dryden.*

Melfoil and honeysuckles pound,
With these alluring savours strew the ground,
And mix with tinkling brass the cymbal's *droning* sound. *Id.*

All, with united force, combine to drive

The lazy *drones* from the laborious hive. *Id. Virgil.*

Luxurious kings are to their people lost;

They live, like *drones*, upon the publick cost. *Id. Aurengzebe.*

It is my misfortune to be married to a *drone*, who lives upon what I get, without bringing any thing into the common stock. *Addison.*

The *dronish* monks, the scorn and shame of manhood,

Rouse and prepare once more to take possession,
To nestle in their ancient hives again. *Rowe.*

Here while his canting *drone-pipe* scanned

The mystic figures of her hand,

He tiptles palmistry, and dines

On all her fortune-telling lines. *Cicaveland.*

You speak with life, in hopes to entertain,

Your elevated voice goes through the brain;

You fall at once into a lower key,

That's worse—the *drone-pipe* of an humble-bee. *Cowper.*

Cobwebs for little flies are spread,

And laws for little folks are made;

But if an insect of renown,

Hornet or beetle, wasp or *drone*,

Be caught in quest of sport or plunder,

The flimsy fetter flies in sunder. *Brattie.*

DRONTHEIM, a town and province of Norway, formerly the capital, and the usual residence of the kings; situated on a gulf of the North Sea. It is nearly surrounded by the ocean and lofty mountains; and has a well-frequented sea-port, which however is not capable of receiving large vessels, on account of rocks at the entrance of the harbour. It is still a bishop's see, is enclosed by a wall, and defended by a castle by no means strong. The houses are mostly of wood. Near it are mines of copper and silver. The principal exports are masts, fir timber, copper, iron, pitch, tar, stock-fish, skins, pot-ash, &c. In exchange, they receive and import spices, wines, salt, brandy, corn, tobacco, cloth, &c. It is 270 miles north-west of Stockholm. Long. 11° 9' E., lat. 63° 26' N. The province of Drontheim is the most northern of the four grand bailliages or dioceses of Norway, and situated on the west coast, between

Bergen, Aggerhuus, the Swedish frontier, and Norrland. In its widest extent it comprises both the last-mentioned province and Finnmark. Drontheim Proper includes eighty-six parishes, with the four towns of Drontheim, Røraas, Christiansand, and Molde. The population of this district has received a marked increase during the last half century; in 1769 it was 105,238, and in 1814, 138,690: including Norrland and Finnmark, the number in 1801 was 239,215. Though full of mountains, and little adapted for cultivation, the progress of rural economy has been of late years very considerable.

DROOP, *v. n.* Dut. *droef* (sorrow); Sax. *drepen*; Isl. *drupa*, from *drop*, almost a cognate word. To languish; bend in sorrow; sink; hang downwards.

I *droop*, with struggling spent;
My thoughts are on my sorrows bent. *Sandys.*

Conceiving the dishonour of his mother,
He straight declined, *drooped*, took it deeply;
Fastened and fixed the shame on 't in himself.
Shakspeare.

I find my zenith doth depend upon
A most auspicious star; whose influence
If now I court not, but omit, my fortunes
Will ever after *droop*. *Id. Tempest.*

I never from thy side henceforth must stray,
Where'er our day's work lies; though now enjoined
Laborious, till day *droop*. *Milton's Paradise Lost.*

His head, though gay,
Carnation, purple, azure, or specked with gold,
Hung *drooping*, unsustained. *Id.*

Can flowers but *droop* in absence of the sun,
Which waked their sweets? and mine, alas! is gone.
Dryden.

When factious rage to cruel exile drove
The queen of beauty and the court of love,
The muses *drooped* with their forsaken arts. *Id.*

When by impulse from heaven Tyrtæus sung,
In *drooping* soldiers a new courage sprung.
Roscommon.

I'll animate the soldiers' *drooping* courage
With love of freedom and contempt of life.
Addison's Cato.

I saw him ten days before he died, and observed
he began very much to *droop* and languish. *Swift.*

On her heaved bosom hung her *drooping* head,
Which with a sigh she raised, and this she said.
Pope.

With secret sighs the virgin lily *droops*,
And jealous cowslips hang their tawny cups.
Darwin.

ISA. Nay, Don Jerome, you promised her forgiveness; see how the poor creature *droops*!

JER. *Droops*, indeed! Why, gad take me, this is old Margaret—but where's my daughter, where's Louisa?
Sheridan.

Little he cared how sped the bower,
And little marked the *drooping* flower,
But wandering through the bushy brake,
Thus in bewildered accents spake. *Id.*

I see before me the Gladiator lie:
He leans upon his hand—his manly brow
Consents to death, but conquers agony,
And his *drooped* head sinks gradually low—
And through his side the last drops, ebbing slow
From the red gash, fall heavy.

The winds were pillowed on the waves,
The banners *drooped* along their staves,
And, as they fell around them furling,
Above them shone the crescent curling. *Id.*

DROP, *v. a., v. n. & n. s.* } Goth. *dropa*;
DROPLET, } Saxon *dropian*;
DROPPING, *n. s.* } Germ. and Dutch
dropfen; Swed. and Dan. *dryppe*. To let fall in small particles; hence let go; quit; speak casually; intermit; suffer to vanish or expire: as a neuter verb, to fall in drops; hence to fall generally; to come casually; to sink, die. Drop-let is a diminutive of drop.

His heavens shall *drop* down dew.
Deut. xxxiii. 28.

The heavens *dropped* at the presence of God.
Psaln lxxviii. 8.

Drop not thy word against the house of Isaac.
Amos.

It was your presumise,
That in the dole of blows your son might drop.
Shakspeare.

The quality of mercy is not strained;
It *droppeth* as the gentle rain from heaven
Upon the place beneath.

Id. Merchant of Venice.
Meet we the medicine of our country's weal,
And with him pour we, in our country's purge,
Each drop of us. *Id. Macbeth.*

Though I could
With barefaced power sweep him from my sight,
And bid my will avouch it; yet I must not,
For certain friends that are both his and mine,
Whose loves I may not drop. *Id.*

Thou abhorrest in us our human griefs,
Scorned our brine's flow, and those our droplets, which
From niggard nature fall. *Id. Timon.*

Thrifts wench scrapes kitchen-stuff,
And barrelling the *droppings* and the snuff
Of wasting candles. *Donne.*

Nothing, says Seneca, so soon reconciles us to
the thoughts of our own death, as the prospect of
one friend after another *dropping* round us.

Digby to Pope.
So mayest thou live, till, like ripe fruit, thou drop
Into thy mother's lap; or be with ease
Gathered, not harshly plucked. *Milton.*

Or sporting, with quick glance,
Shew to the sun their waved coats, *dropped* with gold.
Id.

So thick a drop serene hath quenched their orbs,
Or dim suffusion veiled! *Id. Paradise Lost.*

Admiring in the gloomy shade,
Those little drops of light. *Waller.*

Whereas Aristotle tells us, that if a drop of wine
be put into ten thousand measures of water, the wine,
being overpowered by so vast a quantity of water, will
be turned into it; he speaks very improbably. *Boyle.*

One only hag remained:
Propped on her trusty staff, not half upright,
And *dropped* an awkward courtesy to the knight.
Dryden.

Either you come not here, or, as you grace
Some old acquaintance, drop into the place,
Careless and qualmish, with a yawning face. *Id.*

Beneath a rock he sighed alone,
And cold Lyceus wept from every *dropping* stone.
Id.

Had I but known that Sancho was his father,
I would have poured a deluge of my blood
To save one drop of his. *Id. Spanish Histor.*

*I have beat the hoof till I have worn out these shoes
in your service; and not one penny left me to buy
more; so that you must even excuse me if I drop you
here.* *L'Estrange.*

The thoughts that come often unsought, and, as it
were, *drop* into the mind, are commonly the most va-
luable of any we have, and therefore should be se-
cured, because they seldom return again. *Locke.*

St. Paul's epistles contain nothing but points of
Christian instruction, amongst which he seldom fails to
drop in the great and distinguishing doctrines of
our holy religion. *Id.*

Repentance hath a purifying power, and every tear
is of a cleansing virtue; but these penitential clouds
must be still kept *dropping*; one shower will not suffice;
for repentance is not one single action but a course.

South.

He could never make any figure in company, but by
giving disturbance at his entry: and therefore takes
care to *drop* in when he thinks you are just seated.

Spectator, No. 448.

Thus was the fame of our Saviour perpetuated by
such records as would preserve the traditional account
of him to after-ages; and rectify it, if, by passing
through several generations, it might *drop* any part
that was material. *Addison.*

Virgil's friends thought fit to let *drop* this incident of
Helen. *Id. Travels.*

In every revolution, approaching nearer and nearer
to the sun, this comet must at last *drop* into the sun's
body. *Cheyne.*

Where the act is unmanly or immoral, we ought to
drop our hopes, or rather never entertain them.

Collier on Despair.

After having given this judgment in its favour, they
suddenly *drop* the pursuit. *Sharp's Surgery.*

Philosophers conjecture that you *dropped* from the
moon, or one of the stars. *Gulliver's Travels.*

St. John himself will scarce forbear

To bite his pen and *drop* a tear. *Swift.*

Opinions, like fashions, always descend from those
of quality to the middle sort, and thence to the vulgar,
where they are *dropped* and vanish. *Id.*

The *drops* to thee, Brillante, we consign;

And, Momentilla, let the watch be thine. *Pope.*

I heard of threats occasioned by my verses: I sent
to acquaint them where I was to be found, and so it
dropped. *Id.*

Strain out the last dull *droppings* of your sense,
And rhyme with all the rage of impotence. *Id.*

The most affluent may be stript of all, and find his
worldly comforts like so many withered leaves *dropping*
from him. *Sterne.*

Those who have assumed visible shapes for a season,
can hardly be reckoned among this order of com-
pounded beings; because they *drop* their bodies, and
divest themselves of those visible shapes.

Watts's Logic.

Constancy in friendships, attachments, and familia-
rities, is commendable, and is requisite to support
trust and good correspondence in society. But in
places of general, though casual concourse, where the
pursuit of health and pleasure brings people promiscu-
ously together, public convenience has dispensed
with this maxim; and custom there promotes an un-
reserved conversation for the time, by indulging the
privilege of *dropping* afterwards every indifferent ac-
quaintance without breach of civility or good manners.

Hume.

Evening now from purple wings
Sheds the grateful gifts she brings;
Brilliant *drops* bedeck the mead,
Cooling breezes shake the reed.

Johnson. Ode to Evening.

Shrouded Nile,

Eridanus, and Tiber with his twins,
And palmy Euphrates: they with *dropping* locks
Hang o'er their urns, and mournfully among
The plaintive-echoing ruins pour their streams.

Byron.

DROPS, in meteorology, small spherical bodies,
which the particles of fluids spontaneously form
themselves into when let fall from any height.
This spherical figure, the Newtonian philoso-
phers demonstrate to be the effect of corpuscular
attraction; for, considering that the attractive
force of one single particle of a fluid is equally
exerted to an equal distance, it must follow,
that other fluid particles are on every side drawn
to it, and will therefore take their places at an
equal distance from it, and consequently form a
round superficies.

DROPSY,

DROPSICAL, *adj.*

DROPSIED, *adj.*

} Fr. *hydropisie*; Span. and
Port. *dropesia*, or *tropesia*;
Lat. *hydrops*; Gr. *ὕδρωψ*,
from *ὕδωρ*, water. A disease which accumulates
water in different parts of the body. See below.

Where great addition swells, and virtue none,
It is a *dropied* honour: good alone
Is good. *Shakespeare. All's Well that Ends Well.*

There note they the ship's sicknesses, the mast
Shaked with an ague, and the hold and waist
With a salt *dropie* clogged. *Donne.*

Revenge, that thirsty *dropsey* of our souls,
Which makes us covet that which hurts us most,
Is not alone sweet, but partakes of tartness.

Massinger.

The diet of nephritick and *dropical* persons ought
to be such as is opposite to, and subdueth the alkale-
cent nature of the salts in the serum of the blood.

Arbuthnot on Aliments.

A tendency to these diseases is certainly hereditary,
though perhaps not the diseases themselves; thus a
less quantity of ale, cyder, wine, or spirit, will induce
the gout and *dropsey* in those constitutions, whose pa-
rents have been intemperate in the use of those li-
quors; as I have more than once had occasion to
observe. *Darwin.*

She likewise hinted that a certain widow in the next
street had got rid of her *dropsey*, and recovered her
shape in a most surprising manner. *Sheridan.*

DROPSY (*ὕδρωψ*), a collection of a serous fluid
in the cellular membrane, the viscera, or other
cavities of the body. For the general description
of this disease, see HYDROPS; for dropsey of the
belly, see ASCITES; for dropsey of the brain, HY-
DROCEPHALUS; for dropsey of the chest, HYDRO-
THORAX; for dropsey of the skin, ANASARCA;
for dropsey of the testicle, HYDROCELE.

DROSERA, *ros solis*, or sun-dew, in botany,
a genus of the pentagynia order, and pentandria
class of plants; natural order fourteenth, gru-
inales: CAL. quinquefid, petals five: CAPS. unilo-
cular, and quinquevalved at top: SEEDS very
numerous. Species eleven, which grow natu-
rally in boggy places, in many parts of the king-
dom. They are named sun-dew from a very
striking circumstance in their appearance. The
leaves, which are circular, are fringed with hairs,
supporting small drops or globules of a pellucid
liquor like dew, which continue even in the hot-
test part of the day, and in the fullest exposure
to the sun. The whole plant is acrid, and suffi-
ciently caustic to erode the skin; but some ladies

know how to mix the juice with milk, so as to make it an innocent and safe application to remove freckles and sun-burn. The juice that exudes from it unmixed, will destroy warts and corns.

DROSOMELI, *δροσόμελι*, from *δρόσος*, dew, and *μέλι*, honey; manna.

DROSOMETER, an instrument for ascertaining the quantity of dew which falls in a given time. It consists of a balance, one end of which is furnished with a plate fitted to receive the dew, the other containing a weight protected from it.

DROSS, *n. s.* } Sax. *drof*; Goth. *drits*;
DROSSINESS, } Belg. *droes*, from ancient Teut.

DROSSY, *adj.* } *draussen*, the exterior. The
 crement of metals; and hence, rust, refuse.

Fair proud, now tell me why should fair be proud,
 Sith all world's glory is but *dross* unclean:
 And in the shade of death itself shall shroud,
 However now thereof ye little ween? *Spenser.*

Some scanned the *dross* that from the metal came,
 Some stirred the molten ore with ladles great,
 And every one did swink, and every one did sweat.
Id.

DROTCHEL, *n. s.* Corrupted perhaps from *dretched*. To dretch, in Chaucer, is to idle, to delay. *Droch*, in Frisick, is delay. An idle wench; a slugard. In Scotland it is still used.

DROUAIS (John Germain), born at Paris, 1763, the most distinguished painter of the school of David. His desire of going to Rome to study the great works of art, induced him to enter the lists for the great prize, which consisted of a pension for four years; but, being dissatisfied with his work, he destroyed it, and left the prize to another. When reproached for this by his master, who saw with surprise the remains of his picture, he said, "Are you satisfied with me?" "Perfectly," answered David. "Well, then, I have gained the prize," returned Drouais, "this was my aim; the prize of the academy belongs to another, to whom it may be more useful than it would have been to me; the next year I hope to deserve it by a better work." In 1784, Drouais again entered the lists. The Canaanitish woman at the feet of Jesus was the fruit of his study. He was publicly crowned, and led in triumph, by his fellow students, to their master. He accompanied him as a pensioner to Rome, where he studied and copied the greatest masters. His Dying Gladiator, and, particularly, his Marius at Minturnæ, on being exhibited in Paris, gained him and David's school a new triumph. He now sketched his Philoctetes at Lemnos; but his career was suddenly checked by an inflammatory fever, which put an end to his life before he had completed his 25th year, and while he was engaged on a picture of Caius Gracchus. His rivals and his friends united in erecting a monument to him in St. Mary's church (in the Via Lata).

DROUGHT, *n. s.* } From Sax. *drygan*, to
DROUGHTY, *adj.* } dry. This word is evidently a corruption of dryth, as it was anciently written; it next became drowth, and, lastly, drought. Dry weather; want of rain; thirst; want of drink.

O earth! I will befriend thee more with rain
 Than youthful April shall with all his showers
 In summer's drought I'll drop upon thee still.

Great droughts in summer, lasting till the end of August, some gentle showers upon them, and then some dry weather, portend a pestilent summer the year following. *Bacon.*

To south the Persian bay,
 And inaccessible the Arabian drought. *Milton.*
 One, whose drought

Yet scarce allayed, still eyes the current stream,
 Whose liquid murmur heard new thirst excites. *Id.*

They were so learned in natural philosophy, that they foretold earthquakes and storms, great droughts, and great plagues. *Temple.*

In a drought, the thirsty creatures cry,
 And gape upon the gathered clouds for rain. *Dryden.*

Upon a shower, after a drought, earthworms and land-snails innumerable come out of their lurking places. *Ray.*

If the former years
 Exhibit no supplies, alas! thou must
 With tasteless water wash thy droughty throat. *Philips.*

O ye wild groves, O where is now your bloom!
 (The Muse interprets thus his tender thought)
 Your flowers, your verdure, and your balmy gloom,
 Of late so grateful in the hour of drought! *Beattie.*

DROWN, *v. a. & v. n.* From Germ. *drunden*, below.—Skinner. From Sax. *drumenian*.—Mr. Lye. Teut. *traiden*; Swed. *dranka*. To suffocate in water; sink; immerse in water; and hence to lose in something that overpowers; to be suffocated with water.

There be, that keep them out of fire, and yet was never burned; that beware of water, and yet was never nigh drowning. *Ascham's Schoolmaster.*

Who cometh next will not follow that course however good, which his predecessors held, for doubt to have his doings drowned in another man's praise. *Spenser on Ireland.*

Methought what pain it was to drown!
 What dreadful noise of waters in my ears!
Shakspeare.

Or so much as it needs
 To dew the sovereign flower, and drown the weeds. *Id.*

Galleys might be drowned in the harbour with the great ordnance, before they could be rigged. *Knolles's History.*

Most men being in sensual pleasures drowned,
 It seems their souls but in their senses are. *Davies.*
 That the brightness of the sun doth drown our discerning of the lesser lights, is a popular error. *Wotton.*

They would soon drown those that refused to swim down the popular stream. *King Charles.*

Here was nothing but a majestic terror in the eyes, in the ears of the Israelites.—Here was lightning darted in their eyes, the thunders roaring in their ears, the trumpet of God drowning the thunder claps, the voice of God out-speaking the trumpet of the angel. *Bp. Hall. Contemplations.*

Whatever he (an obstinate man) lays hold on, like a drowning man, he never loses, though it do but help him to sink the sooner. *Bulwer.*

Betwixt the prince and parliament we stand,
 The barriers of the state on either hand:
 'Tay neither overflow, for then they drown the land. *Dryden.*

My private voice is drowned amid the senate.

Addison.

When of God's image only eight he found
Snatched from the watery grave, and saved from na-
tions drowned.

Prior.

The innocent gambols of a few otters have been
known to occasion those yells, which the vulgar of
this country mistake for laughing or crying, and as-
cribe to a certain goblin, who is supposed to dwell
in the waters, and to take delight in drowning the
wilderer traveller.

Beattie.

Care, mad to see a man sae happy,
E'en drowned himself amang the nappy;
As bees flee hame wi' lades o' treasure,
The minutes winged their way wi' pleasure.

Burns.

Thus drownings are much talked of by the divers,
And swimmers who may chance to be survivors.

Byron.

DROWNING, the extinction of life by a total immersion in water. In some respects, there seems to be a great similarity between the death occasioned by immersion in water, and that by strangulation, suffocation by fixed air, apoplexies, epilepsies, sudden faintings, violent shocks of electricity, or even violent falls and bruises. Physicians, however, are not agreed with regard to the nature of the injury done to the animal system, in any or all of these accidents. It is indeed certain that, in all the cases above mentioned, particularly in drowning, there is very often such a suspension of the vital powers, as to us has the appearance of a total extinction of them; while yet they may be again set in motion, and the person restored to life, after a much longer submersion than has been generally thought capable of producing absolute death.

The length of time during which a person may remain in water without being drowned, is very unequal in different individuals; and depends as much on the temperature of the water as on the particular constitution of the subject: in general, however, there is less prospect of recovery, after having continued fifteen minutes immersed in water. In such cases, death ensues from impeded respiration, and the consequent ceasing of the circulation of the blood, by which the body loses its heat, and, with that, the activity of the vital principle. Dr. Goodwyn justly observes, that the water produces all the changes which take place in drowning, only indirectly, by excluding the atmospheric air from the lungs, as they admit but a very inconsiderable quantity of fluid to pass into them, during immersion. Hence we shall find, in the progress of this enquiry, that inflation of the lungs is one of the principal means of restoring life.

Notwithstanding the differences in theory among physicians, it is certain, that great numbers of drowned people have been restored to life, by a proper use of remedies; and societies for recovering drowned persons have been instituted in different places. The first society of this kind was instituted in Holland, where, from the great abundance of canals and inland seas, the inhabitants are particularly exposed to accidents by water. In a very few years 150 persons were saved from death by this society; and many of these had continued upwards of an hour without any signs of life, after they had been

taken out of the water. The society was instituted at Amsterdam in 1767; and, by an advertisement, informed the inhabitants of the United Provinces of the methods proper to be used on such occasions, offering rewards at the same time to those who should, with or without success, use those methods for recovering persons drowned and seemingly dead. The laudable and humane example of the Dutch was followed, in 1768, by the magistrates of health in Milan and Venice; afterwards by the magistrates of Hamburg in 1771, by those of Paris in 1772, and by those of London in 1774. Similar societies have since been instituted at Leith, Glasgow, Aberdeen, and many other places.

The Royal Humane Society of London has circulated the following directions on this important subject:—I. As soon as the patient is taken out of the water, the wet clothes, if the person is not naked at the time of the accident, should be taken off with all possible expedition on the spot (unless some convenient house be very near), and a great coat or two, or some blankets if convenient, should be wrapped round the body. II. The patient is to be thus carefully conveyed in the arms of three or four men, or on a bier, to the nearest public or other house, where a good fire, if in the winter season, and a warm bed, can be made ready for its reception. As the body is conveying to this place, great attention is to be paid to the position of the head; it must be kept supported in a natural and easy posture, and not suffered to hang down. III. In cold or moist weather, the patient is to be laid on a mattress or bed before the fire, but not too near, or in a moderately heated room: in warm or sultry weather, on a bed only. The body is then to be wrapped as expeditiously as possible with a blanket, and thoroughly dried with warm coarse cloths or flannels. IV. In summer or sultry weather too much air cannot be admitted. For this reason it will be necessary to set open the windows and doors, as cool refreshing air is of the greatest importance in the process of resuscitation. V. Not more than six persons are to be present to apply the proper means; a greater number will be useless, and may retard, or totally prevent, the restoration of life, by rendering the air of the apartment unwholesome. It will be necessary, therefore, to request the absence of those who attend merely from motives of curiosity. VI. It will be proper for one of the assistants, with a pair of bellows of the common size, applying the pipe a little way up one nostril, to blow with some force, in order to introduce air into the lungs; at the same time the other nostril and the mouth are to be closed by another assistant, whilst a third person gently presses the chest with his hands, after the lungs are observed to be inflated. By pursuing this process, the noxious and stagnated vapors will be expelled, and natural breathing imitated. If the pipe of the bellows be too large, the air may be blown in at the mouth, the nostrils at the same time being closed, so that it may not escape that way: but the lungs are more easily filled, and natural breathing better imitated, by blowing up the nostril. VII. Let the body be gently rubbed with common salt, or with flannels

sprinkled with spirits, as rum or geneva. Dr. Fothergill of Bath advises mustard moistened with spirits. A warming-pan heated (the body being surrounded with flannel) may be lightly moved up and down the back. Fomentations of hot brandy are to be applied to the pit of the stomach, loins, &c., and often renewed. Bottles filled with hot water, heated tiles covered with flannel, or hot bricks, may be efficaciously applied to the soles of the feet, palms of the hands, and other parts of the body. The temples may be rubbed with hartshorn, and the nostrils now and then tickled with a feather; and snuff, or eau de luce, should be occasionally applied.

VIII. Tobacco fumes should be thrown up the fundament; if a fumigator be not at hand, the common pipe may answer the purpose. The operation should be frequently performed, as it is of importance; for the good effects of this process have been experienced in a variety of instances of suspended animation. But should the application of tobacco smoke in this way not be immediately convenient, or other impediments arise, clysters of this herb, or other acrid infusions with salt, &c., may be thrown up with advantage. IX. When these means have been employed a considerable time without success, and any brewhouse or warm bath can be readily obtained, the body should be carefully conveyed to such a place, and remain in the bath, or surrounded with warm grains, for three or four hours. If a child has been drowned, its body should be wiped perfectly dry, and immediately placed in bed between two healthy persons. The salutary effects of the natural vital warmth, conveyed in this manner, have been proved in a variety of successful cases. X. While the various methods of treatment are employed, the body is to be well shaken every ten minutes, in order to render the process of animation more certainly successful; and children, in particular, are to be much agitated, by taking hold of their legs and arms frequently and for a continuance of time. In various instances, agitation has forwarded the recovery of boys who have been drowned, and continued for a considerable time apparently dead. XI. If there be any signs of returning life, such as sighing, gasping, or convulsive motions, a spoonful of any warm liquid may be administered; and if the act of swallowing is returned, then a cordial of warm brandy or wine may be given in small quantities, and frequently repeated. XII. Electricity may be tried by the judicious and skilful, as its application neither prevents nor retards the various modes of recovery already recommended; but, on the other hand, will most probably tend to render the other means employed more certainly and more expeditiously efficacious. This stimulus bids fair to prove an important auxiliary in cases of suspended animation; and therefore deserves the serious regard and attention of the faculty. These methods are to be employed with vigor for three hours or upwards, although no favorable circumstances should arise; for it is a dangerous opinion to suppose that persons are irrecoverable, because life does not soon make its appearance; an opinion that has consigned to the grave an immense number of the seemingly dead, who

might have been restored to life by resolution and perseverance. Bleeding is never to be employed in such cases, unless by the direction of one of the medical assistants, or some other gentleman of the faculty who has paid attention to the resuscitating art. The Royal Humane Society of London has, for a series of years, offered premiums for machines and other inventions to save mariners and other persons from drowning in cases of shipwreck, or other accidents at sea. The committee of the Society have also recommended several inventions for enabling persons to swim from a wreck to the shore; particularly the cork or marine spencer, described under the article CORK, and the Life Preserver, invented by Mr. Daniel, of Wapping. This last is a sort of bag made of water-proof leather, which wraps round the body just under the arm-pits, and may be inflated like a bladder in the space of half a minute, by blowing with the breath through a silver tube, furnished with a stop-cock, which is to be turned when the machine is full of air.

DROWSE, *v. a. & v. n.* } Dut. *droosen*, from
DROWS'IED, *n. s.* } Goth. *dur*, lightly, and
DROWS'ILY, *adv.* } doze. To make or be
DROWS'INESS, } heavy with sleep;
DROWS'Y, *adj.* } to slumber; to make
heavy. Drowsied is used by Spenser for drowsiness.

The day is spent, and cometh drowsie night,
When every creature shrouded is in sleepe.

Spenser. *Faerie Queene.*

The royal virgin shook off drowsied;
And rising forth out of her baser boure,
Looked for her knight. *Faerie Queene.*
Up, up, my drowsy soul! where thy new ear
Shall in the angels' songs no discord hear.

Donne.

What a strange drowsiness possesses them!

Shakspeare.

They rather drowsed and hung their eyelids down,
Slept in his face, and rendered such aspect
As cloudy men use to their adversaries.

Id. *Henry VI.*

We satisfy our understanding with the first things,
and, thereby satiated, slothfully and drowsily sit down.

Raleigh.

Men are drowsy, and desirous to sleep, before the fit
of an ague, and do use to yawn and stretch.

Bacon's *Natural History.*

In deep of night, when drowsiness
Hath locked up mortal sense, then listen I
To the celestial syren's harmony. *Milton.*

All their shapes

Spangled with eyes, more numerous than those
Of Argus; and more wakeful than to drowse,
Charmed with Arcadian pipe. *Id. Paradise Lost.*

There gentle sleep

First found me, and with soft oppression seized
My drowsed senses uncontrolled. *Id.*

Drunk at last, and drowsy they depart
Each to his house. *Dryden.*

The air swarms thick with wandering deities,
Which drowsingly like humming-beetles rise. *Id.*

Drowsy am I, and yet can rarely sleep.

Sidney.

He that from his childhood has made rising betimes
familiar to him, will not waste the best part of his life
in drowsiness and lying a-bed. *Locke.*

He passes his whole life in a dozed condition,
between sleeping and waking, with a kind of drowsiness
and confusion upon his senses. *South.*

What succour can I hope the muse will send,
Whose drowsiness hath wronged the muse's friend ?
Crashaw.

While thus she rested, on her arm reclined,
The hoary willows waving with the wind,
And feathered quires that warbled in the shade,
And purring streams that through the meadow strayed,
In drowsy murmurs lulled the gentle maid. *Addison.*

A sensation of drowsiness, oppression, and lassitude, are signs of a plentiful meal in young people.

Those inadvertencies, a body would think, even our author, with all his drowsy reasoning, could never have been capable of.
Arbutnot.
Atterbury.

The flowers, called out of their beds,
Start and raise up their drowsy heads.

Now while the drowsy world lies lost in sleep,
Let me associate with the serious night,
And contemplation, her sedate compeer.
Cleveland.

Amidst the drowsy charms of dull delight,
Year chases year with unremitting flight,
Till want now following, fraudulent and slow,
Shall spring to seize thee like an ambushed foe.
Thomson.

A dull rotation, never at a stay,
Yesterday's face, twin image of to-day ;
While conversation, an exhausted stock,
Grows drowsy as the clicking of a clock.
Dr. Johnson's Poems.

The drowsy dungeon-clock had numbered two,
And Wallace tower had sworn the fact was true :
The tide-sworn Frith, wi' sullen sounding roar,
Through the still night dashed hoarse along the shore.
Cowper.

DRUB, *v. a. & n. s.* } Dan. *druber*, to kill ;
DRUB'ING, *n. s.* } Swed. *drabba* ; Island.
drybba, to fight. To beat soundly ; to give blows ;
also, the beating given, for which a drubbing is
the common substantive of low conversation.

He that is valiant, and dares fight,
Though drubbed, can lose no honour by it.
Burns.

The blows and drubs I have received
Have bruised my body, and bereaved
My limbs of strength. *Hudibras.*
The little thief had been soundly drubbed with a
good honest cudgel. *Id.*
Though the bread be not mine, yet, if it had been
less than weight, I should have been drubbed.
L'Estrange.

By setting an unfortunate mark on their followers,
they have exposed them to innumerable drubs and
contusions. *Locke.*
Addison.

In the rude state of society, prior to the existence
of laws, if one man gave another ill language, the
affronted person might return it by a box on the ear ;
and if repeated, by a good drubbing. *Franklin.*

DRUDGE, *v. n.* } Sax. *dreogan* ; Dutch
DRUD'GER, *n. s.* } *drughen* ; perhaps from
DRUD'G'ERY, } Dr which see. To
DRUD'G'INGLY, *adv.* } labor in heavy or servile
DRUG, *n. s.* } work : a drudger is he
who thus labors, and drudgery the work done.
Shakspeare has drugge for drudge in his first fol.
edit. See the passage given below from Timon
of Athens.

My old dame will be undone for one to do her husbandry and her drudgery. *Shakspeare.*

To conclude, this drudge of the devil, this diviner,
laid claim to me. *Id. Comedy of Errors.*

He from his first swath proceeded
Through sweet degrees that this brief world affords,
To such as may the passive drudge of it
Freely command. *Id. Timon of Athens.*

Those whom the Egyptians honoured before as lords,
now they condemn as drudges.

Bp. Hall. Contemplations.
A high spirited man is above the world and its
drudgery, and cannot pull down his thoughts to the
pelting business of life. *Rp. Eurlie.*

He sits above and laughs the while,
At thee, ordained his drudge, to execute
Whate'er his wrath shall bid.

Milton's Paradise Lost,
And to cracked fiddle, and hoarse tabour,
In merriment, did drudge and labour. *Hudibras*

It is not poetry, that makes men poor ;
For few do write, that were not so before ;
And those that have writ best, had they been rich,
Had ne'er been seized with a poetic itch ;
Had loved their ease too well, to take the pains
To undergo that drudgery of brains ; *Id.*
Advantages obtained by industry, directed by philosophy, can never be expected from drudging ignorance. *Glanville.*

The hard master makes men serve him for nought,
who rewards his drudges and slaves with nothing but
shame, and sorrow, and misery. *Tillotson.*

The poor sleep little : we must learn to watch
Our labours late, and early every morning,
Midst winter frosts ; then, clad and fed with sparing,
Rise to our toils, and drudge away the day. *Otway.*

To thee that drudgery of power I give ;
Cares be thy lot : reign though, and let me live.
Dryden.

Paradise was a place of bliss, as well as immortality,
without drudgery, and without sorrow. *Locke.*

Were there not instruments for drudgery as well as
offices of drudgery ? Were there not people to receive
orders, as well as others to give and authorise them ?
L'Estrange.

You do not know the heavy grievances,
The toils, the labours, weary drudgeries,
Which they impose. *Southern's Oroonoko.*

He does now all the meanest and triflingest things
himself drudgingly, without making use of any inferior
or subordinate minister. *Ray on the Creation.*

What is an age, in dull renown drudged o'er !
One little single hour of love is more. *Gracille.*

Even Drudgery himself,
As at the car he sweats, or dusty hews
The palace stone, looks gay. *Thomson's Summer.*

It is now handled by every dirty wench, and con-
demned to do her drudgery.

Swift's Meditations on a Broomstick.
A man of wit is not incapable of business, but
above it. A sprightly generous horse is able to carry
a pack-saddle as well as an ass ; but he is too good
to be put to the drudgery. *Pope.*

I knew that the work in which I engaged is gene-
rally considered as drudgery for the blind, as the pro-
per toil of artless industry.

Johnson. Plan of Dictionary.
But I am bankrupt now ; and doomed henceforth
To drudge, in descaut dry, on others' lays ;
Bards, I acknowledge, of unequalled worth !
But what is commentators' happiest praise ? *Cowper.*

The poor, inured to drudgery and distress,
Act without aim, think little, and feel less,
And no where, but in feigned Arcadian scenes,
Taste happiness, or know what pleasure means. *Id.*

Think ye, that sic as you and I,
Wha *drudge* and drive through wet and dry,
Wi' never-ceasing toil. *Burns.*

DRUGGING-BOX. See DREGGING-BOX.
DRUG, *n. s. & v. a.* } Fr. *drogue*; Span.
DRUG'GET, *n. s.* } and Ital. *droga*; prob-
DRUG'GIST, } ably from Sax. *drug*;
DRUG'STER, } Gr. *τροφη*, dry; drugs

properly signifying dry medicines: and hence any thing dried up or worthless. *Drugget* is a light, common kind of stuff: *druggist* and *drugster*, a seller of drugs.

Mortal *drugs* I have; but Mantua's law
Is death to any he that utters them. *Shakspeare.*
The surfeited grooms

Do mock their charge with snores.—I've *drugged* their
possets,
That death and nature do contend about them. *Id.*

The poore people, the good physician prescribes
cheap but wholesome medicines; not removing the
consumption out of their bodies into their purses, nor
sending them to the East Indies for *drugs* which they
can reach better out of their gardens. *Fuller.*

Of't they assayed,
Hunger and thirst constraining; *drugged* as oft
With hatefulest disrelish, writhed their jaws
With soot and cinders filled. *Milton's Paradise Lost.*

A fleet descried
Hangs in the clouds, by equinoctial winds
Close sailing from Bengal, or the isles
Of Ternate and Tidore, whence merchants bring
Their spicy *drugs*. *Id.*

In the names of *drugs* and plants, the mistake in a
word may endanger life.

Baker's Reflections on Learning.
Common nitre we bought at the *druggist's*. *Boyle.*
Common oil of turpentine I bought at the *drugster's*.
Id.

Each noble vice
Shall bear a price
And virtue shall a *drug* become.
An empty name,
Was all her fame,
But now she shall be dumb.

Dryden's Albion.

In *druggets* drest, of thirteen pence a-yard,
See Philip's son amidst his Persian guard. *Swift.*

They set the clergy below their apothecaries, the
physician of the soul below the *drugsters* of the body.
Atterbury.

Judicious physick's noble art to gain,
He *drugs* and plants explored, alas! in vain. *Smith.*
Bright Helen mixed a mirth-inspiring bowl,
Tempered with *drugs* of sov'reign use, to assuage
The boiling bosom of tumultuous rage.

Pope's Odyssey.

But O the' important budget! ushered in
With such heart-shaking music, who can say
What are its tidings? have our troops awaked?
Or do they still, as if with opium *drugged*,
Snore to the murmurs of the' Atlantic wave?
Cowper.

For Inez called some *druggists* and physicians,
And tried to prove her loving lord was mad,
But as he had some lucid intermissions,
She next decided he was only bad. *Byron.*

DRUGGET, a slight kind of woollen stuff, some-
times made all wool, sometimes half wool half
thread; sometimes corded, but usually plain.
Those that have the woof of wool, and the warp
of thread, are called threaded *druggets*; and
those wrought with the shuttle on a loom of four

marches, as the serges of Moui, Beauvois, and
other like stuffs corded, are called corded *drug-*
gets. The plain are wrought on a loom of two
marches, with the shuttle, in the same manner
as cloths, camblets, and other like stuffs not
corded.

DRUID, *n. s. & adj.* Gr. *δρυς*, Celt. *deru*;
Welsh and Arm. *derw*, an oak. An ancient
priest of Gaul and Britain. See below.

In yonder grave a *druid* lies
Where slowly steals the winding waves. *Collins.*
Sage beneath a spreading oak
Sat the *druid*, hoary chief;
Every burning word he spoke
Full of rage and full of grief. *Cowper.*

It stood embosomed in a happy valley,
Crowned by high woodlands, where the *druid* oak
Stood like Caractacus in act to rally
His host with broad arms 'gainst the thunder-
stroke. *Byron.*

DRUIDS, **DRUIDES**, or **DRUIDÆ**, the priests
or ministers of religion among the ancient Gauls,
Britons, and Germans. Picard (Celtoped. lib.
ii. p. 58) believes the druids to have been thus
called from *Druis*, or *Dryius*, their leader, the
fourth or fifth king of the Gauls, and father of
Saron or Naumes. Pliny, Salmatius, Vigenere,
&c., derive the name from *δρυς*, an oak; on ac-
count of their inhabiting, or frequenting, and
teaching in forests; or because they never sacri-
ficed but under the oak. Menage derives the
word from the old British *drus*, *dæmon*, or ma-
gician: Borel, from the Saxon *dry*, magician; or
from the old British *dru* or *derw*, 'oak,' whence
he takes the Greek word *δρυς* to be derived;
which is the most probable supposition. Gorop.
Becanus, lib. i. takes *druids* to be an old Celtic
and German word, formed from *trouis* or *truwis*,
'a doctor of the truth and the faith;' which ety-
mology Vossius also approves.

The druids were the first and most distin-
guished order among the Gauls and Britons;
they were chosen out of the best families; and
the honors of their birth, joined with those of
their function, procured them the highest veneration
among the people. They were versed in
astrology, geometry, natural philosophy, politics,
and geography; they were the interpreters of
religion, and the judges of all affairs indifferently.
Whoever refused obedience to them was declared
impious and accursed. We know but little as
to their peculiar doctrines; only that they be-
lieved the immortality of the soul; and the me-
tempsychosis. Their chief settlement in Britain
was in the isle of Anglesea, the ancient Mona,
which was well stored with spacious groves of
their favorite oak. They were divided into se-
veral classes. Strabo, however, only distin-
guishes three kinds, *bardi*, *vates*, and *druids*.
The *bardi* were the poets; the *vates*, *harætes*, were
the priests and naturalists; and the *druids*, be-
sides the study of nature, applied themselves to
morality. Diogenes Laertius assures us, that
the druids were the same among the ancient
Britons with the philosophers among the Greeks;
the magi among the Persians; the gymnosophists
among the Indians; and the Chaldeans among
the Assyrians. Their garments were remarkably
long; and, when employed in religious cere-

monies, they wore a white surplice. They generally carried a wand in their hands; and wore a kind of ornament enchased in gold about their necks, called the druid's egg. See *ANGUINUM OVUM*. Their necks were also decorated with gold chains, and their hands and arms with bracelets: they wore their hair very short, and their beards remarkably long. The druids had one chief or arch-druid, in every nation, who acted as high-priest. He had absolute authority over the rest; and commanded, decreed, punished, &c., at pleasure. At his death he was succeeded by the most considerable among the survivors; and, if there were several pretenders, the matter was ended by an election, or else decided by arms. The druids presided at sacrifices, and other ceremonies; and had the direction of every thing relating to religion. The British and Gaulish youth were instructed by them. The children of the nobility, Mela tells us, they carried into caves, or the most desolate parts of forests, and kept them there, sometimes for twenty years, under their discipline. They were here instructed in the motion of the heavens, and the course of the stars; the magnitude of the heavens and the earth; the power and wisdom of the gods, the metempsychosis, immortality, &c. They preserved the memory and actions of great men in their verses, which they never allowed to be written down, but made their pupils get them by heart. In their common course of learning, they are said to have taught them 24,000 such verses. Thus their doctrines appeared more mysterious by being unknown to all but themselves; and, having no book to recur to, they were the more careful to fix them in their memory.

It has been disputed, whether the druids were themselves the inventors of their opinions and systems of religion and philosophy, or received them from others. Some have imagined, that the colony of Phocians, who left Greece and built Marseilles, in Gaul, about the fifty-seventh Olympiad, imported the first principles of learning and philosophy, and communicated them to the Gauls and other nations in the west of Europe. But though we may allow, that the druids of Gaul and Britain borrowed some hints of their philosophy from this Greek colony, we have reason to believe that the substance of it was their own. Others have suggested, that the druids derived their philosophy from Pythagoras, which seems to be confirmed by Ammianus Marcellinus, and indeed the philosophy of the druids bore a much greater resemblance to that of Pythagoras, than to that of any other sage of antiquity. But this resemblance may, perhaps, be best accounted for by supposing that Pythagoras adopted some of the opinions of the druids, as well as imparted to them some of his discoveries. And Aristotle says that the philosophy of the druids passed into Greece. It is therefore highly probable, and in fact directly asserted by several authors, that Pythagoras visited the druids of Gaul, and was initiated into their philosophy. From the concurring testimonies of several authors, it appears that natural philosophy was the favorite study of the druids of Gaul and Britain. According to Dio-

dorus Siculus, Strabo, Cæsar, Mela, Ammianus Marcellinus, and others, they entered into many disquisitions, in their schools, concerning the form and magnitude of the universe in general, and of this earth in particular, and even concerning the most sublime and hidden secrets of nature. On these subjects they formed a variety of systems and hypotheses, which they delivered to their disciples in verse, that they might the more easily retain them in their memories, as they were not allowed to commit them to writing. Strabo has preserved one of the physiological opinions of the druids concerning the universe, viz. that it was never to be entirely destroyed or annihilated; but was to undergo a succession of great changes and revolutions, which were to be produced sometimes by the predominancy of water, and sometimes by that of fire. This opinion, he intimates, was not peculiar to them, but was entertained also by the philosophers of other nations; and Cicero speaks of it as a truth universally acknowledged and undeniable. But they did not express their sentiments on these and the like heads in a plain and natural, but in a dark, figurative, and enigmatical manner. We know not what their opinions were about the dimensions of the universe or of the earth, but we have several reasons to suppose that they believed both to be of a spherical form. This is visibly the shape and form of the sun, moon, and stars, the most conspicuous parts of the universe; and the circle was the favorite figure of the druids, as appears from their houses and places of worship.

It may be thought improbable that the druids had made any considerable progress in arithmetic, as this may seem to be impossible by the mere strength of memory, without the assistance of figures and of written rules. But it is very difficult to ascertain what may be done by memory alone, when it has been long exercised in this way. There is reason to think that they made use of the letters of the Greek alphabet for their calculations. Cæsar, speaking of the druids of Gaul, says, 'In almost all other public transactions, and private accounts or computations they make use of the Greek letters.' This is further confirmed by what the same author says of the Helvetii, a people of the same origin, language, and manners with the Gauls and Britons. 'Tables were found in the camp of the Helvetii, written in Greek letters, containing an account of all the men capable of bearing arms, who had left their native country, and also separate accounts of the boys, old men, and women.'

Astronomy appears to have been one of the chief studies of the druids of Gaul and Britain. 'The druids,' says Cæsar, 'have many disquisitions concerning the heavenly bodies and their motions, in which they instruct their disciples.' Mela, speaking of the same philosophers, observes, 'That they profess to have great knowledge of the motions of the heavens and of the stars.' Some knowledge of this science, indeed, was absolutely necessary for fixing the regular returns of their religious solemnities, of which the druids had the sole direction. The druids computed their time by nights, and not by days, a custom which they had received from their

most remote ancestors by tradition, and in which they were confirmed by their measuring their time very much by the moon. They assembled upon stated days, either at the new or full moon; for they believed these to be the most auspicious times for transacting all affairs of importance. Their most solemn ceremony of cutting the mistletoe from the oak was always performed on the sixth day of the moon. Nay, they even regulated their military operations very much by this luminary, and avoided, as much as possible, to engage in battle while the moon was on the wane. We are told both by Cæsar and Mela that the druids studied the stars as well as the sun and moon; and that they professed to know, and taught their disciples many things concerning the motions of these heavenly bodies.

There are still many monuments remaining in Britain and the adjacent isles which give reason to think that the ancient Britons could apply the *mechanical powers* so as to produce very astonishing effects. As these monuments appear to have been designed for religious purposes, we may be certain that they were erected under the direction of the druids. Many obelisks or pillars, of one rough unpolished stone each, are still to be seen in Britain and its isles. Some of these are both very thick and lofty, erected on the summits of barrows and of mountains; and some of them (as at Stonehenge) have ponderous blocks, raised aloft, and resting on the tops of the upright pillars. We can hardly suppose that it was possible to cut these prodigious masses of stone (some of them above forty tons in weight) without wedges, or to raise them out of the quarry without levers. But it certainly required still greater knowledge of the mechanical powers, and of the method of applying them, to transport those huge stones from the quarry to the places of their destination, to erect the perpendicular pillars, and to elevate the impost to the tops of these pillars. That the British druids were acquainted with the principles and use of the balance, we have good reason to believe, from some druidical monuments still remaining, called Lagan stones, or rocking-stones. Each of them consists of one prodigious block or stone, resting upon an upright stone or rock, and so equally balanced, that a very small force, sometimes even a child, can move it up and down, though hardly any force is sufficient to remove it from its station. Some of these stones may have fallen into this position by accident, but others of them evidently appear to have been placed in it by art. That the ancient Britons understood the construction and use of wheels, the great number of their war-chariots and other wheel-carriages is a sufficient proof; and that they knew how to combine them together, and with the other mechanical powers, so as to form machines capable of raising and transporting very heavy weights, we have good reason to believe.

In Germany and in the northern nations of Europe, the healing art was chiefly committed to the old women of every state; but in Gaul and Britain it was entrusted to the druids, who were the physicians as well as the priests of these countries. Pliny says expressly, 'That Tiberius

Cæsar destroyed the druids of the Gauls, who were the poets and physicians of that nation. The people of Gaul and Britain were probably induced to devolve the care of their health on the druids, and to apply to these priests for the cure of their diseases, not only by the high esteem they had of their wisdom and learning, but also by the opinion which they entertained, that a very intimate connexion subsisted between the arts of healing and the rites of religion; and that the former were most effectual when accompanied by the latter. It was indeed a prevailing opinion of all the nations of antiquity, that all internal diseases proceeded from the anger of the gods; and that the only way to obtain relief was to appease them by sacrifices.—That this was the practice of the Gauls and Britons, who, in some cases sacrificed one man as the most effectual means of curing another, is attested by Cæsar. This gave rise also to that great number of magical rites and incantations with which the medical practice of the druids, and of most ancient physicians was attended. The druids entertained a very high opinion of the medical virtues of the mistletoe, and esteemed it a remedy for all diseases. They believed it to be a specific against barrenness; a sovereign antidote against the effects of poisons; excellent for softening and discussing hard tumors; good for drying up scrofulous sores; for curing ulcers and wounds; and (provided it was not suffered to touch the earth after it was cut) very efficacious in the epilepsy. The selago, a kind of hedge hyssop, resembling savin, was another plant, much admired by the druids for its supposed medicinal virtues, particularly in diseases of the eyes. But its efficacy, according to them, depended much upon its being gathered under certain magical directions. They entertained a high opinion also of the herb samolus or marsh-wort for its sanative qualities; and gave many directions for gathering it. The person who was to perform that office was to do it fasting, and with his left hand; he was on no account to look behind him, nor to turn his face from the herbs he was gathering. It would be tedious to relate the extravagant notions they entertained of the many virtues of the vervain, and to recount the ridiculous mummeries which they practised in gathering and preparing it, both for the purposes of divination and physic. These may be seen in Pliny's Hist. Nat. l. 25. c. 9, from whom we have these anecdotes; but who, like other Greek and Roman writers, seems designedly to represent the philosophers of Gaul and Britain in an unfavorable light. We learn from Cæsar that the druids were the judges and arbiters of all differences and disputes, both public and private: they took cognizance of murders, inheritances, boundaries, and limits; and decreed rewards and punishments. Such as disobeyed their decisions they excommunicated, which was their principal punishment; the criminal being hereby excluded from all public assemblies, and avoided by all the world; so that nobody durst speak to him for fear of being polluted. Strabo observes, they had sometimes authority enough to stop armies upon the point of engaging, and accommodate their differences.

If the British druids made no contemptible proficiency in several parts of real and useful learning, it cannot be denied that they were also great pretenders to superior knowledge in certain vain fallacious sciences, by which they excited the admiration, and took advantage of the ignorance and credulity of mankind. These were magic and divination; by which they pretended to work miracles, and exhibit astonishing appearances in nature; to penetrate into the counsels of heaven, to foretel future events, and to discover the success or miscarriage of public or private undertakings. Their countrymen not only believed that the druids were possessed of these powers, but they were celebrated on this account by the philosophers of Greece and Rome. 'In Britain' says Pliny, 'the magic arts are cultivated with such astonishing success, that the Britons seem to be capable of instructing even the Persians themselves in these arts. They pretend to discover the designs and purposes of the gods. The Eubates or Vates, in particular, investigate and display the most sublime secrets of nature; and by auspices and sacrifices they foretel future events.' They were so famous for the supposed veracity of their predictions, that they were not only consulted on all important occasions by their own princes and great men, but even sometimes by the Roman emperors. Stonehenge, and several other works of the druids, were believed to have been executed by the art of magic, for many ages after the destruction of their whole order. The natural and acquired sagacity of the druids, with their long experience in public affairs, enabled them to form very probable conjectures about the event of enterprises. These conjectures they pronounced as oracles when they were consulted; and they pretended to derive them from inspecting the entrails of victims, observing the flight of certain birds, and other mummeries. By such arts they obtained and preserved the reputation of prophetic foresight among an ignorant and credulous people.

They worshipped the Supreme Being under the name of Esus, or Ihesus, and the symbol of the oak; and had no other temple than a wood or a grove, where all their religious rites were performed. Nor was any person admitted to enter that sacred recess unless he carried with him a chain, in token of his absolute dependence on the Deity. Indeed, their whole religion originally consisted in acknowledging that the Supreme Being, who made his abode in these sacred groves, governed the universe; and that every creature ought to obey his laws, and pay him divine homage. They considered the oak as the emblem, or rather the peculiar residence, of the Almighty; and accordingly chaplets of it were worn both by the druids and people in their religious ceremonies; the altars were strewed with its leaves, and encircled with its branches. The fruit of it, especially the mistletoe, was thought to contain a divine virtue, and to be the peculiar gift of heaven. It was therefore sought for on the sixth day of the moon with the greatest earnestness and anxiety; and when found, was hailed with such raptures of joy, as it almost exceeds imagination to conceive. As soon

as the druids were informed of this fortunate discovery, they prepared every thing ready for the sacrifice under the oak, to which they fastened two white bulls by the horns; then the arch-druid, attended by a prodigious number of people, ascended the tree, dressed in white; and with a consecrated golden knife, or pruning-hook, cropped the mistletoe, which he received in his sagum or robe, amidst the rapturous exclamations of the people. Having secured this sacred plant he descended the tree; the bulls were sacrificed, and the Deity invoked to bless his own gift, and render it efficacious in those distempers in which it should be administered. The consecrated groves, in which they performed their religious rites, were fenced round with stones, to prevent any person's entering between the trees, except through the passages left open for that purpose, and which were guarded by some inferior druids, to prevent any stranger from intruding into their mysteries. These groves were of different forms: some quite circular, others oblong, and more or less capacious, as the votaries in the districts to which they belonged were more or less numerous. The area in the centre of the grove was encompassed with several rows of large oaks set very close together. Within this large circle were several smaller ones, surrounded with large stones; and near the centre of these smaller circles were stones of a prodigious size and convenient height, on which the victims were slain and offered. Each of these being a kind of altar, was surrounded with another row of stones, the use of which cannot now be known, unless they were intended as cinctures to keep the people at a convenient distance from the officiating priest. Suetonius, in his life of Claudius, assures us the druids sacrificed men; and Mercury is said to be the god to whom they offered these victims. Diodorus Siculus (lib. vi.) observes it was only upon extraordinary occasions they made such offerings; as to consult what measures to take, to learn what should befall them, &c., by the fall of the victim, the tearing of his members, and the manner of his blood gushing out. Augustus condemned the custom, and Tiberius and Claudius punished and abolished it.

DRUIDE, or DROUM, in ancient geography, the principal place of the Druids in Gaul; where they met annually in a consecrated grove, according to Cæsar. It was also called Durocases; and is now named Dreux.

DRUM, *n. s. & v. n.* Dan. *tronme*; Dut. *trommel*; Germ. *trommel*; *n. s.* *trombe*; perhaps from Arab. *drub* a *dub*, to beat; but in Ang. Sax. *drymga* is soft murmuring sound; and Skinner thinks the word is formed from the sound. An instrument of military music; the tympanum of the ear; and, from the hum made, a concourse of persons. A drum-major is a chief drummer.

Let's march without the noise of threatening drums, *Shakespeare.*

Drummer, strike up, and let us march away. *Id.*

In drums, the closeness round about, that preserveth the sound from dispersing, maketh the noise

come forth at the drum-hole far more loud and strong than if you should strike upon the like skin extended in the open air. *Bacon.*

Tears trickling down their breasts bedew the ground,
And drums and trumpets mix their mournful sound. *Dryden.*

Now, heart,
Set ope thy sluices, send the vigorous blood
Through every active limb for my relief;
Then take thy rest within the quiet cell,
For thou shalt drum no more. *Id.*

The drummaker uses it, and the cabinetmaker. *Mortimer.*
The under-jaw of the drumfish from Virginia. *Woodward.*

Such company may chance to spoil the swearing
And the drummajor's oaths, of bulk unruly,
May dwindle to a feeble.— *Cleveland.*

Now no more the drum
Provokes to arms, or trumpet's clangor shrill
Affrights the wives, and chills the virgin's blood. *Philips.*

Here rows of drummers stand in martial file,
And with their vellum-thunder shake the pile. *Gay.*

I lastly was with Curtis, among the floating bat-
t'ries,
And there I left for witnesses an arm and limb:
Yet let my country need me, with Elliot to head me,
I'd clatter on my stumps at the sound of the drum. *Burns.*

He hates the field in which no life or drum
Attends him; drives his cattle to a march;
And sighs for the smart comrades he has left. *Cowper.*

There is no variety of notes referable to the gamut
in the beating of a drum, yet, if it be performed in mu-
sical time, it is agreeable to our ears; and therefore
this pleasurable sensation must be owing to the repe-
tition of the divisions of the sounds at certain inter-
vals of time, or musical bars. *Darwin.*

Often in the hottest morn in summer, you may see
her on a little squat pony, with her hair plaited up
behind like a drummer's, and puffing round the ring on
a full trot. *Sheridan.*

And swiftly forming in the ranks of war;
And the deep thunder peel on peel afar;
And near, the beat of the alarming drum
Roused up the soldier e'er the morning star. *Byron.*

DRUM, is a martial musical instrument, in the
form of a cylinder, hollow within and covered at
the two ends with vellum, which may be stretched
or slackened by small cords and sliding leathers
attached. This instrument is said to have been
invented by Bacchus, who, as Polyenes reports,
gave his signals of battle with cymbals and
drums; and the Saracens, who invaded Pales-
tine, first introduced it into Europe. The drums
are sometimes made of brass. Those belonging
to the Blues are silver.

Kettle-drums are two sorts of large basins of
copper or brass, rounded at the bottom and
covered with vellum or goat-skin, which is kept
fast by a circle of iron, and several holes, fastened
to the body of the drum, and a like number of
screws to stretch it at pleasure. They are used
among the horse.

We give the following account of the different
beats of the drum from James's Military Dic-
tionary.

The *General*, to give notice to the troops that
they are to march.

The *Assembly*, or *Troop*, to order the troops to
repair to the place of rendezvous, or to their
colors.

The *March*, to command them to move, always
with the left foot first.

Tat-too, or *Tap-too*, to order all to retire to
their quarters.

To Arms! for soldiers who are dispersed, to
repair to them.

The *Réveillé* always beats at break of day, and
is to warn the soldiers to rise, and the sentinels
to forbear challenging, and to give leave to come
out of quarters.

The *Retreat*, a signal to draw off from the
enemy. It likewise means a beat in both camp
and garrison a little before sun-set, at which time
the gates are shut, and the soldiers repair to their
barracks, &c.

The *Alarm*, to give notice of sudden danger,
that all may be in readiness for immediate duty.

The *Parley*, or *Chamade*, a signal to demand
some conference with the enemy.

Long March, a beat which was formerly used
in England; on the sound of which, the men
clubbed their firelocks, and claimed and used the
liberty of talking all kind of ribaldry.

The *Church Call*, called, also, *Beating the
Bank*; a beat to summon the soldiers of a regi-
ment, or garrison, to church.

The *Pioneer's Call*, known by the appellation
of round heads and cuckolds! come dig; this is
beaten in camp to summon the pioneers to
work.

The *Serjeants' Call*, a beat for calling the ser-
jeants together in the orderly-room, or in camp,
to the head of the colors.

The *Drummers' Call*, a beat to assemble the
drummers at the head of the colors, or in quar-
ters at the place where it is beaten.

The *Preparative*, a signal to make ready for
firing.

The *Warning Drum*, a beat to give officers
and soldiers time to assemble for their meals in
camp or quarters.

The *Roast-beef of Old England*, a beat to call
officers to dinner.

DRUMMER, or DRUM, he that beats the drum;
of whom each company of foot has one, and
sometimes two. Every regiment has a drum-
major, who has the command over the other
drums. They are distinguished from the soldiers
by clothes of a different fashion: their post, when
a battalion is drawn up, is on the flanks, and on
march it is betwixt the divisions.

DRUMBLE, *v. n.* A diminutive of drum;
probably from the noise of a sluggish stream.
Hence drumbly, or drumly, is stagnant: see below.
To drone; to be sluggish.

Take up these cloaths here quickly: where's the
cowstaff? Look, how you drumble! carry them to
the landress in Datchet Mead.

Shakspeare. Merry Wives of Windsor.

DRUMLY, *adj.* From drumble. Stagnant
thick; muddy.

Then houses drumly German water,
To mak himsel look fair and fatter,

An' clear the consequential sorrows,
Love-gifts of Carnival signoras.

Burns.

DRUMMOND (William), the son of Sir John Drummond, of Hawthornden, knight of the black rod to king James I., was born in Scotland in 1585. He was educated at Edinburgh, where he took the degree of A.M. In 1606 he was sent by his father to study civil law at Bourges in France; but, having a dislike for the law, he returned to his agreeable seat at Hawthornden, where he applied himself with great assiduity to classical learning and poetry. Here he wrote his *Cypress Grove*, and, about the same time, *Flowers of Zion*, in verse. But on the death of a lady, to whom he was about to be married, he went to Paris and Rome. He travelled through France, Germany, and Italy, where he visited the universities; and, after an absence of eight years, returned to his native country. On the appearance of a civil war, he retired again; and is now supposed to have written his *History of the Five James's, kings of Scotland*, which was not published till after his death. He was steadily attached to Charles I.; and, in a piece called *Irene*, he harangues the king, nobility, and clergy, about their mutual mistakes, fears, and jealousies; and lays before them the consequences of a civil war. His attachment to the king was so strong, that when he heard of his being executed, he is said to have been overwhelmed with grief, and to have lifted up his head no more. He died in 1649, leaving behind him several children: the eldest of whom, William, was knighted by Charles II. He was the intimate friend of Michael Drayton and Ben Jonson; the latter of whom, at the age of forty-five, travelled from London on foot to visit him at Hawthornden. An edition of his works, with his life prefixed, was printed in folio at Edinburgh in 1711. Among all the writers of the seventeenth century, who flourished after the death of Shakspeare, there is not one whom a general reader of the English poetry of that age will regard with so much and so deserved attention, as William Drummond. His thoughts are generally bold and highly poetical: he closely follows nature, and his verses are delicately harmonious. On the death of Henry prince of Wales, in 1612, Drummond wrote an elegy entitled *Tears on the death of Moeliades*; a name which that prince had used in all his challenges of martial sport, as the anagram of *Miles à Deo*.

DRUNKARD,

DRUNK'EN,

DRUNK'ENLY,

DRUNKEN'NESS.

} See DRINK.

DRUPA, or DRUPPA. See BOTANY. The cherry, plum, peach, ~~h~~pricot, and all other stone fruit are of this kind. The term, which is of great antiquity, is synonymous to Tournefort's *fructus mollis ossiculo*, 'soft fruit with a stone;' and to the *prunus* of other botanists. The stone or nut, which in this sort of fruit is surrounded by the soft pulpy flesh, is a kind of ligneous or woody cup, which contains a single kernel or seed. This definition, however, will not apply to every seed-vessel denominated *drupa* in the *Genera Plantarum*. The almond is a *drupa*, so is the seed vessel of the elm trees and the genus

rumphia, though far from being pulpy or succulent; the first and third are of a substance like leather, the second like parchment. The same may be said of the walnut, the pistachia nut, guetterda, quisqualis, jack-in-a-box, and some others. The seeds of the elm *schrebera*, *stigellaria*, and the mango tree, are not contained in a stone. The seed-vessel of *burr-reed* is dry, shaped like a top, and contains two angular stones.

DRURY (Robert),² an English mariner, and a humble but respectable author, was born in Leicestershire. In 1702, while a boy, he was shipwrecked in the *Degrave*, East Indian, on the south side of the island of Madagasear, and lived in captivity there for fifteen years. On his return he published, in 1743, an account of the island, and of his own adventures, in a plain unadorned manner, and being corroborated as far as it went by the journal of Mr. Benbow, the son of the admiral, who was wrecked at the same time, his book has always been considered authentic. It was republished in 1808. Drury became porter at the India-house, and inherited some little property, but when he died is not known.

DRUSES, DRUZES, or more properly *Duruz*, signifying riches, or sensual comforts, the great rewards of their faith, a remarkable nation in Palestine, inhabiting the environs of Mount Lebanon, of whose origin and history we have considerable details from the pen of M. Volney, to which we subjoin the more modern observations of Messrs. Niebuhr, Burckhardt, &c.

Twenty-three years after the death of Mahomet, the disputes between Ali his son-in-law and Moabiah governor of Syria, occasioned the first schism in the empire of the Arabs, and the two sects subsist to this day: but, in reality, this difference related only to power; and the Mahomedans, however divided in opinion respecting the rightful successor of the prophet, were agreed with respect to their dogmas. It was not until the following century, that the perusal of Greek books introduced among the Arabs a spirit of discussion and controversy, to which till then they were utter strangers. The consequence was, as might be expected, by reasoning on matters not susceptible of demonstration, and guided by the abstract principles of an unintelligible logic, they divided into a multitude of sects and opinions. At this period, too, the civil power lost its authority; and that kind of religion, which derives from it alone the means of preserving its unity, shared the same fate. The nations which had received the religion of Mahomet, mixed with it their former absurd notions; and the errors which had anciently prevailed over Asia again made their appearance, though altered in their forms. The *Metempsychosis*, the doctrine of a good and evil principle, and the renovation after 6000 years, as it had been taught by Zoroaster, were again revived. In this political and religious confusion, every enthusiast became an apostle, and every apostle the head of a sect. No less than sixty of these were reckoned, remarkable for the numbers of their followers, all differing in some points of faith, and all disavowing heresy and error. Such was the state of these countries, when, at

the commencement of the eleventh century, Egypt became the theatre of one of the most extravagant scenes of enthusiasm and absurdity ever recorded in history. The following account is extracted from the eastern writers. In the year of the Hejira 386 (A. D. 996), the third caliph of the race of the Fatemites, called Hakem B' Amr-Ellah, succeeded to the throne of Egypt at the age of eleven years. He was one of the most mad and capricious princes of whom history has preserved the name, not excepting Caligula himself. He caused the first caliphs, the companions of Mahomet, to be cursed in the mosques, and afterwards revoked the anathema: he compelled the Jews and Christians to abjure their religion, and then permitted them to resume it. He prohibited the making slippers for women, to prevent them from coming out of their houses. He burnt one half of the city of Cairo for his diversion, while his soldiers pillaged the other. He prohibited the pilgrimage to Mecca, fasting, and the five prayers; and at length carried his madness so far as to desire to pass for God himself! He ordered a register of those who acknowledged him to be so, and the number amounted to 16,000! This impious pretension was supported by a prophet, named Mohammed Ben Ismael, who came from Persia into Egypt, and taught that it was not necessary to fast or pray, to practise circumcision, to make the pilgrimage to Mecca, or observe festivals; that the prohibition of pork and wine was absurd; and that marriage between brothers and sisters, fathers and children, was lawful. To ingratiate himself with Hakem, he maintained that this caliph was God himself incarnate; and instead of his name Hakem B' Amr-Ellah, which signifies governing by the order of God, he called him Hakem B' Amr-Eh, governing by his own order. Unluckily for the prophet, his new god had not the power to protect him from the fury of his enemies, for they slew him in a tumult almost in the arms of the caliph, who was himself massacred soon after on mount Mokattam, where he, as he said, had held conversation with angels. The death of these two chiefs did not stop the progress of their opinions; a disciple of Mohammed Ben Ismael, named Hamzah Ben Ahmud, propagated them with indefatigable zeal in Egypt, in Palestine, and along the coast of Syria, as far as Sidon and Berytus. His proselytes being persecuted by the sect in power, they took refuge in the mountains of Lebanon, where they were better able to defend themselves; at least it is certain, that, shortly after this era, we find them established there, and forming an independent society. The difference of their opinions disposes them to be enemies; but the urgent interest of their common safety forces them to allow mutual toleration, and they have always appeared united, and have jointly opposed, at different times, the Crusaders, the sultans of Aleppo, the Mamelukes, and the Ottomans. The conquest of Syria by the latter, made no change in their situation. Selim I. on his return from Egypt, meditating no less than the conquest of Europe, disdained to waste his time before the rocks of Lebanon. Soliman II. his successor, incessantly engaged in important wars, either with the knights of Rhodes, the Persians,

the kingdom of Yemen, the Hungarians, the Germans, or the emperor Charles V. had no time to think of the Druses. Emboldened by this inattention, and not content with their independence, they frequently descended from their mountains to pillage the Turks. The pachas in vain attempted to repel their inroads; their troops were invariably routed or repulsed. And it was not till 1588, that Amurath III. wearied with the complaints made to him, resolved, at all events, to reduce these rebels, and had the good fortune to succeed. His general, Ibrahim Pacha, marched from Cairo, and attacked the Druses and Maronites, with so much address and vigor, as to force them into their strong holds in the mountains. Dissension took place among their chiefs, of which he availed himself to exact a contribution of upwards of 1,000,000 of piastres, and to impose a tribute which has continued to the present time.

This expedition was the epocha of a considerable change in the constitution of the Druses. Till then they lived in a sort of anarchy, under the command of different sheiks or lords. The nation was likewise divided into two factions, such as is to be found in all the Arab tribes, and which are distinguished into the Kaisi and Yamani parties. To simplify the administration, Ibrahim permitted them only one chief, who should be responsible for the tribute, and execute the office of civil magistrate; and this governor, from the nature of his situation, acquiring great authority, became almost the king of the republic; but, as he was always chosen from among the Druses, a consequence followed, which the Turks had not foreseen, and which was nearly fatal to their power. The chief thus chosen, having at his disposal the whole strength of this people, was able to give it unanimity and energy, and naturally turned it against the Turks; who, by becoming their masters, had not ceased to be their enemies. They took care, however, that their attacks should be indirect, so as to save appearances, and only engaged in secret hostilities. About this time, viz. in the beginning of the seventeenth century, the power of the Druses attained its greatest height; which it owed to the talents and ambition of the celebrated Faker-el-din, commonly called Fakardin. No sooner was this prince advanced to be the chief of that people, than he turned his whole attention to humble the Ottoman power, and aggrandise himself. In this enterprise he displayed an address seldom seen among the Turks. He first gained the confidence of the Porte, by every demonstration of loyalty and fidelity; and as the Arabs at that time infested the plain of Balbec, and the country around Acre, he made war upon them, freed the inhabitants from their depredations, and thus rendered them desirous of living under his government. The city of Bairout was situated advantageously for his designs, as it opened a communication with foreign countries, particularly with the Venetians. Faker-el-din availed himself of the misconduct of the aga, expelled him, seized on the city, and even had the art to make a merit of this act of hostility with the divan, by paying a more considerable tribute. He proceeded in the

same manner, at Saide, Balbec, and Sour; and at length, about A. D. 1613, says himself of all the country as far as in and The pachas of Tripoli and as someti opposed him by open fo

him ineffectually, his him at the Porte by secret insinuations; but the emir, who maintained there his spies and defenders, defeated every attempt. At length, however, the divan began to be alarmed at the progress of the Druses, and made preparations for an expedition capable of crushing them. Whether from policy or fear, Faker-el-din did not think proper to wait this storm. He had formed connections in Italy, on which he built great hopes, and determined to go in person to solicit the succours they had promised him; persuaded that his presence would increase the zeal of his friends, while his absence might appease the resentment of his enemies. He therefore embarked at Bairout; and after resigning the administration to his son Ali, repaired to the court of the Medici at Florence. The arrival of an oriental prince in Italy did not fail to attract the public-attention. Enquiry was made into his nation, and the origin of the Druses became a popular topic of research. Their history and religion were found to be so little known, as to leave it a matter of doubt, whether they should be classed with the Mahomedans or Christians. The crusades were called to mind; and it was suggested, that a people who had taken refuge in the mountains, and were enemies to the natives, could be no other than the offspring of the crusaders. This conceit was too favorable to Faker-el-din for him to endeavour to disprove it; he was artful enough, on the contrary, to pretend he was related to the house of Lorraine; and the missionaries and merchants, who promised themselves a new opening for conversion and commerce, encouraged his pretensions. When an opinion is in vogue, every one discovers new proofs of its certainty. The learned in etymology, struck with the resemblance of the names, insisted that Druses and Dreux must be the same word; and on this foundation formed the system of a pretended colony of French crusaders, who, under the conduct of a count de Dreux, had formed a settlement in Lebanon. This hypothesis, however, was completely overthrown by the remark, that the name of the Druses is to be found in the itinerary of Benjamin Tudela, who travelled before the time of the crusades. Indeed the futility of it ought to have been sufficiently apparent at first, from the single consideration, that had they been descended from any nation of the Franks, they must have retained at least the traces of some European language; for a people, retired into a remote district, and living distinct from the natives of the country, do not lose their language. That of the Druses, however, is almost a pure Arabic. After a stay of nine years in Italy, Faker-el-din returned to resume the government of his country. During his absence, his son Ali had repulsed the Turks, appeased discontents, and maintained affairs in good order. Nothing remained for the emir, but to employ the knowledge he had acquired, in perfecting the internal administration of govern-

ment, and promoting the welfare of the nation; but instead of the useful arts, he abandoned himself to the frivolous and the expensive, for which he had imbibed a passion in Italy. He built numerous villas; constructed baths, and planted gardens; he even presumed, notwithstanding they are prohibited by the Koran, and without respect to the prejudices of his country, to employ the art of painting and sculpture. The consequence of this was, the Druses, who paid the same tribute in justice of war, became dissatisfied. The Yemahi faction was roused into revolt, the people murmured at the expenses of the prince, and the luxury he displayed renewed the jealousy of the pachas. They attempted to levy greater tribute: hostilities again commenced, and Faker-el-din repulsed the forces of the pachas; who took occasion, from this resistance, to render him suspected by the sultan himself. Amurath III. licensed that one of his subjects should dare to enter into a competition with him, resolved on his destruction; and the pacha of Damascus received orders to march, with all his forces, against Bairout, the usual residence of Faker-el-din; while forty galleys invested it by sea, and cut off all communication. The emir, who depended on his good fortune and succours from Italy, determined at first to brave the storm. His son Ali, who commanded at Safad, bravely opposed the progress of the Turkish army, notwithstanding the great disparity of his forces; but after two engagements, in which he had the advantage, being slain in a third attack, the face of affairs was greatly changed, and every thing went to ruin. Faker-el-din terrified at the loss of his troops, afflicted at the death of his son, and enfeebled by age and luxury, lost his courage. He sent his second son to solicit a peace of the Turkish admiral, whom he attempted to seduce by presents; but the admiral, detaining both the presents and envoy, declared he would have the prince himself. Faker-el-din, intimidated, took flight, and was pursued by the Turks, now masters of the country. He took refuge on the steep eminence of Niha, where they besieged him ineffectually for a whole year, when they left him at liberty: but shortly after, the companions of his adversity, wearied with their sufferings, betrayed and delivered him up to the Turks. He was carried to Constantinople, where Amurath, pleased to behold at his feet a prince so celebrated, at first treated him with that benevolence which arises from the pride of superiority; but afterwards yielded to the instigations of his courtiers, and in one of his violent fits of passion, ordered him to be strangled.

After the death of Faker-el-din, his posterity still continued in possession of the government, as vassals of the Turks. But this family failing in the male line at the beginning of the eighteenth century, the authority devolved, by the election of the sheiks, on the house of Shelah or Shihab, in which it still continues. The only emir of that house who merits notice is Melhem, who reigned from 1740 to 1759, retrieved the losses of the Druses, and restored them to that consequence which they had lost by the defeat of Faker-el-din. Towards the end of his life,

about 1754, Melhem, wearied with the cares of government, abdicated his authority, and retired to religious retirement, after the manner of the Ottomans; but the troubles that succeeded occasioned him once more to resume the reins of government, which he held till 1759, when he died, universally regretted. He left three sons, minors; the eldest of whom ought to have succeeded him, but, being only seven years of age, the authority devolved on his uncle Mansour, agreeably to a law very general in Asia, that the people shall be governed by a sovereign who has arrived at the years of maturity. The young prince was but little fitted to maintain his pretensions; but a Maronite, named Sad-el-Kouri, to whom Melhem had entrusted his education, took this upon himself. Aspiring to see his pupil a powerful prince, that he might himself become a powerful vizier, he made every exertion to advance his fortune. He first retired with him to Djebail, in the Kesraouan, where the emir Yousef possessed large dominions, and there undertook to conciliate the Maronites, by embracing every opportunity to serve both individuals and the nation. The great revenues of his pupil, and the moderation of his expenditure, amply furnished him with the means. The farm of the Kesraouan was divided between several sheiks, with whom the Porte was not very well satisfied. Sad treated for the whole with the pacha of Tripoli, and got himself appointed sole receiver. The Motoualis of the valley of Balbec had for some years before made several encroachments on Lebanon, and the Maronites began, to be alarmed at the near approach of these intolerant Mahommedans. Sad purchased of the pacha of Damascus a permission to make war upon them; and in 1763 drove them out of the country. The Druses were at that time divided into two factions; Sad united his interest with those who opposed Mansour, and secretly prepared the plot which was to raise the nephew by the ruin of the uncle. At this period the Arab Daher, who had made himself master of Galilee, and fixed his residence at Acre, disquieted the Porte by his progress and pretensions: to oppose him, the diwan had just united the pachalics of Damascus, Saide, and Tripoli, in the hands of Osman and his children; and it was evident that an open war was not very remote. Mansour, who dreaded the Turks too much to resist them, made use of the policy usual on such occasions, pretending a zeal for their service, while he secretly favored the enemy. This was a sufficient motive for Sad to pursue measures directly opposite. He supported the Turks against the faction of Mansour, and manœuvred with so much address, as to depose that emir in 1770, and place Yousef in his government. In 1771 Ali Bey declared war, and attacked Damascus. Yousef, called on by the Turks, took part in the quarrel, but without being able to draw the Druses from their mountains, to enter into the army of the Ottomans. Besides their natural repugnance, at all times, to make war out of their country, they were on this occasion too much divided, at home to quit their habitations, and they had reason to congratulate themselves on the event.

The battle of Damascus ensued, and the Turks were completely routed. The pacha of Saide, escaping from the defeat, and not thinking himself safe in that town, sought an asylum even in the house of the emir. The moment was unfavorable: another state of affairs soon changed by the flight of Mohammed Bey. The emir, concluding that Ali Bey was dead, and not imagining that Daher was powerful enough singly to maintain the quarrel, declared openly against him. Saide was threatened with a siege, and he detached 1500 men of his faction to its defence; while himself in person, prevailing on the Druses and Maronites to follow him, made an incursion with 25,000 peasants into the valley of Bekaa; and in the absence of the Motoualis, who had joined the army of Daher, laid the whole country waste with fire and sword from Balbec to Tyre. While the Druses, proud of this exploit, were marching in disorder towards the latter city, 500 Motoualis, informed of what had happened, flew from Acre inflamed with rage and despair, and fell with such impetuosity on their army as to give them a complete overthrow. Such was the surprise and confusion of the Druses, that, imagining themselves attacked by Daher himself and betrayed by their companions, they turned their swords on each other as they fled. The steep declivities of Djezin, and the pine woods which were in the route of the fugitives, were strewn with dead, few of whom perished by the hands of the Motoualis. The emir Yousef, ashamed of this defeat, escaped to Dair el Kamer, and shortly after attempted to take revenge; but, being again defeated in the plain between Saide and Sour (Tyre), he was constrained to resign to his uncle Mansour the ring, which, among the Druses, is the symbol of command. In 1773 he was restored by a new revolution; but he could not support his power but at the expense of a civil war. In order, therefore, to prevent Bairout from falling into the hands of the adverse faction, he requested the assistance of the Turks, and demanded of the pacha of Damascus a man of sufficient abilities to defend that city. The choice fell on Ahmad, an adventurer, who, from his subsequent fortune, merits particular notice. This man was a native of Bosnia, and spoke the Slavonian as his mother tongue. It is said, that flying from his country at the age of sixteen, to escape the consequences of an attempt to violate his sister in law, he repaired to Constantinople, where, destitute of the means of procuring a subsistence he sold himself to the slave-merchants to be conveyed to Egypt; and, on his arrival at Cairo, was purchased by Ali Bey, who placed him among his Mamelukes. Ahmad was not long in distinguishing himself by his courage and address.—His patron employed him on several occasions in dangerous coups de main, such as the assassination of such beys and caches as he suspected; of which commissions he acquitted himself so well, as to acquire the name of Djeddar. With this claim to his friendship, he enjoyed the favor of Ali, until he was disturbed by an accident. The jealous Bey, having proscribed one of his benefactors called Saleh Bey, commanded Ahmad Djeddar to cut off his head.

Either from humanity or some secret friendship for the devoted victim, Djezzar hesitated, and even remonstrated against the order. But learning the next day that Mohammed Bey had executed the commission, and that Ali had spoken of him not very favorably, he thought himself a lost man, and, to avoid the fate of Saleh, escaped unobserved, and reached Constantinople. He there solicited employments suited to his former rank; but meeting, as is usual in capitals, with a great number of rivals, he pursued another plan, and went to seek his fortune in Syria as a private soldier. Chance conducted him among the Druses, where, being hospitably entertained in the house of the kiaya of the emir Yousef, he repaired to Damascus, and obtained the title of Aga, with the command of five pair of colors, that is to say of fifty men. He was thus situated when fortune destined him to the government of Bairout. Djezzar was no sooner established there, than he took possession of it for the Turks. Yousef was confounded at this proceeding. He demanded justice at Damascus; but finding his complaints treated with contempt, entered into a treaty with Daher, and concluded an offensive and defensive alliance with him at Rafien, near Sour. No sooner was Daher united with the Druses, than he laid siege to Bairout by land, whilst two Russian frigates, whose service was purchased by 600 purses, cannonaded it by sea. Djezzar was compelled to submit to force, and, after a vigorous resistance, gave up the city and surrendered himself prisoner. Sheik Daher, charmed with his courage, and flattered with the preference he had given him in the surrender, conducted him to Acre, and showed him every mark of kindness. He even ventured to trust him with a small expedition into Palestine; but Djezzar, on approaching Jerusalem, went over to the Turks, and returned to Damascus. The war of Mohammed Bey breaking out, Djezzar offered his service to the captain Pacha, and gained his confidence. He accompanied him to the siege of Acre; and that admiral, having destroyed Daher, and finding no person more proper than Djezzar to accomplish the designs of the Porte in that country, named him pacha of Saide. Being now, in consequence of this revolution, superior lord to the emir Yousef, Djezzar was mindful of his past injuries, and, by a conduct truly Turkish, feigning alternately gratitude and resentment, he extorted from the emir, within the space of five years, 4,000,000 of French money (above £160,000), a sum the more astonishing as the farm of the country of the Druses did not then amount to 100,000 livres, £4000. In 1784 he made war on him, deposed him, and bestowed the government on the emir of the country of Hasbeyra, named Ismael. Yousef, having once more purchased his favor, returned, towards the end of the same year, to Dair-el-Kamar, and even courted his confidence so far as to wait on him at Acre, from whence nobody expected him to return; but Djezzar was too wise to shed blood while there were any hopes of obtaining money: he released the prince, and sent him back with every mark of friendship. The present emir bashir is a descendant of Yousef. He pays 130 purses annually to the pacha of Tripoli, and 400 to the

pacha of Saide; and, perhaps, 300 purses more in the way of extraordinary demands, or about £20,750 altogether. He has also to purchase, annually, the friendship of the pacha of Akri, or Acre. This revenue is derived from the whole country situated between Bilad Accar, the north declivity of Mount Libanus, and the immediate neighbourhood of Akri. The internal animosities of the Druses have continued from the middle of the last century: in 1799 or 1800 some of the chiefs of one faction were put to death in the palace of the emir. and the most powerful chief in the country in 1812, was, according to Burekhardt, El-sheikh Beshir, of the Jonbelat tribe: he has a clear income of about £50,000 a year, while that of the emir, his nominal superior, is not above £10,000.

Neither the chief nor the individual emirs maintain troops; they have only persons attached to the domestic service of their houses, and a few black slaves. When the nation makes war, every man, whether sheik or peasant, able to bear arms, is called upon to march. He takes with him a bag of flour, a musket, some bullets, and a small quantity of powder, made in his village, and repairs to the rendezvous appointed by the governor. If it be a civil war, as sometimes happens, the servants, the farmers, and their friends, take up arms for their patron, or the chief of their family, and repair to his standard. In such cases, the parties irritated frequently seem on the point of proceeding to the last extremities; but they seldom have recourse to acts of violence, or attempt the death of each other; mediators always interpose, and the quarrel is appeased the more readily, as each patron is obliged to provide his followers with provisions and ammunition. This system, which produces happy effects in civil troubles, is attended with great inconvenience in foreign wars, as sufficiently appeared in that of 1784. Djezzar, who knew that the whole army lived at the expense of the emir Yousef, aimed at nothing but delay, and the Druses, who were not displeased at being fed for doing nothing, prolonged the operations; but the emir, wearied with paying, concluded a treaty, the terms of which were not a little rigorous for himself, and eventually for the whole nation. 'The ceremonies to which I have been a witness on these occasions,' says M. Volney, 'bear a striking resemblance to the customs of ancient times. When the emir and the sheiks had determined on war at Daer-el-Kamar, criers in the evening ascended the summits of the mountain, and there began to cry with a loud voice: 'To war, to war; take your guns, take your pistols: noble sheiks, mount your horses; arm yourselves with the lance and sabre; rendezvous to-morrow at Daer-el-Kamar. Zeal of God! zeal of combats!' This summons, heard from the neighbouring villages, was repeated there; and, as the whole country is nothing but a chain of lofty mountains and deep valleys, the proclamation passed in a few hours to the frontiers. These voices, from the stillness of the night, the long resounding echoes, and the nature of the subject, had something awful and terrible in their effect. Three days after, 15,000 armed men rendezvoused at Daer-el-Kamar and opera-

tions might have been immediately commenced. We may easily imagine that troops of this kind no way resemble our European soldiers; they had neither uniforms, discipline, nor order. They are a crowd of peasants with short coats, naked legs, and muskets in their hands; differing from the Turks and Mamelukes in that they are all foot; the sheiks and emirs alone have horses, which are of little use from the rugged nature of the country. War there can only be a war of posts. The Druses never risk themselves in the plain, and with reason; for they would be unable to stand the shock of cavalry, having no bayonets to their muskets. Their whole art consists in climbing rocks, creeping among the bushes and blocks of stone; from whence their fire is the more dangerous, as they are covered, fire at their ease, and, by hunting and military sports, have acquired the habit of hitting a mark with great dexterity. They are accustomed to sudden inroads, attacks by night, ambuscades, and all those coups de main which require to fall suddenly on, and come to close fight with the enemy. Ardent in improving their success, easily dispirited, and prompt to resume their courage; daring even to temerity, and sometimes ferocious, they possess above all two qualities essential to the excellency of any troops; they strictly obey their leaders, and are endowed with a temperance and vigor of health, at this day unknown to most civilised nations. In the campaign of 1784 they passed three months in the open air without tents, or any other covering than a sheep-skin; yet there were not more deaths or maladies than if they had remained in their houses. Their provisions consisted, as at other times, of small loaves baked on the ashes or on a brick, raw onions, cheese, olives, fruits, and a little wine. The table of the chiefs was almost as frugal; and we may affirm, that they subsisted 100 days, on what the same number of Englishmen or Frenchmen would not have lived ten. They have no knowledge of the science of fortification, the management of artillery or encampments, nor, in a word, any thing which constitutes the art of war. But had they among them a few persons versed in military science, they would readily acquire its principles, and become a formidable soldiery. This would be the more easily effected, as their mulberry plantations and vineyards do not occupy them all the year, and they could afford much time for military exercises.

The Druses are considered, throughout the Levant, as restless, enterprising, hardy, and brave even to temerity. Only 500 of them have been seen to enter Damascus in open day, and spread around them terror and carnage. No people are more nice than they, with respect to the point of honor: any offence of that kind, or open insult, is instantly punished by blows of the kandjur or the musket; while, among the inhabitants of the towns, it only excites injurious retorts. This delicacy has occasioned in their manners and discourse a reserve, or, if you will, a politeness, which one is astonished to discover among peasants. It is carried even to dissimulation and falsehood, especially among the chiefs, whose greater interests demand greater attentions. Circumspection is necessary to all, says M. Volney,

from the formidable consequences of that retaliation of which I have spoken. These customs may appear barbarous to us; but they have the merit of supplying the deficiency of regular justice, which is necessarily tedious and uncertain in these disorderly and almost anarchical governments. The Druses have another point of honor, that of hospitality. Whoever presents himself at their door, in the quality of a suppliant or passenger, is sure of being entertained and lodged in the most generous and unaffected manner. M. Volney often saw the lowest peasants give the last morsel of bread they had in their houses, to the hungry traveller; and when it was observed to them that they wanted prudence, their answer was, 'God is liberal and great, and all men are brethren.' There are, therefore, no inns in their country any more than in the rest of Turkey. When they have once contracted with their guest the sacred engagement of bread and salt, no subsequent event can make them violate it. Various instances of this are related, which do honor to their character. A few years ago, an aga of the janissaries having been engaged in a rebellion, fled from Damascus and retired among the Druses. The pacha was informed of this, and demanded him of the emir, threatening to make war on him in case of refusal. The emir demanded him of the sheik Talhouk, who had received him; but the indignant sheik replied, 'When have you known the Druses deliver up their guests? Tell the emir, that as long as Talhouk shall preserve his beard, not a hair of the head of his suppliant shall fall!' The emir threatened him with force; Talhouk armed his family. The emir, dreading a revolt, adopted a method practised as juridical in that country. He declared to the sheik, that he would cut down fifty mulberry-trees a-day until he should give up the aga. He proceeded as far as a thousand, and Talhouk still remained inflexible. At length the other sheiks, enraged, took up the quarrel; and the commotion was about to become general, when the aga reproaching himself with being the cause of so much mischief, made his escape without the knowledge even of Talhouk. The Druses have also the prejudices of the Bedouins respecting birth; like them, they pay great respect to the antiquity of families; but this produces no essential inconveniences. The nobility of the emirs and sheiks does not exempt them from paying tribute in proportion to their revenues. It confers on them no prerogatives, either in the attainment of landed property or public employments. Every man, after paying his miri and his rent, is master of his property. In short, by a particular privilege, the Druses pay no fine for their succession: nor does the emir, like the sultan, arrogate to himself original and universal property: there exists nevertheless, in the law of inheritance, an imperfection which produces disagreeable effects. Fathers have, as in the Roman law, the power of preferring such of their children as they think proper: hence it has happened in several families of the sheiks, that the whole property has centered in the same person, who has perverted it to the purpose of intriguing and caballing, while his relations remain, as they well express

it, 'princes of olives and cheese;' that is to say, poor as peasants. In consequence of their prejudices, the Druses do not choose to make alliances out of their own families. They invariably prefer their relation, though poor, to a rich stranger; and poor peasants have been known to refuse their daughters to merchants of Saïde and Bairout, who possessed from 12,000 to 15,000 piastres. They observe also, to a certain degree, the custom of the Hebrews, which directed that a brother should espouse his brother's widow; but this is not peculiar to them, for they retain that as well as several other customs of that ancient people, in common with other inhabitants of Syria and all the Arab tribes. In short, the proper and distinctive character of the Druses, is a sort of republican spirit, which gives them more energy than any other subjects of the Turkish government, and an indifference for religion, which forms a striking contrast with the zeal of the Mahommedans and Christians. They are further said to be remarkably domestic and intelligent. In the evening they sometimes assemble in the court, the area, or house of the chief of the village or family. There, seated in a circle, with legs crossed, pipes in their mouths, and poniards at their belts, they discourse of their various labors, the scarcity or plenty of their harvests, peace or war, the conduct of the emir, or the amount of the taxes; they relate past transactions, discuss present interests, and form conjectures on the future. Their children, tired with play, come frequently to listen; and a stranger is surprised to hear them, at ten or twelve years old, recounting, with a serious air, why Djazzar declared war against the emir Youssef, how many purses it cost that prince, what augmentation there will be of the miri, how many muskets there were in the camp, and who had the best mare. This is their only education. They are neither taught to read the psalms, as among the Maronites, nor the Koran like the Mahommedans; hardly do the sheiks know how to write a letter. But if their minds be destitute of useful or agreeable information, at least it is not pre-occupied by false and hurtful ideas; and, without doubt, such natural ignorance is well worth all our artificial folly. This advantage results from it, that their understandings being nearly on a level, the inequality of conditions is less perceptible. For, in fact, we do not perceive among the Druses that great distance, which, in most other societies, degrades the inferior, without contributing to the advantages of the great. All, whether sheiks or peasants, treat each other with that rational familiarity, which is equally remote from rudeness and servility. The grand emir himself is not a different man from the rest: he is a good country gentleman, who does not disdain admitting to his table the meanest farmer. In a word, their manners are those of ancient times, and of that rustic life which marks the origin of every nation; and prove that the people among whom they are still found are yet only in the infancy of the social state.' *Volney's Travels*.

The opinions of Mohammed ben Ismael may be regarded as the substance of the religion of

the Druses. They practise neither circumcision, nor prayers, nor fasting; they observe neither festivals nor prohibitions. They drink wine, eat pork, and allow marriage between brothers and sisters, though not between fathers and children. From this we may conclude, that the Druses have properly no religion; but one class of them must be excepted, whose religious customs are very peculiar. Those who compose it are to the rest of the nation what the initiated were to the profane; they assume the name of Okkals, which means spiritualists, and bestow on the vulgar the epithet of Djahel or ignorant; they have various degrees of initiation, the highest orders of which require celibacy. These are distinguished by the white turban they affect to wear, as a symbol of their purity; and so proud are they of this supposed purity, that they think themselves sullied by even touching a profane person. If such eat out of their plate, or drink out of their cup, they break them; and hence the custom, so general in this country, of using vases with a sort of cock, which may be drunk out of without touching them with the lips. All their practices are enveloped in mysteries: their oratories always stand alone, and are constantly situated on eminences: in these they hold their secret assemblies, to which women are admitted. It is pretended they perform ceremonies there, in presence of a small statue resembling an ox or calf; whence some have attempted to prove that they are descended from the Samaritans. But, besides, that the fact is not well ascertained, the worship of the ox may be deduced from other sources. They have one or two books which they conceal with the greatest care: but chance has deceived their jealousy; for in a civil war, which happened about twenty-eight years ago, the emir Youssef, who is Djahel or ignorant, found one among the pillage of one of their oratories. M. Volney was assured by persons who had read it, that it contains only a mystic jargon, the obscurity of which doubtless renders it valuable to adepts. Hakem Bahr Ellah is there spoken of, by whom they mean God incarnate in the person of the caliph. It likewise treats of another life, of a place of punishment, and a place of happiness, where the Okkals shall of course be most distinguished. Several degrees of perfection are mentioned, to which they arrive by successive trials. In other respects these sectaries have all the insolence and all the fears of superstition; they are not communicative, because they are weak; but it is probable that, were they powerful, they would be promulgators and intolerant. The rest of the Druses, strangers to this spirit, are wholly indifferent about religious matters. The Christians, who live in their country, pretend that several of them believe in the metempsychosis; that others worship the sun, moon, and stars: all which is possible; for, as among the Ansarians, every one, left to his own fancy, follows the opinion that pleases him most; and these opinions are those which present themselves most naturally to unenlightened minds. When among the Turks, they affect the exterior of Mahommedans, frequent the mosques, and perform their ablutions and prayers. Among the Maronites, they ac-

company them to church, and, like them, make use of holy water. Many of them, importuned by the missionaries, suffer themselves to be baptised; and if solicited by the Turks, receive circumcision, and conclude by dying neither Christians nor Mahomedans.

Mr. Burckhardt confirms this general picture of former travellers. Though a sect of the Mahomedans, they mingle so much of the tenets of Zoroaster and the eastern Christian heretics with their religion, that it belongs as a whole to themselves only. Niebuhr has printed a catechism of their faith, which is principally remarkable for its affected mysteriousness on the one hand, and its positive injunction to curse its original author (a great poet) on the other. 'We are they,' says their patriarch Hamzah, 'who have been put in possession of the Faith after the religion of Mahomet, the son of Abdullah; may the curse of our Lord be upon him!'

They are a branch, it is clear, of the sect Ismayly. 'Enquiries,' says Burckhardt, 'have often been made concerning the religious doctrines of this sect, as well as those of the Anzeiryys and Druses. Not only European travellers, and Europeans resident in Syria, but many natives of influence, have endeavoured to penetrate the mysteries of these idolaters, without success, and several causes combine to make it probable, that their doctrines will long remain unknown. The principal reason is, that few individuals among them become acquainted with the most important and secret tenets of their faith, the generality contenting themselves with the observance of some exterior practices, while the arcana are possessed by the select few. It will be asked, perhaps, whether their religious books would not unveil the mystery! It is true that all the different sects possess books, which they regard as sacred, but they are intelligible only to the initiated. A sacred book of the Anzeiryys fell into the hands of a chief of the army of Yousef pacha, who plundered the castles of that sect in 1803; it came afterwards into the possession of my friend Selym of Hamah who had destined it as a present to me; but he was prevailed upon to part with it to a travelling physician, and the book is now in the possession of M. Rousseau, the French Consul at Aleppo, who has had it translated into French, and means to publish it, but it will probably throw little light upon the question. Another difficulty arises from the extreme caution of the Ismaylys upon this subject; whenever they are obliged to visit any part of the country under the Turkish government, they assume the character of Musulmans; being well aware that if they should be detected in the practice of any rite contrary to the Turkish religion, their hypocrisy, in affecting to follow the latter, would no longer be tolerated; and their being once clearly known to be pagans, which they are only suspected to be at present, would expose them to the heaviest exactions, and might even be followed by their total expulsion or extirpation. Christians and Jews are tolerated because Mahomet and his immediate successors granted them protection, and because the Turks acknowledge Christ and

the prophets; but there is no instance whatever of pagans being tolerated.

'The Ismaylys, when they go to Hamah, pray in the mosque, which they never do at Kalaat Maszyad. This castle has been from ancient times their chief seat. One of them asserted that his religion descended from Ismayl, the son of Abraham, and that the Ismaylys had been possessed of the castle since the time of El Melek el Dhaher, as acknowledged by the Firmahns of the Porte. A few years since they were driven out of it by the Anzeiryys, in consequence of a most daring act of treachery. The Anzeiryys and Ismaylys have always been at enmity; the consequence, perhaps, of some religious differences.'

With respect more particularly to the true religion of the Druses, says this intelligent traveller, 'none but a learned Druse can satisfy the enquirer's curiosity. What I have already said of the Anzeiryys is equally applicable to the Druses; their religious opinions will remain for ever a secret, unless revealed by a Druse. Their customs, however, may be described; and, as far as they can tend to elucidate the mystery, the veil may be drawn aside by the researches of the traveller. It seems to be a maxim with them to adopt the religious practices of the country in which they reside, and to profess the creed of the strongest. Hence they all profess Islamism in Syria; and even those who have been baptised, on account of their alliance with the Shehab family, still practise the exterior forms of the Mahomedan faith. There is no truth in the assertion, that the Druses go one day to the mosque, and the next to the church. They all profess Islamism, and whenever they mix with the Mahomedans they perform the rites prescribed by their religion. In private, however, they break the fast of Ramadban, curse Mahomet, indulge in wine, and eat food forbidden by the Koran. They bear an inveterate hatred to all religions except their own, but more particularly to that of the Franks, chiefly in consequence of a tradition current among them, that the Europeans will one day overthrow their commonwealth. This hatred has been increased since the invasion of the French; and the most unpardonable insult which one Druse can offer to another, is to say to him, 'May God put a hat on you.'

'Nothing is more sacred with a Druse than his public reputation: he will overlook an insult, if known only to him who has offered it; and will put up with blows, where his interest is concerned, provided nobody is a witness; but the slightest abuse given in public he revenges with the greatest fury. This is the most remarkable feature of the national character: in public a Druse may appear honorable; but he is easily tempted to a contrary behaviour, when he has reason to think that his conduct will remain undiscovered. The ties of blood and friendship have no power amongst them; the son no sooner attains the years of maturity, than he begins to plot against his father. Examples are not wanting of their assailing the chastity of their mothers, and towards their sisters such conduct is so frequent, that a father never allows a full grown son to remain alone with any of the fe-

males of his family. Their own religion allows them to take their sisters in marriage; but they are restrained from indulging in this connexion, on account of its repugnance to the Mahomedan laws. A Druse seldom has more than one wife, but he divorces her under the slightest pretext; and it is a custom among them, that if a wife asks her husband's permission to go out, and he says to her 'Go,' without adding 'and come back,' she is thereby divorced; nor can her husband recover her, even though it should be their mutual wish, till she is married again according to the Turkish forms, and divorced from her second husband. It is known that the Druses, like all Levantines, are very jealous of their wives; adultery, however, is rarely punished with death: if a wife is detected in it, she is divorced; but the husband is afraid to kill her seducer, because his death would be revenged, for the Druses are inexorable with respect to the law of retaliation of blood; they know too that if the affair were to become public, the governor would ruin both parties by his extortions. Unnatural propensities are very common amongst them.

'The Akal are those who are supposed to know the doctrines of the Druse religion; they superintend divine worship in the chapels, or, as they are called, Khaloue, and they instruct the children in a kind of catechism. They are obliged to abstain from swearing, and all abusive language, and dare not wear any article of gold or silk in their dress. Many of them make it a rule never to eat of any food, nor to receive any money, which they suspect to have been improperly acquired. For this reason, whenever they have to receive considerable sums of money, they take care that it shall be first exchanged for other coin. The sheik El Nedjem, who generally accompanies the sheik Beshir, in his visits to the emir, never tastes food in the palace of the latter, nor even smokes a pipe there, always asserting that whatever the emir possesses has been unlawfully obtained. There are different degrees of Akal, and women are also admitted into the order, a privilege which many avail themselves of, from parsimony, as they are thus exempted from wearing the expensive head-dress and rich silks fashionable among them.

'A father cannot entirely disinherit his son; in that case his will would be set aside; but he may leave him a single mulberry-tree for his portion. There is a Druse Kadhi at Daer-el Kamar, who judges according to the Turkish laws, and the customs of the Druses; his office is hereditary in a Druse family; but he is held in little repute, as all causes of importance are carried before the emir or the sheik Beshir.

'The Druses do not circumcise their children; circumcision is practised only in the mountain by those members of the Shehab family who continue to be Mahomedans.

'The best feature in the Druse character is that peculiar law of hospitality, which forbids them ever to betray a guest. I made particular enquiries on this subject, and I am satisfied that no consideration of interest or dread of power will induce a Druse to give up a person who has once placed himself under his protection. Per-

sons from all parts of Syria are in the constant practice of taking refuge in the mountain, where they are in perfect security from the moment they enter upon the emir's territory: should the prince ever be tempted by large offers to consent to give up a refugee, the whole country would rise to prevent such a stain upon their national reputation. The mighty Djezzar, who had invested his own creatures with the government of the mountain, never could force them to give up a single individual of all those who fled thither from his tyranny. Whenever he became very urgent in his demands, the emir informed the fugitive of his danger, and advised him to conceal himself for a time in some more distant part of his territory; an answer was then returned to Djezzar, that the object of his resentment had fled. The asylum which is thus afforded by the mountain is one of the greatest advantages that the inhabitants of Syria enjoy over those of the other parts of the Turkish dominions.

'The Druses are extremely fond of raw meat; whenever a sheep is killed, the raw liver, heart, &c., are considered dainties; the Christians follow their example, but with the addition of a glass of brandy to every slice of meat. In many parts of Syria I have seen the common people eat raw meat in their favorite dish the Kobbes; the women especially indulge in this luxury.

'Mr. Barker told me that during his two years' residence at Harissa and in the mountain, he never heard any kind of music. The Christians are too devout to occupy themselves with such worldly pleasures, and the Druses have no sort of musical instruments.

'The Druses have a few historical books which mention their nation; Ibn Shebat, for instance, as I was told, gives in his history of the Califes, that of the Druses also, and of the family of Shehab. Emir Haidar a relation of the emir Beshir, has lately begun to compile a history of the Shehabs, which already forms a thick quarto volume.

'I believe that the greatest amount of the military forces of the Druses is between 10,000 and 15,000 firelocks; the Christians of the mountain may, perhaps, be double that number; but I conceive that the most potent pacha or emir would never be able to collect more than 20,000 men from the mountain.' *Travels*, p. 200.--204.

DRUSIUS (John), a protestant writer of great learning, born at Oudenarde in Flanders, in 1555. He was designed for the study of divinity, but his father being outlawed, and deprived of his estate, they both retired to England, where the son became professor of the oriental languages at Oxford: upon the pacification of Ghent, they returned to their own country, where also Drusius was appointed professor of oriental languages. From thence he removed to Friesland, where he was admitted Hebrew professor in the university of Franeker; the functions of which he discharged with great honor till his death in 1616. His works show him to have been well skilled in Hebrew; and the States General employed him in 1600 to write notes on the most difficult passages in the Old Testament, with a pension of 400 florins a-year: but, being frequently disturbed in this undertaking, it was

not published till after his death. He held a large correspondence with the learned; among his papers there were found 2300 Latin letters.

Drusius (John), the son of the preceding, was born at Franeker in 1588; and began to learn Latin and Hebrew at five years old; at nine he could read that language without points, and add them where wanted. He spoke Latin as readily as his native tongue, and could make himself understood in English. At twelve he wrote in Hebrew extempore; at seventeen he made a speech in Latin to king James I. in the midst of his court, and was admired by all present. He died of the stone, in 1609, aged twenty-one, at the house of Dr. W. Thomas, dean of Chichester, who gave him a considerable salary. He left several works; as, Letters and Verses in Hebrew; Notes on Solomon's Proverbs; &c. And digested into alphabetical order Elias Levita's Nomenclator; to which he added the Greek words.

DRY, <i>adj.</i> v. a. & v. n.	} Goth <i>thur</i> ; Sax. <i>drig</i> ; Teut. <i>treig</i> ; Belg. <i>droog</i> , from Gr. <i>τρυγη</i> , dryness. Arid; free from moisture: hence barren, and, figuratively, jejune, deficient; hard; severe; sneering. The verbs seem to have been formed from the adjective.
DRY'ER, <i>n. s.</i>	
DRY'EYED, <i>adj.</i>	
DRY'LY, <i>adv.</i>	
DRY'NESS, <i>n. s.</i>	
DRY'NURSE, <i>v. a. & n. s.</i>	
DRY'SHOD, <i>adj.</i>	

And he seide to it, nevere fruyt come forth of thee into withouten ende; and anon the fige-tree was dried up: and discipulis sighen wondriden and seiden, hout anon it driede. *Wiclif. Matt. xxi.*

Their honourable men are famished, and their multitude dried up with thirst. *Isaiah v. 13.*

Dryshod to pass, she parts the floods in tway; And eke huge mountains from their native seat She would command themselves to bear away.

Faerie Queene.

I will drain him *dry* as hay;
Sleep shall neither night nor day
Hang upon his penthouse lid:
He shall live a man forbid:

Shakspeare. Macbeth.

The meat was well, if you were so contented.
—I tell thee, Kate, 't was burnt and dried away.

Shakspeare.

If he filled

His vacancy with his voluptuousness,
Full surfeits, and the *dryness* of his bones,
Call on him for't. *Id. Antony and Cleopatra.*
Mrs. Quickly is his nurse, or his *drynurse*, or his cook, or his laundry, his washer, and his wringer.

Shakspeare.

A *dry* March and a *dry* May portend a wholesome summer, if there be a showering April between.

Bacon.

Of two noblemen, the one was given to scoff, but kept every royal cheer in his house, the other would ask of those that had been at his table, was there never a flout or *dry* blow given?

Id.

There is a tale, that boiling of daisy roots in milk, which it is certain are great *driers*, will make dogs little.

Id.

The archduke, conscious to himself how *dryly* the king had been used by his council, did strive to recover the king's affection.

Id. Henry VII.

As we should take care that our stile in writing be neither *dry* nor empty, we should look again it be not

winding or wanton with far-fetched descriptions: either is a vice. *Ben Jonson.*

Their new flowers and sweetness do as much corrupt as others *dryness* and aqualor, if they chuse not carefully. *Id.*

It remaineth to treat concerning ornaments within or without the fabrick; a piece not so *dry* as the meer contemplation of proportions: and therefore I hope therein somewhat to refresh both the reader and myself. *Wotton's Architecture.*

When they have flesh, yet they must stay a time ere they can have a full meal; unless they would eat their meat breadless, and their bread *dry*.

Bp. Hall. Contemplations.

I find that an evil fountain is not soon drawn *dry*.

Bp. Taylor.

It may be, that by this *dryness* of spirit, God intends to make us the more fervent and resigned in our direct and solemn devotions, by the perceiving of our weakness. *Id.*

That the fire burns by heat, is an empty *dry* return to the question, and leaves us still ignorant.

Glanville.

When God said,
Be gathered now, ye waters under heaven,
Into one place, and let *dry* land appear!

Milton.

Sight so deform what heart of rock could long
Dryeyed behold? Adam could not, but wept. *Id.*

I rather hoped I should no more
Hear from you o'th' gallanting score;
For hard *dry* bastings used to prove
The readiest remedies of love;
Next a *dry* diet.

Hu'tibras.

As Romulus a wolf did rear,

So he was *drynursed* by a bear.

Id.

The Africans are conceived to be peculiarly scorched and torried by the sun, by *dryness* of the soil, from want and defect of water.

Browne's Vulgar Errors.

The ill effects of drinking are relieved by this plant, which is a great *dryer* and opener, especially by perspiration.

Temple.

It is a *dry* fable, with little or nothing in it.

L'Estrange.

'Twas grief no more, or grief and rage were one
Within her soul: at last 'twas rage alone;
Which, burning upwards in succession, *dries*
The tears that stood considering in her eyes.

Dryden.

Has honour's fountain then sucked back the stream?
He has: and hooting boys may *dryshod* pass,
And gather pebbles from the naked ford. *Id.*

Wouldst thou to honour and preferments climb,
Be bold in mischief, dare some mighty crime,
Which dungeons, death, or banishment deserves;
For virtue is but *dryly* praised, and starves.

Id. Juvenal.

He had embarked us in such disadvantage, as we could not return *dryshod*.

Sidney.

A palsy may as well shake an oak, or a fever *dry* up a fountain, as either of them shake, *dry* up, or impair the delight of conscience.

South.

The marrow supplies an oil for the inunction of the bones and ligaments in the articulations, and particularly of the ligaments, preserving them from *dryness* and rigidity, and keeps them supple and flexible.

Ray on the Creation.

To clear up this theory, I was willing to lay aside *dry* subtilties with which the schools are filled.

Burnet's Theory.

Is the sea ever likely to be evaporated by the sun, or to be emptied with buckets? Why then must we

fancy this impossible *dryness*, and then, upon that fictitious account, calumniate nature? *Bentley.*

There are a set of *dry*, joyless, dull fellows, who want capacities and talents to make a figure amongst mankind upon benevolent and generous principles. *Guardian.*

The weather, we agreed, was too *dry* for the season. *Addison.*

Be faithful where the author excels, and paraphrase where penury of fancy or *dryness* of expression ask it. *Garth.*

As to the business of being profound, it is with writers as with wells; a person with good eyes may see to the bottom of the deepest, provided any water be there: and that often, when there is nothing in the world at the bottom besides *dryness* and dirt, though it be but a yard and a half under ground, it shall pass, however, for wondrous deep, upon no wiser a reason than because it is wondrous dark. *Swift.*

These epistles will become less *dry*, and more susceptible of ornament. *Pope.*

Some *dryly* plain, without invention's aid,
Write dull receipts how poems may be made. *Id.*

Rash Elpenor, in an evil hour,

Dried an immeasurable bowl, and thought

T' exhale his surfeit by irriguous sleep,

Imprudent: him death's iron sleep oppress. *Philips.*

The water of the sea, which formerly covered it, was in time exhaled and *dried up* by the sun. *Woodward.*

Of turbid elements the sport;

From clear to cloudy tost, from hot to cold,

And *dry* to moist. *Thomson.*

You cannot pump the ocean *dry*; and as long as it continues in its present bed, so long all the causes which weaken authority by distance will continue. *Burke on the American War.*

He purposes to take up and reform, whenever his appetites are fully gratified; like the rustic, whose plan was, to wait till the water of the river should run by, and then pass over *dry-shod*. *Beattie.*

A beard like an artichoke, with *dry* shrivelled jaws, that would disgrace the mummy of a monkey! *Sheridan.*

DRYADES, or **DRYADS**, in the heathen mythology, a sort of deities, who, the ancients believed, inhabited groves and woods. They differed from the *Hamadryades*; these latter being attached to some particular tree, with which they were born, and with which they died; whereas the *Dryads* were goddesses of trees and woods in general. See *HAMADRYADES*.

DRYANDER (John), A.M. university of Lund, a Swedish naturalist, the pupil and friend of Linnæus, was born in 1748, near Gottenburgh, where his father was a clergyman. In consequence of the decease of his father, the care of his education devolved on a maternal uncle, Dr. Lars Montin, a member of the Stockholm Academy. This gentleman was also the intimate friend of Linnæus, and published under his presidency, an Inaugural Dissertation on the Genus *Splachnum*, reprinted in the *Amœnitates Academicæ*, vol. ii. 263. Young Dryander received his early education in the university of Gottenburgh; but removed to Lund, where he took his degree of Master of Arts, or Doctor of Philosophy, in 1776; he published on this occasion a dissertation, *Fungos Regno Vegetabili Vindicans*, asserting the vegetable nature of these

bodies. He was afterwards a student for a short time at Upsal, and tutor to a young Swedish nobleman. He first visited England with his countryman Dr. Solander, who introduced him to the acquaintance of Sir Joseph Banks; and on whose sudden death, in 1782, he succeeded to the place of librarian to Sir Joseph. Mr. Dryander was also librarian to the Royal and the Linnæan Societies. Of the latter institution he was indeed one of the first founders, and drew up its laws and regulations, when in 1802 the society was incorporated by royal charter. He continued an able and active vice-president of the society until his death, which took place towards the end of October, 1810, in the sixty-third year of his age. The publications of Mr. Dryander on the subject of botany are very valuable, and consist of, 1. An Account of the Genus *Albucca*, in the Stockholm Transactions for 1784, in Swedish. 2. Observations on the Genus *Begonia*, in the Transactions of the Linnæan Society, vol. i. 3. On Genera and Species of Plants which occur twice or three times in Professor Gmelin's edition of Linnæus' *Systema Naturæ*; Trans. of Linn. Soc. v. ii. 4. *Lindsea*, a New Genus of Ferns; Trans. of Linn. Soc. v. iii. 5. A Botanical Description of the Benjamin Tree of Sumatra, Phil. Trans. v. lxxvii. He also superintended and assisted in the publication of Mr. Aiton's *Hortus Kewensis*, and Dr. Roxburgh's Plants of the Coast of Coromandel. But his Catalogus Bibliothecæ Historico-Naturalis Josephi Banks, 5 vols. 8vo. is his most celebrated work, and a model for all future bibliographers.

DRYANDRA, in botany, a genus of plants of the class *diœcia*, order *monadelphia*: *cal.* two-leaved; petals five; stamens nine: *fruit* three or four grained: *seeds* solitary. Species one only; a dwarf tree of Japan.

DRYAS, in botany, a genus of the polygynia order, and *icosandria* class of plants; natural order thirty-fifth, *sciticosæ*: *cal.* octofid; petals eight: *seeds* long and hairy with a train. Species, one only; a native of Denmark, and sometimes found on our own mountains.

DRYBURGH ABBEY. This place was dedicated to religious institutions so anciently as the year 522, when Modan, a presbyter and missionary was there seated; as appears by records cited in Chalmers de Statu Hominis, veteris simul ac novæ Ecclesiæ, b. i. p. 142; and King, in his Kalendar. Breviar. Aberdeen. There is no doubt that the Roman station of *Trimon-tium* was at the foot of the Eilden hills, in this district, about three miles distant from Dryburgh; as appears from the Antonine Itinerary, and from General Roy's Survey and Map of Roman Scotland. Many coins of Vespasian, Domitian, and Trajan, are found in this neighbourhood; and a considerable part of the Roman road is still in good preservation, passing through the parishes of Ancrum, Lilliesleaf, and Maxton. In the abbey of Dryburgh, Chaucer, the English poet, passed some time with his friend Ralph Strode, a Welshman, a monk and student here, to whom Chaucer dedicates or addresses some of his verses. At the Reformation, the abbey lands were erected into a temporal lordship.

by James VI. in favor of John, earl of Marr, K. G. and lord high treasurer of Scotland; who gave it to Henry his third son, from whom the title descended to the present earl of Buchan, who bought the abbey lately from the heirs of colonel Tod, and has made it his principal residence. It was here that James Thomson composed his beautiful poem of Winter, the first of his classical Seasons; having occasionally resided with the Haliburtons of Newmains, who were then proprietors of the place. Thomas Hannah, the astronomer, was born here, in a house built in the area of the abbey, in 1662; and Allan Ramsay composed an epitaph for his tomb in Kelso church-yard, which is still extant. The remains of Sir Walter Scott are deposited here.

DRYDEN (John), one of the most eminent English poets of the seventeenth century, descended of a respectable family in Huntingdonshire, was born at Aldwinkle 1631, and educated at Westminster school under Dr. Busby. Thence he was removed to Cambridge in 1650, being elected scholar of Trinity College, of which he appears, by his *Epithalamia Cantabrigiensia*. 4to, 1662, to have been afterwards a fellow. On the death of Oliver Cromwell he wrote some heroic stanzas to his memory; but on the Restoration, being desirous of ingratiating himself with the new court, he wrote first a poem entitled *Astræa Redux*, and afterwards a panegyric on the king. On the 1st January, 1662, he addressed a poem to Chancellor Hyde; and published in the same year a satire on the Dutch. In 1668 appeared his *Annus Mirabilis*, an historical poem in celebration of the duke of York's victory over the Dutch. These pieces at length obtained him the favor of the crown; and Sir William Davenant dying at this period, Dryden was appointed to succeed him as poet laureat. In 1669 he produced the *Wild Gallants*, his first comedy. This met with very indifferent success; yet the author, not discouraged by its failure, soon after published his *Indian Emperor*. Other pieces now followed with such rapidity, that in the key to the duke of Buckingham's *Rehearsal* he is recorded to have engaged himself by contract, to write four plays per year; and in the years 1679 and 1680, he appears to have fulfilled it. To this may be attributed those irregularities, bombastic flights, and even puerile exuberances, for which he has been so severely criticised. In 1675 the earl of Rochester, who was chagrined at the applause with which Dryden's dramatic pieces had been received, was determined if possible to shake his interest at court; and succeeded so far as to recommend a Mr. Crowne, at that time of obscure reputation, to write a mask; an honor which certainly belonged to Dryden's office. The duke of Buckingham also most severely ridiculed several of our author's plays at this time, in his admired *Rehearsal*. Dryden, however, did not suffer these attacks to pass with impunity; for in 1679 there came out an *Essay on Satire*, said to be written jointly by that gentleman and the earl of Mulgrave, containing some very severe reflections on earl Rochester and the duchess of Portsmouth; and in 1681 he published his *Abshalom and Achitophel*, in which the well-known character of

Zimri, drawn for the duke of Buckingham, is certainly severe enough to repay all the ridicule of that nobleman. The resentment shown by the two peers was very different. Lord Rochester, who was a coward, as well as a man of the most depraved morals, basely hired three ruffians to cudgel Dryden in a coffee-house; but the duke of Buckingham took the task upon himself; and at the same time presented him with a purse containing a large sum of money; telling him that he gave him the beating as a punishment for his impudence, but bestowed that gold on him as a reward for his wit. In 1682 Dryden published his *Religio Laici*, designed as a defence of revealed religion against Deists, Papists, &c. Soon after the accession of James II. he went over to the church of Rome, and wrote two pieces in vindication of the Romish tenets: viz. A defence of the Papers written by the late king, found in his strong box; and the celebrated poem, afterwards answered by lord Halifax, entitled, *The Hind and the Panther*. By this extraordinary step he not only engaged himself in controversy, and incurred much censure and ridicule from his contemporary wits: but on the completion of the Revolution, being, on account of his newly-chosen religion, disqualified from bearing any office under the government, he was stripped of the laurel, which, to his still greater mortification, was bestowed on Richard Flecknoe, a man to whom he had a most settled aversion. This circumstance occasioned his writing the very severe poem called *Mac-Flecknoe*. Mr. Dryden's circumstances had never been affluent; but now, being deprived of this little support, he found himself reduced to the necessity of writing for bread. From this period, therefore, he was engaged in works of labor as well as genius, translating the works of others, &c.; and to this necessity we stand indebted for some of our best translations. In the year he lost the laurel, he published the life of St. Francis Xavier from the French. In 1693 came out his *Juvenal and Persius*. In 1695 his prose version of *Fresnoy's Art of Painting*; and in the year 1697 a translation of Virgil's entire work, which still stands foremost among the translations of that author. The minor pieces of this eminent writer, viz. his prologues, epilogues, epitaphs, elegies, songs, &c. are too numerous to specify here, but may all be found in the elegant editions of this poet by Sir Walter Scott, Malone, and Dr. Warton. His last work is his *Fables*, which consist of many of the most interesting stories in Homer, Ovid, Boccaccio, and Chaucer, translated or modernised in the most elegant manner; together with some original pieces, among which is the celebrated ode on St. Cecilia's day. Dryden married the lady Elizabeth Howard, sister to the earl of Berkshire, who survived him eight years. By this lady he had three sons, Charles, John, and Henry. Of the eldest there is a circumstance related by Charles Wilson, esq. in his *Life of Congreve*, which seems so well attested, and is itself of so very extraordinary a nature that we cannot avoid giving it a place here. Dryden, with all his understanding, was weak enough to be fond of judicial astrology, and used to calculate the nativity of his children. On

casting that of Charles he found, according to the rules by which he calculated, that his eighth, twenty-third, and thirty-third years were of peculiar omen. In his eighth year, notwithstanding his father's precautions, he went out on his birth-day to see a stag hunted, and the animal flung down on him a wall ten feet in length which was nearly fatal to him. In his twenty-third year he fell from the top of a tower in the Vatican, and never fully recovered his health; and in his thirty-third year he was drowned in swimming across the Thames near Windsor.

Dryden died May 1701, and was buried in Westminster Abbey. The day after his death, the dean of Westminster sent a message to his widow, that he would make a present to her of the ground and all other abbey-fees for the funeral; lord Halifax likewise sent to lady Elizabeth, and to Mr. Charles Dryden, offering to defray the expenses of our poet's funeral, and afterwards to bestow £500 on a monument in the abbey. Accordingly, on Sunday following, the company being assembled, the corpse was put into a hearse and attended by eighteen mourning coaches. When they were just ready to move, lord Jefferys, son of lord chancellor Jefferys, a name dedicated to infamy, riding by with some of his companions, asked whose funeral it was; and being told it was Mr. Dryden's, he protested he should not be buried in that private manner; that he would himself, with lady Elizabeth's leave, have the honor of the interment, and bestow £1000 on a monument in the abbey for him. This put a stop to the procession; and lord Jefferys, with several of the gentlemen who had alighted from their coaches, went up stairs to the lady, who was sick in bed. His lordship repeated the purport of what he had said below; but lady Elizabeth refusing her consent, he fell on his knees, vowing never to rise till his request was granted. The lady under a sudden surprise fainted away; and lord Jefferys, pretending to have obtained her consent, ordered the body to be carried to Mr. Russel's an undertaker in Cheapside, and to be left there till further orders. In the mean time the abbey was lighted up, the ground opened, the choir attending, and the bishop of Rochester waiting some hours to no purpose for the corpse. The next day Mr. Charles Dryden waited on lord Halifax and the bishop, and endeavoured to excuse his mother by relating the truth. Three days after, the undertaker having received no orders, waited on lord Jefferys; who pretended that it was a drunken frolic, that he remembered nothing of the matter, and he might do what he pleased with the body. Upon this the undertaker waited upon lady Elizabeth, who desired a day's respite, which was granted. Mr. Charles Dryden immediately wrote to lord Jefferys, who returned for answer, that he knew nothing of the matter, and would be troubled no more about it. Mr. Dryden hereupon applied again to lord Halifax and the bishop of Rochester, who absolutely refused to do any thing in the affair. In this distress, Dr. Garth, who had been Mr. Dryden's intimate friend, sent for the corpse to the college of physicians, and proposed a subscription; which succeeding, about three weeks after Mr. Dryden's decease,

Dr. Garth pronounced a fine Latin oration over the body, which was conveyed from the college, attended by a numerous train of coaches to Westminster Abbey, but in great disorder. It was interred in a private manner. After the funeral Charles Dryden sent a challenge to lord Jefferys, and repeatedly sought admittance to him to provoke a duel, or to chastise him for the above barbarous indignity, in vain. Dryden had no monument erected to him for several years, to which Mr. Pope alludes in his epitaph intended for Mr. Rowe, in this line,

Beneath a rude and nameless stone he lies.

In a note upon which we are informed, that the tomb of Mr. Dryden was erected upon this hint by Sheffield, duke of Buckingham, to which was originally intended this epitaph:

This Sheffield raised.—The sacred dust below
Was Dryden once; the rest, who does not know?

Which was afterwards changed into the plain inscription now upon it, viz.

J. DRYDEN,

Natus Aug. 9, 1631.

Mortuus Maii 1, 1701.

Johannes Sheffield, dux Buckinghamiensis, fecit.

Were we to form a judgment of this celebrated writer from some of his dramatic writings, we should be apt to conclude him a man of the most licentious morals; many of his comedies containing gross obscenity. But Congreve, whose authority cannot be suspected, has depicted him as no less amiable in his private character as a man, than he was illustrious in his public one as a poet. He was, according to this authority, humane, compassionate, forgiving, and friendly; gentle in the correction of the writings of other authors, and patient under the censure of his own; easy of access himself, but slow and diffident in his advances to others; and of all men the most modest, and the most easy to be discountenanced in his approaches either to his superiors or his equals. As to his writings, he has been thought to have attained the greatest general harmony in his numbers, of any of our poets.

DRYPIS, in botany, a genus of the trigynia order, and pentandria class of plants; natural order twenty-second, caryophyllæ: *cal.* quinque-entated: petals five; the opening at the capsule as if cut round horizontally, monospermous. Species one only, a native of Barbary and Italy.

DRYSDALE (John), D. D., a late eminent clergyman of the church of Scotland, was born at Kirkcaldy, April 29th 1718. He soon distinguished himself as a classical scholar, and, in 1732, was sent to finish his studies at the university of Edinburgh. In 1740 he was licensed to preach by the presbytery of Kirkcaldy; and, after having been several years employed as assistant minister of the college church at Edinburgh, was settled at Kirkcaldy in 1748. After continuing fifteen years in this town, he obtained a presentation to Lady Yester's church, from the town-council of Edinburgh. This having been the first

time the magistrates of Edinburgh had exercised their right of presentation, a most formidable opposition was now made to his settlement. The opposition however, which was more against the measure than the man, being at last overcome, he was settled as minister of Lady Yester's. In 1765 the Marischal College of Aberdeen conferred on him the degree of D. D. In 1766, on the death of Dr. Jardine, he was translated to the Tron church, where he became colleague to Dr. Wishart; and was also appointed one of the king's chaplains, with one-third of the emoluments of the deanery of the chapel royal. In 1773, he was unanimously elected moderator of the General Assembly; 'the greatest mark of respect,' says professor Dalzel, 'which an ecclesiastical commonwealth can bestow;' and in 1784 he was again raised to the same dignity, by a great majority. In May, 1788, he appeared in his place at the meeting of the Assembly, and acted as principal clerk the first day; but was obliged to ask the assistance of professor Dalzel during the remaining days; and, being violently attacked with a cough, became gradually weaker, till he died on the 16th June following, aged seventy. Dr. Drysdale's sermons have been published since his death, and are esteemed a valuable addition to the public stock of instruction.

DSJEDSIAL, a sect of Mahomedan Arabs, chiefly inhabiting Mecran, a maritime province of Persia. 'Its first author,' says Mr. Niebuhr, 'was a venerable old man, who was found by some wood-cutters shut up in the middle of a tree, and having a book in his hand.' This miraculous origin he was informed of at Mas-kat, but 'each sect,' he adds, 'tells ridiculous stories of the others, to bring them into contempt.'

DSJOBIA, an ancient city of Arabia, in the province of Yemen; the capital of a district and the seat of a Dola; seated on the brink of a precipice, and containing about 600 houses, of considerable height and of good appearance. Its streets are paved.

DU'AI, *adj.* Lat. *dualis*, from *duo*; Gr. *δύω*; Chald. 17, two. Expressing two.

Modern languages have only one variation, and so the Latin; but the Greek and Hebrew have one to signify two, and another to signify more than two, under one variation the noun is said to be of the *dual* number, and under the other of the plural.

Clarke's Latin Grammar

DUB, *v. a. & n. s.* Goth. *dubba*; Sax. *dubben*; Fr. *adoubier*. The Northern words mean to strike, and have been thought to allude to the mode of making a knight by a slight blow with a sword. To make a knight. To confer any kind of dignity or honor. Butler uses it as a substantive for a blow.

Knight, knight, good mother! Basilisco like.

What! I am *dubbed*; I have it on my shoulder.

Shakespeare.

He

Gave thee no instance why thou shouldst do treason,
Unless to *dub* thee with the name of traitor. *Id.*

The jealous o'erworn widow and herself,
Since that our brother *dubbed* them gentlewomen,
Are mighty gossips in this monarchy.

Id. Richard III.

The robes which the kings then allowed to each knight, when he was *dubbed*, of green, or burnet, as they spake in that age, appeareth upon record.

Camden's Remains.

The king stood up under his cloth of state, took the sword from the lord protector, and *dubbed* the lord mayor of London knight. *Hayward on Edward VI.*

As skilful coopers hoop their tubs
With Lydian and with Phrygian *dubs*. *Hudibras.*

O poet! thou hadst been discreeter,
Hanging the monarch's hat so high,

If thou hadst *dubbed* thy star a meteor,
That did but blaze, and rove, and die. *Prior.*

These demoniacks let me *dub*
With the name of legion club. *Swift.*

A man of wealth is *dubbed* a man of worth;
Venus shall give him form, and Anstis birth.

Pope.

Women commence by Cupid's dart,
As a king hunting *dubs* a hart. *Cleaveland.*

A plain gentleman, of an ancient family, is of better quality than a new knight, though the reason of his *dubbing* was meritorious. *Collier on Pride.*

I have on the seat behind me the constitution of Mr. John Probert; a knight-errant, *dubbed* by the noble lord in the blue ribbon, and sent to search for revenues and adventures upon the mountains of Wales. *Burke.*

DU'BIOUS, <i>adj.</i>	} Lat. <i>dubius</i> ; anciently <i>duvius</i> , from <i>duo</i> , two, and <i>via</i> , a way; drawn two ways; in doubt.
DUBIOUSITY, <i>n. s.</i>	
DUBIOUSLY, <i>adv.</i>	
DUBIOUSNESS, <i>n. s.</i>	
DUBITABLE, <i>adj.</i>	
DUBITATION, <i>n. s.</i>	} Doubtful; uncertain in argument or event; not plain. Dubitable is also doubtful, or that may be doubted.

Dubitation may be called a negative perception; that is, when I perceive that what I see is not what I would see. *Grew.*

Men often swallow falsities for truths, *dubiosities* for certainties, feasibilities for possibilities, and things impossible for possible. *Browne's Vulgar Errors.*

Authors write often *dubiously*, even in matters wherein is expected a strict definitive truth. *Id.*

Many of the ancients denied the antipodes; but the experience of our enlarged navigation can now assert them beyond all *dubitation*. *Id.*

No quick reply to *dubious* questions make.

Denham.

His utmost power with adverse power opposed,
In *dubious* battle, on the plains of heaven. *Milton.*

Satan with less toil, and now with ease

Wafts on the calmer wave, by *dubious* light. *Id.*

Yet where truth and knowledge are concerned in the case, I know not what fault it can be to desire the explication of words, whose sense seems *dubious*. *Locke.*

She speaks with *dubiousness*, not with the certainty of a goddess. *Broome.*

Almanack-makers wander in generals, and talk *dubiously*, and leave to the reader the business of interpreting. *Swift.*

It is a common and just observation, that, when the meaning of any thing is *dubious*, one can no way better judge of the true intent of it, than by considering who is the author, what is his character in general, and his disposition in particular. *Pope.*

We also call it a *dubious* or doubtful proposition, when there are no arguments on either side.

Watts's Logick.

Now hope exalts the fisher's beating heart;
Now he turns pale, and fears his *dubious* art. *Gay.*

When a question of orthography is *dubious*, that practice has, in my opinion, a claim to preference, which preserves the greatest number of radical letters, or seems most to comply with the general custom of our language. *Johnson. Plan of Dictionary.*

In clay-formed beds the trickling streams collect, Strain through white sands, through pebbly veins direct;

Or point in rifted rocks their *dubious* way,
And in each bubbling fountain rise to day. *Darwin.*

Where Reason's meteor-rays, with sickly glow,
O'er the dun gloom a dreadful glimmering throw;
Disclosing *dubious* to the' affrighted eye
O'erwhelming mountains tottering from on high,
Black billowy deeps in storms perpetual tossed,
And weary ways in wildering labyrinths lost. *Beattie.*

You'll find there are such shortly,
By its rich harvests, new disease, and gold;
From one-half of the world named a whole new one,
Because you know no better than the dull
And *dubious* notice of your eyes and ears. *Byron.*

DUBITZA, a town and fortress in Bosnia, European Turkey, situated on the right bank of the Unna, near its confluence with the Save; and opposite a fortified Austrian town of the same name in Croatia. The Austrians, in the campaign of 1788, twice attempted to take it by storm, and it at last surrendered; but, at the peace of Sistov, it was restored to the Porte. Population 6000. Twelve miles north-east of Kostainitza: the Austrian town has about 1600 inhabitants.

DUBLIN COUNTY, the metropolitan county of Ireland, lies on the east coast of that country, immediately opposed to the Welsh coast: it is between 53° 10' and 53° 37' N. lat., and 6° 36' W. long. from Greenwich. The boundaries are, on the north the county of Meath, on the west parts of Kildare and Meath counties, on the south the county of Wicklow, and on the east the Irish sea. Its sea-front is terminated by the Nanny Water on the north, and by Bray River on the south.

This county contains 240,113 statute acres: seventy-three parishes and fourteen parts of parishes, with 693 townlands; and is divided into eight baronies and one half barony. The surface of that part north of the river Liffey is flat and badly supplied with water, on which account it is less inhabited by gentry but more applied to agriculture: the surface of the southern side is a beautiful inclined plane, ascending gradually from the sea-shore to the foot of the Dublin and Wicklow Mountains. The soil in this part is lighter than the rich loam in the northern baronies, but this disadvantage is not felt, as from the natural beauty of the country south of the Liffey it is almost wholly appropriated to the demesnes of the gentry of Dublin and to manure villas for the summer season.

The entire county may be considered as naturally divided into two parts, by a line drawn from the village of Newcastle to Rathfarnham, where it will form a very obtuse angle with its new direction, which may be represented by a line drawn from Rathfarnham to Booterstown, where the limestone crops out on the strand: all north of this line rests on a base of foetz limestone, except one patch extending from Skerries to Balbriggan, which rests on transition rocks. Fuel

is scarce in the centre of the county, although there are coals at Naul and an extensive turf bog at Ganistown, but the coal vein is not worked. The northern baronies are still in a very wild and uncultivated state, although much benefited by the new Drogheda road by Ashbourne: a place hitherto almost unknown. The tract between the great western road near Rathcool, and the Blessington road, with the Golden Hill and Ballinscorney, rests on slaty rock. The remainder of the county, with little exception, is of granite formation; the field of granite commencing at Williamstown strand and extending to Brandon Hill in the county of Kilkenny, having an average breadth, in that distance, of eleven miles.

There are few good harbours on the coast of this county; piers have been constructed at Balbriggan, at Howth, &c., and an extensive asylum harbour at Kingstown, enclosing 226 acres by two piers of several kants, having a depth of twenty-six feet at low water. The Holyhead and Liverpool mail packets sail from this asylum, and it is in contemplation to connect it with the Ringsend docks by a ship canal, or else to convey merchandise hence to the city of Dublin by a rail-way: the distance is about six miles and a half. It was here that his majesty George IV. embarked in 1821, and a handsome obelisk, bearing an appropriate inscription, is erected on the spot, to commemorate the event. Kingstown harbour is too large, and the pier should have been faced with cut stone down to the foundation.

DUBLIN, the metropolis of Ireland, the second city in his majesty's dominions, is situated in the province of Leinster, and county of Dublin. The river Liffey, which falls into Dublin Bay, immediately below the custom-house, divides the city into two nearly equal parts. Dublin lies seventy-two miles west of Holyhead in Wales, 303 south-west of Edinburgh, and 420 north-west of London. Long. 6° 6' W., lat. 53° 20' N.

Dublin is a place of great antiquity; it was anciently confined to the south side of the Liffey. In the tenth century, after the fortifications of Dublin were repaired by the Ostmen, the walls of the city, including those of the castle, did not occupy more than an Irish mile; they extended from Wine-Tavern gate to Audeon's Arch, and were continued thence to Newgate, now Thomas-street; they were continued to Ormond's-gate, or, as it has been since called, Wormwood-gate; thence to the Whitworth-bridge, and along the banks of the river to Newman's Tower, nearly the present site of the south entrance of Essex-bridge; and, from Newman's Tower, in an oblique direction, to Dame's-gate, at the west end of Dame-street. From the gate at the south-west angle of the castle, the wall ran to Nicholas-gate, and was continued thence to Newgate. The principal streets without the walls were, on the west, New-row, Francis-street, Thomas-street, and James's-street; on the south, Patrick-street, Bride-street, and Ship-street; and on the east, Dame-street, George's-lane, and Stephen-street. That space of ground now occupied by Crane-lane, Temple-bar, Fleet-street, Lazar's-hill, or, as it is now

called, Townsend-street, Crampton, Aston's, George's, and Sir John Rogerson's quays, &c., was then overflowed by the Liffey. On the north side of the river there were only Church-street, Mary's-lane, Hammond-lane, and Pill-lane, then built but on one side as far as Mary's Abbey, which terminated the extent of that part of the town to the east. Grange-gorman, Stoney-batter, now called Manor-street, and Glassmanogue, were then villages at some distance from the city; and, at the latter, the sheriffs have held their courts in times of the plague. In 1664 the inhabitants amounted to 2565 men, and 2986 women, Protestants; and 1252 men, and 1406 women, Roman Catholics: in all 8159.

Ptolemy, who flourished about A.D. 140, says, it was anciently called *Ascheled*. In 155 Alpinus, whose daughter, Auliana, was drowned in the Liffey, changed the name from *Ascheled* to Auliana. It was afterwards named *Dublana*, and Ptolemy calls it *Eblana*. *Dublana*, whence *Dublinum* and *Dublin*, is evidently derived from *Dub-leana*, the place of the black harbour or lake, or rather the lake of the sea; the Bay of *Dublin* being frequently so called. The city has had a variety of names. The Irish call it *Drom-choll-coil*, 'the brow of a hazel wood.' In 181 Eogan, king of Munster, being on a royal tour, paid a visit to this place, which was then called *Atha Cliath Dubb-Line*, 'the passage of the ford of hurdles over the black pool.' The harbour of *Dublin* was likewise known by the name of *Lean-Cliath*, or *Leam-Cliath*, from *Lean* or *Leam*, a harbour; and from *Cliath* or *Cliabb*, which literally signifies a hurdle or any thing made of wicker-work; it also signified certain wires formed with hurdles, and placed in rivers and bays by the ancient Irish, for the purpose of taking fish; whence any river or bay, wherein these wires were fixed, had the name of *Cliath* or *Cliabb* annexed to it, to signify the establishment of a fishery. *Dublin*, therefore, being originally built on or near one of these harbours, was anciently called *Baly-lean-Cliath*; that is, the town on the fishing harbour. It is still distinguished in the Irish language by the appellations of *Ath-Cliath*, 'the ford of hurdles,' and *Ballyath-Cliath*, 'the town of the ford of hurdles,' the inhabitants having formerly had access to the city, over the river, by hurdles laid on the low marshy grounds adjoining the water; and this name was also extended to the north side of the river, from a temporary bridge of hurdles thrown over the *Anna-Liffey*, a corruption of *Auin Loniiffa*, or the swift river, so termed from the rapidity of the mountain floods. The north side was enlarged by Mac-Turkill, the Danish prince; who, notwithstanding, fixed his residence on the south side, and abandoned the northern town; which, from the original country of the invaders, was called *Eastmantown*, then *Ostmentown*, since corrupted to *Oxmantown*. King Edgar, in the preface to his charter, dated 964, mentions Ireland, with its most noble city (*nobilissima civitas*) of *Dublin*. By the Fingalians, it is called *Divelin*, and by the Welsh *Dinas Dulin*, or the city of *Dulin*.

In 448 Alpin M'Eachard, king of *Dublin*, and all his subjects, are said to have been converted to

Christianity by St. Patrick. In 498 the *Ostmen*, or Danes, having entered the Liffey, with a fleet of sixty sail, made themselves masters of *Dublin* and the adjacent country, and soon after environed the city with walls. About 1170 Dermot M'Murrough, king of Leinster, having quarrelled with the other princes of the kingdom, a confederacy was formed against him by Roderic O'Connor, monarch of Ireland. Dermot applied to Henry II., king of England, who sent over a number of English adventurers, by whose assistance he was reinstated in his dominions; in 1171 the descendants of the Danes still continuing to hold possession of *Dublin*, it was besieged and taken by a powerful party of the English, under Raymond-Le-Gros. M'Turkill, the Danish king, escaped to his shipping; but returned soon after, with a strong fleet, to recover the city; he was killed in the attempt, and in him ended the race of Easterling princes in Ireland. In 1172 Henry II. landed at Waterford, and obtained from Richard, earl Strongbow, who married Eva, the daughter of M'Murrough, and by compact was his successor, a surrender of the city of *Dublin*; where he built a pavilion of wicker-work near St. Andrew's church, then situated where Castlemarket lately stood, and there entertained several Irish princes, who voluntarily submitted to him, on condition of being governed by the same laws as the people of England. Henry also held a parliament here. In 1173 he granted his first charter to *Dublin*, and by divers privileges encouraged a colony from Bristol to settle in it. In 1210 upwards of twenty Irish princes swore allegiance to king John at *Dublin*; engaging to establish the English laws and customs in the kingdom; and in the same year courts of judicature were instituted. In 1216 *Magna Charta* was granted to the Irish by Henry III., an entry of which was made in the red book of the exchequer at *Dublin*. In 1217 the city was granted to the citizens, in fee-farm, at 200 marks per annum; and, in 1227 Henry ordained, that the charter granted by king John should be kept inviolably. In 1404 the statutes of Kilkenny and *Dublin* were confirmed in a parliament, held at the city, under the earl of Ormond. The charter of the city of *Dublin* was renewed in 1609 by James I. The civil government of the city was anciently under the management of a provost and bailiffs; in 1308 John le Decer was appointed the first provost, Richard de St. Olave and John Stakebold bailiffs. In 1409 the title of the chief magistrate was changed to that of mayor, when Thomas Cussac was appointed to the office, Richard Bove and Thomas Shortall being bailiffs; the office of bailiffs was changed to sheriffs in 1547. In 1600 Charles II. gave a collar of SS. and a company of foot-guards to the mayor; and in 1665 he conferred the title of lord mayor on the chief magistrate, to whom he also granted £500 per annum, in lieu of the foot company. Sir Daniel Bellingham was the first lord mayor of *Dublin*; Charles Lovet and John Quelsh were sheriffs the same year. In 1672 Arthur, earl of Essex, introduced new rules for the better government of the city; and in 1683 the old Tholsel was built by Inigo

Jones, for the magistrates to hold their courts, assemblies, &c.

The hospital for lying-in women, founded by Dr. Bartholomew Mosse, and opened in 1757, stands on the north side of Great Britain-street. The building, designed by Cassels, is light and elegant; a beautiful steeple rises in the centre, and the wings are formed by semicircular colonnades on each side. Adjoining the east colonnade is the rotunda, where balls and assemblies are held, and concerts performed for the benefit of the charity. The blue-coat hospital was founded on the west side of Queen-street, by Charles II., in 1670, for educating the children of reduced freemen of the city; but the original building being greatly decayed, was taken down, and the new blue-coat hospital, situated on Oxmantown-green, was begun in 1773. The front is enriched by four three-quarter Ionic columns, supporting a pediment in the centre, over which the steeple rises, embellished with Corinthian and composite columns in an admired taste. Connected with the front by circular walls, ornamented with balustrades and niches, are the school on one side and the church on the other, which form two well-proportioned wings, each crowned with a small turret; the steeple is not yet finished. The royal hospital at Kilmainham, for the support of invalids of the Irish army, was founded by king Charles II., on a plan similar to that of Chelsea. It was completed in 1683, and cost upwards of £23,500. It is situated at the west end of the town, on a rising ground, near the south side of the river, from whence there is an easy ascent to it through a handsome avenue and park. It is of a quadrangular form, enclosing a spacious area, laid out in grass-plots and gravelled walks; an arcade is carried along the lower story in each square, to the entrance of the hall and chapel, which are both curiously decorated; in the former are several whole length portraits of royal personages, and other distinguished characters. Madam Steven's hospital, the foundation of which was laid in 1720, is a quadrangular building, pleasantly situated on the banks of the river, near the west end of James's-street; the hospital for lunatics, in Bow-lane, founded by Dean Swift, and opened in 1757; Sir Patrick Dun's hospital, in which the royal college of physicians hold their meetings and examinations; the Cork-street fever hospital; the new Meath hospital, built by Mr. Pleasants; Mercer's hospital, in Johnson's-place, founded by the amiable Mrs. Mercer; Simpson's hospital, in Great Britain-street, an asylum for blind and gouty men; the house of industry, in Brunswick-street, for the aged and infirm; the hospital for incurables, on the Donnybrook-road; and the charitable infirmary, Jervis-street, are the most conspicuous in alleviating the afflictions of disease, and ministering to the numerous calls of the impoverished. There are several noble institutions also, that derive aid, either wholly, or in part, from parliament; such are the Hibernian school, in Phoenix park, for the education of the children of soldiers, and the Royal Marine school, for the maintenance and education of the children of distressed sailors.

Dublin is seated in view of the sea on the east, and a fine country which swells into gently rising eminences on the north and west, while it towers boldly up in lofty mountains, that bound the horizon, on the south. The city itself cannot be seen to full advantage on entering the harbour; but the approach to it exhibits a fine prospect of the country for improvement and cultivation, interspersed with numerous villas, that enliven this delightful scene, which, beginning at the water's edge, is continued all over the coast to the north of the bay, as far as the eye can reach, and is finely contrasted by a distant view of the Wicklow mountains on the south, where the conical hills, called the Sugar Loaves, contribute not a little, by the singularity of their appearance, to embellish the landscape, so extensive and picturesque as not on be equalled by any natural scenery in Europe, except the entrance of the Bay of Naples, to which it bears a striking resemblance.

The form of Dublin is rectangular. From the royal hospital at Kilmainham, at the western extremity of the town, to the east end of Townsend-street, the length is two miles and a half, and its greatest breadth two, and it is about nine miles in circumference. It contains about 16,000 houses, whose inhabitants are estimated at 180,000.

The civil government of Dublin is executed by a lord mayor, recorder, two sheriffs, twenty-four aldermen, and a common-council composed of representatives from the twenty-five guilds. Dublin, being the seat of government, and of the chief courts of justice, has received many charters and ample privileges from the kings of England, since the reign of Henry II. Richard II. erected it into a marquisate in favor of Robert de Vere, earl of Oxford, whom he also created duke of Ireland. It is an archiepiscopal see, and sends two members to parliament.

Dublin is remarkable for the breadth and elegance of its leading streets; from the Cavalbridge, in Baggot-street, along the north side of Stephen's-green, or by Merriion-square into Grafton-street and College-green, thence through Westmoreland-street, Sackville-street, Rutland-square, Gardiner's-row, and so to Mountjoy-square, is probably the most elegant succession of city avenues to be seen in any European capital; but the back streets are a melancholy contrast, very few of them presenting the appearance either of wealth or comfort. There are five handsome squares in the city, the largest of which, called Stephen's-green, is one mile in circumference, enclosed by iron-railing, mounted on a dwarf wall, outside of which is a broad gravel-walk, protected from the carriage-way by chains and pillars. In the centre of this great level space, stands a fine equestrian statue, by Van Nott, of king George II. Merriion-square is a large rectangle, surrounded by noble mansions; those on the north side enriched, in the basement story, by rustic work in stone; these were built from the designs of John Ensor, esq., who laid out this fine square. Rutland-square is the Grosvenor-square of Dublin; a few of the Irish nobility still retain their mansions here, the noblest of which is Charlemont

House. Considerable improvements are still carrying on in the avenues of Dublin, under the direction of the Wide-street commissioners, particularly in the vicinity of St. Patrick's cathedral, decidedly the most miserable part of the city or its liberties.

Dublin is divided into four districts, each submitted to the care and protection of a police magistracy, who have an office and court within their respective districts. The head office of police is in the Castle division; to this belong thirty-one peace-officers, and to each of the other, seven. Police stations are established at convenient distances round the city, and a patrol of horse-police is in constant motion during the greater part of each night, even to a distance of seven miles from the city. The old archiepiscopal palace has been converted into the horse-barrack of the police corps.

The public buildings of Dublin are both numerous and noble: the most architectural is the Bank of Ireland (formerly the Parliament House) the foundation of which was laid in 1729; it was erected under the instruction of Sir Edward Lovet Pearce, after a design by Mr. Cassels. The original building consisted of a grand colonnade of the Ionic order, forming three sides of a rectangular court-yard. The central colonnade is connected with the two noble porticos, forming the east and west fronts, by circular curtain walls, ornamented with three-quarter columns. These last-mentioned porticos are built from the designs of Messrs. Gandon and Parke. No part of the interior remains as formerly, except the corridors and the House of Lords, in the last of which is a fine statue of George III. by Bacon jun. The cash office stands on the site of the old House of Commons, and is a very spacious, light and beautiful apartment. The establishment for engraving and printing of bank notes, under the direction of Mr. Oldham, exhibits a singular specimen of ingenious mechanism; it was visited by his present Majesty during his stay in Ireland in 1821. The General Post Office, established in 1784, stands in Sackville Street at the intersection of four leading streets and adjacent to Nelson's pillar. The portico in front, of Portland stone, is a remarkably beautiful piece of architecture: the ornaments of the frieze are not exceeded by any similar designs in the city. This very large and convenient building was raised for the comparatively moderate sum of £50,000 from the design of Francis Johnston Esq. The Stamp Office, in William Street, is also a fine building of cut granite stone raised in the Wicklow Mountains.

The Castle of Dublin, now the town residence of the lord-lieutenants who formerly lodged at the Royal Hospital of Kilmainham, may be considered as divided into two parts, called the upper and lower yards. The upper is a quadrangle of brick buildings, with ornamental stone architraves to the windows; the entrance to his excellency's apartments is by a fine colonnade, antehall and grand flight of steps; opposite to the state entrance is a handsome building, containing the apartments of the guard of honor and of several of the household; the basement is an arcade supporting an open colonnade surmounted

by a pediment, above which rises an octagonal tower crowned by a tapering dome. This pretty building is terminated as wings, by two lofty archways of rustic-work, on the crowns of which rest statues of Justice and Fortitude. The Castle was built by Henry de Londres, archbishop of Dublin in 1220, but not used as the vice-regal residence until the year 1560, by command of queen Elizabeth, since which time it has received so many additions that it does not present the appearance of any regular edifice, but an assemblage of irregular buildings raised for some immediate necessity. In the state apartments there is a fine room, eighty-two feet in length, called St. Patrick's Hall, having the ceiling ornamented by three characteristic paintings of Waldre's. Here the knights of the noble order of St. Patrick were regaled after their original institution, and here, by annual balls, the birth-day of the great patron saint of Ireland is celebrated. The lower Castle yard contains several offices, the Old Treasury, the ordnance office, &c., beside the very beautiful chapel lately erected after a design by Francis Johnston Esq. the very best specimen of modern pointed architecture in the city. It is built of cut stone, highly enriched with carved heads and Gothic pinnacles. Nor does the interior lose any of that masterly style so conspicuous in the exterior. The regal seat and front pannels of all the pews are adorned with armorial bearings in carved oak of a series of viceroys; the great window embellished with stained glass, and the ceiling decorated with highly enriched pendants. The first stone of the chapel was laid by his grace John duke of Bedford, in 1807, and the expense of its erection was about £40,000. The Record Tower, adjoining the chapel, was erected by king John, its walls are fourteen feet thick: here James II. established a mint and secreted a quantity of the royal plate. Birmingham Tower, another of the flankers of the town wall, stands at a little distance from the record tower. The old building of this name having been destroyed by fire, the present unmeaning mass was erected in its stead.

The Royal Exchange contiguous to the castle, is a magnificent pile, erected after a design of Mr. Cooley; the ground plan is simply a circle inscribed in a square. It is wholly built of Portland-stone, has three fronts adorned with pillars and pilasters, and contains a noble area within, lighted by a beautiful and spacious dome, for the transaction of commercial business. In the circular ambulatory, fronting the principal entrance door, stands a handsome statue of his late majesty in Roman military costume designed by Van Nort. Besides the royal exchange, which is now almost disused for commercial purposes, there are two other handsome buildings faced with stone appropriated to the accommodation of merchants, the commercial buildings in College Green and the corn exchange on Burgh Quay, in the former of which the chamber of commerce hold their meetings. The Custom House is acknowledged to be one of the noblest buildings in the city; its south front towards the river is built of Portland stone, extends 375 feet, and is adorned with a beautiful portico in the centre, consisting of

four Doric columns supporting an enriched entablature and pediment, the tympanum of the latter decorated with a group of figures in alto relievo, representing Hibernia and Britannia presenting emblems of peace and liberty. A magnificent dome supporting a cupola, on whose apex stands a colossal figure of Hope, rises nobly from the centre of the building to a height of 125 feet. The north front is of equal extent; but, the ornamented parts excepted, is entirely of granite stone, which produces rather a sombre effect. The only handsome apartments within for public use are the Board room, and what is called the Long room. To the custom house are attached large and well designed docks, much too capacious and of too expensive a character for the trade of Dublin. The old dock, which is quite sufficient for the present trade, is 400 feet in length by 200 in breadth; the second dock measures 330 feet by 250, and the third or inner basin is 650 in length by 300 in breadth. Extensive stores have also been erected: the tobacco store is 500 feet long, its breadth being 160. Besides these docks which belong to government, and are leased for about £7000 per annum to private individuals, there are canal docks on both sides of the river which alone would afford abundant accommodation to all the shipping engaged in the Dublin trade; these, of course, are quite unemployed. These seven great basins are faced with limestone of the very best description and in a workmanlike style. The linen hall is a very extensive range of building, not uninteresting in external appearance: a handsome statue of his present majesty has lately been erected there by the trustees; it was executed by Kirk. A most useful building has lately been erected, to be called the National Mart, or Usher's Quay, the object of which is to encourage the small capitalist, who is here to be supplied, not only with an immediate sale for the produce of his labor, but also with a loan, to enable him to bring something more valuable to market as a second venture.

There are two noble buildings appropriated to the accommodation of the legal profession, and to the administration of justice. The principal is the stately edifice called the Four Courts, or Inn's Quay: the first stone was laid in March 1786, by his grace the duke of Rutland, but the whole structure was not completed for fourteen years after. The design which is by Cooley, but executed by Gandor, is truly noble. It consists of a grand central building, with squares on each side, enclosed by ranges of lofty buildings, containing the different offices of records, &c. The front of the centre is adorned with an elegant picture of six Corinthian columns, supporting a frieze and pediment; on the apex of the latter stands a statue of Moses, and at each extremity are allegorical figures of Justice and Mercy. Behind the pediment and statues rises a circular lantern, sixty-four feet in diameter, crowned by a lofty dome. The spacious court yards on each side are enclosed in front by light and beautiful open arcades, in the centre of which are great coach ways, ornamented by groups of allegorical emblems. The four law courts are contained in the central buildings, radiating from a spacious

circular hall of sixty-four feet diameter: they are all of equal dimensions, rather small, but lofty and well lighted. The rolls court is also in the same building. The extent of the grand front of the four courts, presented to the quays, is 450 feet, and its depth 170. It is built of cut granite, the ornamental parts being of Portland stone: the expense is estimated at £200,000.

The inns of court, at the upper end of Henrietta Street, occupy a beautiful and singularly original building, designed by Mr. Gandor. The front is hewn of granite, the ornamental parts being of Portland stone. The plan consists of a centre and wings, each of the latter being crowned with noble pediments. In the central compartment of the three great subdivisions of the front, beautiful panels are inserted, filled with allegorical representations in alto-relievo the central of which represents the judicium authorities of Ireland, receiving from queen Elizabeth a translation of the Bible and a charter of incorporation. The door-ways of the wing are ornamented by caryatides, the only specimen of this description of sculpture in Dublin. In one of the wings is the dining hall of the benchers and students of the inns; and in the other are the Prerogative Court and Consistorial Office, &c. A law library is now (1827) erecting, with a front of cut stone, adjacent to the back entrance to the inns on the site of the priam's old city palace. There are other courts in Dublin and its vicinity. The city court-house or Sessions House, adjacent to Newgate, is a uninteresting building, and rather badly adapted to the purpose of its erection. The Court of Conscience, in Coppinger's Row, where the ex lord mayor, or his substitute, presides, is held in a miserable apartment in the basement story of the City Assembly Room: besides four Manx Courts, only one of which has a suitable court house; and the Insolvent Court, held in a very humble description of building.

The ecclesiastical division of Dublin is into nineteen parishes, to each of which a church is attached. There are also the cathedral of St. Patrick, Christ Church, which is only collegial though called metropolitan; seven assistant chapels to the parish church of St. Peter, besides many private chapels, which are independent of the diocesan, such as those of Kilmaham Hospital; the Foundling Hospital; the Lying-in Hospital; the Blue-coat Hospital: the Marist School; Hibernian School, &c. The Roman Catholic division of parishes does not correspond with that of the established church; but their places of worship are numerous, and the chapels in Anne Street and Exchange Street possessed of much architectural elegance. The Metropolitan Chapel in Marlborough Street when finished, will be a great ornament to the city. The great aisle is 150 feet in length, and 120 in breadth; the exterior is still in a very unfinished state. The Quakers, Moravian Methodists, &c., have meeting houses in various parts of the city: the number of Methodist meeting houses is not increasing; on the contrary one of them has been purchased for a fine church, for the Protestant poor; and proposals have been made for the purchase of a second.

The cathedral of St. Patrick is a venerable pile, originally possessing much grace, beauty, and lightness of style. The ground plan is a single cross with four side aisles: the nave, 150 feet in length, is adorned with several fine monuments. Here is the simple slab, inscribed with an epitaph written by himself, consecrated to the memory of Swift; and an adjacent column supports an equally plain tablet, with an inscription, also from the pen of dean Swift, to Stella. The monuments of Dr. Marsh, the founder of the public library, called after his name, and Dr. Smyth, the endower of the Bethesda, are the most rich and beautiful designs. The south transept has lately been refitted, and in levelling the floor some curiously figured tiles, forming the steps of an ancient altar, were discovered, which, together with the remains of the altar, are left uncovered for the gratification of the public taste in matters of antiquity. The northern transept, lately rebuilt, is used as the parish church of St. Nicholas without. The choir of St. Patrick's is strikingly picturesque; it is lighted by five lancet-shaped windows at the summit of the eastern wall, which shed an indefinite and partial light upon the various objects beneath. The organ is large and fine toned: the echo of the chancel most grateful to the ear. The walls and panelled gallery fronts decorated with the helmets, swords, and banners of the knights of St. Patrick; and the oaken canopied stalls adorned with their armorial bearings, emblazoned in golden characters. Near the communion table is the monument of the great earl of Cork; opposite is a tablet to duke Schomberg; while, amongst the fantastic relics of the place, are preserved the skull of the duke, perforated by a musket ball, and the chain ball by which lord Lofton was slain at the siege of Limerick. St. Patrick's Cathedral was built in 1190, upon the site of a church said to have been founded by St. Patrick himself. The steeple was added in 1370, and the spire in 1749; the hall of which is 223 feet from the level of the street. The collegiate church of the Holy Trinity, called also Christ Church, is said to have been built in 1033, by Litricus, the son of Am-lane, an Ostman king of Dublin. Its site had been appropriated to sacred purposes by St. Patrick, who is said to have preached to the heathen in the precise vaults on which this ancient edifice stands, these being the stores used by the Danes for lodging merchandise. The original building was destroyed almost wholly by fire, and, with the exception of a fine Norman door-way in John's Lane, little either of the ancient architecture, or of any intelligible design, is discoverable in the present mutilated structure of Christ Church. In this church the reformed service was first read in Ireland; and here also Lambert Simnell was crowned by the title of Edward VI. St. Andrew's Church still exhibits some few traces of Norman architecture, and is worth the attention of the antiquarian. Several of the other parish churches are well designed, and executed in a masterly style: St. Werburgh's, Thomas's, and Catherine's, are not unlike each other in internal arrangements, and are all spacious and venerable. St. Werburgh's had once a handsome spire, which the parishioners

removed, from an apprehension that the foundation was sinking. St. Paul's, lately erected, has a low and clumsy spire; St. George's possesses not only a grateful and delicate spire, but also a beautiful Grecian portico, supporting a frieze and pediment; the elevation resembles that of St. Martin's, in London, but is probably less heavy, owing to the omission of the Græco-Italian block ornaments of the latter. The parishioners of St. Michan's are about to rebuild their church, the present being decayed to a perilous extent: underneath the old church are the vaults remarkable for their antiseptic power; bodies deposited here 120 years ago are found as perfectly preserved this moment as if they had undergone the process of embalming.

Amongst the useful institutions of Dublin are, —the Royal Dublin Society, for the encouragement of husbandry and the arts, established in 1731: here public lectures are delivered by the society's professors, in geology, mineralogy, botany, and chemistry: and free-schools are opened for instruction in drawing and sculpture. The Society occupy the noble mansion of the dukes of Leinster, built from Cassel's designs, and perhaps one of the noblest private residences in Europe; —the Royal Hibernian Academy, for the advancement of the arts, built at the sole expense of Francis Johnston, Esq., now president, who bestowed it upon the artists of Ireland, to whom his present majesty had most graciously granted a charter of incorporation (the first exhibition of the Royal Hibernian Academy took place in 1826); —and the Royal Irish Academy situated in Grafton Street, whose Transactions contain many valuable articles; in the library are several valuable MSS. The principal public libraries in Dublin are, those of the college; the Dublin Society, rich in botanical works; the Dublin Library Society, in D'Olier Street; and Marsh's Library, in Kevin Street. Since the erection of the Royal Hibernian Academy, the committee of the Irish Institution have felt themselves called upon to contribute their aid to the advancement of the arts in Ireland, and in consequence erected a handsome gallery in College Street, for the exhibition of the works of the old masters, a situation both central and convenient.

Trinity College was founded by queen Elizabeth, and endowed with many valuable livings by James I. The foundation was laid in 1591, and students were admitted in 1593. By the original charter, the corporation consisted of the provost, three fellows, and three scholars; but it is now enlarged to seven senior fellows, eighteen juniors, and seventy scholars, besides the provost; each of the junior fellows having nearly 100 private pupils to instruct, independent of the delivery of occasional public lectures. The independent members are divided into an equal number of classes, called fellow-commoners, pensioners, and sizars. The provost, fellows, masters, and scholars, return two members to parliament, and the provost and senior fellows alone transact all the 'negotia collegii.' A senior fellowship is supposed to be worth about £1500 per annum. There is a limit placed to the number of pupils permitted to enter under a junior fellow in each class, viz. thirty-six; but this limit is so great

DUBLIN.

that 144 may thus be intrusted to one lecturer to instruct in the short periods of each year called terms. The scholars have the privilege of voting for representatives to parliament; commons for five years (the duration of a scholarship); chambers at half fire and rent, and £4 per annum. They are also eligible to chapel markships, and assistant librarianships; but these places are few in number, and neither valuable nor permanent. The independent members merely receive instruction, for which they pay their tutors, the fellow-commoners sixteen guineas, the pensioner eight guineas, per annum (the sizars are exempt from charges), besides some small annual fees. The first class graduate after three years and a half, the second and third not until the expiration of four years. During the collegiate course quarterly examinations are held in the theatre, at a certain number of which every student is obliged to answer in the prescribed course, from which it follows that in this college no pupil can possibly graduate without having obtained a certain quantity of information, while the most distinguished are rewarded by the collegiate honors of premiums and certificates. The number of names on the college books has for some few years amounted nearly to 2000.

The buildings of Dublin College are numerous and elegant. The grand front, presented to College Green, is entirely of cut granite, the ornamental parts being of Portland stone. It measures 300 feet in length, is enriched by a centre beautifully relieved by four noble three-quarter Corinthian columns supporting a pediment, and terminated by two lofty pavilions, surmounted by balustrades, and adorned with graceful coupled pilasters. Within are three large squares, and one smaller, called formerly the quadrangle. The Parliament Square, 316 feet long by 212 in breadth, is enclosed by lofty buildings (four stories in height) of cut stone, terminated by the beautiful porticoes of the chapel and theatre, which correspond while they oppose. The quadrangle contains the dining hall, vice-provost's residence, and a corresponding building (fellows' chambers) beyond the quadrangle in the Library Square, 265 feet in length by 214 in breadth, enclosed on three sides by ancient brick buildings, chiefly inhabited by the students, but, on the fourth, by the college library, the noblest apartment in the city of Dublin. To the north of the Library Square is that usually called Botany Bay, somewhat larger than any of the others, and surrounded by lofty buildings. The College Park, containing about twenty acres, is planted with noble elms. Here are the New Anatomy House, and the Printing House, a beautiful little Doric building. The chapel and theatre have similarly beautiful fronts of Portland stone, consisting of porticoes of four Corinthian pillars supporting a pediment; behind the porticoes, arcades open into a vestibule on each side, and in the centre of which are the entrances to the great hall and chapel. The hall contains an admired monument to provost Baldwin, and several fine portraits of eminent persons, former students, amongst whom are Swift and Burke. The dimensions of the chapel are equal, but the internal arrangement necessarily different from those of the

theatre. The dining hall is a singular design, the front, of cut stone, is adorned with coupled pilasters, and a shallow pediment; the great door opens on a broad terrace, approached by a flight of steps the entire breadth of the building: over the ante-hall, leading to the refectory, is the apartment in which the Historical Society hold their meetings. The library is an unpicturesque, though stately edifice: it is perforated by so many windows, that it defied the efforts of the artist to consult beauty of elevation. The chief library room (where his majesty Geo. IV. was received by the corporation) measures 210 feet in length by forty-one in breadth, is beautifully adorned with carved oak pilasters, and an indented frieze; while many fine busts of celebrated persons, standing on tapering pedestals, are ranged along either side: the inner, called also the Fagel Library, is fifty-two feet long, and contains the collection of a Dutch family, whose name it bears, of about 20,000 volumes. The manuscript room is over the Fagel Library: here are Persian and Arabic MSS., an autograph of king James II., and a most valuable collection of unpublished MSS. on Irish history and antiquities; to the south of the library is the master's garden, being a continuation of the pleasure ground attached to the provost's house: this latter mentioned building is a very beautiful structure, built entirely of cut stone, from a design by lord Burlington. The College Museum does not contain many things of interest: there is here a curious model, by Mr. Bald, of the surface of the county of Mayo. The College Observatory is situated at Dunsink, three miles from the city, and the Botanic Garden at Beggar's Bush, about half a mile from College Green.

The College of Surgeons was endowed with a charter in 1731; the first licentiate was Thomas Wright, author of some valuable works on anatomy. It is a handsome building of cut stone; consisting of a rusticated basement story, surmounted by a handsome façade, adorned with three-quarter columns, separated by large circular-headed windows: the present elevation is an improvement by Mr. Murray: it stands in a commanding position in Stephen's Green, at the corner of York Street. The School of Anatomy here is highly valued, and much visited by surgical students from England and Wales. The College of Physicians hold their meetings in Sir Patrick Dunn's Hospital, a noble building in Canal Street, erected at the expense of the munificent testator whose name it bears. There are several private schools of anatomy in Dublin, in Park Street, Brunswick Street, &c., also well attended by students from various parts of Great Britain. Dublin possesses numerous classical schools, conducted by distinguished scholars of its university.

The river Liffey, which divides the city, is enclosed by magnificent walls of cut stone, from Ringsend to Bloody Bridge, a distance of about two miles, in which length it is crossed by seven noble bridges, six of cut stone, and one of cast iron: an additional bridge of cast iron is about to be thrown across the river, near the entrance of the Phoenix Park, and above the Royal Barracks; and a magnificent arch spans the river,

about one mile west of Bloody Bridge, called Sarah's Bridge.

Dublin is encompassed by a circular road, and enclosed between two canals of noble breadth; these canals terminate in docks, communicating with the Liffey, capable of accomodating all the shipping that visits Dublin river, and of harbouring all the boats from the interior, which could be employed in transmitting the inland produce to this harbour for exportation: it is very probable that most of the export trade of Ireland will yet be carried on, by means of these canals, at Dublin.

The population of Dublin has increased but little in the last twenty years, and the number of houses has rather diminished.

DUBNO, a town of Volhynia, European Russia, on the river Irwa. The great annual market of Poland, called the Contract, was for some time held here. The population was then more considerable; at present it is not above 6600. Great numbers of Jews reside here, who carry on an extensive trade in wood, cattle, and raw produce, brought from Podolia, the Ukraine, Moldavia, &c. East of the town stands a castle, twenty-four miles S. S. E. of Lucko.

DUBOS (John Baptist), a learned and ingenious French author, born at Beauvais in 1670. He finished his studies at Paris, and was intrusted with the management of several important affairs in Italy, England, and Holland. At his return to Paris, he obtained a prebendary; he afterwards had a pension of 2000 livres, and the abbey of Notre Dame at Reims, near Beauvais. He died at Paris, when perpetual secretary of the French Academy, on the 23d March 1742. His principal works are, 1. Critical Reflections on Poetry and Painting, 3 vols. 12mo. 2. A Critical History of the French Monarchy in Gaul, 2 vols. 4to.

DUCAL, *adj.* From duke. Pertaining to a duke: as a ducal coronet.

BERTRUCIO FALIERO. (*reading.*) Decreed
In council, without one dissenting voice,
That Michel Steno, by his own confession,
Guilty on the last night of Carnival
Of having graven on the ducal chair
The following words—

DUCALS, letters patent granted by the c-devant senate of Venice, or written in the name of the senate, to foreign princes: so named because the name of the doge or duke was prefixed to them.

DUCAREL (Andrew Coltee), an eminent archæologist, was born at Caen in Normandy in 1713; but his father, removing to England, placed him at Eton, and afterwards at Oxford, where he took the degree of doctor of civil law. He became a member of Doctors' Commons, in 1743, and in 1755 was elected commissary, or official of the jurisdiction of the collegiate church of St. Catherine, near the Tower. In 1757 he was appointed librarian of the palace of Lambeth; and the following year became commissary of the diocese of Canterbury. He was one of the first fellows of the society of Antiquaries. In 1762 he was elected F. R. S.; and appointed in 1763, together with Sir Joseph Ayloffe and Mr. Astle, to methodise the records

in the State Paper office at Whitehall, and in the Augmentation office. Dr. Ducarel died at his house in South Lambeth, in May 1785. His principal works are, Anglo-Norman Antiquities, 1767, folio; a series of above 200 Anglo-Gallic, or Norman and Aquitaine Coins of the ancient Kings of England, &c., 1757, 4to.; the History and Antiquities of the Archiepiscopal Palace at Lambeth, 4to.; and the History of the Royal Hospital and Collegiate Church of St. Catherine, 4to.

DUCAS (Michael), a Greek historian who wrote a history of the empire, from the elder Andronicus to its termination. Though his style is barbarous, he relates facts not elsewhere to be found, and was an attentive observer of what passed. Nothing is known of his life except that he was often engaged in diplomatic employments. His works were printed at the Louvre in 1649, folio; accompanied with a Latin version and notes. This was afterwards translated into French by Cousin, of whose History of Constantinople, printed at Paris, 1672, 4to., and at the Hague, in 1683, 12mo., it concludes the eighth volume.

DUCAT, *n. s.* } From duke. Coins struck
DUCATOON', *n. s.* } by dukes. See COINS.

I cannot instantly raise up the gross

Of full three thousand ducats.

Shakspeare.

There was one that died in debt: it was reported, where his creditors were, that he was dead: one said, he hath carried five hundred ducats of mine into the other world.

Bacon.

An ounce of silver, whether in pence, groats, or crown pieces, stivers, or ducatoons, or in bullion, is, and eternally will be, of equal value to any other ounce of silver.

Locke.

DUCAT. See COINS. The origin of ducats is assigned by Procopius to Longinus, governor of Italy; who, revolting against the emperor Justin II., made himself duke of Ravenna, and called himself Exarcha, i. e. without lord or ruler; and, to show his independence, struck pieces of money, of very pure gold, in his own name, and with his own stamp, which were called ducati. After him, the first who struck ducats were the Venetians, who called them zechini or sequins, from Zecca, the place where they first were struck. This was about A. D. 1280, in the time of John Danduli: but we have pretty good evidence, that Roger, king of Sicily, coined ducats as early as 1240. And Du Cange affirms, that the first ducats were struck in the duchy of Apulia. The chief gold ducats are, the single and double ones of Venice, Florence, Genoa, Germany, Hungary, Poland, Sweden, Denmark, Flanders, Holland, and Zurich. The double ducats weigh from five pennyweights seventeen grains, to five pennyweights ten grains; and the single in proportion. The Spaniards have no ducats of gold; and the silver one, with them, is no real species, but only a money of account like our pound. It is equivalent to eleven rials. The silver ducats of Florence serve there for crowns.

DUCATOON, a silver coin, struck chiefly in Italy; particularly in Milan, Venice, Florence, Genoa, Lucca, Mantua, and Parma: though there are also Dutch and Flemish ducatoons. See COINS.

DUCE CREEK, called also **Cross Roads** and **Salisbury**, a town of the United States, America, in the state of Delaware, standing on Duce Creek, which runs into Delaware Bay. It is a celebrated wheat market, and has a flourishing trade with Philadelphia.

DUCENARIUS, Δουκεναριος, in antiquity, an officer of the Roman army, who had the command of 200 men. The emperors had also ducenarii among the procurators or intendants, called procuratores ducenarii. Some say that these had salaries of 200 sesterces; as in the games of the circus, horses hired for 200 sesterces were called ducenarii. Others hold, that ducenarii were those who levied the 200th penny, the officers appointed to inspect the raising of that tribute. In the inscription at Palmyra, the word occurs very often.

DUCK, *n. s., v. a., v. n. &* From Dut, *ducken*; **DUCK'ER**, *n. s.* [*adj.*] Swed. *dyka*; Tent. **DUCK'ING-STOOL**, [*adj.*] and Welsh *tuck*; **DUCK'LEGGED**, [*adj.*] to dip or dive; from **DUCK'LING**, *n. s.* Goth. *doggwa*, water. A bird of the **anas** genus; a term of endearment; and, from the common habits of the duck, a stone made to dip in and out of the water in throwing: to dive as a duck, hence to bow; and, as an active verb, to put under water.

The varlet saw, when to the flood he came,
How without stop or stay he fiercely leapt;
And deep himself he *ducked* in the same,
That in the lake his lofty crest was steep.
Faerie Queene.

Let the labouring bark climb hills of seas
Olympus high, and *duck* again as low
As hell's from heaven. *Shakespeare. Othello.*

The learned pate
Ducks to the golden fool. *Id. Timon.*

Will you buy any tape or lace for your cap,
My dainty *duck*, my dear-a? *Id. Winter's Tale.*
That we call *duckweed* hath a leaf no bigger than a
thyme leaf, but of a fresher green; and putteth forth
a little string into the water, far from the bottom.
Bacon.

Back, shepherds, back; enough your play
Till next sunshine holyday;
Here be without *duck* or nod,
Other trippings to be trod,
Of lighter toes, and such court guise
As Mercury did first devise. *Milton.*
The *ducks*, that heard the proclamation cried,
And feared a prosecution might betide,
Full twenty mile from town their voyage take,
Obscure in rushes of the liquid lake. *Dryden.*

Thou art wickedly devout;
In Tiber *ducking* thrice by break of day. *Id.*
Ducklegged, short waisted, such a dwarf she is,
That she must rise on tiptoes for a kiss.
Id. Juvenal.

Ducklings, though hatched and led by a hen, if she
brings them to the brink of a river or pond, presently
leave her, and in they go. *Ray on the Creation.*

As some raw youth in country bred,
When at a skirmish first he hears
The bullets whistling round his ears,
Will *duck* his head aside, will start,
And feel a trembling at his heart. *Swift.*

She in the *duckingstool* should take her seat,
Drest like herself in a great chair of state.
Dorset.

Reclaim the obstinately opprobrious and virulent
women, and make the *duckingstool* more useful.

Addison's Freeholder.

Every morn

Amid the *ducklings* let her scatter corn.

Gay's Pastoral.

Neither cross and pile, nor *ducks* and drakes, are
quite so ancient as handy-dandy.

Arbuthnot and Pope.

But still 'tis rural—trees are to be seen
From every window, and the fields are green;
Ducks paddle in the pond before the door,
And what could a remoter scene show more?

Cowper.

The wanton coot the water skims,
Among the leaves the *ducklings* cry,
The stately swan majestic swims,
And every thing is blest but I. *Burns.*

The love of offspring's nature's general law,
From tigresses and cubs to *ducks* and *ducklings*;
There's nothing whets the beak or arms the claw
Like an invasion of their babes and sucklings.
Byron.

Duck, in ornithology. See **ANAS** and **DECOY**.
This fowl is furnished with a peculiar structure
of vessels about the heart, which enables it to
live a considerable time under water, as is ne-
cessary for it in diving. This made Mr. Boyle
think it a more proper subject for experiments
with the air-pump than any other bird. A full
grown duck being put into the receiver of an air-
pump, of which she filled one third part, and
the air exhausted, the creature seemed to bear it
better for the first moments, than a hen or other
fowl; but, after about a minute, she showed great
signs of uneasiness, and in less than two minutes
her head fell down, and she appeared dying, till
revived by the letting in of air. A young callow
duck was afterwards tried in the same manner,
and with the same issue, it being nearly reduced
to death in less than two minutes. But it is ob-
servable, that both birds swelled very much on
pumping out the air, so that they appeared greatly
larger to the spectators, especially about the crop;
it not being intended that any water fowl should
live in so exceedingly rarefied air, but only be
able to continue occasionally some time under
water. The strongest instance of these creatures
being calculated to live almost in any situation,
we have in the accounts of the blind ducks in
the Czirknitz Zee lake in Carniola; which is sup-
posed to communicate with another lake under
ground in the mountain Savornic, and to fill or
empty itself according to the emptiness or ful-
ness of that lake. See **CZIRKNITZ ZEE**. The ducks
which always frequent it in great numbers, are
often carried down along with the water, and
forced into the subterraneous lake to which it re-
tires. In this unnatural habitation, many of
these creatures undoubtedly perish, but some re-
main alive. These become blind, and lose their
feathers; and in the next filling of the lake, both
they and vast numbers of fish are thrown up by
the water. In about a fortnight they are said to
recover their sight and feathers.

DUCKING, plunging in water, a diversion
anciently practised among the Goths by way of ex-
ercise; but among the Celts, Franks, and ancient
Germans, it was a sort of punishment for persons
of scandalous lives. At Marseilles and Bourdon,

before the revolution, men and women of scandalous life were condemned to the gale; i.e. to be shut up in an iron cage fastened to the yard of a shallop, and ducked several times in the river. The same was done at Toulouse to blasphemers.

DUCKING, a sort of marine punishment, inflicted by the French before the revolution, on those who had been convicted of desertion, blasphemy, or sedition. It was thus performed: The criminal was placed astride of a short thick batten, fastened to the end of a rope, which passed through a block hanging at one of the yard-arms. Thus fixed, he was hoisted suddenly up to the yard, and the rope being slackened at once, he was plunged into the sea. This was repeated several times conformably to the sentence against the culprit, who had also several cannon-shot fastened to his feet. A gun was also fired to advertise the other ships of the fleet, that their crews might become spectators.

DUCKING is also a penalty which veteran sailors pretend to have a right to inflict on those who, for the first time, pass the tropic of Cancer, the equator, or the straits of Gibraltar, in consequence of their refusal or incapacity to pay the usual fine levied on such occasions.

DUCKING-STOOL. See **BRANK** and **CUCKING-STOOL**.

DUCKO'Y, *v. a. & n. s.* Mistaken for decoy: the decoy being commonly practised upon ducks, produced the error. To entice to a snare: the snare laid.

This fish hath a slender membranous string, which he projects and draws in at pleasure, as a serpent doth his tongue: with this he *duckoys* little fishes, and preys upon them. *Grew.*

Seducers have found it the most compendious way to their designs, to lead captive silly women, and make them the *duckoys* to their whole family.

Decay of Piety.

DUCK UP, is a phrase used at sea by the steers-man, when the main sail, fore sail, or sprit sail, hinders his seeing to steer by a landmark: upon which he calls out, duck up the clew-lines of these sails, that is, hale the sails out of the way. When a shot is made by a chace-piece, if the clew of the sprit sail hinders the sight, they call out duck up, &c.

DUCT, *n. s.* Lat. *ductus*, from *duco*, to lead. Guidance; direction: a passage through which any thing is conducted.

This doctrine, by fastening all our actions by a fatal decree at the foot of God's chair, leaves nothing to us but only to obey our fate, to follow the *duct* of the stars, or necessity of those iron chains which we are born under. *Hammond.*

A *duct* from each of those cells ran into the root of the tongue, where both joined together, and passed forward in one common *duct* to the tip of it.

Addison's Spectator.

It was observed that the chyle, in the thoracic *duct*, retained the original taste of the aliment.

Arbuthnot on Aliments.

DUCTILE, *adj.* } Lat. *ductilis*, from *duco*, to lead.
DUCTILENESS, *n. s.* } *tus*, part. of *duco*, to lead.
DUCTILITY. } Tensile; easy to be drawn out.

All bodies *ductile* and tensile, as metals, that will be drawn into wires; wool and tow, that will be drawn into yarn or thread; have the appetite of not discontinuing strong. *Bacon.*

I, when I value gold, may think upon
 The *ductileness*, the application;
 The wholesomeness, the ingenuity,
 From rust, from soil, from fire ever free.

Donne.

Thick woods and gloomy night
 Conceal the happy plant from human sight:
 One bough it bears; but wond'rous to behold!
 The *ductile* rind and leaves of radiant gold.

Dryden's Æneid.

Yellow colour and *ductility* are properties of gold: they belong to all gold, but not only to gold; for saffron is also yellow, and lead is *ductile*.

Watts's Logick.

He generous thoughts instils
 Of true nobility; forms their *ductile* minds
 To human virtues. *Philips.*

Their designing leaders cannot desire a more *ductile* and easy people to work upon.

Addison's Freeholder.

Hence *ductile* clays in wide expansion spread,
 Soft as the cygnet's down, their snow-white bed;
 With yielding flakes successive forms reveal,
 And change obedient to the whirling wheel.

Darwin.

DUCTILITY, in physics, a property possessed by certain solid bodies, which consists in their yielding to percussion or pressure, and in receiving different forms without breaking. Some bodies are ductile both when they are hot and when they are cold, and in all circumstances. Such are metals, particularly gold and silver. Other bodies are ductile only when heated to a sufficient degree; such as wax and other substances of that kind, and glass. Other bodies, particularly some kinds of iron, called by the workmen red-short, brass, and some other metallic mixtures, are ductile only when cold, and brittle when hot. The degrees of heat requisite to produce ductility in bodies of the first kind, vary according to their different natures. In general, the heat of the body must be such as is sufficient to reduce it to a middle state betwixt solidity and perfect fusion. As wax for instance, is fusible with a very small heat, it may be rendered ductile by a still smaller one; and glass, which requires a most violent heat for its perfect fusion, cannot acquire its greatest ductility until it is made perfectly red-hot, and almost ready to fuse. Lastly, some bodies are made ductile by the absorption of a fluid. Such are certain earths, particularly clay. When these earths have absorbed a sufficient quantity of water, to bring them into a middle state betwixt solidity and fluidity, that is to the consistence of a considerably firm paste, they have then acquired their greatest ductility. Water has precisely the same effect upon them in this respect, that fire has upon the bodies above-mentioned.

The ductility of metals is distinguished into three states by professor Chaptal, relative to the manner in which it is modified by various processes: viz. 1. Under the hammer: 2. Through the wire-drawer's plate; and 3. Between the laminating rollers. Metals ductile under the hammer he ranks thus, in the order of their ductility: gold, silver, copper, iron, tin, and lead. Through the wire-drawer's plate they rank in this order: gold, iron, copper, silver, tin, and lead. Some metals that are neither ductile under the hammer, nor through the plate, become very

considerably so, when an equal and gradual pressure is applied. Thus zinc may be reduced into very thin and flexible leaves by being passed between the laminating cylinders.

DUDGEON. Anciently *dadgeon*, a diminutive of *dag*; or, says Dr. Johnson, from Germ. *dolch*, a dirk; or *degen*, a sword. A dagger; a quarrel in which daggers are either used, or 'spoken;' ill temper.

It was a serviceable *dudgeon*,
Either for fighting or for drudging.

Hudibras.

Civil *dudgeon* first grew high,
And men fell out they knew not why. *Id.*
The cuckoo took this a little in *dudgeon*.

L'Estrange.

DUDLEY (Edmund), an eminent lawyer and able statesman in the reign of Henry VII. who, with Sir Richard Empson, assisted in filling that rapacious monarch's coffers, by arbitrary prosecutions of the people, on old penal statutes. They were both beheaded on the accession of Henry VIII. to pacify the clamors of the people for justice.

DUDLEY (John), duke of Northumberland, son of the above, a statesman memorable in the English history, for his unsuccessful attempt to place the crown on the head of his daughter-in-law, lady Jane Grey, who fell a victim to his ambition; was born in 1502, and beheaded in 1553. Ambrose his eldest son was a brave, generous and able statesman under queen Elizabeth; and received the appellation of the good earl of Warwick. Henry, his second son, was killed at the siege of St. Quintin. Robert, the third son, a man of bad character, was created earl of Leicester; and was one of queen Elizabeth's favorites. His fourth son, was the unfortunate lord Guildford Dudley, whose only crime was his being the husband of lady Jane Grey, for which he was beheaded in 1554.

DUDLEY (Sir Robert), earl of Warwick and duke of Northumberland, was the son of Robert above-mentioned, by the lady Douglas Sheffield; and was born at Sheen in Surrey in 1573, where he was carefully concealed, to prevent the queen's knowledge of the earl's engagements with his mother. He studied at Oxford; when his father dying, left him the bulk of his estate. Having a particular fondness for navigation, he fitted out a small squadron at his own expense, with which he sailed to the river Orinoco, and took and destroyed nine sail of Spanish ships. In 1595 he attended the earl of Essex, and the lord high admiral of England, in their expedition against the Spaniards; when he was knighted for his gallant behaviour at the taking of Cadiz. He now endeavoured to prove the legitimacy of his birth, in order to be entitled to his hereditary honors. But being overpowered by the interest of the countess dowager of Leicester, he applied for a licence to travel; and, being well received at the court of Florence, resolved to continue there, notwithstanding his receiving a letter of recall; on which his whole estate was seized by king James I. and vested in the crown. He discovered at the court of Cosmo II., great duke of Tuscany, those great abilities for which he had been admired in England, and was at length

made chamberlain to his highness's consort. He there contrived several methods of improving shipping; introduced new manufactures; and by other services obtained so high reputation, that, at the desire of the archduchess, the emperor Ferdinand, in 1620, created him a duke of the holy Roman empire. He afterwards drained a vast tract of morass between Fisa and the sea; and raised Leghorn, which was then a mean, pitiful place, into a large and beautiful town, improving the haven by a mole, which rendered it both safe and commodious; and having engaged his highness to declare it a free port, he, by his influence and correspondence, drew many English merchants to settle and set up houses there, which was of very great service to his native country, as well as to the Spaniards. He was also the patron of learned men, and held a high place himself in the republic of letters. His most celebrated work is his *Del Arcano del Mare*, in 2 vols. folio.

DUDLEY (Rev. Sir Henry Bate), was born at Fenny Compton, August 25th 1745. His father, Henry Bate, was rector of St. Nicholas in Worcester, and of North Farmbridge, in Essex. The son also was educated for the church, and took his degrees in arts at the University of Cambridge, after which he became curate of Hendon in Middlesex. At this period of his life, however, he became entirely a man of pleasure; but exhibited considerable literary talent, and established in succession, the *Morning Post*, and *Morning Herald*, newspapers. He also produced some dramatic pieces, of which the principal were, *The Rival Candidates*, *The Flitch of Bacon*, and *The Woodman*. In the year 1781 the advowson of Bradwell juxta Mare, in Essex, was purchased in trust for Mr. Bate, subject to the life of the incumbent; without waiting for whose demise, he commenced those extensive alterations and improvements of the church, parsonage, and glebe, which are said to have cost him upwards of £28,000. But when in 1797 he applied for institution, on the death of the incumbent of the living, the bishop of London refused him on the ground of simony. Shortly afterwards the rectory lapsed to the crown, and Dr. Gamble was presented to it. This was considered an exceedingly hard case, and very nearly ruined Mr. Dudley, who had now taken this addition to his name in compliance with the will of a relative. In 1804 he was in some degree compensated for his loss, by a presentation to the rectory of Kilscoren in Ireland, and the chancellorship of the cathedral of Ferns; to which, three years afterwards, was added the living of Kilglass, in the county of Longford. In 1812 he resigned the two Irish benefices, on being presented to the rectory of Willingham in the county of Cambridge; and the same year was created a baronet. In 1816 he obtained a prebend in the cathedral of Ely. Sir Henry was at one time magistrate for seven counties in England and four in Ireland. He died at Cheltenham, February 1st, 1824.

DUDLEY, a town of England, of the county of Worcester, but insulated in Staffordshire, has a weekly market on Saturday. Most of the inhabitants are employed in manufacturing nails, or

other articles of iron. It has two churches; and is ten miles west of Birmingham, and 120 north-west of London. It sends one member to parliament.

DUDLEY (Robert, earl of Leicester), was the fifth son of the duke of Northumberland, and was born about 1532. He was knighted when young, and was made gentleman of the bed-chamber to Edward VI. Though involved in the criminal designs of his father, and included in the sentence of attainder passed against him on the accession of Mary, he was pardoned, and employed by that queen. After Elizabeth ascended the throne, Dudley soon acquired the distinction of being her favorite. Offices, honors and wealth were showered on him with an unsparing hand. He was appointed master of the horse, knight of the garter, and privy counsellor; and he received grants of the princely domains of Kenilworth, Denbigh, and Chirk castle. In 1560 the death of his wife took place at Cumnor-hall, in Berkshire. This event, according to popular opinion, as appears from Aubrey, involved Dudley in the guilt of murder. If he sacrificed the life of his consort, in the hope of marrying the queen, his ambitious views were disappointed. Elizabeth, however, encouraged him to aspire to the hand of Mary of Scotland, who rejected him with disdain. In 1564 he was created baron Denbigh and earl of Leicester, and was the same year elected chancellor of Oxford university, having previously been chosen to the same office at Cambridge. About 1572 he appears to have married the baroness-dowager Sheffield, lady Douglas Howard, by whom he had children, but whom he disowned as his wife, and even compelled her to marry another person. In 1575 he gave a princely entertainment to the queen, at Kenilworth castle; the festivities of which are described in a picturesque manner, in the celebrated romance of Kenilworth, and, in defiance of chronology, connected with the death of Leicester's first wife. Leicester, in 1578, offended the queen by his marriage with the widow of Walter Devereux, earl of Essex. He, however, recovered her favor, and, in 1585, was appointed, through her influence, governor of the Netherlands, then recently emancipated from the Spanish yoke. His conduct in this station did not give satisfaction to the queen, or to the states over which he presided, and he was recalled the following year. He returned to his command in June, 1587; but he was finally displaced a few months after, and returned to England. He was accused of misconduct by lord Buckhurst and others; but Elizabeth still retained so much partiality for him, that she supported him against all his enemies; and, on the prospect of the Spanish invasion, in 1588, appointed him commander of the forces, assembled at Tilbury, for the defence of the kingdom. Leicester died, on the fourth of September in that year, at Cornbury Park, in Oxfordshire, and was interred in a chapel attached to the collegiate church of Warwick, where a sumptuous monument was erected to his memory.

DUE, *n. s. adj. & v. a.* } From *deu*, to bind;
 DU'EFULL, } Lat. *debeo*, to owe.
 DUTY, *n. s.* } That which is owed;
 DU'TEOUS, *adj.* } right; obligation;
 DU'TEOUSNESS, *n. s.* } whatever is required
 DU'TIFUL, *adj.* } to be done or paid.
 DU'TIFULLY, *adv.* } As an adjective due
 DU'TIFULNESS, *n. s.* } is, owed; proper; fit;
 exact; consequent to. Shakspeare uses it as an active verb; but we have met with no other instance. Duty is also obligation, and reciprocal with right. What one man has a right to claim, another has a duty to yield or give.

When ye shall have done all those things which are commanded you, say, We are unprofitable servants: we have done that which was our *duty* to do.
Luke xvii. 10.

They both atone,
 Did *duty* to their lady as became.
Faerie Queene.

All which that day in order seemly good
 Did on the Thames attend, and waited well
 To doe their *duefull* service as to them befell.
Spenser.

This is the latest glory of their praise,
 That I thy enemy *due* thee withal. *Shakspeare.*

My *due* from thee is this imperial crown,
 Which, as immediate from thy place and blood,
 Derives itself to me. *Id.*

Like the Pontick sea,
 Whose icy current, and compulsive course,
 Ne'er feels retiring ebb, but keeps *due* on
 To the Propontick and the Hellespont.
Id. Othello.

My prayers
 Are not words *duly* hallowed, nor my wishes
 More worth than vanities; yet prayers and wishes
 Are all I can return. *Id. Henry VIII.*

Thou better know'st
 Effects of courtesy, *dues* of gratitude;
 Thy half o' th' kingdom thou hast not forgot,
 Wherein I thee endowed. *Id. King Lear.*

Think'st thou that *duty* shall have dread to speak,
 When power to flattery bows? To plainness honour
 Is bound, when majesty to folly falls. *Id.*
 * I know thee well; a serviceable villain!
 As *duteous* to the vices of thy mistress,
 As badness would desire. *Id.*

There is *due* from the judge to the advocate some commendation and gracing, where causes are well handled and fair pleaded. There is likewise *due* to the public a civil reprehension of advocates, where there appeareth cunning, gross neglect, or slight information.
Bacon.

The key of this infernal pit by *due*,
 And by command of heaven's all-powerful king,
 I keep. *Milton. Paradise Lost.*
 And Eve within, *due* at her hour prepared
 For dinner savoury fruits. *Id.*

Befriend
 Us, thy vowed priests, till outmost end
 Of all thy *dues* be done, and none left out. *Id.*
 Every beast, more *duteous* at her call,
 Than at Circean call the herd disguised. *Id.*
 Some *duties* we owe to humanity, more to nearness
 of blood. *Bp. Hall. Contemplations.*

All our *duty* is set down in our prayers, because in all our *duty* we beg the Divine assistance; and remember that you are bound to do all those *duties*, for the doing of which you have prayed for the Divine assistance.
Taylor's Devotion.

Mirth and cheerfulness are but the *due* reward of innocence of life. *More's Divine Dialogues.*

A present blessing upon our fasts is neither originally *due* from God's justice, nor becomes *due* to us from his veracity. *Smatridge's Sermons.*

There is a respect *due* to mankind, which should incline ever the wisest of men to follow innocent customs. *Watts.*

The *duty* of a collator is indeed dull, yet, like other tedious tasks, is very necessary. *Johnson.*

Turn on the prudent and thy heedful eyes,
Observe her labours, sluggard, and be wise :
No stern command, no monitory voice,
Prescribes her *duties*, or directs her choice ;
Yet timely provident, she hastens away,
To snatch the blessings of the plenteous day.

Id. Poems.

Nothing is more common than to say, when a person does not behave with *due* decency towards his superiours, such a one does not understand himself. *Mason.*

Estates are landscapes, gazed upon awhile,
Then advertised, and auctioneered away.
The country starves, and they that feed the' o'er-charged
And surfeited lewd town with her fair *dues*,
By a just judgment strip and starve themselves.

Cowper.

Duly at my time I come,
Publishing to all abroad—

Soon the grave must be your home,
And your only suit a shroud. *Id.*

'Do as you would be done by,' and 'Love your neighbour as yourself,' include all our *duties* of benevolence and morality; and if sincerely obeyed by all nations, would a thousand-fold multiply the present happiness of mankind. *Darwin.*

Whatever tenderness may be *due* to the errors into which they would inevitably fall in their speculations concerning the present condition of mankind, and the apparent constitution of the moral world, of which, destitute as they were of the light of revelation, they knew neither the beginning nor the end,—the Christian is possessed of a written rule, delivered from on high, which is treated with profane contempt, if reference be not had to it upon all questions of *duty*. *Bp. Horsley.*

Salt, *duty* free, is a great deal cheaper, and (as far as experiments have gone) very superior in power and permanency of effect to lime. *Sir T. Bernard.*

Triumphant Sylla! Thou, who didst subdue
Thy country's foes ere thou wouldst pause to feel
The wrath of thy own wrongs, or reap the *due*
Of hoarded vengeance till thine eagles flew
O'er prostrate Asia. *Byron.*

Forgive me; there is something at your heart
More than the mere discharge of public duties,
Which long use, and a talent like to yours,
Have rendered light, nay, a necessity
To keep your mind from stagnating. *Id.*

DU'EL, *n. s., v. n. & v. a.* } Fr. *duel*, from
DU'ELLER, *n. s.* } Lat. *duellum*, i. e.
DU'ELLIST. } *duo*, two and *bell-*
DU'ELLO. } *lum*, war. A
fight or combat between two. Dueller and duellist appear synonymous.

The gentleman will, for his honour's sake, have one bout with you: he cannot by the *duello* avoid it. *Shakespeare.*

In many armies, if the matter should be tried by *duel* between two champions, the victory should go on the one side; and yet, if it be tried by the gross, go on the other side. *Bacon.*

Victory and triumph to the Son of God
Now entering his great *duel*, not of arms,
But to vanquish by wisdom, hellish wiles. *Milton.*

Who single

Duelled their armies ranked in proud array,
Himself an army, now unequal match
To save himself against a coward armed,

At one spear's length. *Id. Agonistes.*

His bough arms Mung not liked; for his first day
Of bearing them in field, he threw 'em away;
And hath no honour lost, our duellists say.

Ben Jonson.

'Twas I that wronged you; you my life have
sought;

No *duel* ever was more justly fought. *Waller.*

Henceforth let poets, ere allowed to write,
Be searched like duellists before they fight. *Dryden.*

He must at length, poor man! die dully at home,
when here he might so fashionably and genteelly have
been *duelled* or flaxed into another world. *South.*

If the king ends the differences, the case will fall
out no worse than when two duellists enter the field,
where the worsted party hath his sword again, with-
out further hurt. *Suckling.*

I never read of a *duel* among the Romans, and yet
their nobility used more liberty with their tongues
than one may now do without being challenged. *Tatler.*

They perhaps begin as single *duellers*, but then they
soon get their troops about them. *Decay of Piety.*

DU'EL, a single combat, at a time and place appointed, in consequence of a challenge. This custom came originally from the northern nations, among whom it was usual to decide all their controversies by arms. Both the accuser and accused gave pledges to the judges on their respective behalf; and the custom prevailed so far amongst the Germans, Danes, and Franks, that none were excused from it but women, sick people, cripples, and such as were under twenty-one years of age or above sixty. Even ecclesiastics, priests, and monks, were obliged to find champions to fight in their stead. The punishment of the vanquished was either death, by hanging or beheading, or mutilation of members, according to the circumstances of the case. Duels were at first admitted not only on criminal occasions, but on some civil ones, for the maintenance of rights or estates, and the like: in latter times, however, before they were entirely abolished, they were restrained to these four cases. 1. That the crime should be capital. 2. That it should be certain the crime was perpetrated. 3. The accused must by common fame be supposed guilty. And 4. The matter must not be capable of proof by witnesses.

DU'EL, at present, is used for single combat on some private quarrel; and is premeditated; otherwise it is called a *rencontre*. If a person is killed in a *duel*, both the principals and seconds are guilty, whether the seconds engage or not. See MURDER. It is also a very high offence to challenge a person either by word or letter, or to be the messenger of a challenge. See LAW. The general practice of duelling, in this last sense, took its rise in 1527, at the breaking up of a treaty between the emperor Charles V. and Francis I. The former desired Francis's herald to acquaint his sovereign, that he would hence-

forth consider him not only as a base violator of public faith, but as a stranger to the honor and integrity of a gentleman. Francis, too high-spirited to bear such an imputation, had recourse to an uncommon expedient to vindicate his character. He instantly sent back the herald with a cartel of defiance, in which he gave the emperor the lie in form, challenging him to single combat, requiring him to name the time and place of encounter, and the weapons with which he chose to fight. Charles, as he was not inferior to his rival in spirit or bravery, readily accepted the challenge; but after several messages, concerning the arrangement of all the circumstances relative to the combat, accompanied with mutual reproaches bordering on the most indecent scurrility, all thoughts of this duel, more becoming the heroes of romance than the two greatest monarchs of their age, were entirely laid aside. The example of two persons so illustrious, drew such general attention, and carried with it so much authority, that it had considerable influence in introducing an important change in manners all over Europe. Duels had been long permitted by the laws of all European nations; and, forming a part of their jurisprudence, were authorised by the magistrate on many occasions, as the most proper method of terminating questions with regard to property, or of deciding in those which regarded crimes. But single combats being considered as solemn appeals to the omniscience and justice of the Supreme Being, they were allowed only in public causes, according to the prescription of law, and carried on in a judicial form. See *BATTLE*. Men accustomed to this manner of decision in courts of justice, were naturally led to apply it to personal and private quarrels. Duels, which at first could only be appointed by the civil judge, were fought without the interposition of his authority, and in cases to which the laws did not extend. Upon every affront or injury, which seemed to touch his honor, a gentleman thought himself entitled to draw his sword, and to call on his adversary to make reparation. Such an opinion, introduced among men of fierce courage and high spirit, and of rude manners, where offence was often given, and revenge was always prompt, produced most fatal consequences. Much blood was shed; many useful lives were lost; and, at some periods, war itself has hardly been more destructive than these contests of honor. So powerful, however, is the dominion of fashion, that neither the terror of penal laws, nor reverence for religion, nor the fear of a future state, has yet been able entirely to abolish a practice unknown among the ancients, and not justifiable by any principle of reason. Its best defence only seals the greater disgrace on the parties who have recourse to it; i. e. that we must ascribe to it, in some degree, the extraordinary gentleness and complaisance of modern manners in high life, and that respectful attention of one man to another, which at present renders the social intercourse of life far more agreeable and decent than among civilised nations of antiquity. In other words, that gentlemen can only be governed by the weapons of fear and force by which, in fact, the vilest of slaves are at last restrained. Public opinion,

however, is not easily controlled by civil institutions; for which reason it may be questioned whether any human regulations can be contrived of sufficient force to suppress or change that false rule of honor, which stigmatises all scruples about duelling with the reproach of cowardice. The inadequate redress which the law of the land affords, for those injuries which chiefly affect a man in his sensibility and reputation, tempts many to redress themselves; and prosecutions for such offences, by the trifling damages that are recovered, serve only to make the sufferer ridiculous. This ought to be remedied. A court of honor might be established, especially for the army, where the point of honor is cultivated with exquisite attention and refinement, with a power of awarding those submissions and acknowledgments, which it is generally the object of a challenge to obtain; and it might grow into a fashion with persons of rank of all professions, to refer their quarrels to the same tribunal. In fact, as the law now stands, duelling can seldom be overtaken by legal punishment. The challenge, appointment, and other previous circumstances, which indicate the intention with which the combatants met, being suppressed, nothing appears to a court of justice but the actual rencounter; and if a person be slain when actually fighting with his adversary, the law deems his death nothing more than manslaughter.

DUE'NNA, *n. s.* Spar. An old woman kept to guard a young one.

I felt the ardour of my passion increase as the season advanced, till in the month of July I could no longer contain: I bribed her *duenna*, was admitted to the bath, saw her undressed, and the wonder displayed. *Arbutnot and Pope.*

DUETT, duetto, in music, a composition expressly written for two voices or instruments, with or without a bass and accompaniments. In good duets the execution is pretty equally distributed between the two parts, and the melodies so dependent on each other, as to lose every effect when separated, but to be perfectly related and concinnous when heard together.

DUFF'S ISLANDS, or *DUFF'S GROUP*, a range of islands in the South Pacific Ocean, discovered by captain Wilson, in the course of his missionary voyage in the *Duff*. They are about eleven in number, and extend fourteen or fifteen miles in a north-west to south-east direction. They are of different sizes; the smallest is apparently barren, but the largest two, which are about six miles in circumference, and situated in the middle of the others, are well wooded. Between these two there is a small islet; and at the end of one on the north-west part of the group rises a remarkable rock in the shape of a pillar. The natives, who are stout and well made, were shy and apprehensive of strangers. A village was seen on the south-west side of Disappointment Island, the largest of this group. They have ornamented canoes about twelve or fourteen feet long, and about fifteen inches broad, which seemed to be made of a single tree. Long. 167° E., lat. 9° 57' S.

DUFRESNE, or *DU FRESNE* (Charles), lord of Cange, hence often called Ducange; a man

of letters, who did much for the history of the middle ages, especially as regards his own country, as well as for the Bazantine history. He was born in 1610, at a farm near Amiens, of a respectable family, and studied in the Jesuits' college, at that place, afterwards at Orleans and Paris. At this last place he became parliamentary advocate, in 1631, and, in 1645, royal treasurer at Amiens, from which place he was driven by a pestilence, in 1668, to Paris. Here he devoted himself entirely to literature, and published his great works, viz., his Glossary of the Greek and Latin peculiar to the Middle Ages and the Moderns; his *Historia Byzantina* (Paris, 1680, fol.); the *Annals of Zonaras*; the *Numismatics of the Middle Ages*, and other important and valuable works. He died in the year 1688.

DUGDALE (Sir William), an eminent English historian, antiquarian, and herald, born in Warwickshire in 1605. He was introduced into the herald's office by Sir Christopher Hatton; and ascended gradually through all the degrees, until he became garter principal king at arms. His chief work is the *Monasticum Anglicanum*, in 3 vols. folio; containing the charters and descriptions of all the English monasteries, adorned with engravings. Nor are his Antiquities of Warwickshire less esteemed. He wrote likewise the History of St. Paul's Cathedral; a History of Embanking and Draining; a Baronsage of England: and completed the second volume of Sir Henry Spelman's Councils, with a second part of his Glossary. He died in 1686. His son John was Norroy king at arms, and published a Catalogue of English Nobility.

DUGOMMIER (M.), a French republican general, a native of Martinique in the West Indies, where, at the beginning of the revolution, he defended Fort St. Pierre against a body of troops sent from France. He was at this time a considerable proprietor, and colonel of the national guards of the island. He afterwards went to France to procure succours for the patriots. In 1793 he rapidly rose to be general of brigade; and then commander in chief of the army in Italy, where he gained many advantages with a very inferior force. He took Toulon December 19th, 1793, as commander in chief of the army of the Eastern Pyrenees, and prosecuted the war against the Spaniards with great success. On the 1st of May, 1794, he gained the battle of Albalades, and seized Montesquieu, taking 200 pieces of cannon, and 2000 prisoners. In August, 1794, he defeated an army of nearly 50,000 men at St. Laurence de la Mouga, and was killed November 17th, in an engagement at St. Sebastian. The convention decreed that his name should be inscribed on a column of the Pantheon.

DUILLIA LEX, the Duillian law, a Roman law, enacted by M. Duillius, a tribune, A. U. C. 304. It made it a capital crime to leave the Roman people without its tribunes, or to create any new magistrate without a sufficient cause. There was another Duillian law in 392, regulating the interest to be paid for money lent.

DUILLIUS NEPOS (Gaius), a Roman consul, the first who obtained a victory over the naval

power of Carthage, A. U. C. 492. He took fifty ships, and was honored with a naval triumph, the first that ever appeared at Rome. The senate rewarded his valor by permitting him to have music playing, and torches lighted, at the public expense, every day while he was at supper. There were some medals struck in commemoration of this victory; and there still exists a column at Rome, which was erected on the occasion.

DUISBURG, a town of Prussia, in the circle of Westphalia, and that part of the former duchy of Cleves which lies on the east, or right bank of the Rhine. It has two churches, three convents. The university founded here for Protestants, in 1635, was removed to Dusseldorf in 1806. Its chief manufactures are in cloth and iron. It is seated on the Roer, a little below where it falls into the Rhine. Inhabitants about 4600. It lies fourteen miles north of Dusseldorf, and thirty-five north-west of Cologne.

DUKE, *n. s.* } Fr. *duc*; Span. and Port. *duque*; Ital. *duca*, from Lat. *dux*, *ducis*, à *duco*, to lead. See the article.

And thou Bethleem, the lord of Juda, for of thee a *duyh* schal go out that schal gouerne my puple of Israel. *Wiclif.*

The duke of Cornwall, and Regan his dutchess, will be here with him this knight.

Shakspeare. King Lear.

Her brother found a wife,

Where he himself was lost; Prospero his *duhedom*, In a poor isle. *Id. Tempest.*

Aurmarle, Surrey, and Exeter, must lose The names of *dukes*, their titles, dignities, And whatsoever profits thereby rise.

Dan. Civil Wars.

The cardinal never resigned his purple for the prospect of giving an heir to the *duhedom* of Tuscany. *Addison.*

A prince can mak a belted knight,

A marquis, *duke*, and a' that;

But an honest man's aboon his might,

Guid faith he mauna fa' that! *Burns.*

DUKE, *dux*, was originally a Roman dignity, denominated a *ducendo*, leading or commanding. Accordingly, the first dukes, *duces*, were *ductores exercituum*, commanders of armies. Under the later emperors, the governors of provinces during war were entitled *duces*. In after times the same denomination was also given to the governors of provinces, in time of peace. The first governor under this name was a *duke* of the *Marchia Rhaetica*, or Grisons, of whom mention is made in Cassiodorus; there were afterwards thirteen dukes in the eastern empire, and twelve in the western. The Goths and Vandals, upon their overrunning the provinces of the western empire, abolished the Roman dignities wherever they settled. But the Franks, &c., to please the Gauls, who had long been used to that form of government, made it a point of politics not to change any thing therein: and accordingly they divided all Gaul into duchies and counties; and gave the names, sometimes of dukes, and sometimes of counts, *comites*, to the governors of them. In England, during the time of the Saxons, Camden observes, the officers and commanders of armies were called *dukes*, *duces*, after the ancient Roman manner.

without any addition. After the Conqueror came in, the title lay dormant till the reign of Edward III., who created his son Edward, first called the Black Prince, duke of Cornwall; which has ever since been the peculiar inheritance of the king's eldest son during the life of his father; so that he is *dux natus, non creatus*. After him there were more made, in such manner as that their titles descended to their posterity. They were created with much solemnity, per *cincturam gladii, cappæque, et circuli aurei in capite impositionem*. However, in the reign of queen Elizabeth, A. D. 1572, the whole order became utterly extinct; but it was revived about fifty years afterwards by her successor, in the person of George Villiers, duke of Buckingham. Though the French retained the names and form of the ducal government, yet under their second race of kings there were scarcely any dukes: but all the great lords were counts, peers, or barons; excepting, however, the dukes of Burgundy and Aquitain, and the duke of France, which was a dignity Hugh Capet himself held, corresponding to that of *maire de palais*, or king's lieutenant. By the weakness of the kings, the dukes or governors sometimes made themselves sovereigns of the provinces trusted to their administration. This change happened chiefly about the time of Hugh Capet, when the lords began to dismember the kingdom, so that that prince found more competitors among them than subjects. It was even with a great deal of difficulty they could be brought to own him their superior, or to hold of him by faith and homage. By degrees those provinces, both duchies and counties, which had been rent from the crown, were again united to it. But the title duke was no longer given to the governors of provinces. From that time it became a mere title of dignity, annexed to a person and his heirs male, without giving him any domain, territory, or jurisdiction over the place whereof he was duke. All the advantages therefore now consist in the name, and the precedence it gives. Modern dukes retain nothing of their ancient splendor but the coronet on their escutcheon. It is composed of a rim of gold, lined with ermine, and surmounted with eight strawberry leaves, in contradistinction from that of a marquis, which has only four strawberry leaves and four pearls. See the annexed diagram. They are created by patent, cincture of the sword, mantle of state, imposition of a cape, and coronet of gold upon the head, and a verge of gold in their hand. The eldest sons of dukes are by the courtesy of England styled *marquisses*, though they are usually distinguished by their father's second title, whether it be marquis or earl; and the younger sons lords, with the addition of their Christian name, as lord James, lord Thomas, &c., and they take place of viscounts, though not so privileged by law. A duke has the title of grace; and he is styled, in heraldic language, most high, potent,

and noble prince. Dukes of the blood royal are styled most high, most mighty, and illustrious princes. There are also sovereigns who bear the title of duke. The title of *GREAT DUKE* belongs to the heir-apparent of Russia; that of *ARCH-DUKE* to all the sons of the house of Austria, and that of *ARCH-DUCHESS* to all the daughters. See these articles.

DUKE, among Hebrew grammarians, is an appellation given to a species of accents answering to our comma.

DUKE (Richard), a clergyman and inferior poet of the last century. Dr. Johnson says, 'His poems are not below mediocrity, nor have I found much in them to be praised.' He was a native of Otterton in Devonshire, and educated at Westminster school, and Trinity College, Cambridge, where he obtained a fellowship. He was presented to the living of Blaby in Leicestershire in 1688, and was soon after made a prebend of Gloucester. Just previous to his death, which took place in 1710, he became possessed of the valuable benefice of Witney in Oxfordshire. He was the author of *Translations* of some of the *Odes* of Horace, and some detached poems.

DUKE-DUKE, a title given in Spain to a grandee of the house of Sylva, on account of his having several duchies, from the uniting of two considerable houses in his person. Don Roderigo de Sylva, eldest son of Don Ruy Gomez de Sylva, and heir of his duchies and principalities, married the eldest daughter of the duke de l'Infantado; by which marriage the present duke de Pastrana, who is descended therefrom, and is grandson of Don Roderigo de Sylva, has added to other titles that of duke-duke, to distinguish himself from the other dukes; some whereof may enjoy several duchies, but none so considerable ones, nor the titles of such eminent families.

DUKE'S COUNTY, a county on the south-east coast of the state of Massachusetts, comprehending Martha's Vineyard Island, Chabaquidick Island, Norman's Island, and the Elizabeth Islands. The chief town is Edganton. Population. 3290.

DUKE OF CLARENCE'S STRAIT is a channel on the east coast of North America, bounded on the east by the Duke of York's Islands, part of the continent, and the isles of Gravina. To the west the shore is an extensive tract of land, forming an archipelago, to which Vancouver gave the name of the Prince of Wales's Archipelago.

THE DUKE OF GLOUCESTER'S ISLANDS are two woody islands of the South Pacific Ocean, about five or six leagues asunder. They were visited in 1767 by captain Carteret. The most southern is of a half-moon shape, low, flat, and sandy, with a reef projecting half a mile from the south end, where the sea breaks violently: its appearance is agreeable, but it affords neither vegetables nor water. There seemed also no traces of inhabitants. Many birds were seen on it, however, and they were so tame, that they readily allowed themselves to be taken. Captain Carteret thought these islands were seen by Quiros, the Spanish navigator, in 1606. One lies in lat.

20° 38' S., long. 146° W.; the other in lat. 20° 34' S., long. 146° 15' W.

DUKE OF YORK'S ISLAND, an island of the South Pacific Ocean, in St. George's Channel, which divides New Ireland and New Britain. It is situated between Cape Palliser and Cape Stephens, where the strait is about fifteen leagues broad, and has a beautiful aspect, being covered inland with lofty woods, which near the water-side are interspersed with the houses of the natives. Their canoes are very neat. Long. 151° 20' E., lat. 4° 9' S.

DUKE OF YORK'S ISLAND, an island in the South Pacific Ocean, discovered in 1765 by commodore Byron. It is low, and about thirty miles in circumference. There is a large lake in the centre, and the whole island is well wooded. The surf breaks violently round the coast. No inhabitants were seen. Long. 187° 30' E., lat. 7° 56' S.

DUKE OF YORK'S ISLANDS, a cluster of islands off the north-western coast of America. They were first discovered by Vancouver, from whom they received their present name. They extend about fifty miles in length, and twenty-five in breadth. Long. 227° 15' to 228° 15' E., lat. 55° 50' N.

DUKER (Charles Andrew), a celebrated German editor and critic, was born at Unna in Westphalia in 1670. He was educated at the university of Franeker, and appointed professor of ancient history at Utrecht, where he acquired great notice. His works are, *Oratio de Difficultatibus Quibusdam Interpretationis Grammaticæ Veterum Scriptorum Græcorum et Latinorum*; *Sylloge Opusculorum Variorum de Latinitate Jurisconsultorum Veterum*; an edition of *Thucydides*; and an edition of *Florus*, &c. &c. He died at Meyderick, near Duisbourg in 1752.

DUL'CET, *adj.* } Fr. *doucet*, from Lat.
DUL'CIFY, *v. a.* } *dulcis*, sweet. To dulcify
DUL'CIMER, *n. s.* } or dulcorate, is to make
DUL'CORATE, *v. a.* } sweet : dulcimer, an in-
DUL'CORATION, *n. s.* } strument remarkable for
its sweet tones. •

Ye hear the sound of the cornet, flute, harp, sack-
but, psaltery, *dulcimer*, and all kinds of musick.

Daniel iii. 5.

I sat upon a promontory,
And heard a mermaid, on a dolphin's back,
Uttering such *dulcet* and harmonious breath,
That the rude sea grew civil at her song.

Shakspeare.

The ancients, for the *dulcorating* of fruit, do com-
mend swine's dung above all other dung. *Bacon.*

Malt gathereth a sweetness to the taste, which ap-
peareth in the wort : the *dulcoration* of things is wor-
thy to be tried to the full ; for that *dulcoration* im-
porteth a degree to nourishment : and the making of
things inalimental to become alimental, may be an
experiment of great profit. *Id.*

A decoction of wild gourd, or colocynthis, though
somewhat qualified, will not from every hand be *dul-*
cified into aliment, by an addition of flour or meal.

Brown.

A fabrick huge
Rose like an exhalation, with the sound
Of *dulcet* symphonies, and voices sweet.

Milton.

In colcothar, the exactest calcination, followed by an
exquisite *dulcification*, does not reduce the remaining
body into elementary earth ; for after the salt of vi-
triol, if the calcination have been too faint, is drawn
out of the colcothar, the residue is not earth, but a
mixt body, rich in medical virtues. *Boyle.*

Turbith mineral, as it is sold in the shops, is a
rough medicine ; but, being somewhat *dulcorated*, first
procureth vomiting, and then salivation.

Wiseman's Surgery.

I dressed him with a pledgit, dipt in a *dulcified*
tincture of vitriol. *Id.*

Spirit of wine *dulcifies* spirit of salt ; nitre or vitriol
have other bad effects. *Arbuthnot on Aliments.*

They to the dome where smoke with curling play
Announced the dinner to the regions round,
Summoned the singer blithe, and harper gay,
And aided wine with *dulcet*-streaming sound.

Dr. Johnson's Poems.

High o'er the chequered vault with transient glow
Bright lustrous dart, as dash the waves below ;
And echo's sweet responsive voice prolongs
The *dulcet* tumult of their silver tongues. *Darwin.*

So well that thought the' employment seems to
suit,

Psaltery and sackbut, *dulcimer* and flute.

O fie ! 'tis evangelical and pure :

Observe each face, how sober and demure ! *Cowper.*

DUL'IA, *n. s.* Δουλία. An inferior kind of
adoration.

Paleotus saith, that the same worship which is given
to the prototype may be given to the image, but with
the different degrees of latria and *dulia*. *Stillingfleet.*

DULL, *adj. & v. a.* } Got. *dulla*, a fool ; Sax.
DUL'LARD, *n. s.* } dole ; Swed. and Dut.
DULL'EYED, *adj.* } *dull* ; Wel. *dwl* ; Teut.
DULL'HEAD, *n. s.* } *dwl* ; Gr. *δουλος*, a ser-
DUL'LY, *adv.* } vant. Tooke says from
DULL'NESS, *n. s.* } the Ang.-Sax. *dwolian*,
to thicken. Heavy, thick ; stupid ; awkward ;
sad ; melancholy ; drowsy : as a verb, to make
stupid ; to blunt ; thicken ; weaken ; damp ;
make heavy. A dullard, or dullhead, is a block-
head.

This people's heart is waxed gross, and their ears
are *dull* of hearing. *Matt.* xiii. 15.

For to illumine she said I was to *dulle*

Adusynge me my penne awaye to pulle. *Skelton.*

Nothing hath more *dulled* the wits, or taken away
the will of children from learning, than care in
making of Latin. *Ascham.*

This people be fools and *dulheads* to all goodness ;
but subtle, cunning, and bold in any mischief. *Id.*

Now forced to overflow with brackish tears,
The troublesome noise did *dull* their dainty ears.

Spenser.

O help thou my weak wit, and sharpen my *dull*
tongue. *Faerie Queene.*

Prayers were short, as if darts thrown out with a
sudden quickness, lest that vigilant and erect atten-
tion of mind, which in prayer is very necessary,
should be wasted or *dulled* through continuance.

Hooker.

Such is their evil hap to play upon *dull*-spirited
men. *Id.*

He that hath learned no wit by nature, nor art,
may complain of gross breeding, or comes of a very
dull kindred. *Shakspeare.*

Borrowing *dulle* the edge of industry. *Id.*

This arm of mine hath chastised

The petty rebel, *dullbrained* Buckingham. *Id.*

I'll not be made a soft and *dull-eyed* fool,
To shake the head, relent, and sigh, and yield
To Christian intercessors. *Id. Merchant of Venice.*

What! mak'st thou me a *dullard* in this act?
Wilt thou not speak to me? *Id. Cymbeline.*

Here cease more questions;
Thou art inclined to sleep. 'Tis a good *dullness*,
And give it way. *Id. Tempest.*

It (drunkenness) *dulleth* the spirits, and destroyeth
the body as ivy doth an old tree, or as the worm that
ingendereth in the kernel of the nut. *Raleigh.*

A *dull* man is so near a dead man, that he is
hardly to be ranked in the list of the living; and as
he is not to be buried whilst he is half alive, so he is
as little to be employed whilst he is half dead.

Saville.

Usury *dulls* and damps all industries, wherein
money would be stirring, if it were not for the slug.

Bacon.

The princess of Germany had but a *dull* fear of the
greatness of Spain, upon a general apprehension: now
that fear is sharpened and pointed. *Id.*

Nature, by a continual use of any thing, groweth
to a satiety and *dulness* either of appetite or working.
Id.

The air, if it be moist, doth in a degree quench
the flame, and howsoever maketh it burn more *dully*.
Id.

Honours oppress weak spirits, and our sense
Strong objects *dull*; the more the less we see.

Donne.

Meeting with Time, Slack thing, said I,
Thy sythe is *dull*; whet it, for shame. *Herbert.*

Correction may reform negligent boys, but not
amend those that are insensibly *dull*. All the whet-
ting in the world can never set a razor's edge on that
which hath no steel in it. *Fuller.*

O could I flow like thee! and make thy stream
My great example, as it is my theme;
Tho' deep yet clear, tho' gentle yet not *dull*;
Strong without rage, without o'erflowing full.

Denham. Cooper's Hill.

Not that I think those pantomimes,
Who vary action with the times,
Are less ingenious in their art
Than those who *dully* act one part. *Hudibras.*
Every man, even the *dullest*, is thinking more than
the most eloquent can teach him how to utter.
Dryden.

Shadwel alone my perfect image bears,
Mature in *dulness* from his tender years. *Id.*

It is not sufficient to imitate nature in every cir-
cumstance *dully*, literally, and meanly; but it becomes
a painter to take what is most beautiful.

Id. Dufresnoy.

So was she *dulled* with all, that we could come so
near as to hear her speeches, and yet she not perceive
the hearers of her lamentations. *Sidney.*

Memory is so necessary to all conditions of life,
that we are not to fear it should grow *dull* for want of
exercise, if exercise would make it stronger. *Locke.*

Nor is the *dulness* of the scholar to extinguish, but
rather to inflame, the charity of the teacher. *South.*

Why, how now, Andrew? cries his brother droll;
To-day's conceit, methinks, is something *dull*. *Prior.*

Dull rogues affect the politician's part,
And learn to nod, and smile, and shrug with art.
Congreve.

Whoe'er has travelled life's *dull* round,
Where'er his stages may have been,
May sigh to think he still has found
The warmest welcome at an inn. *Shenstone.*

As turns a flock of geese, and, on the green,
Poke out their foolish necks in awkward spleen,
(Ridiculous in rage)! to hiss, not bite,
So war their quills, when sons of *Dulness* write.

Young.

In England every man may be an author that can
write; for they have by law a liberty, not only of say-
ing what they please, but of being as *dull* as they
please. *Goldsmith.*

Dulness it is easy to despise, and laughter it is
easy to repay. *Johnson. Plan of Dictionary.*

The punch goes round, and they are *dull*

And lumpish still as ever;

Like barrels with their bellies full,

They only weigh the heavier. *Cowper.*

Could thine art

Make them indeed immortal, and impart

The purity of heaven to earthly joys,

Expel the venom and not blunt the dart—

*The *dull* satiety which all destroys—

And root from out the soul the deadly weed which
cloys? *Byron.*

DULL, in the manege. The marks of a *dull*
horse, called by the French, *marquis de ladre*,
are white spots round the eye and on the tip of
the nose, upon any general color whatsoever.
Though some take these spots for signs of stu-
pidity, it is certain they are great marks of the
goodness of a horse; and the horses that have
them are very sensible and quick upon the spur.

DULSE, or **DILLS**, a kind of esculent sea-
weed, eaten by the common people near Edin-
burgh. See **FUCUS**, **PALMATUS**.

DULWICH, a hamlet of Camberwell, five
miles from London; celebrated for its college,
founded by Alleyn, the actor, in consequence of
a supposed apparition of the devil. See **ALLEYN**.
This foundation was endowed for the mainte-
nance of six poor men, six poor women, and
twelve poor boys; the latter of whom, when
they arrive at a proper age, are either sent to the
universities, or apprenticed. This establishment
is under the direction of a master (who must
always be of the name of Allen), a warden, and
four fellows, of whom three must be divines,
and the fourth an organist. The master is lord
of the manor for a considerable extent; but
both he and the warden and fellows must con-
tinue unmarried, on pain of exclusion. The
building was erected after a design of Inigo
Jones, and contains the chapel and master's
apartments in front; the chambers for the poor
men, women, and boys, are in the wings. The
beautiful prospects of this village and its neigh-
bourhood have made it a favorite residence of
many gentry and citizens of London.

DULVERTON, a town in Somersetshire,
seated on a branch of the Ex; twenty-four
miles east of Barnstaple, and 165 west by south
of London. It has a market on Saturday, and
a manufacture of coarse woollens and blankets.
There are some lead mines near the town, but
the ore is hard and barren. Market on Saturday,
the toll of which is annually distributed to the
poor.

DUMAS (Louis), an ingenious Frenchman,
was the natural son of Montcalm, lord of
Candiac, born at Nismes, in 1676. He was bred
to the law, but applied himself to mathematical
and mechanical studies. He invented an instru-

ment called the Bureau Typographique, to teach children reading and writing mechanically. He also devised another, for instructing them in music. On both these subjects he wrote explanatory treatises, besides a history of the unfortunate Mary, queen of Scots. He died in 1744.

DUMAS (Charles Louis), a French surgeon and anatomist, who suggested considerable improvements in the nomenclature of anatomy. He was professor of the science at Montpellier, where he died in 1814. His works are A Treatise on Mythology, in which is proposed a new mode of classification and denomination of the muscles; and Principes de Physiologie, Paris, 1806, 4 vols. 8vo.

DUMB, *adj.* } Goth, *dumbs*; Saxon,
DUMB'LY, *adv.* } dumb; Dan. *dum*; Belg.
DUMB'NESS, *n. s.* } and Germ. *stumm*, from
DUMB'-FOUND, *v. a.* } Heb. דָּוָם, he was silent.

Mute; incapable or deprived of speech: hence silent, refusing to speak. To dumbfound, is to strike dumb.

And the aungel answerde and seyde to him, for Y am Gabriel that stonde nygh bifore God, and Y am sent to thee to speke and to evangelise to thee these thingis, and lo thou schalt be doumbe. *Wiclif.*

It hath pleased himself sometime to unloose the very tongues even of *dumb* creatures, and to teach them to plead in their own defence, lest the cruelty of man should persist to afflict them. *Hooker.*

They spake not a word;
But like *dumb* statues or unbreathing stones,
Stared each on other. *Shakespeare. Richard III.*

There was speech in their *dumbness*, language in their very gesture: they looked as they had heard of a world ransomed or one destroyed.

Id. Winter's Tale.

Silence in love bewrays more woe
Than words, tho' ne'er so witty;
A beggar that is *dumb*, you know,
May challenge double pity. *Raleigh.*

The tenants wonder at their land-lord's sonne,
And blesse them at so sudden coming on,
More than who vies his pence to view some trick
Of strange Moroccoe's *dumbe* arismetike. *Bp. Hall. Satires, iv. 2.*

His gentle *dumb* expression turned at length
The eye of Eve to mark his play. *Milton.*
Her humble gestures made the residue plain,
Dumb eloquence persuading more than speech. *Roscommon.*

'Tis love, said she; and then my downcast eyes,
And guilty *dumbness*, witnessed my surprize. *Dryden.*

For he who covets gain in such excess
Does by *dumb* signs himself as much express,
As if in words at length he showed his mind. *Id. Juvenal.*

They had like to have *dumbfounded* the justice; but
his clerk came in to his assistance. *Spectator.*

Nothing is more common than for lovers to complain, relent, languish, despair, and die in *dumb* show. *Addison.*

Some positive terms signify a negative idea; blind implies a privation of sight, *dumb* a denial of speech. *Watts's Logick.*

The *dumb* shall sing, the lame his crutch forego,
And leap exulting like the bounding roe. *Pope.*

At length our mighty bard's victorious lays
Fill the loud voice of universal praise;

And baffled spite with hopeless anguish *dumb*,
Yields to renew the centuries to come.

Johnson. Prologue.

Loud when they beg, *dumb* only when they steal.
Cowper.

Unless an instance has occurred of furniture's behaving in a disorderly manner, or a *dumb-waiter's* barking in consequence of the hydrophobia, I conceive such a phrase could not have been introduced. *Sheridan.*

And near, the beat of the alarming drum
Roused up the soldier ere the morning star;
While thronged the citizens with terror *dumb*,
Or whispering, with white lips—'The foe! They come! they come!' *Byron.*

DUMBNESS. The most general, if not the sole cause of dumbness, is the want of the sense of hearing. The use of language is originally acquired by imitating articulate sounds. From this source of intelligence, deaf people are excluded: they cannot acquire articulate sounds by the ear: unless, therefore, articulation be communicated to them by some other medium, these unhappy people must for ever be deprived of the use of language. Deafness has in all ages been considered as such a total obstruction to speech or written language, that an attempt to teach the deaf to speak or read was uniformly regarded as impracticable, till Dr. Wallis and some others showed that although deaf people cannot learn to speak or read by the direction of the ear, there are other sources of imitation, by which the same effect may be produced. The organs of hearing and of speech have little or no connexion. Persons deprived of the former generally possess the latter in such perfection, that nothing further is necessary, in order to make them articulate, than to teach them how to use these organs. This indeed is no easy task; but experience shows that it is practicable.

The late Mr. Thomas Braidwood, was perhaps the first who ever brought this surprising art to any degree of perfection. He began with a single pupil in 1764; and, since that period, has taught great numbers of people born deaf to speak distinctly; to read, to write, to understand figures, the principles of religion and morality, &c. and even to make a rapid progress in those useful branches of education. Mr. Braidwood's principal difficulty, after he had discovered this art, was to make the public believe in the practicability of it. He advertised in the public papers; he exhibited his pupils to many noblemen and gentlemen; still he found the generality of mankind unwilling to receive his discoveries.

The first effort in this method is, to teach the pupil to pronounce the simple sounds of the vowels and consonants. He would pronounce the sound of *a* slowly, pointing out the figure of the letter at the same time, and making the pupil observe the motion of his mouth and throat, anxiously imitating him all the while, though at first at a loss to understand what he would have him do. In this manner he proceeded till the pupil had learned to pronounce the sounds of the letters. He went on in the same manner to join a vowel and a consonant, till at length the pupil was enabled both to speak and read. That his pupils were taught not only the mere pro-

nunciation, but also to understand the meaning of what they read, was easily ascertained by a conversation with any of them. Of this Mr. Pennant gives a remarkable instance in a young lady of about thirteen years of age, who had been some time under the care of Mr. Braidwood. She read, she wrote well, says that writer, her reading was not by rote. She could clothe the same thought in a new set of words, and never vary from the original sense.

A new and different method, equally laborious and successful, was practised by the abbé de l'Epée, of Berlin. He began not by endeavouring to form the organs of speech to articulate sounds, but communicating ideas to the mind by means of signs and characters: to effect this, he wrote down the names of things; and, by a regular system of signs, established a connexion between these words and the ideas to be excited by them. After he had thus furnished his pupils with ideas, and a medium of communication, he taught them to articulate and pronounce. In this manner he enabled one of his pupils to deliver a Latin oration in public, and another to defend a thesis against the objections of one of his fellow-pupils in a scholastic disputation; but it does not appear that the abbé taught his pupils to understand what was spoken. There is perhaps no word, says the abbé, more difficult to explain by signs than the verb *croire*, 'to believe.' To do this, he wrote the verb with its significations in the following manner:—

Je dis oui par l'esprit, Je pense que oui.
 Je dis oui par le coeur, J'aime à penser
 Je crois que oui.
 Je dis oui par la bouche.
 Je ne vois pas des yeux.

After teaching these four significations by as many signs, he connected them with the verb, and added other signs to express the number, person, tense, and mood, in which it is used. If to the four signs, corresponding with the lines above mentioned, he added that of a substantive, the pupil will write the word *foi*, 'faith;' but, if a sign, indicating a participle used substantively, be adjoined, he will express *la croyance*, 'belief;' to make him write *croiyable*, 'credible,' the four signs of the verb must be accompanied with one that indicates an adjective terminating in *able*: all these signs are rapidly made, and immediately comprehended. M. Linguet, a member of the Royal Academy, having asserted that persons thus instructed could be considered as little more than automata, the abbé invited him to be present at his lessons, and expressed his astonishment, that M. Linguet should be so prejudiced in favor of the medium by which he had received the first rudiments of knowledge, as to conclude that they could not be imparted by any other; desiring him, at the same time, to reflect, that the connexion between ideas and the articulate sounds by which they are excited in the mind, is not less arbitrary than that between these ideas and the written characters which are made to represent them to the eye. M. Linguet complied with the invitation; and the abbé having desired him to fix on some abstract term, which he would by signs communicate to his pupils, he chose the word un-

intelligibility; which, to his astonishment, was almost instantly written by one of them. The abbé informed him, that to communicate this word he had used five signs, which, though scarcely perceivable to him, were immediately and distinctly apprehended by his scholars: the first of these signs indicated an internal action; the second represented the act of a mind that reads internally, or, in other words, comprehends what is proposed to it; a third signified that such a disposition is possible; these, taken together, form the word intelligible; a fourth sign transforms the adjective into the substantive; and a fifth, expressing negation, completes the word required. M. Linguet afterwards proposed this question, What do you understand by metaphysical ideas? which being committed to writing, a young lady immediately answered on paper in the following terms: 'I understand the ideas of things which are independent of our senses, which are beyond the reach of our senses, which make no impression on our senses, which cannot be perceived by our senses.'

In the Ephemerides of the Curious, we have an account of a periodical dumbness, which had continued for more than fifteen years, and had not gone off at the time the account was written. The person was son to an inn-keeper at Jesing, in the duchy of Wirtemberg. He was one night taken so ill after supper, that he could neither stand nor sit. He continued, for about an hour, oppressed with sickness, to such a degree as to be in danger of suffocation. At the expiration of this time he grew better; but, during three months, he was much dejected, melancholy, and, at times, fearful. He was then suddenly struck dumb, and became unable to pronounce the least word, or form the least sound, though he could speak very articulately before. The loss of speech was at first instantaneous, and continued only a few minutes: but the duration of it began to lengthen every day; so that it soon amounted to half an hour, two hours, three hours, and at last to twenty-three hours, yet without any order. And at last the return of speech kept so constant and regular an order, that, for fourteen years together, he could not speak except from noon, during the space of one entire hour, to the precise moment of one o'clock. Every time he lost his speech, he felt something rise from his stomach to his throat. Excepting this loss of speech, he was afflicted with no other disorder of any animal function. Both his internal and external senses continued sound; he heard always perfectly well, and answered the questions proposed to him by gestures or writing. All suspicion of deceit was removed by his keeping exactly the same hour, though he had no access to any instruments by which time can be measured.

Modern researches into this curious and interesting topic, instigated mainly, perhaps, by the efforts of the abbé de l'Epée, have made us better acquainted both with the few historical facts that belong to the subject, and with the actual faculties possessed by the dumb. In this country, in particular, the art of instructing these unhappy persons has been cultivated, of late years, with great success.

Aristotle notices, *Hist. An. iv. 9*, that deafness produces dumbness, but speaks of no remedy for this calamity. Pliny, who quotes the learned Stagirite on this subject, mentions a young painter, Q. Pedius, xxxv. 7, who was born deaf and dumb; but through the care of a kinsman in his education, he attained considerable eminence in his art. The first person who is recorded to have made any systematic attempts to instruct the deaf and dumb, is Pedro de Ponce, a Benedictine monk of Sahagen, in Spain. He died in 1584. The earliest publication on this subject, is a Spanish work of the early part of the seventeenth century, 1620, *Reduction de las Letvas, y Arte para enseñar a hablar los Mudos*, written by the then secretary to the constable of Castile, Bonet. A brother of the constable having been born deaf, was likewise dumb, and Bonet was one of his tutors. But Sir Kenelm Digby, who saw the former in the course of his travels, ascribes the faculty he possessed of understanding conversation, to the successful efforts of an ecclesiastic. 'There was a priest,' he says, 'who undertook the teaching him to understand others when they spoke, and to speak himself that others might understand him, for which attempt at first he was laughed at; yet, after some years he was looked upon as if he had wrought a miracle. In a word, after strange patience, constancy, and pains, he brought the young lord to speak as distinctly as any man whatsoever, and to understand so perfectly what others said, that he would not loose a word in a whole day's conversation. I have often discoursed with the priest whilst I waited upon the prince of Wales, now our gracious sovereign, in Spain, and I doubt not but his majesty remembreth all I have said of him, and much more; for his majesty was very curious to observe and inquire into the utmost of it. He could discern in another whether he spoke shrill or low; and he would repeat after any body any hard word whatsoever, which the prince tried often, not onely in English, but by making some Welshmen that served his highness, speak words of their language, which he so perfectly echoed, that I confesse I wondred more at that than at all the rest, and his master himselfe would acknowledge, that the rules of his art reached not to produce that effect with any certainty. And therefore concluded, this in him must spring from other rules he had framed unto himself out of his attentive observation, which the advantages which nature had justly given him in the sharpnesse of senses to supply the want of this, endowed him with an ability and sagacity to do beyond any other man that had his hearing. He expressed it surely, in a high measure, by his so exact imitation of the Welsh pronunciation, for that tongue, like the Hebrew, employeth much the guttural letters, and the motion of that part which frameth them cannot be seen or judged by the eye, otherwise than by the effect they may happily make by consent, in the other parts of the mouth exposed to view! For the knowledge he had of what they said, sprung from his observing the motions they made, so that he could converse currently in the light, though they he talked with whispered never so softly; and I have seen him, at the dis-

tance of a large chamber's breadth, say words, after one, that I, standing close by the speaker, could not hear a syllable of.'

The next writer on the subject was Dr. John Bulwer, 'surnamed,' as he tells us, 'the Chiroso-pher,' in 1648. His tract was entitled, *Philosophus, or the Deafe and Dumble Man's Friend*, 'exhibiting the philosophical verity of that subtle arte which may inable with an observant eie to heare what any man speaks by the moving of his lips. Upon the same ground, with the advantage of an historicall exemplification, apparently proving that a man borne deafe and dumbe may be taught to heare the sound of words with his eie, and hence learne to speake with his tongue.' This writer was tutor to Sir Edward Gastwicke of Wellington, in Bedfordshire, and Mr. William Gastwicke his youngest brother, who were both dumb. He also published, in 1644, *Chirologie, the Natural Language of the Hand; and Chironomia, or the Art of Manuel Rhetorique*. In 1670 Dr. Wallis inserted a Letter to Mr. Boyle on this subject, in the *Philosophical Transactions*; and another in 1698. It is also noticed by him incidentally in his *Grammatica Lingua Anglicana*; and a treatise prefixed to it, *De Loquela, seu de Sonorum omnium Loquellarium Formatione*. In the *Philosophical Transactions* for January, 1668, an account is given of a tract published the preceding year by a M. Helmet, of Salzburg, entitled *Alphabetum Nature*.

Dr. Holder's Elements of Speech appeared in 1669, with an appendix expressly concerning persons deaf and dumb, and containing an account of his successful endeavours to teach Mr. A. Popham, a dumb son of colonel Popham, to speak. He was one of those persons who could hear a softer sound when the action of the tympanum was excited by a loud one. Dr. Holder first taught him to write, and then showed him the motion of the lips necessary to pronounce each separate letter. Dr. Wallis had been successful a little earlier in the education of a youth similarly circumstanced, the son of the mayor of Northampton. In the course of a year this youth could read 'a great part of the English Bible, and had attained so much skill as to express himself intelligibly in ordinary affairs; to understand letters written to him, and to write answers to them, though not elegantly, yet so as to be understood.' In the presence of many foreigners, 'who out of curiosity had come to see him,' as well as before the court and the royal family, he had 'often not only read English and Latin, but pronounced the most difficult words of their language, even Polish itself, which they could propose to him.' Young Popham was afterwards removed to the care of Dr. Wallis; and this circumstance, together with what Dr. Holder thought an unfair passage in one of Dr. Wallis's publications, produced a controversy between these writers, to be found in the *Philosophical Transactions*, 1670. In *Transactions*, 1698, p. 353, Dr. Wallis enters fully into his own plans, to which, it is contended by some writers, that no material addition has been since made.

We ought not here, perhaps to omit noticing the early and scarce tract of George Daigarno, a Scottish schoolmaster, entitled *Didascalocophus, or the Deaf and Dumb Man's Tutor*, which was

printed in a small volume at Oxford, in 1680 His design he states to be, 'to bring the way of teaching a deaf man to read and write, as near as possible to that of teaching young ones to speak and understand their mother tongue.' 'In prosecuting this general idea,' says Mr. Dugald Stewart, 'he has treated in one short chapter, of a Deaf Man's Dictionary; and, in another, of a Grammar for Deaf Persons; both of them containing a variety of precious hints, from which useful practical lights might be derived by all who have any concern in the tuition of children during the first stage of their education.' See Mr. Stewart's Account of a Boy born Blind and Deaf, Transactions, Royal Society edition, vol. VII. Dalgarno had, twenty years before, given to the world a very ingenious piece, entitled *Ars Signorum*, from which, says Mr. Stewart, it appears indisputably that he was the precursor of bishop Wilkins in his Speculations concerning 'a real character, and a philosophical language'. 'That Dalgarno's suggestions, with respect to the education of the dumb,' adds Mr. Stewart, were not altogether useless to Dr. Wallis, will be readily admitted by those who take the trouble to compare his Letter to Mr. Beverly, published eighteen years after Dalgarno's Treatise, with his *Tractatus de Loquela*, published in 1653. In this letter some valuable remarks are to be found on the method of leading the dumb to the signification of words; and yet the name of Dalgarno is not once mentioned to his correspondent.'

More recent professors of this useful art have been Father Vannin and Mons. Perreize, of Paris; Mr. Heinrich, of Leipsic; Mr. Baker, of London; and Mr. Braidwood, of Edinburgh; the abbé de l'Épée; and his successor the abbé Sicard; Dr. Watson, formerly the assistant of Mr. Braidwood; and Mr. Young, of Peckham.

We have noticed the plans of Mr. Braidwood and the abbé de l'Épée. The latter, in the last years of his life, relinquished an object upon which he employed considerable pains at the commencement of his career, viz. teaching the dumb to use articulate sounds: the abbé Sicard, down to the year 1815, also abandoned every attempt of this kind.

In England and Scotland this has been a favorite point with professors, and Dr. Watson speaks decidedly of its utility, as multiplying the means of association, whereby the dumb, like all other persons, retain and digest ideas. He informs us that he constantly found deaf persons who had learnt to articulate, speaking softly to themselves; and rehearsing words or sentences, either for the purpose of better remembering them, or of framing such expressions as would best convey their ideas. This appears very important; and we understand that the abbé Sicard, since his visit to England in the year above named, has resumed the abbé de l'Épée's original plan.

This gentleman is at the head of the continental system of employing artificial signs for the impression of ideas, or a set of conventional gestures prescribed by the teacher in the education of the dumb. In his first lessons he endeavours

to teach his pupil the relation between the names of objects and the objects themselves; the analysis of words into the letters of the alphabet; and the particular gesture which he is to attach to each word. He now explains the meaning of collective words, as distinguished from those denoting individual objects or parts of objects. Then he proceeds to general terms, applicable in common to a number of individuals, and to generic names comprehending a number of species; and lastly, to the most general and abstract words, such as being, thing, object. The accidents, modifications, and variations of objects, as denoted by adjectives, are next taught. He first endeavours to make his pupil conceive these qualities as inherent in the objects themselves, and next as being capable of being detached by a mental operation. For instance, taking several pieces of paper, each white on one side, and colored on the other with a common color, he places them on a table, before a black board, with their white sides uppermost. He then proceeds to inscribe some familiar word, like HORSE, on the board, leaving sufficient intervals between the letters for the insertion of other letters. Then turning the sheet painted gray, so that the colored side is now uppermost, he writes the word GRAY between the letters of the former word, but in smaller characters, thus,

H O R R A S Y E.

This is done successively with regard to the other sheets of paper, inserting the name of its respective color between the letters of the word HORSE, which is repeated for that purpose. The gray sheet is again turned down, so that its white side is presented; upon which the smaller letters, composing the word gray, are effaced, while the great letters, H, O, R, S, E, are allowed to remain. Thus the pupil is taught to consider the quality as part of the object, or as inherent in it. In like manner, he proceeds with other adjectives, such as round, square, &c., expressing the form of objects; writing them in the intervals of the letters composing the name of the respective objects; effacing them, and substituting others in succession.

To lead the pupil to form the abstraction of the quality thus expressed, that is, to the use of the adjective as a separate word that may be applied to different substantives, he employs the following diagram, the different lines of which he traces before his eyes, in order to point out the steps by which he is to arrive at this notion.

H O R R A S Y E

H . O . R . S . E

G R A Y

H . O . R . S . E * G R A Y *

Thus obtaining separately, the two words, he afterwards unites them by a connecting line, thus :

HORSE—GRAY

In order to form this into a sentence, he inserts the word *is*, instead of the line ; of which it may accordingly be regarded as the substitute, thus :

HORSE *is* GRAY.

Thus by making his pupils understand the nature of a verb, and afterwards teaching them that the verb can express either an existence or an action, *past, present, or future*, he leads them to the system of conjugation, and to all the shades of tenses. The varieties of significations, and of pronouns, with the corresponding affections of verbs, in regard to number and person, are conveyed by contrivances analogous to the preceding. They proceed upon the principle of connecting together words by lines, denoting the ideas, which are the component parts of other ideas ; and writing in the place where the lines unite, or in place of the other words in a similar diagram, the name of the compound idea.

Mr. Sicard also employs a system of cyphers, written on the top of every word or member of a sentence, according to the office it performs in the sentence ; by the help of which his pupils are better enabled to analyse it into its parts, distinguishing the name of the object, which is either acting or receiving an action, the verb and its regimen, direct, indirect, or circumstantial ; and displaying in a similar way every part of speech.

The mere child, while learning written words, is made to copy them himself, so that, by dwelling upon their forms sufficiently, they make a strong impression on his mind. Then from time to time he is shown the objects, and required to write their names himself : and in these preliminary lessons, much assistance is derived from drawings of the objects. The abbé Sicard has availed himself, with much ingenuity, of this mode of denoting them. He begins, for instance, by tracing the outline of a familiar object, such as a key, on a black board, with a chalk pencil ; and placing the object itself before the eye of the pupil, he readily understands the resemblance of the design with what it is meant to represent. He does the same with other objects ; and exercises his pupil in pointing out the objects denoted by each drawing, which of course is an amusement to him. He next writes the name of each object within the outline of the figure on the board ; and after effacing the outlines, so that nothing but the words remain, signifies to the pupil that he is still to consider what he now sees as the representation of the drawing, that is, of the object denoted. Dr. Watson has had a set of plates engraved, containing delineations of 600 objects most generally met with. These are annexed to his book of Instruction of the Deaf and Dumb, in eighty octavo pages, and accompanied by a printed vocabulary, consisting of the names of all the objects represented, as also of most of the words explained in the earlier lessons, before the engravings were had recourse to. The first time of going through this vocabulary, the heads or

generic names under which the objects are classed are not regarded. But, in subsequent lessons, these are particularly attended to, and their relations to the subordinate specific names explained.

It is also found extremely advantageous to instruct the pupil, as soon as he is familiar with the use of letters, in the manual alphabet, as it is called ; or the expression of letters by different positions of the fingers. This is not only a very quick and ready means of communication commonly learned at other schools ; but easily retained, or recovered if lost, and it furnishes an excellent substitute for the pencil, or pen and ink, when those materials are not at hand. The dumb, when properly instructed, converse thus together with the utmost rapidity.

Another mode of yet quicker intercourse has also been devised for the dumb. It is that of writing the forms of the letters by the point of the finger in the air, and on various prominent parts of the body, as the back for instance. It must, however, be recollected that, to a spectator, who stands before us, writing in the air would appear reversed, if traced in the ordinary manner, and this must be remedied by the letters being written in a reversed form, a method which is said to be easily acquired by practising before a looking-glass. For the particulars of Dr. Watson's course we must refer to his *Instruction of the Deaf and Dumb*, by Joseph Watson, LL.D, 2 vols. 8vo. London, 1809.

A singular example of a child being born deaf and blind, has recently occurred in the person of James Mitchell, whose history has been narrated by Mr. Dugald Stewart, in a memoir published in the *Transactions of the Royal Society of Edinburgh*, Vol. VII. p. 70. The celebrated Mr. Wardrop, performed upon him the operation of couching, and has also given us some valuable and interesting particulars of his case, in a separate work, entitled *History of James Mitchell, a Boy, born Blind and Deaf, with an Account of the Operation performed for the Recovery of his Sight*. Lond. 4to. 1813. In the eighth volume of the *Transactions of the Royal Society of Edinburgh*, are to be found Additional Communications respecting the Blind and Deaf Boy, James Mitchell, by the late Dr. John Gordon ; a gentleman who had paid particular attention to the case of Mitchell, and from whom Mr. Stewart acknowledges he received much information. The volume also contains a paper on the Education of James Mitchell, by Dr. Dewar.

An Asylum for Educating the Deaf and Dumb Children of the Poor, was established in the neighbourhood of London, in the year 1792, and is now under the superintendence of Dr. Joseph Watson, to whose work we have alluded. No child is admitted under the age of nine years, and fourteen is the earliest age at which they can be apprenticed.

In a report, issued in July 1820, by the committee appointed for managing this establishment, the subscribers are informed that the admissions, on the average, have amounted to between forty and fifty within each year ; yet the applications have much increased. At the election, in Ja-

uary, 1820, a list of ninety-five candidates was presented to the governors, out of which they were under the painful necessity of electing only twenty-five, though all seemed to have powerful, if not equal, claims to their notice. An examination of this report will show that a defect in the organs of hearing is a misfortune of much more frequent occurrence than is generally imagined. From a statement given by the committee, the public will see that among those who have applied to this charitable institution for relief are to be found twenty-four families, which contain no fewer than eighty-seven children deaf and dumb. We shall extract some of their names.

William Coleman, with eleven children, of whom five are deaf and dumb.

David Thomson, with ten children, five deaf and dumb.

George Franklin, with eight children, five deaf and dumb.

Silas Vokins, with seven children, five deaf and dumb.

Fourteen families, with three children, in each, deaf and dumb.

The greater number of the successful applicants for admission into this asylum are natives of the metropolis, or of the adjoining counties only.

Similar institutions have been established at Birmingham and Edinburgh. In the latter, besides the ordinary branches of education, a certain number of boys are taught the trade of shoemaking; and some profit arises from the sale of articles manufactured by them.

At the Asylum for the Deaf and Dumb at Paris, under the management of the abbé Sicard, the apprenticeship of such as are designed for trades begins on their first entering the institution, under the inspection of ten different masters, viz. 1. a printer; 2. an engraver of precious stones; 3. a copper-plate engraver; 4. a drawing master; 5. a turner; 6. a Mosaic artist; 7. a tailor; 8. a shoemaker; 9. a cabinet-maker; 10. a gardener. These masters reside in the asylum, and receive their board and a regular salary. Public exercises, which the abbé Sicard gives once or twice a month, are meant to excite emulation among the pupils, and to make the establishment known.

Institutions formed upon a similar model have been established in Holland, Germany, Russia, and Sweden.

It has been suggested that a very competent share of instruction may be imparted to a deaf and dumb pupil by any teacher who undertakes the task with the talents and temper of an ordinary schoolmaster, and the art of instructing the infant deaf and dumb; by John Pouncefort Arrowsmith, 8vo. Lond. 1823, offers some considerable encouragement to this attempt. The editor's brother, now an artist of considerable merit, was at an early age sent, like other boys, to a common school; with a request, on the part of his mother, that he might be treated, in every respect, like the other children. The worthy old dame to whom he was sent, exclaimed, 'How can he be taught his letters? He cannot hear.' 'True,' replied his mother, 'he cannot hear, but

he can see. As you can do nothing with the ear, try what can be done with the eye. If he cannot make out the difference between the sound of *a* and that of *b*, you will acknowledge that he is as competent as any other child to distinguish the form of one from that of the other.' And this expectation was soon proved to be correct, to the astonishment of those who ridiculed the idea; 'for in a very little time he knew the twenty-six letters, large and small, as well as any child in the school.' Then vanished all the difficulty; the dame and her wondering neighbours began to see, as his mother had predicted, that he would 'learn by the window, his eyes, as well as any other child could by the door, his ears.' 'At this school,' proceeds Mr. Arrowsmith, 'every child went up to his governess twice in the morning and afternoon. By constantly going up in the same manner, to look at the letters, he soon observed the difference between himself and the other children, by taking notice of their mouths; so that, at length, when the letters were pointed out to him for observation, he looked up to the governess, as much as to say, what is it? She endeavoured to gratify his curiosity, and called the letters by their names as she pointed to them; and in a few months he learnt to pronounce the alphabet, in his own way, which he does to this day.' The moment he convinced his mother that he knew every letter, she got several sets of alphabetical counters, large and small, with which he was exercised, and taught the name of every thing he could see at home and at school. By these means he constantly gained information from his school-fellows without the knowledge of his mistress.

'To those who are still incredulous, and feel an interest in the subject,' says an able writer in the Quarterly Review, 'we earnestly recommend the account which Mr. Arrowsmith gives of the plan adopted in educating his brother. And to render their conviction more certain—let them try the plan which he details. There are few neighbourhoods in which, unfortunately, a subject may not be found for such a purpose. Let him be regularly sent to any village school with other children. Let him be treated, in all respects, like them, and we venture to predict that it will be even impossible to prevent him from acquiring the knowledge of a medium which may enable him to converse with his youthful associates. The mind is fully as active and vigorous in the one as it is in the other; and the curiosity of a deaf and dumb child, being strongly excited by the objects which attract his attention, he can hardly fail to devise some means of obtaining from his companions the information which he wishes to procure.

'We are perfectly convinced that the deaf and dumb might be admitted, with peculiar advantages, into seminaries in which children who hear and speak receive their instruction. The efforts which would be made by the latter class of pupils to explain their ideas to their less fortunate associates would, in the end, prove highly beneficial even to themselves. It is well known that children frequently acquire a knowledge of words without comprehending the ideas of which they are representatives. A constant association with

the deaf and dumb, would impose upon them the necessity of acquiring a precise conception of the words which they used, for the purpose of making them intelligible to their young companions. The advantages which would, inevitably, result from this admixture would be, therefore, mutual, and would much more than counterbalance any imaginary excess of skill which a teacher who confines himself to the sole instruction of the deaf and dumb may be supposed to possess. The admission of deaf and dumb pupils into establishments now exclusively devoted to the reception of those who can hear and speak, could, by no possibility, retard the progress of the latter, while it would greatly facilitate the instruction of the former. Were the intercourse of the deaf and dumb to be confined, in after-life, to persons laboring under a similar misfortune, separate establishments for their education would be recommended by reasons much more cogent than any which can be urged in their favor, while it is remembered that, when they leave these institutions, they must converse principally, if not exclusively, with persons who hear and speak.'

DUMFRIES, or DUMFRIES-SHIRE, a county in the south of Scotland, comprehending the district of Nithsdale, the stewartry of Annandale, and the lordship of Eskdale, extending in length from north-west to south-east about sixty miles, and about thirty miles in breadth where broadest. It is bounded on the south-west by Galloway and part of Kyle: on the north-east by the counties of Roxburgh, Selkirk, and Peebles; on the north-west by Clydesdale; and on the south-east by Solway Frith and the marshes between Scotland and England. A great part of the county is mountainous, overspread with heath, and well stocked with game of all kinds: but the valleys, through which the Esk, the Annan, the Nith, and other smaller rivers run, are extremely pleasant; and some of them well cultivated and very fertile, producing oats, barley, and wheat, in abundance, both for exportation and home consumption; while the mountainous parts afford pasture for innumerable flocks of sheep and herds of black cattle, many thousands of which are annually exported to England. In the valleys are several natural woods and some extensive plantations of different kinds of timber. In Nithsdale, are the rich lead mines of Wanlockhead, the coal mines of Sanquhar and Cairnburn, the inexhaustible lime quarries of Closeburn and Barjarg, and freestone in almost every parish. Annandale has the rich lime quarries of Kellhead and Comtongan, with plenty of free stone near the towns of Annan and Lochmaben: and in the lower part of Eskdale are limestone and coal in abundance. In some places there are indications of iron; copper is wrought; and in Westerkirk is a valuable mine of antimony. Besides the mineral springs of Moffat and Hartfell Spa, there are a great many wells which contain metallic or mineral impregnation. This county contains four royal boroughs, Dumfries, Sanquhar, Annan, and Lochmaben, several small towns and villages, and is divided into forty-two parochial districts, containing in all about 55,000 inhabitants. It sends one member to parliament. The manufactures of Dumfries

shire are not very extensive. Cotton-spinning is carried on at Langholm and Annan, and also cotton-weaving at the latter place; a small iron-work has been erected at Kirkconnel; a paper-mill, two small foundries, and several breweries and tan-works at Dumfries, and a carpet manufactory near Sanquhar. Salt was formerly made from sleet, in the parishes of Cummertrees and Ruthwell, without paying duty, in consequence of an act of 1671; but the right to this exemption has been lately questioned. In 1809 the entries inwards to this county were 493 vessels, carrying 1339 men, and 18,985 tons; and 287 vessels cleared outwards, with 802 men, and 12,090 tons. Most of the inward vessels are laden with coal, and of the outward with grain. But its most valuable exports are cattle, sheep, bacon, and wool; almost all of which, excepting the last, are sent out of it by land.

DUMFRIES, the capital of the above county, is a handsome town, situated on a ridge or rising ground, on the north-east side of the river Nith, about nine miles above its junction with the Solway Frith. Its present name appears to have been derived partly from its situation, and partly from the monastery of grey friars, that formerly stood near the head of the street, being only a corruption of Drum friars, or 'the eminence of the friary;' and accordingly, till within these eighty or a hundred years, it was always spelt Drumfries. Besides the pleasantness of its situation, on the side of a beautiful winding river, it is surrounded on all sides with one of the finest and best cultivated sheets of dale country that are any where to be met with; and the prospect from it is terminated, at the distance of a few miles, by a continued chain of hills, forming altogether one of the grandest natural amphitheatres perhaps in Britain. On the north-east side of it, at some little distance, are the ruins of a chapel built by king Robert Bruce. Dumfries appears to have been erected into a royal borough before the middle of the eleventh century, as a grave-stone was discovered some time ago bearing the date of 1079, and mentioning the person buried under it to have been a merchant and Burgess of the town. And that it was a place of consequence in the beginning of the fourteenth century, is evident, from the circumstance, that Edward II. called the estates of Scotland to meet there in 1307. In the above-mentioned monastery, too, king Robert Bruce killed his rival, Cumming, lord of Badenoch, with the assistance of James Lindsay and Roger Kirkpatrick, on the 5th February, 1305. The houses of Dumfries are well built and commodious; the principal street extends three quarters of a mile, the whole length of the town, in a direction parallel to the Nith; and the town in general is well paved. It has two very elegant churches and an episcopal chapel, a strong prison, a hospital, an infirmary, and a narrow bridge of nine arches over the river, said to have been built by one of the three daughters and co-heiresses of Alan, lord of Galloway. The assizes for the county, and for the shire of Galloway and stewartry of Kirkcudbright, are held in the town twice a year. It is also the place for holding the sheriff's and commissary courts,

the quarter-sessions of the peace, and the courts of the commissioners of supply. It is governed by a provost, three bailies, a dean of guild, treasurer, and twelve merchant councillors, with the deacons of the incorporations. The corporation obtained from king James I., in one of his journeys to England, a small silver tube, like a pistol barrel, called the silver gun, with his royal license to shoot for it every year; a festival which is still kept up. The town has a weekly market on Wednesday, with two fairs in February and September, at which vast numbers of horses and black cattle are sold. Dumfries lies thirty miles W.N.W. of Carlisle, and seventy-two S.S.W. of Edinburgh.

DUMFRIES, a town of the United States, the capital of Prince William county, in Virginia. It is a port of entry and post town, and has an episcopal church and court house. It lies on the north side of Quantico Creek, ten miles from Colchester, twenty-eight north by east of Fredericksburg, and 185 south-west of Philadelphia.

DUMONT (John), baron of Carlsroom a political and historical writer, who became a refugee in Holland on account of religion, and was made historiographer to the emperor of Germany. He died in 1726, leaving behind him several works, valuable for the facts they contain, as, *Mémoires Politiques, pour servir à l'Intelligence de la Paix de Ryswick*, 4 vols. 12mo., 1699; *Voyages en France, en Italie, en Malte, et en Turquie*, 4 vols. 12mo., 1699; *Corps Universel Diplomatique du Droit des Gens*, 8 vols. fol. 1726; *Lettres Historiques depuis Jauvier 1652 jusqu'en 1710*.

DUMOURIEZ (Charles Francis Duperier), of noble but reduced family, was born in Provence, January 25th, 1739. He entered into the French military service at the age of eighteen, against the same duke of Brunswick whom, after a lapse of many years, he compelled to retire from France. Having, in his twenty-second year, obtained the rank of captain, and the cross of St. Louis, he went on his travels, and among other countries visited Portugal, of which kingdom he published an account in 1767. Soon after this he was employed in Corsica, with the rank of colonel. In 1770 he was sent to Poland to assist the confederates. He was next engaged on a mission to Sweden, but was committed in 1773 to the Bastille, from whence he was released on the death of Louis XV. During the American war he was much employed at Cherbourg, of which place he was made commandant. At the commencement of the revolution he distinguished himself as a patriot, was raised to the rank of lieutenant-general, and made minister of foreign affairs. When the Prussians, 100,000 strong, advanced on France, he dispersed them with a very inferior force, through the superiority of his tactics. The battle of Jemappe shortly after consolidated his triumph, and revolutionised Belgium. On his return to Paris, he found the trial of the king was in progress; and, becoming suspected of attachment to that unfortunate prince by the terrorists, he soon retired, and replaced himself at the head of his army. He now concluded a

treaty with the prince of Saxe Coburg for the evacuation of Belgium, while he himself determined to lead his troops to Paris, and re-establish the constitution of 1791. Coburg promised, if necessary, to furnish an auxiliary force, but the design was frustrated by some of the subordinate generals conveying intelligence of it to the convention. Commissioners were sent to arrest Dumouriez, when he took the decisive step of instantly arresting them, and handing them over to the custody of the enemy, as hostages for the safety of the king and his family. Finding insubordination now beginning to show itself among his troops, he resolved on quitting them, and repaired for refuge to the headquarters of the prince of Coburg, who offered him a command, but he declined it, and retired to Switzerland. The cantons were however too near to France to render that country a safe asylum, especially as the sum of 300,000 francs was offered for his head. He afterwards retreated to Hamburg and to England, where he for some time subsisted on a pension of 400 louis, granted him by the landgrave of Hesse Cassel. He survived the restoration of the Bourbon dynasty several years. In 1821 he published two memoirs, addressed to the Greeks, and died in his eighty-fifth year, at Turville Park, near Henley-upon-Thames, March 14th, 1823.

DUMP, *n. s.* } Dutch *dom*; Dan. *dum*;
DUMP'ISH, *adj.* } Goth. *domp*; perhaps from
DUMP'LING, *n. s.* } dumb. Sorrow; sadness;
DUMP'Y, } hence, first a melancholy
tune or air; and then any tune. The Scottish
dumpy, according to Dr. Jamieson, signifies short
and thick: a dumpling is a dumpy pudding.

New year, forth looking out of Janus' gate,
Doth seem to promise hope of new delight;
And bidding the' old adieu his passed date
Bids all old thoughts to die in *dumpish* spite.

Spenser,

Sing no more ditties, sing no more
Of the *dumps* so dull and heavy;
The frauds of men were ever so,
Since summer first was leafy.

Shakspeare. Much Ado About Nothing.

Visit by night your lady's chamber window
With some sweet consort; to their instruments
Tune a deploring *dump*: the night's dead silence
Will well become such sweet complaining grievance.

Shakspeare.

Funerals with stately pomp
March slowly on in solemn *dump*. *Hudibras.*
Pudding and *dumpling* burn to pot. *Dryden.*
This shame *dumps* cause to well-bred people, when
it carries them away from the company. *Locke.*
The squire who fought on bloody stumps,
By future bards bewailed in doleful *dumps*.

Gay's Pastoral.

The life which I live at this age is not a dead,
dumpish, and sour life; but cheerful, lively, and pleasant.

She, in sooth,

Possessed an air and grace by no means common:
Her stature tall—I hate a *dumpy* woman. *Byron.*

DUN, *adj.* Sax. *dun*; Goth. *dauckn*; Welsh
dwnn; Belg. *dunker*. A dark tawny color: hence
dark, gloomy, in a figurative sense.

Come, thick night!

And pall thee in the *dunest* smoke of hell.

Shakspeare.

He then surveyed

Hell and the gulph between, and Satan there
Coasting the wall of heaven on this side,
In the *dun* air sublime. *Milton. Paradise Lost.*

The cattle droop, and o'er the furrowed land,
Fresh from the plough, the *dun*-discoloured flocks
Untended spreading crop the wholesome root.

Thomson.

Oh send them to the sullen mansions *dun*,
Her baleful eyes where sorrow rolls around ;
Where gloom-enamoured mischief loves to dwell,
And murder, all blood-boltered, schemes the wound.

Dr. Johnson's Poems.

It changed of course ; a heavenly camelion,
The airy child of vapour and the sun,
Brought forth in purple, cradled in vermilion,
Baptized in molten gold, and swathed in *dun*.

Byron.

DUN, *v. a. & n. s.* Sax. *ḍunan*, to clamor.
To claim a debt with vehemence and importunity : a clamorous creditor.

Borrow of thy back, and borrow of thy belly :
they'll never ask thee again. I shall be *dunning* thee
every day. *Bacon.*

An university *dun* is a gentleman's follower cheaply
purchased, for his own money has hired him.

Bp. Earle.

When thou *dunnest* their parents, seldom they,
Without a suit before the tribune pay. *Dryden.*

They are ever talking of new silks, and serve the
owners in getting them customers, as their common
dunners do in making them pay. *Spectator.*

I remember what she won :

And hath she sent so soon to *dun* ? *Swift.*

It grieves my heart to be pulled by the sleeve by
some rascally *dun*—Sir, remember my bill.

Arbutnot's John Bull.

Secretaries of state, presidents of the council, and
generals of an army, have crowds of visitants in a
morning, all soliciting for past promises ; which are
but a civil sort of *duns*, that lay claim to voluntary
debts. *Congreve.*

DUN, or BURG, the name of an ancient species of buildings, of a circular form, common in the Orkney and Shetland isles, the Hebrides, and northern parts of Scotland. The latter term points out the founders, who at the same time bestowed on them their natal name of *bofg*, a defence or castle, a Suedo-Gothic word ; and the Highlanders universally apply to these places the Celtic name *dun*, signifying a hill defended by a tower, which plainly points out their use. They are confined to the countries once subject to the crown of Norway. With few exceptions, they are built within sight of the sea, and one or more within sight of the other ; so that on a signal by fire, flag, or trumpet, they could give notice of approaching danger, and yield a mutual succour. In the Shetland and Orkney islands they are most frequently called wart or ward-hills, which shows that they were garrisoned. They had their wardmadher, or watchman, a sort of sentinel, who stood on the top and challenged all who came in sight. The gackman was an officer of the same kind, who not only was on the watch against surprise, but was to give notice if he saw any ships in distress. He was allowed a large horn of generous liquor, which he had always by him, to keep up his spirits. Along the Orkney and Shetland shores they almost form a chain ; and by these means not only kept the natives in

subjection, but were situated commodiously for covering the landing of their countrymen, who were perpetually roving on piratical expeditions. These towers vary in their inner structure ; but externally are universally the same ; yet some have an addition of strength on the outside. The burgh of Culswick in Shetland, notwithstanding it is built on the top of a hill, is surrounded with a dry ditch thirteen feet broad ; that of Snaburgh in Unst, has both a wet and a dry ditch ; the first cut, with great labour, through the rock. The burgh of Moura is surrounded by a wall, now reduced to a heap of stones, and the inside is cylindrical, not taper, as usual with others.

DUNAN AULA, an ancient tumulus in Craignish parish, in Argyllshire, where the ashes of Olaus, the son of a king of Denmark, were deposited, near the field of battle in which he was killed many centuries ago. General Campbell converted this mount into a burying-place, and erected a neat monument on the top of it, in memory of his only son. The tumulus is supposed to have been raised before the introduction of Christianity, as the urn, containing the ashes of Olaus, was discovered under a heap of stones by the workmen ; and the practice of burning the dead was discontinued after the conversion of the ancient Caledonians.

DUNBAR, a royal borough of Scotland, in the county of East Lothian, once remarkable for a strong castle, the key of Scotland from the east, which gave shelter to Edward II. of England, in his flight from Bannockburn, but of which scarce a vestige now remains. This castle was bravely defended, in 1336, by Agnes, countess of March, sister of Randolph earl of Murray. In the absence of her husband, this heroine forced lord Montague to raise the siege and leave the country. Here are still preserved some of the Scottish pikes, six ells long, and formed for both offence and defence. Under the rock, on which the castle stands, are two natural arches, through which the tide flows. Between the harbour and the castle is a stratum of vast basaltic columns of red grit-stone. Dunbar is remarkable for the defeat of John Baliol's army by earl Warrenne, in 1296, and for a victory gained near it by Cromwell over the Scotch in 1650. Dunbar is governed by a provost, three bailies, dean of guild, treasurer, and fifteen councillors. It joins with Haddington, North Berwick, Lauder, and Jedburgh, in sending a representative to parliament. Within the royalty there is a handsome village, called Belhaven, near which the harbour was originally built. The east pier of the present harbour was begun during the protectorship of Cromwell, who granted £3000 towards defraying the expense. But it was still very imperfect, and could only receive a few small vessels ; and even now, though a great deal of labor and money have since been expended in improving it, the access is difficult and the bounds small. It is defended by a battery of twelve guns, of nine, twelve, and eighteen pounders ; besides which, here are a large and convenient dry-dock, and two considerable rope-walks : ship-building is carried on to some extent. Here are a soap-work, and a cotton manufactory ; two iron-foundries, and spinning-mills. Its principal

trade is the exportation of corn and of kelp. It has also a tolerable trade in the fisheries. It is equi-distant from Edinburgh and Berwick-upon-Tweed, being twenty-seven miles from each.

DUNBAR (William), a celebrated Scottish poet, born at Salton, in East Lothian, in 1465. He wrote several good poems for that age; and he has been frequently styled the Scottish Horace. The Golden Terge, and The Thistle and the Rose, are the most admired pieces of his production. He died about 1530. Sir David Dalrymple published an edition of his poems with notes.

DUNBARTON, the chief town of Lennox or Dunbartonshire, in Scotland, remarkable for its castle. This is a steep rock, rising up in two points, and every where inaccessible, except by a very narrow passage or entry, fortified with a strong wall or rampart. Within this wall is the guard-house, with lodgings for the officers; and from hence a long flight of stone steps ascends to the upper part of the castle, where there are several batteries mounted with cannon, the wall being continued almost round the rock. In the middle of this upper part, where the rock divides, there are commodious barracks, with a deep well in which there is always plenty of water. Here, likewise, are the remains of a gateway and high wall, at the top of which there was a wooden bridge of communication from one rock to another. This gateway was sometimes blocked up during the intestine commotions of Scotland, so that garrisons of different factions possessed different parts of the castle, and each had a gate towards the water. The castle stands in an angle formed at the conflux of the Clyde and Leven: so that it is wholly surrounded by water, except a narrow isthmus, and even this is overflowed at every spring tide: nor is there any hill or eminence within a Scotch mile of this fortress. It commands the navigation of the Clyde; and, being deemed the key of the western Highlands, is kept in some repair, and garrisoned with invalids, under the command of a governor and some subaltern officers. The government of it is worth £700 a year. There is a considerable manufactory of crown glass and bottles in the town. It has a good harbour. The vessels employ seventy seamen and carry about 2000 tons. Dunbarton was erected into a royal borough by king Alexander II., in 1221. It contains about 2000 inhabitants, and lies fifteen miles north-west of Glasgow, fifty-eight west of Edinburgh, and eighty-nine north of Dumfries.

DUNBLANE, a town in a parish of the same name, pleasantly seated on the river Allan, thirty miles north of Edinburgh. The battle of Dunblane, or Sherrifmuir, was fought near it, in 1715, when the duke of Argyll defeated the rebels under the earl of Marr. It has four fairs; in March, May, August, and November.

DUNCE, *n. s.* From Lat. *densus*, thick,—Minshew; or Span. *tonto*, stupid,—Skinner; still more probably a word of reproach introduced by the Thomists against the Scotists, from the name of Duns Scotus, as Mr. Tooke and Mr. Todd suggest; i. e. Duns' disciples, dunces.

*Dunce at the best, in streets but scarce allowed
To tickle, on thy straw, the stupid crowd, Dryden.*

Was Epiphanius so great a *dunce* to imagine a thing, indifferent in itself, should be directly opposite to the law of God? *Stillingfleet.*

Till critics blame, and judges praise,
The poet cannot claim his bays.

On me when *dunces* are satiric,
I take it for a panegyric.

Hated by fools, and fools to hate,
Be that my motto, and my fate.

Swift.

The schools became a scene

Of solemn farce, where Ignorance in stilt,
His cap well lined with logic not his own,

With parrot tongue performed the scholar's part,
Proceeding soon a graduated *dunce*.

Cowper.

DUNCOMBE (William), a laborious author, born in London in 1690. He published a Translation of Racine's *Athalie*, which was well received by the public, and has gone through many editions. In 1724 he was editor of the works of Mr. Needler; in 1735, of the poems of his deceased brother-in-law, Mr. Hughes, 2 vols. 12mo.; in 1737 of the miscellanies of his younger brother Mr. Jabez Hughes, for the benefit of his widow, in 1 vol. 8vo.; and in, 1745, of the works of the Rev. Mr. Samuel Say, in 1 vol. 4to. In 1726 he married the only sister of John Hughes, Esq. whom he long survived. In 1734 his tragedy of *Lucius Junius Brutus* was acted at Drury-lane theatre. It was published in 1735, and again in 1747. The works of Horace, in English verse, by several hands, were edited by him in 2 vols. 8vo., with notes, &c. in 1757. A second edition, in 4 vols. 12mo. with many imitations, was published in 1762. In 1763 he collected and republished *Seven Sermons* by Archbishop Herring, on Public Occasions; with a Biographical Preface. He died Feb. 26, 1769, aged seventy-nine.

DUNCAN (Adam), lord viscount, a gallant British admiral, born at Dundee, in Scotland, in 1731, of an ancient and respectable family. Being a younger son, he was brought up to the sea, and after the usual gradations was appointed a lieutenant in the navy on the 10th of January, 1755; and about four years after he became a commander. He received his naval education, it is said, under the auspices of lord Keppel, through whom he was appointed captain of the *Valiant* of seventy-four guns. He was likewise on the court-martial of that distinguished veteran. In 1778 he was appointed to the *Monarch*, of seventy-four guns, one of the ships employed on the home station. About the end of December he was ordered, with Sir George Rodney, to Gibraltar, and greatly distinguished himself in the encounter with the Spanish squadron under Don Juan de Langara. Not long after this captain Duncan quitted the *Monarch*, and in 1782 was appointed to the *Blenheim* of ninety guns. He continued in this ship during the remainder of the war, being constantly attached to the channel fleet, then commanded by lord viscount Howe, and consequently proceeded with his lordship to Gibraltar in September. When peace was settled, captain Duncan was appointed to the *Edgar* of seventy-four guns, and continued in that command the three succeeding years. On the 14th of September 1787 he was made rear-admiral of the blue; of the white on the 22d of September 1790; and

in 1793 he became vice-admiral; thus rising progressively till the 1st of June 1795, when he obtained the rank of admiral of the blue. Upon this last advancement he hoisted his flag on board the *Venerable* of seventy-four guns, and was appointed to the command of the squadron stationed in the North Sea, and particularly destined to act against the Dutch, who had then a considerable naval force lying ready for service in the *Texel*. The mutinous spirit which, about this time, had broken out among the British seamen in different quarters, having spread itself to the squadron under admiral Duncan, occasioned a slackening of the blockade of the *Texel*; and the enemy, acquainted with his situation, prepared for sea, and in his absence, early in October, slipped out, but he soon gained intelligence of their motions, and on the 11th of October, about nine in the morning, a signal was given of having discovered the enemy: after a pursuit of three hours, the British fleet came up with the Dutch; the action commenced at about forty minutes past twelve o'clock, at which time every ship of the British had broken the enemy's line, and cut them off from getting into the *Texel*, the land being then distant about seven miles. While the rear was attacked by the larboard division under vice-admiral Onslow, admiral Duncan directed all his attention to the enemy's van, and his own ship, the *Venerable*, was in close action for nearly two hours and a half, when he observed all the masts of the Dutch admiral's ship (*Vryheid*) go by the board; she was, however defended for some time after in a most gallant manner; but was at last obliged to strike to the *Venerable*, admiral de Winter himself being the only man left on the quarter deck, who was not either killed or wounded. The Dutch lost also their vice-admiral, in the ship *Jupiter*, and seven other ships of the line; the remainder having escaped with the greatest difficulty. The attack, on the part of the British admiral, was considered one of the most daring, and the issue of the contest one of the most important, during the war; indeed it afterwards appeared that the Dutch fleet was designed to assist the French in their intended invasion of this country. In consequence of this very brilliant success, the gallant admiral was, on the 1st of the same month, created viscount Duncan of Camperdown, and baron Duncan of Lundie, in the shire of Perth. A pension also of £2000 per annum was granted to him, and the two next heirs of the peerage. He died in 1804. Lord Duncan was married to Miss Dundas, daughter of Robert Dundas, Esq. lord president of the court of session in Scotland, June 6th 1777, by whom he had several children. His first son, Mr. Henry Duncan, died at Edinburgh on the 23d December, 1787; and his second son, Robert, born in 1785, succeeded to the estate and honors.

DUNCAN (Daniel), an eminent physician, born at Montauban, Languedoc, in 1649. He received his education at Montpellier, where he took his degree. He resided at Paris till the death of Colbert, who was his patron, after which he removed to his paternal estate at Montauban; but during the persecution of the Protestants, in 1690, he went to Geneva. He afterwards became successively physician to the

prince of Hesse Cassel and the king of Prussia. He died in London in 1735. He wrote an *Explanation of the Animal Functions*; *Natural Chemistry*; *Salutary Advice against the Abuse of Hot Liquors*, particularly coffee, chocolate, and tea.

DUNDAS (Henry), viscount Melville, son of lord Arniston, was born in 1740, and educated at the University of Edinburgh. He was admitted, in 1763, a member of the faculty of advocates; in 1773 became solicitor-general; in 1775 lord-advocate; and in 1777 joint keeper of the signet for Scotland. In 1782 he was sworn of the privy council, and made treasurer of the navy; but did not continue long in office, the coalition between lord North and Mr. Fox having displaced his party. On their return to power, he resumed office under the ministry of Mr. Pitt, to whom he firmly attached himself during their joint lives. On the passing of the act for regulating the affairs of the East India Company, Mr. Dundas was appointed president of the board of control; in 1791 he was made secretary of state for the home department; and in 1794 secretary at war. On the resignation of Mr. Pitt, in 1801, he also retired, and was created viscount Melville. When the former resumed the helm of affairs, he was appointed first lord of the admiralty. In 1805 lord Melville was impeached before the house of lords, of high crimes and misdemeanors in his office of treasurer of the navy. But the evidence adduced did not directly implicate him in the malversations of his deputy Mr. Trotter. He was accordingly acquitted. But he never afterwards held any public situation, except that of privy counsellor. His death took place in May 1811.

DUNDALK, a barony in the county of Louth, province of Leinster, in which is a borough, market, post, fair, and sea-port town of the same name, on a bay of the Irish channel, bearing its name. It lies above twenty-one miles five furlongs north of Drogheda, and fifty-two miles from Dublin. Lat. 53° 57', long. 6° 42'. A handsome bridge was thrown over the Castletown River in 1822, at the end of the town. It is the assizes town, and has some trade; it consists of one wide street near a mile long, and some cross avenues; has a very good market-house, a court-house, a beautiful specimen of Grecian architecture, after the design of the Temple of Theseus; and carries on a manufacture called Dundalk cambrics. It has been fortified (though now dismantled), as may be seen by the ruins of the walls, and a castle destroyed in 1641. In the reign of Edward II. it was a royal city, and is the last where a monarch of Ireland was actually crowned and resided. It is very advantageously situated for an inland trade, and the port is very safe for shipping. The bay, which is nine miles across, and nine inland, has good moorings at all times in four to upwards of eight fathoms water, with very good land-marks either for bringing up, or making the harbour, and in crossing the bar at high water in ordinary neap tides, this is from fifteen to eighteen feet water; besides many other good qualities, the bay abounds with all kinds of fish customary in the channel. A pier might be built for about £3000 at a place called

Giles-quay, which would shelter vessels waiting for tide to cross the bar, and enable the inhabitants to procure fuel at a cheap rate, while at present the only supply is turf from a bog ten miles distant. Here are a charter-school of eighty-six girls; a school of 264 children on Erasmus Smith's foundation, and an endowed classical school of high character; a Protestant church; two Roman Catholic chapels, and two meeting-houses, one for Presbyterians, the other for Methodists. Exports, corn, live cattle, beef, and butter. Imports, coal and flax-seed. Manufactures are, salt, soap, and leather; here is an extensive barrack.

DUNDEE, a royal borough of Scotland, in Angus-shire, seated on the north-side of the Tay, about twelve miles from its mouth, forty north of Edinburgh, and twenty-three east of Perth. Its situation for commerce is very advantageous. Trading vessels of the largest burden can get into the harbour; and on the quay there are very convenient and handsome warehouses, as well as good room for ship-building, which is carried on to a large extent. The houses are built of stone, generally three or four stories high. The market-place or high street in the middle of the town is a spacious oblong square, from whence branch out the four principal streets, which, with a number of lesser ones, are well paved. On the south side of the market-place stands the town house; an elegant structure, with a very handsome front, piazzas below, and a neat spire over it 140 feet high. This building was finished in 1734, and contains the guild-hall, the court-room, the bank, vaulted repositories for the records, and the common prison, which is in the upper story, and does honor to the taste and humanity of the magistrates, under whose auspices it was constructed, being well aired commodious rooms, at the same time very strong and secure. The meal-market and shambles, which were formerly a nuisance on the High street, were removed, and in their place was erected by the nine incorporated trades, on the east end of the above large square, a grand building, with a large and elegant cupola: in the ground floor of which is a very neat coffee-room, and several merchants' shops; and in the upper stories public rooms for each trade, and a common hall fifty feet long, thirty feet broad, and twenty-five feet high; having its front to the square decorated with Ionic columns. St. Andrew's Church, also built by the incorporations, stands on a rising ground a little north from the Cowgate-street; and has an elegant spire 130 feet high, with a peal of bells much admired. Dundee has also four other churches, and five ministers on the establishment. The old church, in which were originally four places of worship, had been a very magnificent building, with a large square Gothic tower or steeple, 186 feet high, on the west end of the church. It was in the form of a cross, erected by David earl of Huntingdon, brother to William I. of Scotland, and was dedicated to the Virgin Mary. This he did on his return from the third crusade (in which, with 500 of his countrymen, he had accompanied Richard I. of England), A. D. 1189, in gratitude for his deliverance from several imminent dangers, and particularly from

shipwreck, by which he had nearly perished when in sight of this town. At the same time he changed its name from Alectum to Dei Donum, whence its present name is thought by many to be derived; while others maintain that its name was Duntay, or the Hill of Tay. A hill rises on the north of the town to a great height, and is called The Law of Dundee. On its top, there are evidently the remains of a camp, said to have been first erected by Edward I. of England, and last repaired by general Monk. Dundee had an old castle which was demolished by the celebrated Scotch governor Sir William Wallace, who was educated in this town, which so exasperated Edward I. that, taking the town by storm, he set fire to the churches; and a number of the inhabitants, having taken sanctuary there, with their most valuable effects, were all burnt along with them. The desolation he brought on the church continued till the year 1787, when a noble edifice began to be built on the site of the one that was burnt down, in which the ancient Gothic of the outside is excellently united with internal modern architecture, making one of the largest and neatest churches in the kingdom, and again completing the superb superstructure, as erected at the first by the earl of Huntingdon. Besides the public grammar-school, and the English schools, there is an academy, or rather college, for mathematics, the French and Italian languages, and the polite arts, with proper professors in the different branches, and a large apparatus for natural and experimental philosophy. This town suffered greatly last century during the civil war, being sometimes under the command of one party, and at others of another. In 1645 the marquis of Montrose took it by storm; and in 1651, under the command of its provost major-general Lumsden, it vigorously opposed general Monk, who carried it by storm, September 1st, and put all in arms to the sword. And so great were the riches of Dundee, all the neighbouring gentlemen having retired to it with their best effects, as a place of safety, that every private soldier in Monk's army had nearly £60 sterling to his share of the plunder, there being above sixty merchant vessels in the harbour at that time; and the like number of vessels sailed for England loaded with the spoils of the unfortunate inhabitants. The magistrates have been at great expense in enlarging and fitting up the harbour, so as to render it of easy access, safe and commodious; and have made the passage over the Tay, where there is a great resort, so convenient, that travellers with their horses can get over it at any time of tide; a sufficient number of boats properly manned being always ready. The river Tay before Dundee is about three miles broad; and, being sheltered by high lands on both sides, is a safe road for ships of the greatest burden. The piers are extensive, broad, and well adapted for the purposes of loading and discharging vessels; and the harbour is equal to any in Scotland. There are upwards of 160 ships of different denominations belonging to the port, which employ upwards of 1300 seamen in the Greenland fishery, and the Baltic and the London trades. A wet-dock has been constructed on a

very extensive scale, and on the quay are several new ranges of warehouses. The principal manufacture here is of linen, particularly osnaburghs, canvas, bagging, &c., for exportation, and the Dundee colored thread has long been in high repute. Two sugar-houses are also established here. Till 1745 the town had only draw-wells; but since that period, it is most amply supplied from a large fountain of excellent water, conveyed into the town in leaden pipes, and discharged by good wells at proper distances. The salmon fishing in the Tay is of much importance; and the town is well supplied with fish of various kinds, though much raised in price of late years, on account of the quantities sent to London. Dundee was the birth-place of the celebrated Hector Boethius. It possesses the privilege, separately, of returning one representative to the British parliament.

DUNDONALD CASTLE, an ancient royal castle, seated on an eminence near a village of the same name, where Robert II. the first monarch of the house of Stuart, resided much and at last died in 1390.

DUNFERMLINE, a royal borough of Fife-shire, Scotland, fourteen miles west of Kirkcaldy, and fifteen north-west of Edinburgh. The greatest part of the town is situate on a hill which commands a view of the surrounding country. Here are the remains of a magnificent abbey and palace of the kings of Scotland, in which the princess Elizabeth, daughter of king James I. was born. In the inn of this town was the marriage bed of James VI. and his queen; it is still entire, and is now in the possession of the earl of Elgin. This place is noted for a manufactory of figured diapers. It is governed by a provost, two bailies, dean of guild, and eighteen counsellors, among whom are the eight deacons of incorporations. The houses of Dunfermline are well built, and the size of the town is rapidly increasing. A large suburb, connected by the bridge, and road over the glen on the west, opposite to the principal street, add much to the elegant appearance of the town. This bridge is of a peculiar structure. An arch 297 feet long, twelve broad, and fifteen feet five inches high, was thrown over the burn in the bottom of the glen; and the remaining hollow filled up by a mound of earth, sixty-eight feet six inches thick at the centre, having a gradual slope on both sides to the extremity of the stone arch below. On the top is the road, enclosed on both sides by houses forming a very neat street. On the slopes of the mound, and at the back of the houses, are very convenient hanging gardens. The church of Dunfermline was the burial place of several of our Scottish monarchs; particularly of Malcolm III. with his queen St. Margaret; Edgar; Alexander I. with his queen Sibilla; David I. and his two queens; Malcolm IV.; Alexander III. with his queen Margaret; and Robert I. with his queen Isabel; besides many other princes and nobles. About 85,000 tons of limestone are quarried in the neighbourhood; and about 260,000 bolls of limeshells, and 35,000 chaldrons of lime, are sold annually; 90,000 tons of coals are also raised, of which 60,000 are exported. A beautiful specimen of the art of

weaving is preserved in the chest of the incorporation. It is a man's shirt wrought in the loom, about 100 years ago, by a weaver of the name of Ingles. The shirt is without seam, and was finished by the ingenious artisan, without the least assistance from the needle. Dunfermline has eight annual fairs and a market on Friday.

DUNG, *n. s. & v. a.* Sax. *dung*; Goth. *DUNG-FORK*, *n. s.* } *dung*; Swed. *dynger*,
DUNG-HILL, } from Tent. *tingen*, to
DUNG-YARD, } still land. Excrement
DUNG, *v. adj.* } or other matter used to
 fatten land. To manure with dung. Dungy is
 base, mean, vile.

He raiseth the poor out of the dust, and lifteth up the beggar from the *dung-hill*, to set them among princes. *Bible. 2 Sam. ii. 8.*

The poor he raiseth from the dust,
 Even from the *dunghil* lifts the just. *Sandys.*

His *dunghil* thoughts, which do themselves enure
 To dirty dross, no higher dare aspire.

Spenser on Love.

Out, *dunghil*! dar'st thou brave a nolleman?

Shakspeare.

I, his brother, gain nothing under him but growth; for the which his animals on his *dunghils* are as much bound to him as I. *Id. As You Like It.*

We need no grave to bury honesty;

There's not a grain of it, the face to sweeten

Of the whole *dungy* earth. *Id. Winter's Tale.*

For *dung*, all excrements are the refuse and putrefactions of nourishment. *Bacon's Natural History.*

It was received of old, that *dunging* of grounds when the west wind bloweth, and in the decrease of the moon, doth greatly help.

Bacon's Natural History.

For when from herbs the pure part must be won,
 From gross by stilling, this is better done
 By despised *dung* than by the fire or sun. *Donne.*

There cannot be a more evident, palpable, gross manifestation, of poor, degenerate, *dunghilly* blood and breeding, than a rude, unpolished, disordered, and slovenly outside. *Massey.*

There as his dream foretold, a cart he found,
 That carried compost forth to *dung* the ground.

Dryden.

Perhaps a thousand other worlds, that lie
 Remote from us, and latent in the sky,
 Are lightened by his beams, and kindly nurst,
 Of which our earthly *dunghil* is the worst. *Id.*
 Two cocks fought a duel for the mastery of a *dung-hil*. *L'Estrange.*

Never enter into a league of friendship with an ingrateful person; that is, plant not thy friendship upon a *dunghil*: it is too noble a plant for so base a soil. *South.*

He soon would learn to think like me,
 And bless his ravished eyes to see

Such order from confusion sprung,

Such gaudy tulips raised from *dung*. *Swift.*

Dungforks and paddles are common every where. *Mortimer.*

Any manner of vegetables cast into the *dungyard*.

Id.

They are not hawks or kites; they are only miserable fowls whose flight is not above their *dunghill* or henroost. *Burke.*

Aye, as the *dunghill* may conceal a gem

Which is now set in gold, as jewels should be.

Byron.

DUNGANNON, a barony in county Tyrone, province of Ulster, having in it a borough, mar-

kat, fair, and post town of the same name; situated about fourteen miles north of Armagh, and ninety-one and a half north-west of Dublin. Lat. $54^{\circ} 28'$, long. $7^{\circ} 18'$. It returns one member to parliament. The town belongs to lord Northland who has a handsome seat there. Fair days, first Thursday in February; second Thursday in April; second Monday in May; first Thursday in July; third Tuesday in August; first Monday O. S. in October; last Tuesday in November. This town was made remarkable for the Ulster delegation of volunteers on the 15th of Feb. 1782. There is a part of the town called the New Town, the houses of which in general are too narrow. Its chief business is the linen trade. In 1816 about £2000 per week was regularly expended in that market on the purchase of that article. Here is a poor school endowed by the lady Northland, and a free school founded by Charles I., and endowed with 1000 plantation acres, producing about £800 per annum. There is a good house here, and glebe of 405 acres. In this parish are the coal mines of Drumglass, leased by the primate to the Hibernian Mining Company for £300 per annum: the company have already expended £2000 in the erection of steam engines and other necessary apparatus for working the mines.

DUNG MEERS, in husbandry, places where soils and dungs are mixed and digested together. These consist of pits, prepared at the bottom with stone and clay, that they may hold water, or the moisture of the dung. They ought to be so situated, that the sinks and drips of the houses and barns may run into them. Into these are cast refuse, fodder, litter, dung, weeds, &c., where they lie and rot together, till the farmer has occasion for them.

DUNGEON, *n. s.* Anciently donjon, the principal tower of a castle, from Cel. and Brit. *dun*, a hill on which towers usually stood. A close prison.

Then up he took the slumbered senseless corse,
And, ere he could out of his swoon awake,
Him to his castle brought with hasty force,
And in a *dungeon* deep him threw without remorse.

Spenser.

No man can marvel how that tyrant blinded his captives, when he hears that he brought them immediately, out of a dark *dungeon*, into rooms that were made bright and glorious.

Bp. Hall. Contemplations.

We know not that the king of heaven hath doomed
This place our *dungeon*; nor our safe retreat
Beyond his potent arm.

Milton's Paradise Lost.

Death only can such thieves make fast

As rob, though in a *dungeon*.

Marvell.

By imagination, a man in a *dungeon* is capable of entertaining himself with scenes and landscapes, more beautiful than any that can be found in the whole compass of nature.

Addison.

Let Vanity adorn the marble tomb

With trophies, rhymes, and 'scutcheons of renown.

In the deep *dungeon* of some Gothic dome,

Where night and desolation ever frown.

Beattie.

An eye of most transparent light,

That almost made the *dungeon* bright.

Byron.

DUNIPACE, HILLS OF, two artificial mounts in a parish of the same name in Stirlingshire.

said to be of great antiquity. Each of them covers about an acre of ground. The whole structure of these mounts is of earth; but they are not both of the same form and dimensions. The more easterly one is perfectly round, resembling an oven, and upwards of fifty feet in height. The other bears no resemblance to the eastern one either in shape or size. At the foundation it is nearly of a triangular form; but the superstructure is quite irregular; nor does the height thereof bear any proportion to the extent of its base. These mounts are now planted with firs, which, with the parish church of Dunipace standing in the middle between them, and the river running hard by, give this valley a very romantic appearance. The common account given of them is, that they were erected as monuments of a peace concluded in that place between the Romans and the Caledonians, and that their name partakes of the language of both people; *dun* signifying a hill in the old language of this island; and *pax*, peace, in the language of Rome. And we find in history, that no less than three treaties of peace were, at different periods, entered into between the Romans and Caledonians: the first, by Severus, about A. D. 210; the second, soon after, by his son Caracalla; and the third, by Carasius, about 280; but of which of those treaties Dunipace is a monument, we cannot pretend to determine.

DUNKELD, a town of Scotland, in Perthshire, seated on the north side of the river Tay, in a situation truly romantic, among high and almost inaccessible craggs, partly naked and partly wooded. It is the chief market town of the Highlands, and has been greatly improved with buildings by the dukes of Athol. It was the capital of ancient Caledonia. About the dawn of Christianity, a Pictish king made it the seat of religion, by erecting a monastery of Culdees there; which king David I., in 1130, converted into a cathedral: it ranked as the first in Scotland. The entire shell of the cathedral still remains, the east end serving for a parish church, on the north side of which is the burial place of the dukes of Athol. The architecture is simple and elegant, the pillars are round. The monument of one of its bishops remains in the south aisle of the nave, with that of Alexander Stuart, earl of Buchan, third son of Robert II., called, for his cruelty, The Wolf of Badenoch. The tower at the west end, with a singular crack down one of its sides, adds to the picturesque appearance which the whole makes, among the venerable pines at the end of the duke's garden. His grace's seat is a neat modern building, with pleasant gardens, and a fine cascade on the water of Bran, which, in its way from the western hills, forms a fall of 150 feet, called the Rumbling Brig, from a narrow bridge made by the fall of two rocks across the stream. Dunkeld has four fairs, January 21, February 3, March 8, and second Tuesday in November. Besides the tanning of leather, the linen manufacture has been carried on to considerable extent, for a number of years, and the manufacture of cotton goods is now also introduced. Dunkeld is fifteen miles north-west from Perth.

DUNKIRK, from *dun*, Celt. a hill, and *kirk*, Flem. a church; a maritime town of France, in the department of the north, and ci-devant province of French Flanders. It is the most easterly harbour on that side of France which is next to Great Britain, and was originally a mean hamlet, consisting only of a few fishermen's huts. Baldwin, earl of Flanders, about A.D. 960, thinking the situation convenient, enlarged it into a town, and surrounded it with a wall. In the year 1322 Robert, earl of Flanders, who held it as an appendage, built a castle for its defence, which was afterwards demolished by the revolvers of Flanders. Robert of Bar erected a fortification round it, the remains of which are visible on the side next the harbour. The emperor Charles V., who held it as part of Flanders, built another castle to defend the harbour, but this was also demolished soon afterwards. In 1558 the French, under marshal de Thermes, took Dunkirk by storm, and almost ruined the place; the Spaniards recovered it again in about a fortnight, and put all the French to the sword. During a peace procured for the inhabitants by Philip II. of Spain, they rebuilt their town with greater splendor than before, and flourished for some time by privateering against the Dutch; at length they fortified their town and harbour, and fitted out fifteen ships of war at their own charge. In 1634 the inhabitants agreed with those of Bergues to dig a canal, at their joint expense, for a communication between the two towns; which was some time afterwards effected. By this time Dunkirk was become the best harbour the Spaniards possessed in Flanders, which induced many foreigners to settle there; and, it being necessary to enlarge the town, a new fortified wall was built at a considerable distance from the former. In 1646 it was besieged and taken by the prince of Condé. In 1652 it was retaken by the archduke Leopold, then governor of the Netherlands. France entering into a treaty with England, in 1655, the Dunkirkers, with views of pecuniary advantage, fitted out privateers against both these powers; the consequence of which was, that the French, assisted by Cromwell, attacked and took it, and it was left in the hands of the English. It was even then of great importance to us; for, during the war in which it was taken, the Dunkirkers had made prizes of no less than 250 English vessels, many of which were of great value. The fortifications were now, therefore, improved, and a citadel built; yet the English kept it only four years; for in 1662, two years after the Restoration, Charles II. sold this valuable acquisition to France, for the paltry sum of £500,000. It was accordingly taken possession of, for Louis XIV., by the count d'Estrades, on the 29th November, 1662. The celebrated engineer, Monsieur Vauban, now erected an arsenal here, large enough to contain all the stores necessary for fitting out and maintaining a large fleet; the fortifications on the land side were constructed in a manner that was thought to render them impregnable; and, towards the sea, the entrance of the harbour was strongly fortified. These works were completed in 1683; and, in 1685, the whole circumference

of the basin was faced with masonry, and the quays completely formed. In 1689 the fort, called the Cornichon, and some other works, were added. Upwards of thirty years were employed in improving the fortifications. At the treaty of Utrecht, it having been made appear that the privateers of Dunkirk had, during the war then closing, taken from the English no less than 1614 prizes, valued at £1,334,375 sterling, it was stipulated, that the fortifications of the city and port of Dunkirk should be entirely demolished, and the harbour filled up; and queen Anne deputed colonels Armstrong and Clayton to inspect the execution of this part of the treaty. A large bar was now built across the mouth of the harbour, between the jetties and the town, by which all communication between it and the canal, which formed its entrance, was entirely cut off. The sluices were also broken up, and the materials of them broken to pieces. This was scarcely accomplished, when Louis XIV. ordered 30,000 men to construct the new canal of Mardick, which in a short time they accomplished; and thus the harbour was rendered almost as commodious as ever; but in 1717 this likewise was rendered unserviceable. In 1720, during a great storm, the sea broke up the bar, and restored the use of the harbour in a very considerable degree. When, in 1740, Great Britain was engaged in a war with Spain, Louis XV. set about improving the advantage which Dunkirk had derived from the storm in 1720, by restoring the works and repairing the harbour. He rebuilt the jetties and erected new forts in the place of those which had been destroyed; and soon afterwards espoused the cause of Spain, and became a principal in the war. But at the peace of Aix-la-Chapelle, in 1748, it was stipulated, that all the works towards the sea should be destroyed a second time; yet, in 1756, the place was again in a good state of defence. At the peace of 1763 it was once more stipulated that a British commissary should reside at Dunkirk, to see to the destruction of this harbour. But by the peace of 1783 he was withdrawn, and the French were left to resume their works. The British, under his late royal highness the duke of York, laid siege to this town in 1793, but were soon obliged to abandon it.

Dunkirk is, on the whole, a well-built town: the houses are chiefly of white brick; but seldom consist of more than two stories. It is a place of brisk trade in fish, corn, colonial produce, and home manufactures. Its chief inconvenience is a scarcity of fresh water. The barracks are extensive and elegant; and the churches contain some beautiful paintings. The town is approached by a canal of a mile and a half in length, the port and basin being in the interior of the town; the roadstead is at the outer extremity of the canal, and formed by a sand-bank running parallel to the shore. A mound and ditch surround the town. Dunkirk was restored to the privilege of a free port by a royal ordinance of the 22d April, 1816. Population about 20,000. It is twenty-five miles north-east of Calais, and forty north-west of Lisle.

DUNMORE, East, a post town in the county of Waterford, eighty-four Irish miles from Dub-

gn, and nine from Waterford city, lat. $50^{\circ} 8' 17''$, N. long. $7^{\circ} 3'$, W., is remarkable for a pier built for establishing a packet station to ply between this port and Milford Haven, from which it is distant seventy-eight nautical miles. This great work was undertaken at the expense of government, as an important step in the desirable object of improving and facilitating communication between England and Ireland in 1814, from a design by A. Nimmo, Esq. and has been executed at an expense of £80,000. The packets formerly ran up the harbour or river to Cheek Point, the junction of the Suir and Barrow rivers; and at this place were not unfrequently wind-bound. The new harbour is immediately upon the Atlantic, and, being carried into five fathoms at low water, is accessible at all times, and may be sailed from with all winds. The pier issues from a lofty bold conglomerate rock, which has furnished all the rubble stone consumed in its formation; and is carried in a N. N. E. direction to a distance of 1000 feet, having a base of 250 feet in breadth; the back, being exposed to the heavy swell of the Atlantic, is paved with enormous blocks of stone. The inside of the pier is an upright quay wall, forty-five feet in height, faced with hewn sand-stone; the foundations of which were laid by the aid of the diving-bell in twenty-four feet of water. On the quay is an elegant range of vaulted apartments, containing the light keeper's residence, coals for the steam packets, and the stores. The platform over these forms an agreeable promenade, and has a light-house at its extremity, the design of which is a fluted Doric column, copied from the pillars of the temple at Pæstum: the lantern exhibits red lights to the sea, and bright towards Waterford haven. There is a slip constructed on the inside of the pier, affording a safe and convenient place for landing and embarking at all times. On the opposite side of the harbour is a small rock-formed island, curiously perforated by natural arches; the extremity of this rock, below water, is marked by a stone beacon, connected to the island by a suspension foot-bridge of very simple construction, 180 feet span. This island divides the whole enclosed space into an outer and inner harbour, the latter of which, a surface of six acres, is completely sheltered from the awful swell of the Atlantic by the judicious position of the pier, while the outer might be so enlarged (to nine acres) as to admit line of battle ships. The harbour has fully realised expectation; the economy observed in its construction is *very* conspicuous, and, during the period of the erection of the pier, little or no damage was sustained by the shipping that were necessitated to seek shelter there.

DUNMOW, LITTLE, a village in Essex. It had once a priory, and is still famous for the custom instituted in the reign of Henry III., by Robert de Fitzwalter, and now the tenure of the manor: namely, that whatever married couple will go to the priory, and swear, kneeling upon two sharp-pointed stones in the church, that they had not quarrelled, nor repented of their marriage, within a year and a day after it took place, shall receive from the lord of the manor a fitch of bacon. Some old records mention several that have

claimed and received it. It has been actually received so lately as since the year 1750, by a weaver and his wife, of Coggeshall in Essex. It has been demanded more recently still; but the ceremony being attended with considerable expense to the lord of the manor, the demand is now evaded. See **BACON, SERVICE OF THE**.

DUNN (Samuel), an English mathematician, born at Crediton in Devonshire. He opened a school in his native town, where he gained considerable reputation as a teacher, and where he continued for several years. He afterwards removed to Chelsea, where he kept an academy, and became mathematical examiner for the East India service. He published an Atlas, folio; Treatises on Book-keeping, Navigation, &c. He died in 1792, and left his property towards founding a mathematical school at Crediton.

DUNNEMARLE CASTLE, i.e. the castle near the sea, an ancient fort of the Macduffs, thanes of Fife, now in ruins; said to have been their utmost boundary to the west. It was here that lady Macduff and her children were murdered by the tyrant Macbeth. It was seated on the banks of the Forth, in a fine situation, now called Castle-hill.

DUNNING (John), an eminent English lawyer, born at Ashburton in Devonshire, in 1731, where his father practised as an attorney, and where he began the studies connected with his profession. But after continuing some time with his father, he entered of the Temple, and was called to the bar, where he soon distinguished himself as an able lawyer and a powerful orator. He likewise obtained a seat in parliament, where he was particularly noticed on the side of the opposition. He afterwards became solicitor-general and recorder of Bristol, and chancellor of the duchy of Lancaster. In 1782 he was created lord Ashburton, but died the year following, leaving an infant son to inherit the title. His lordship was an upright lawyer, and it is recorded of him, much to his honor, that he often pleaded the cause of the poor unsolicited, and without a fee.

•**DUNNOTAR CASTLE**, an ancient fortress, now in ruins, built in the reign of Edward I. by an ancestor of the Marischal family. In 1661 the regalia of Scotland were lodged in it, to preserve them from the English army, and a garrison, with ammunition and provisions, obtained for their defence by E. Marischal, the proprietor; who, upon joining the king's forces in England, appointed George Ogilvy, of Barras, lieutenant-governor of the fort. This trust he maintained with the greatest heroism. For though besieged and summoned to surrender by general Lambert, so early as November 1651, he held out obstinately for six months, till May 1652; when, the siege being turned into a blockade, and provisions and ammunition all spent, the garrison began to mutiny, and he at last capitulated upon honorable terms; but not till he had privately conveyed the regalia to the clergymen of Kinneff. The English not finding the regalia, shut up the governor and his wife close prisoners for years, using every means of severity and allurements to produce a discovery, but in vain. Mr. Ogilvy continued faithful to his trust till the Restoration, when he

returned the regalia to E. Marischal; but to the disgrace of Charles II.'s administration, received no other reward for all his fidelity, sufferings, and losses, but the title of baronet, and a new coat of arms! In 1685 Dunnottar castle was employed as a prison for 167 Presbyterians, who had been seized in the west of Scotland, during the persecution, and were here treated with the greatest cruelty; the whole number of men and women being confined during the warmest season of the year, in one vault, which is still to be seen entire, and hence called the Whigs' Vault. A list of their names is on record in the sheriff court office of the county; and a grave-stone in the church-yard of Dunnottar, placed upon those who died under the confinement, narrates the fact.

DUNSE, a market town of Scotland, in the county of Merse, containing about 2100 inhabitants. It is situated on a rising ground in the middle of the county, and has a weekly market for cattle. Dunse has four fairs, in March, June, August, and November, for horses, sheep, and black cattle.

DUNSINNAN, a hill of Scotland in Perthshire, celebrated in dramatic story by the immortal Shakspeare. It lies partly in the parish of Collace and partly in that of Abernethy. The ruins of Macbeth's castle are still to be seen on that part of the hill which lies in Collace. 'The site of it,' says Mr. Adamson, 'was admirably chosen for a place of defence, being a conical rising on the west end of the hill, almost inaccessible except on one side. The excellence of its situation had before pointed it out to Kenneth III. and other kings, as a secure place of residence. Upon the top of king's seat, there is the ruin of a circular enclosure, similar to Macbeth's castle, but much smaller. This, as it commanded a more extensive prospect than the castle, taking in a vast extent of country, great part of the sea-coast, from the mouth of the Frith of Forth, to the south Esk, probably was a watch-tower, or outpost: and from this circumstance had received its name.'

DUNS SCOTUS (John), a Franciscan friar, commonly called Doctor Subtilis, was born in 1274; but whether in England, Scotland, or Ireland, has long been a matter of dispute among the learned of each nation. When a boy, he became accidentally known to two Franciscan friars; who, finding him to be a youth of extraordinary capacity, took him to their convent at Newcastle. From thence he was sent to Oxford, where he was made fellow of Merton College and professor of divinity; and Mackenzie says, that not less than 30,000 students came to Oxford to hear his lectures. His fame was now become so universal, that the general of his order sent him to Paris, in 1304, where he was honored first with the degree of B. D. then of D. D. and in 1307 was appointed regent of the divinity schools. During his residence here, the famous controversy about the immaculate conception of the virgin Mary arose. Albertus Magnus maintained that she was born in original sin. Scotus advanced 200 arguments in support of the contrary opinion, and convinced the university, that she was really conceived immaculate. This important nonsense continued to be disputed till 1496, after the

council of Basil, when the University of Paris made a decree, that no student who did not believe the immaculate conception, should be admitted to a degree. Our author had not been above a year at Paris, when his general sent him to Cologne; where he was received with great pomp and ceremony by the magistrates and nobles of that city, and where he died of an apoplexy soon after his arrival, in 1308, in the thirty-fourth year of his age. Paul Jovius and others have reported, that Scotus was buried in an epileptic fit; and that, upon removing his bones, he appeared to have turned himself in his coffin. He was doubtless one of the first wranglers of his time, admirably well versed in scholastic divinity, and a most indefatigable writer; and, if all his huge volumes hardly contain a page now worth perusal, it was the fault of the age. He was the author of a new sect of schoolmen called Scotists; who opposed the opinions of the Thomists. He was a most voluminous writer; his works making 12 vols. folio; as published at Lyons by Luke Wadding, in 1629.

DUNSTABLE, a town in Bedfordshire with a market on Wednesdays; was made a borough and market town by Henry I. who had a royal palace near the church, called Kingsbury. He also built a priory here, of which there now remains only a part. The front of the church is singular; the great door is under a semi-oval arch, richly ornamented with various grotesque sculptures; the tower stands at the north-western angle of the building. The town is seated on a chalky hill. It has several good inns, it being a great thoroughfare on the northern road. It consists of four streets, intersecting each other at right angles; and in the centre stood one of those beautiful crosses of queen Eleanor, but it was destroyed by the enthusiasts in the time of the civil wars. Here is an extensive manufacture of various articles of use and ornament in straw, particularly hats, known by the name of Dunstable, all over the kingdom; and which employs a great number of women and girls. It lies seventeen miles south of Bedford, and thirty-four north-west of London.

DUNSTAFFNAGE, an ancient castle and royal palace of Scotland, in the county of Argyll and Lorne. It was a chief seat of the Scottish kings before the conquest of the Picts by Kenneth II., A. D. 843. In this place was long preserved the famous stone, the palladium of Caledonia; brought, says the legend, out of Spain, where it was first used as a seat of justice by Gathelus, the son of Cecrops, contemporary with Moses. It continued here as the coronation chair till the reign of Kenneth II. who removed it to Scone. Some of the ancient regalia were preserved here, but the late keeper's servants, during his infirm years, embezzled them for the silver ornaments; and left only a battle-axe, nine feet long, of beautiful workmanship, and ornamented with silver. The castle is square; the inside only eighty-seven feet; partly ruinous, partly habitable. At three of the corners are round towers; one of them projects very little. The entrance is towards the sea at present by a stair-case, in old times probably by a drawbridge, which fell from a little gateway. The masonry appears

very ancient; the tops battlemented. This pile is seated on a rock at the mouth of Loch Etive, whose waters expand within to a beautiful bay, where ships may safely ride in all weathers. Of this building, the founder of which is unknown, little remains except the outer walls, which, though roofless, are still in good order; and within which some buildings have been erected, which serve as the residence of the laird. The duke of Argyll is hereditary keeper under the crown.—At a small distance from the castle is a ruined chapel, once an elegant building; and at one end an enclosure, a family cemetery. Opposite to these is a high precipice, ending abruptly and turning suddenly towards the south-east. A person concealed in the recess of the rock, a little beyond the angle, surprises friends stationed at some distance beneath the precipice, with a very remarkable echo of any word, or even sentence, he pronounces; which reaches to the last distinct and unbroken. The repetition is single, but remarkably clear. In 1307 this castle was possessed by Alexander Macdougall lord of Argyll, a friend to the English; but was that year reduced by Robert Bruce, when Macdougall sued for peace with that prince, and was received into favor. About 1455 it was the residence of the lords of the Isles; for here James, last earl of Douglas, after his defeat in Annandale, fled to Donald, the regulus of the time, and prevailed on him to take arms and carry on a predatory war against his sovereign, James II.

DUNSTAN (St.), an Anglo-Saxon divine and statesman of the tenth century, whose history has come down to us sufficiently adorned with legends. He appears to have been born about A. D. 925, and to have been educated at Glastonbury by Irish ecclesiastics. In addition to a knowledge of the Latin tongue, and the usual learning of his profession, he acquired in his youth considerable skill in music, metallurgy, and the arts of painting and carving. He constructed an organ of brass pipes, and filled with air from bellows; and there is preserved in the Bodleian library a drawing made by him of Christ, with himself kneeling at his feet. He also excelled, like a modern statesman and prince of Spain, in preparing ladies' robes, to be afterwards embroidered (MS. Cleop. b. 13.). Thus accomplished, he was early introduced to the court of king Athelstan, by his uncle Athelm, archbishop of Canterbury. But some indiscretion, or the jealousy of the courtiers, compelled him to retreat from this hopeful scene; and the disappointment of his prospects produced a serious fit of illness. He now took the vows at Glastonbury, and devoted himself with ardor to the discipline of St. Benedict. It is said that he divided between the church and the poor at this time a valuable estate bequeathed to him by a wealthy Saxon lady, as well as his paternal inheritance. To this period of his life is also attached the memorable legend of his conflicts with the spirit of darkness, who is said to have assailed him often in his cell; till he one day caught the demon by the nose with a red-hot pair of pincers, after which he no more molested him. On the accession of Edmund, the brother

and successor of Athelstan, he was again invited to court, and the rich abbey of Glastonbury was bestowed on him. He advanced still higher in the confidence of Edred, the next monarch, who made him his prime minister.

At the coronation feast of his successor, Edwy, this lordly ecclesiastic distinguished himself by a remarkable outrage on the person of the king. 'The popular account of this affair is, that the young prince had espoused a beautiful young lady of the royal blood, Elgiva, who was pronounced by the monks to be within the canonical degrees of affinity. Before his accession, therefore, she had been a source of dispute between the dignified ecclesiastics and the king. On the coronation-day he did not obtrude her claims upon the people; nor, on the contrary, would he forego his private comforts in her society. When the barons were indulging themselves in the pleasures of the feast, Edwy retired to his domestic apartments, and, in the company of Elgiva and her mother, laid aside his crown and regal state. Dunstan surmised the cause of his retreat; and taking with him his creature Odo, the nominal primate, penetrated into the interior of the palace, upbraided the prince with this untimely indulgence of his passions, and after branding his consort with the most opprobrious name of woman, brought him back with considerable violence into the hall. Mr. Turner, our able Anglo-Saxon historian, regards the transaction as a bold attempt of Dunstan to subvert the regal power to his ambition. He represents the nobility as evincing some displeasure at the king's early departure, and the anxiety of Odo to communicate the state of their minds to Edwy. That the persons he first addressed excused themselves from undertaking this errand: and the commission devolved by a sort of general wish on Dunstan, and Cynesius, a bishop, his relative. 'But with the delivery of the message,' he observes, 'his commission must have terminated; and on the king's refusal [if he did refuse] it was his duty to have retired. As an ecclesiastic, he should not have compelled him to a scene of inebriety; as a subject, it was treasonable to offer violence to his prince.'

'The latest, and not least able of our English historians, however, would place these events in a different light. He insists, somewhat in the spirit of the monkish writers, on this amour being highly disgraceful to the king; and while he represents it as 'the scandal of the age' (whose sources, in the king's disputes with the ecclesiastics, Mr. Lingard in any other instance would have readily traced), he states it as not altogether incredible that both Ethelgiva, the mother, and her daughter, whom he does not name, had sacrificed their honor to the equivocal ambition of one of them becoming queen. The nobles, he adds, accompanied their demand for the king's return with an injunction in the name of the whole assembly, for Ethelgiva to leave the court. The rest of his account does not materially differ from that of former historians. But with all the unfeigned respect for his impartiality, with which the perusal of this writer's volumes has inspired us, we cannot hold him successful

in this attempt to disengage the character of Dunstan and his associates from the imputation of great indecorum.

Were the lady the king's mistress, and not his wife, was a dignified ecclesiastic justified in following him into her apartments? and, had the amour been ever so unbecoming, was this a species of conduct likely to detach him from it? But the story of the wife and daughter together speculating upon his affections is surely improbable in the highest degree: we know that the monkish writers, who furnish the only account we have of the transaction, would call a wife, espoused in opposition to the will of the church, a mistress; and the sufferings of the young monarch from this interference with his affections, should teach us to exercise the judgment of charity on his memory.

Dunstan was now compelled to retire to Flanders, and this was a severe blow to the monks, who were expelled from several monasteries: but their sufferings were not of long continuance. For Edgar, the younger brother of Edwy, having raised a successful rebellion against the latter, and usurped his dominions north of the Thames, recalled Dunstan, and gave him the bishopric of Worcester, A. D. 957. From this time he was the chief confidant and prime minister of king Edgar, who became A. D. 959 sole monarch of England. In 960 Dunstan was raised to be archbishop of Canterbury; and being thus possessed of the primacy, and assured of the royal support and assistance, he prepared to execute the grand design which he had long meditated, of compelling the secular canons to put away their wives, and become monks; or of driving them out, and introducing Benedictine monks in their room. With this view, he procured the promotion of Oswald to the see of Worcester, and of Ethelwald to that of Winchester: two prelates who were monks themselves, and animated with the most ardent zeal for the advancement of their order. These confederates, by their arts and intrigues, in the course of a few years, filled no fewer than forty-eight monasteries with Benedictines. But on the death of Edgar in 975 they received a check. The sufferings of the persecuted canons had excited much compassion; and many of the nobility, who had been overawed by the power and zeal of the late king, now espoused their cause, and promoted their restoration. Elfric, duke of Mercia, drove the monks by force out of all the monasteries in that extensive province, and brought back the canons, with their wives and children; while Elfwyn duke of East Anglia, and Brithnot duke of Essex, raised their troops to protect the monks in these countries. To allay these commotions several councils were held: in which Dunstan was so hard pressed by the secular canons and their friends, that he was obliged to have recourse to miracles, we are told, to overcome their opposition. St. Dunstan died A. D. 988, in the sixty-fourth year of his age, having held the bishopric of London, together with the archbishopric of Canterbury, about twenty-seven years.

DUNWICH, a town in Suffolk, most of

which is destroyed by the encroachments of the sea, and not one church left of eight. It has a market on Saturday; until 1832 it sent two members to parliament. The walls of the town enclose seven acres, and the remains of two gates are yet visible. It is thirty miles north-east of Ipswich, twenty-four south of Yarmouth, and ninety-nine north-east of London.

DUO, in music, a song or composition, to be performed in two parts only, one sung, the other played on an instrument, or by two voices. Also when two voices sing different parts, as accompanied with a third, which is a thorough bass. It is seldom that unisons and octaves are used in duos, except at the beginning and end.

DUODECUPLE, *adj.* Lat. *duo* and *decuplus*. Consisting of twelves.

☛ Griseusius, a learned Polander, endeavours to establish the *duodecuple* proportion among the Jews by comparing some passages of Scripture together.

Arbuthnot on Coins.

DU PAN (James Mallet), a modern political writer, was born at Geneva in 1749. He was appointed through the interest of Voltaire professor of belles lettres at Cassel, and in 1783 went to Paris. During the three years sitting of the first French assembly he published a respectable analysis of their debates. Being employed in 1792 on a confidential mission from Louis XVI. to his brothers, his estate, together with the whole of his personal property, was confiscated. He after this wrote at Brussels a work on the French Revolution, which was highly eulogised by Mr. Burke. He finally settled and carried on a journal in London, entitled *Mercurie Britannique*. His death took place in May 1800.

DUPE, *v. a. & n. s.* Dr. Johnson says from Fr. *duppe*, a foolish bird, easily caught; but the verb, to dupe, is probably the root, and may be derived from Lat. *duplex*, double. To cheat; trick: one easily tricked or imposed upon.

An usurping populace is its own *dupe*, a mere underworker, and a purchaser in trust for some single grant. *Swift.*

First slave to words, then vassal to a name,
Then *dupe* to party; child and man the same.

Duncun.

The throne a bigot keep, a genius quit;
Faithless through piety, and *duped* through wit.

Pope.

For, believe me, you will find, that in the opinion of the world there is not a fairer subject for contempt and ridicule, than a knave become the *dupe* of his own art.

Sheridan.

I have not been thy *dupe*, nor am thy prey—
But was my own destroyer, and will be
My own hereafter.—Back, ye baffled fiends!
The hand of death is on me—but not yours!

Byron.

DUPIN (Lewis Ellis), a learned doctor of the Sorbonne, and one of the greatest critics of his time in ecclesiastical matters, was born at Paris, in 1657. When he published the first volume of his *Bibliothèque Universelle des Auteurs Ecclesiastiques*, in 1686, the liberty, with which he treated some ecclesiastical writers, gave such offence, that M. de Harlay, archbishop of Paris, obliged Dupin to retract many propositions, and suppressed the work. He was nevertheless suf-

ferred to continue it, by altering the title from *Bibliothèque Universelle*, to *Bibliothèque Nouvelle*. This great undertaking, continued in several successive volumes, though sufficient to occupy the life of an ordinary man, did not hinder M. Dupin from publishing several other works. He was professor of philosophy in the royal college; but was banished some time from the chair to Chatelheraut, on account of the famous *Cas de Conscience*, but was restored, and died in 1719.

DUPLICATE, *v. a., n. s. & adj.* } French
DUPLICATION, *n. s.* } *duplicata*,
DUPLICATION. } from Lat.

duplex, duplicis, i. e. *duo*, two, and *plicatus*, from *plico*, to fold; twice folded; double. To make double, or enlarge by doubling; to fold; the second thing or number so added: for the arithmetical use of the adjective, see the example. Duplication is synonymous with duplicate.

And some alterations in the brain *duplicate* that which is but a single object to our undisturbed sentiments. *Glanville.*

What great pains hath been taken concerning the quadrature of a circle, and the *duplication* of a cube, and some other mathematical problems.

Hale's Origin of Mankind.

The lympheducts, either dilacerated or obstructed, exonerate themselves into the foldings, or between the *uplicatures* of the membranes.

Ray on the Creation.

Duplicate proportion is the proportion of squares. Thus, in a rank of geometrical proportions, the first term to the third is said to be in a *duplicate* ratio of the first to the second, or as its square is to the square of the second: so in 2, 4, 8, 16, the ratio of 2 to 8 is a *duplicate* of that of 2 to 4, or as the square of 2 to the square of 4. *Phillips, Harris, Bailey.*

It has been found, that the attraction is almost reciprocally in a *duplicate* proportion of the distance of the middle of the drop from the concourse of the glasses. *Newton.*

Nothing is more needful for perfecting the natural history of bodies, than the subjecting them to the fire; to which end I have reserved *duplicates* of the most considerable. *Woodward.*

The peritonæum is a strong membrane, every where double; in the *duplications* of which all the viscera of the abdomen are hid.

Wiseman's Surgery.

Will you give me leave to illustrate this affair of wit and judgment, by the two knobs on the back of my chair? Here stands wit—and there stands judgment. You see they are the highest and most ornamental parts of its frame—as wit and judgment are of ours, and like them too, indubitably both made and fitted to go together,—in order, as we say in all such cases of *duplicated* embellishments—to answer one another. *Sterne.*

Clandestine marriage. This kind of sea-weed is buoyed up by bladders of air, which are formed in the *duplicatures* of its leaves, and forms immense floating fields of vegetation; the young ones, branching out from the larger ones, and borne on similar little air-vessels. *Darwin.*

Duplicate, in law, used for the second letters patent, granted by the lord chancellor, in a case wherein he had before done the same; which were therefore thought void. But it is more commonly a copy or transcript of any deed or writing, account, &c., or a second letter, written and sent to the same party and purpose as a

former, or a copy of despatches, for fear of a mis-carriage of the first, or for other reasons.—4 *Car.* 2. c. 10.

DUPLICITY, *n. s.* Lat. *duplicis*. Double-ness: the number of two.

This *duplicité* was ill contrived to place one head at both extremes, and it had been more tolerable to have set three or four at one. *Browne's Vulgar Errors.*

Do not affect *duplicities* nor triplicities, nor any certain number of parts, in your division of things.

Watts's Logick.

DUPONDIIUS, in antiquity, a weight of two pounds, or a money of the value of two asses. See *As*. As the *as* at first weighed a just pondo, or libra, the dupondius then weighed two; and hence the name. And though the weight of the *as* was afterwards diminished, and of consequence that of the dupondius also, yet they still retained the denomination. See *LIBRA*.

DUPORT (James), a learned English divine, was born in 1606, in *Jesus' College*, Cambridge, of which his father was master. He was educated at Westminster School, and at Trinity College, Cambridge, where he obtained a fellowship. In 1632 he was appointed regius professor of Greek; and, in 1641, made prebendary of Lincoln and archdeacon of Stow. He was deprived, in 1656, of his professorship for refusing the engagement, but recovered it at the Restoration, and resigned it again the same year in favor of Dr. Barrow. In 1664 he became D. D., and was promoted to the deanery of Peterborough. In 1668 he was elected master of Magdalen College. He died in 1679. His works are—1. *Gnomologia Homerica*. 2. *Tres Libri Solomonis, Græco Carmine donati*, 12mo. 3. *Metaphrasis Psalmorum versibus Græcis contexta cum versione Lat.* 4to. 4. *Musæ Subsecivæ seu Poëmata Stromata*, 8vo. In 1712 some of his lectures were printed by Needham. His father was one of the translators of the Bible.

DUPORT (Marguerite Louis Francis du Tertre), was an advocate at Paris. In 1790 he was appointed minister of justice on the recommendation of La Fayette, and vainly endeavoured to adhere to the constitution which had been established. On the departure of Louis XVI. for Varennes, Duport went to the National Assembly, according to the king's directions, to deliver up the great seal; and when the representatives enjoined him to resume it, and seal the order for the arrest of that prince, being denounced anew, he gave in his resignation. He was however involved in the proscription of the 10th of August, 1792, and, being sent to Orleans, was condemned and executed in November, 1793, as an enemy to the liberty of the press. On hearing his sentence, he exclaimed, 'Revolutions destroy men; posterity will judge them.' Duport published, in conjunction with Kerverseau, the first eight volumes of a work, entitled *L'Histoire de la Révolution, par deux Amis de la Liberté*.

DUPPA (Brian), a learned English bishop, born in 1589, at Lewisham, in Kent, of which place his father was then vicar. In 1634 he was instituted chancellor of the church at Sarum, and soon after made chaplain to Charles I. He was appointed tutor to Charles, prince of Wales, and his brother James, duke of York; was made

bishop of Chichester; and, in 1641, translated to Salisbury, though the confusion that followed deprived him of all benefit from his promotion. Charles I. held him in high esteem, and he is said to have assisted the king in composing the Eikon Basiliké. On the Restoration he was made bishop of Winchester, and lord high almoner; but died in 1662. He bequeathed large sums to charitable purposes: and published a few sermons, with other religious pieces.

DURA MATER, from *durus*, hard, and *mater*, a mother; called *dura* from its comparative hardness with the *pia mater*, and *mater* from its being supposed to be the source of all the other membranes. *Dura meninx*, *Dermatodes*. A thick and somewhat insensible membrane, formed of two layers, that surrounds and defends the brain, and adheres strongly to the internal surface of the cranium. It has three considerable processes, the falciiform, the tentorium, and the septum cerebelli; and several sinuses, of which the longitudinal, lateral, and inferior longitudinal, are the principal. See **ANATOMY**.

DURANGO, a town of Spain, in Biscay, famous for its manufacture of sword-blades and steel articles. Population 2800. Fifteen miles east of Bilbao.

DURANGO, or New Biscay, an intendancy of Mexico, extending from south to north from the mines of Guariamey to the mountains of Carcay, north-west of the Presidio de Yanos, 232 leagues. Its breadth is unequal: near Parras it is scarcely fifty-eight leagues; but is taken on an average at sixty-three leagues. It does not appear to contain above 160,000 inhabitants, but, in this country, except through the details furnished by Humboldt in his New Spain, we are very little acquainted with this region. It is bounded on the south by New Galicia, or by the two intendancies of Zacatecas and Guadalupe, on the south-east by a small part of the intendancy of San Luis Potosi, and on the west by the intendancy of Sonora. North and east it is bounded by an uncultivated country, inhabited by warlike and independent Indians. But since the end of the last century these troublesome neighbours have been on the decline. The intendancy comprehends the northern extremity of the great table land of Anahuac, which declines to the north-east towards the banks of the Rio del Norte. The ground around the city of Durango is about 1500 feet above the level of the sea. The extent of surface at this intendancy is 16,873 square leagues.

DURANGO, a town of Mexico, the chief city of the intendancy of that name, is situated in the southern part of New Biscay, 170 leagues north-west from the city of Mexico, and 298 from the town of Santa Fe. It is the residence of the intendant and of a bishop. The height of the ground on which the town is built is 6845 feet above the level of the sea. There are frequent falls of snow, and the thermometer sometimes descends to 14° of Fahrenheit. The population is estimated at 12,000. The surrounding country is fertile in corn and fruits, and the fine pastures abound with cattle.

DURANTA, in botany, a genus of the angiospermia order and didynamia class of plants; natural order fortieth, personatæ: CAL. quin-

quefid, superior: BER. tetraspermous: SEED, bi-locular. Species, three; natives of the West Indies and South America.

DURANTE ABSENTIA (during absence), in law, is an administration granted when the executor is out of the realm, to continue in force until his return.

DURE, *v. n.*

DUR'ABLE, *adj.*

DUR'ABLENESS, *n. s.*

DUR'ABLY, *adv.*

DURA'TION, *n. s.*

DURE'FUL, *adj.*

DURE'LESS, *adj.*

DUR'ING, *prep.*

DUR'ITY, *n. s.*

Fr. *durer*; Span.

and Port. *durable*;

Lat. *durabilis*, from

durus; Heb. דָּרָךְ,

} hard. To last; con-

tinue: durable is last-

ing; permanent: as

is *dureful*: *dureless*

is the opposite to these.

Duration and durity express a state of hardness or permanence: during is while any thing lasts.

For tho things that ben seien ben but *duryng* for a schoot tyme, but tho thingis that ben not seen ben euer las-yng. Wiclif. 2 Cor. iv.

The *dureful* oak, whose sap is not yet dried,

Is long ere it conceive the kindling fire;

But when it once doth burn, it doth divide

Great heat, and makes his flames to heaven aspire.

Spenser.

Stones, though in dignity of nature inferior unto plants, yet exceed them in firmness of strength, or durability of being. Hooker.

No less *durable* and mighty is the seed of God in his children regenerate, than the seed of the serpent in the unregenerate, to move and rule the will of man accordingly. MS. Note of Bradford the Martyr.

Wit is brushwood, judgment timber: the one gives the greatest flame, the other yields the *durablest* heat; and both meeting make the best fire. Overbury.

The bones of his body we may compare to the hard rocks and stones, and therefore strong and *durable*.

Raleigh's History.

Our times upon the earth have neither certainty nor durability. Id.

Yet were that aptitude natural, more inclination to follow and embrace the false and *dureless* pleasures of this stage-play world, than to become the shadow of God. Id.

Ancients did burn fragments of marble, which in time became marble again, at least of indissoluble *durity*, as appeareth in the standing theatres.

Wotton's Architecture.

With pins of adamant,

And chains, they made all fast; too fast they made And *durable*! Milton's Paradise Lost.

Time, though in eternity, applied

To motion, measures all things *durable*

• By present, past, and future. Id.
There indeed he found his fame flourishing, in monuments engraved in marble, and yet more *durably* in men's memories. Sidney.

Such a constitution as this would make the mighty Leviathan of a shorter *duration*, than the feeblest creatures, and not let it outlast the day it was born in. Locke.

If *during* his childhood he be constantly and rigorously kept from drinking cold liquor whilst he is hot, forbearance grows into a habit. Id.

Aristotle, by greatness of action, does not only mean it should be great in its nature, but also in its *duration*; that it should have a due length in it.

Addison's Spectator.

A bad poet, if he cannot become immortal by the goodness of his verse, may by the *durableness* of the metal that supports it. Id. On Ancient Medals

The different consistence and *durableness* of the strata whereof they consist, are more or less.

Woodward.

Duration is a circumstance so essential to happiness, that, if we conceived it possible for the joys of heaven itself to pass from us in an instant, we should find ourselves not much concerned for the attainment of them.

Rogers.

The glories of her majesty's reign ought to be recorded in words more *durable* than brass, and such as our posterity may read a thousand years hence.

Swift.

Extreme volatile and sprightly tempers seem inconsistent with any great enjoyment. There is too much time wasted in the mere transition from one object to another. No room for those deep impressions, which are made alone by the *duration* of an idea.

Shenstone.

Though art may sometimes prolong their *duration*, it will rarely give them perpetuity.

Johnson. *Plan of Dictionary.*

SIR F. Pray, madam, do you speak as to *duration* of time; or do you mean that the story is tediously spun out?

Sheridan.

DURATION OF ACTION, according to Aristotle, is confined to a natural day in tragedy; but the epopee, according to the same critic, has no fixed time. See POETRY.

DURANCE, *Fr.* *duresse*, hardship, from *DUR'ESSE*. {*Lat.* *durus*, hard. See *DURABLE*. Applied particularly to constraint; imprisonment.

Thy Dol, and Helen of thy noble thoughts,
Is in base *durance* and contagious prison;
Hauled thither by mechanick dirty hands.

Shakspeare.

There's neither iron bar nor gate,
Portcullis, chain, nor bolt, nor grate;
And yet men *durance* there abide,
In dungeons scarce three inches wide.

Hudibras.

Sick nature at that instant trembled round,
And mother earth sighed as she felt the wound;
Of how short *durance* was this new made state;
How far more mighty than heaven's love, her hate!

Dryden.

A poor, innocent, forlorn stranger, languishing in *durance*, upon the false accusations of a lying, insolent, whorish woman.

South.

Notwithstanding the warning and example before me, I commit myself to lasting *durance*.

Congreve's *Old Bachelor*.

Duresse is a plea used, by way of exception, by him who, being cast into prison at a man's suit, or otherwise by threats, beating, &c., hardly used, seals any bond to him during his restraint. This the law holds as invalid, and supposes to be constrained. Cowell.

Our fame is in men's breath, our lives upon
Less than their breath; our *durance* upon days;
Our days on seasons; our whole being on
Something which is not us!

Byron.

DUREIL (David), a learned divine and critic, born in the island of Jersey, in 1728. He received his education at Pembroke College, Oxford, where he took his degrees in arts, but afterwards became fellow of Hertford College, of which he was appointed principal in 1757. He obtained the degree of D.D. in 1764, and about three years after a prebendal stall in the church of Canterbury. He died in 1775. He published, 1. *The Hebrew Text of the Parallel Prophecies of Jacob and Moses, relating*

to the Twelve Tribes, with a Translation and Notes, &c. 4to. 2. *Critical Remarks on the books of Job, Psalms, Ecclesiastes, and Canticles*, 4to.: which is frequently referred to by bishop Horne, in his Commentary on the Psalms.

DURER (Albert), one of the first engravers and painters of his age, was descended of an Hungarian family, and born at Nuremberg, in 1471. He was also a man of letters and a philosopher; and was an intimate friend of Erasmus, who revised some of his works. He was one of the first improvers of the art of engraving. In many of those prints which he executed on copper, the engraving is elegant to a great degree. His 'hell scene,' in particular, which was engraved in 1513, is as highly finished a print as ever was engraved, and as happily executed. This artist understood the principles of design; his composition, too, is often pleasing; and his drawing generally good. But he knew very little of the management of light; and still less of grace: yet his ideas are purer than could well be expected from the awkward archetypes which his country and education afforded. In a word, he was a man of very extensive genius; and, as Vasari remarks, would have been an extraordinary artist, if he had had an Italian instead of a German education. His prints are very numerous. They were much admired in his own life-time, and eagerly bought up; which made his wife urge him to spend more time upon engraving than he was inclined to do. But he was rich; and chose rather to practise his art as an amusement than as a business. He died in 1527.

DURESS, *durities*, *constraint*, in English law, is more particularly applied to whatever is done by man to save either life or limb. If a man through fear of death or mayhem, is prevailed upon to execute a deed, or do any other legal act, though accompanied with all other requisite solemnities, it may be afterwards avoided. And the same is a sufficient excuse for the commission of many misdemeanours. There are two sorts of *duress*: *duress of imprisonment*, where a man actually loses his liberty; and *duress per minas* (by threats), where the hardship is only threatened and impending.

A man who was under *duress* of imprisonment, being an illegal restraint of liberty, until he seals a bond or the like, may allege this *duress*, and avoid the extorted bond. But if a man be lawfully imprisoned, and either to procure his discharge, or on any other fair account, seals a bond or deed, this is not by *duress* of imprisonment, and he is not at liberty to avoid it. 2 Inst. 482.

Duress per minas, is either for fear of loss of life, or else for fear of mayhem or loss of limb. And this fear must be upon sufficient reason: non suspicio cujuslibet vani et meticulosi hominis, sed talis qui possit cadere in virum constantem. Bract. l. 2. c. 5. A fear of battery (or being beaten) though never so well grounded, is no *duress*; neither is the fear of having one's house burned, or one's goods taken away and destroyed; because in these cases, should the threat be performed, a man may have satisfaction, by recovering equivalent damages; but no suitable

atonement can be made for the loss of life or limb. 2 *Inst.* 483.

D'URFEY (Thomas), an eminent English satirist and songster, whose name is well known, but of whose life few particulars are to be collected. He was born in Devonshire; but when, where, or of what family, are uncertain. He was bred to the law, which he forsook for the more agreeable employment of writing plays and songs; and the latter he had so happy a talent both of writing and singing, that he received many favors from persons of quality on that account. The writer of the *Guardian*, No. 67, tells us, he remembered to have seen Charles II. leaning on Tom D'Urfeys shoulder more than once, humming over a song with him. This indeed was not extraordinary in so merry a monarch; but even the phlegmatic king William could relax his muscles on hearing him sing. D'Urfeys grew poor as he grew old, and prevailing on the managers of the playhouse to act his comedy of the *Plotting Sisters*, for his benefit, Addison wrote the above-mentioned paper in the *Guardian*, with another, No. 82, representing him in a good humored light, to procure him a full house. He died very old, in 1723.

DURIAM, a maritime county of England, is situated between the rivers Tees and Derwent, and along the German Ocean. It is bounded on the north by Northumberland, from which it is separated by the rivers Derwent and Tyne; on the east by the German Ocean; on the south by the river Tees, which divides it from Yorkshire; and on the west by Cumberland and Northumberland. Its form is triangular, extending forty-five miles in length, from its most western extremity, near the village of Kelhope, to Hartlepool on the east; and thirty-six in breadth, from the village of Stockburn in the south, to South Shields in the north. Though only a small part of the county is either of this length or breadth, it is nearly 180 miles in circumference. Its superficial area includes about 610,000 acres, containing four wards, one city, 120 parishes, ten market towns, and 230 villages. It is in the diocese of its own name, and is included in the northern circuit. Durham is divided into wards, and the archdeaconry comprehends four deaneries.

Before the Roman invasion Durham was inhabited by the Brigantes, but, after the conquest of this kingdom, it became part of the Roman province called *Maxima Cesariensis*. The Anglo-Saxons included it in the kingdom of Northumberland. The etymology of the present name of this county appears to be derived, according to Bede, from *dun* a hill, and *holm* an island. It is usually called the bishopric of Durham, from the great power which the bishop of the diocese formerly possessed. It is, however, a palatine county, deriving its privileges from a grant made by Egfrid, king of Northumberland, in the year 685, of all the land betwixt the rivers Wear and Tyne, to St. Cuthbert, the apostle of the north, and to the ministers of his church for ever.

Speed remarks, that the air is sharp and very piercing, and would be more so, were it not that the vapors from the German Ocean help much to dissolve the ice and snow; yet the air is generally deemed healthy. It is milder and more

pleasant towards the sea than in other parts. The general aspect is mountainous. A ridge of hills crossing the western angle has been denominated the English Appenines. They are not, however, extremely elevated. Of the soils of this county Granger says: near the river Tees, and in some spots bordering the other rivers and brooks in this county, the soil is loamy or a rich clay; at a further distance from these rivers and brooks, the soil is of a poorer nature, commonly termed watershaken, with here and there spots of gravel interspersed: but these are of small extent, the middle of none of them being half a mile from clay. The hills between the sea and an imaginary line drawn from Barnard Castle on the Tees, to Alansford on the Derwent, are for the most part covered with a dry loam, the fertility of which varies in proportion to its depth: from this line westward, the summits as well as the sides of the hills are moorish wastes. Mr. Bailey, in his *Agricultural Report*, remarks that the soils of this county vary in such insensible degrees, that it would be difficult to describe them in all their varieties. The principal distinctions, or heads of classification, may be taken as clay, loam, and peat. The south-east part of the county, from the Tees mouth to a few miles west of Stockton, and from thence by Redmarshall, Walviston, Elwich, and as far north as Hart, consists of a strong fertile clayey loam. To the westward of this, as far as Sedgfield, Trimdon, and Eppleton, and northward to near Sunderland, the soil is principally a poor stubborn unfertile clay. Of the loamy soils there are different varieties, as is the case with the clayey soils just mentioned. The deep, mellow, tenacious, dry, fertile, loams are in general found in the vicinity of rivers. The limestone district, extending from near Sunderland by Houghton-le-Spring, Kelloe, Coxhoe, Ferryhill, and to Merrington, is mostly a dry but not a productive loam. The peaty soils are most prevalent in the western parts, the greatest portion of the moors that have been enclosed being of this description.

Hartlepool, situated on a promontory, nearly encompassed by the German Ocean, which forms a capacious bay on the south side of the town, is advantageously placed for the reception of vessels, and landing of troops from the Continent. South Shields, also, sends out many vessels, and Stockton-upon-Tees is well situated for commerce.

The chief rivers which communicate with the sea are the Tyne, the Wear, and the Tees. The Tees rises in those vast moors which separate Yorkshire from Durham, Cumberland, Westmoreland, and Northumberland. Its course is at first rather inclined to the south-east, but below Darlington it turns abruptly to the north-east, and falls into the sea below Stockton in this county, which may be called its port. The Wear rises in the same wild moors, but considerably to the north of the Tees. Its course is almost parallel with it, bearing at first to the south-east, and at Bishop's Auckland turning to the north-east; after nearly surrounding the city of Durham, it flows northward to Chester-le-Street, and then inclines a little towards the east, to reach its port of Sunderland. The Wear, Mr. Skrine calls the miniature of the Tees, much

resembling that river in character, though greatly its inferior in width and rapidity. The Tyne, strictly speaking, belongs to Northumberland, though it has its source in the Durham Moors. The fish in these rivers are salmon, trout, eels, dace, pike, and spartings in the Tees. The salt springs near Birtley, and the spas at Butterby and Dinsdale, are also deserving of notice. Near the water-gate, at the south side of the town of Hartlepool, is a chalybeate spring, covered every tide by the sea, and slightly impregnated with sulphur.

The mineral productions of Durham are numerous and valuable.—The coal districts, in particular, are extensive in various parts of the county. Mr. Bailey has enumerated thirty-four collieries, which he calls Watersale Collieries, and thirty-five which he calls Landsale Collieries. From these lists it appears that the quantity of coals obtained in this county annually is 1,480,080 chaldrons of thirty-six bushels; 10,650 men are employed. In the year 1809 there were eighty-six lead-mines working in this county. Of these, twenty-three belonged to the bishop of Durham; forty-seven, being all the mines in Teesdale, except one, to the earl of Darlington. Iron ore is found in abundance in the western parts of the coal district. The county, also, produces various kinds of excellent stone for chimney-piece ornaments, mill-stones, grind-stones, &c.; as also fire-stone for ovens, furnaces, &c., and freestone for building; as also gray slates for roofing, &c. The cattle of Durham are in much repute; as for form, weight, produce of milk and butter, and quickness of fattening, they are equal to any in England.

Durham sends ten members to parliament, viz. four for the county, two for the city of Durham, and four for other places. This county was the birth-place of Sir John de Baliol, founder of Baliol College, Oxford, born at Barnard castle, 1248; the venerable Bede, born at Wearmouth, or more probably at Iscomb, 672, died 735; Dr. Sir Samuel Garth; Joseph Reed, a dramatic writer; Rev. W. Romaine, a Calvinistic clergyman of the established church; Dr. Richard Grey, author of *Memoria Technica*, and many other works on theology, &c.

In this county are manufactures of all kinds of wrought iron, foundries for casting iron and brass, glass-houses, potteries, salt, copperas, sal-ammoniac, coal tar, woollen, cotton, and linen; some silk ribbon, and paper-mills. It abounds in noblemen's and gentlemen's seats.

Here are, likewise, several natural and artificial curiosities worth the notice of travellers: as, the black halls, near Hartlepool, consisting of clusters of rocks, formed by the force and constant action of the waves of the sea, which have created several fine pointed archways and vast towers, resembling those of a cathedral. At Oxenhall are some of those curious cavities called hell-kettles; the diameter of the largest is 114 feet, and that of the least seventy-five feet.

Kepier hospital, near Durham, founded in 1112, has only part of the gateway standing, a strong and handsome piece of masonry with pointed arches. Remains of several monastic buildings occur near the church at Monk Wear-

mouth; that of Jarrow may still be traced in its ruins on the summit of an elevated ridge near the church; and the ruins of a monastery for grey friars may be seen at Hartlepool. On the east side of the main street of Gateshead are the ruins of St. Edmund's monastery, established, according to Bede, before the middle of the seventh century; and Finchall priory, once beautifully situated in a vale on the banks of the Wear, covers with its ruins an extensive plot of ground. The principal existing ecclesiastical buildings are—Sedgefield church, in the Saxon style; Bishop Wearmouth church, supposed to have been founded by Athelstan; the parish church of Brancepeth, an ancient structure of the conventual form; and the cathedral of Durham, begun in 1093, in the Saxon and Norman style.

Durham is also rich in civil architecture and remains: amongst the most conspicuous are Hilton castle, an ancient baronial residence of a family of that name, situated on the north side of the Wear, about three miles from Wearmouth; its form is an oblong square, the interior consisting of five stories. Ravensworth castle, which seems anciently to have formed a quadrangle, having four square towers, connected by a curtain wall; two of the towers are built up, and the others are in ruins. Brancepeth castle, an irregular stately pile, erected about Stephen's reign. Lunley castle, about a mile to the east of Chester-le-Street, a seat of the earl of Scarborough; it is a quadrangle, with an area in the centre, and at each angle are projecting turrets of an octangular form. Bishop Auckland's castle, standing on the north angle of the town, and covering with its courts and offices about five acres of ground. Raby castle, the magnificent seat of the earl of Darlington, enlarged on the basis of a more ancient castle which stood here prior to the year 1379. Barnard castle, situated on the southern acclivity of an eminence, rising with a steep ascent from the river Tees. And the castle of the county town. See DURHAM, the city.

Roman coins have been dug up at Gateshead, on Fulwell Hill, and at South Shields, which was clearly the ad finem of Richard of Cirencester's Itinerary. Binchester, the seat and manor of the Wren family, is the site of the Roman station Vinovium; and Evesham is supposed to be the Vindomara of Antoninus, many Roman inscriptions, and an urn of uncommon form, having been found here. The latter was nearly a yard high and seven inches wide, having in the centre a small cup. Chester-le-Street has been supposed to be the Condercum of the Romans. It is situated on the military way leading to Newcastle. Glanibanta, near Lanchester, is another, and remarkably distinct Roman station. It is of an oblong figure, 174 paces from north to south, and 160 from east to west, within the vallum, which occupies a beautiful eminence. In some parts, the wall remains perfect; the outside is perpendicular, twelve feet in height, built of ashler work in regular courses, each stone being about nine inches thick, and twelve long. The site of the Pretorium is very distinctly to be traced.

Three miles west of the city of Durham, and to the right of the road, is Brandon, a village

situated in the vicinity of a high hill. On the summit is a remarkable tumulus, of an oblong form, 120 paces in circumference at the base, and about twenty-four feet in perpendicular height; but it does not appear that this tumulus was ever opened. It is now covered with a thick plantation of fir, and seems a relic of British antiquity. Near Eggleston is an ancient structure, called the Standing Stones, also of this class: it originally consisted of a cairn in the centre, surrounded by a trench, and encompassed by a circular arrangement of rough stones; many of which have been removed and broken to repair the roads.

Durham is termed a county palatine (à palatio) because the owners thereof had, in this county, the authority to use the royal prerogative as fully as the king had in his palace. Its privileges are thought to have been originally granted to the county, on account of its bordering so near upon Scotland, in order that the inhabitants, having justice administered at home, might not be obliged to go out of their county and leave it open to the enemy. The bishopric of Durham was dissolved, and the king to have all the lands, &c., by a statute (7 Ed. VI.) not printed. But this act was afterwards repealed (1 Mary, stat. 3, c. 3), and the bishopric newly erected, with all jurisdiction ecclesiastical and temporal annexed to the county palatine. The justices of the county palatine of Durham may levy fines of lands in the county; and writs upon proclamation, &c., are to be directed to the bishop. (Stats. 5 Eliz. c. 27, 31 Eliz. c. 2). Writs to elect members of Parliament in the county palatine of Durham, also go to the bishop or his chancellor, to be returned by the sheriff, &c. There is also a distinct court of chancery in this county; and the bishop is at the head of the whole administration of justice.

DURHAM, a principal city of England, the capital of the foregoing county, is sixteen miles south from Newcastle, and 259 north from London. This city was founded in 995, on the monks of Landisfarne removing to this spot, and making it the sacred depository of the relics of St. Cuthbert. It is nearly surrounded by the river Wear. Its situation, and the venerable appearance of its public buildings, strike the eye very agreeably at the southern entrance of the city. Altogether it is about a mile square, and is well paved, watched, and lighted. The municipal government is vested in a mayor, recorder, twelve aldermen, twenty-four common-council-men, who are chosen from twelve chartered trading companies, and an indefinite number of freemen: the corporation and freemen amounting in the whole to about 1000 electors, who return two members to parliament.

The cathedral and castle occupy the crown of an eminence, eighty feet perpendicular from the river, and enclosed by the remains of the old city walls. At the bottom flows the Wear. The slope of the hill is decorated with hanging gardens and rich meadows, and the opposite banks are clothed with wood and fruit trees. The cathedral is itself 411 feet long, the length of the nave 200 feet, and the width seventy-four; the great cross-aisle has an aisle towards the

east, at both ends, 170 feet in length, and seven wide; the middle tower is 214 feet high. It is divided into five aisles by four rows of pillars. The pillars are vast cylinders, twenty-three feet in circumference, and, with the whole of the interior, are adorned with carvings, exhibiting fine specimens of the early Norman style. Near the west end is the font, an elegant marble basin, ornamented with carved red-oak. The oak-skreen at the entrance of the choir, as well as the bishop's throne, and the stalls for the bishop, dean, and prebendary, are finished in a magnificent style. The founder's tomb is on the south side of the throne. The beautiful mutilated screen, on the eastern side of the choir, was the gift of John lord Neville. Behind the high-altar stood the shrine of St. Cuthbert, once the richest in England. The north aisle of this cathedral is now used as a register-office for wills. In 1782 several parts of this structure being found in a ruinous condition, they were restored with considerable taste. The Galilee, or St. Mary's chapel, at the west end of the cathedral, is said to have been built as a place of worship for those females who were not allowed to enter the cathedral. The old Frater House is converted into an elegant library. The College is an oblong square, containing the deanery and prebendal houses. The kitchen here is curious, and at the upper end of it is a beautiful fountain. On the north side of the church-yard is the grammar-school, and the master's house.

Durham has six other churches, namely, St. Oswald's, an ancient structure, with a curious vaulted roof of wood, and some fine painted glass: St. Nicholas, an ancient but plain edifice, at which the corporation attend divine service: St. Mary-le-bow, built of hewn stone, in 1685; here the bishop and archdeacon's visitations are held: and St. Margaret's, St. Giles's, and Little St. Mary's. In the city are two Roman Catholic chapels, a quakers', presbyterian, methodist, and other meeting-houses.

On the Palace-Green stands the castle, first erected by William the Conqueror, and part of which has been repaired, and made the residence of the bishop occasionally. The great tower stands upon an artificial mount, and is of an irregular octagonal form, sixty-three feet in diameter. It formerly contained four tiers of apartments, but nothing now remains of it except the vaults, and part of the keep. Round the mount are three delightful terraces.

The market-place is large and spacious; in the centre is an excellent fountain, from which the inhabitants are supplied with water. A spacious piazza has been built, where the market for corn, provisions, &c., is held. Near it is the Guildhall, where the public meetings are convened. Among the recent improvements, are a new gaol, house of correction, county-courts, and governor's house. There are three stone bridges in this city. The New bridge was finished in 1777, at the expense of the dean and chapter. Framwellgate bridge consists of two elliptic arches, and crosses the canal. Elvet bridge is at the southern entrance to the city. Between the New bridge and St. Oswald's church are the public walks called the Banks,

which afford an agreeable retreat in fine weather. An extensive cloth and carpet manufactory has been established, from funds bequeathed by a Mr. Smith, which affords employment to a great number of men and boys. A county infirmary is also well supported. In the town are many public charities, a subscription library, and several other literary and useful institutions. A neat little theatre was erected in 1791, and annual races are held in July.

Durham market on Saturday is well supplied with corn and all kinds of provisions. Sea fish are brought from Hartlepool and Sunderland. Fairs are held on the 31st of March, for cattle; Whit-Tuesday, for sheep and swine; and on the 15th of September, for horses; they each continue three days.

About half a mile eastward are the remains of a fortification called Old Durham and Maiden castle; and two miles and a half east stands Sherborn House, an hospital founded by bishop Pudsey, for a master and sixty-five lepers; in which are now maintained fifteen in-brethren, each having a separate room, good diet, a suit of clothes annually, and 40s. in money: there are also fifteen out-brethren. In a deep vale, near the river, are the ruins of Finchall Abbey, founded in 1196 for Benedictines. On the west of the city is an old cross, erected by Ralph, lord Neville, in memory of a battle between the English and Scots, wherein the latter were defeated with the loss of 15,000 men, and their king David II. taken prisoner.

DURHAM, a township of Connecticut, in New-Haven county, settled from Guildford, in 1698, and incorporated in 1708. It is about twenty-two miles south-west of Hartford, and eighteen north-east of New-Haven. It was called Cagingchague, by the Indians; which name a small river that chiefly rises here still bears.

DURHAM, a township of the United States, in Cumberland county, district of Maine, on the south-west bank of the Androscoggin, which separates it from Bowdoin on the north-east. It lies 145 miles north-east of Boston.

DURHAM, a post town of New Hampshire, in Strafford county, seated on Oyster river, near where it joins the Piscataqua; twelve miles west of Portsmouth. It was incorporated in 1633. It was formerly a part of Dover, which adjoins it on the north, and was called Oyster River. On the top of a hill in this town is a rock, computed to weigh sixty or seventy tons, so exactly poised on another rock, as to be easily moved by one's finger. Its situation appears to be natural.

DURIO, in botany, a genus of the polyandria order, and polyadelphia class of plants: CAL. a monophyllous perianth: cor. petals five growing to the calyx; stamina conjoined in five bodies; germ, roundish; style bristly, the length of the stamina: FRUIT a roundish apple every where mucicated: SEED containing mucous orilla. Species one only, a native of the East Indies.

DURLACH, a well built town of Germany, formerly the capital of the margraviate of Baden-Durlach, now of the circle of the Pfalz and Enz, in the grand duchy of Baden. It is situated on the Pfalz, at the foot of a long and lofty range

of mountains called the Thurmberg. It was burnt down in 1689, and, though rebuilt at the peace, never regained its prosperity. It contains 4000 inhabitants, for the most part Lutherans. Here is the ducal castle of Carlsburg, an elegant church, and an academy; but the seat of government has been removed to Carlsruhe. It is remarkable for its manufactory of porcelain. A considerable trade is also carried on in corn, madder, and tobacco. Durlach is five miles east of Carlsruhe, fifteen north-east of Rastadt, and thirty-two N. N. W. of Stuttgart.

DUROBRIVÆ, in ancient geography, a town of the Catyechlani, in Britain, now in ruins; which lies on the Nen, between Castor and Dornford, in Northamptonshire, on the borders of Huntingdonshire.

● DUROBRIVÆ, or DUROCOBRIVÆ, a town of the Trinobantes, in Britain; whose ruins are situated between Flamstead and Redburn, in Hertfordshire. See CATTI.

DUROBRIVIS, an ancient town of Britain, twenty-five miles west of Durovernum, or Canterbury; now called Rochester, which, in the charter of the foundation of the church, is styled Durobrevis.

DUROC (Marshal), duke of Friuli, was born at Pont-a-Mousson in 1772, and studied in the military school of that place. His father, who was a notary, intended him for that employment; but in 1792 he became a lieutenant of artillery, and soon after emigrated into Germany. Returning home, we find him aid-de-camp to general Lespinasse, and engaged in that capacity, in his first revolutionary campaigns. In 1796 he was appointed aid-de-camp to Buonaparte, in Italy, and distinguished himself at the passage of the Isonzo. He was also in the expedition to Egypt; and being wounded by a cannon-ball, at the siege of Acre, returned with Buonaparte to France. Duroc after this had several important missions to Berlin, Stockholm, Vienna, and St. Petersburg; in which he is said to have been remarkably successful. He was a great favorite with Napoleon, and an adroit diplomatist; but he never acquired much military renown. He was killed by a cannon-ball at Wartschen, May 22d, 1813.—*Biog. Univ.*

DUROA, in botany, a genus of the monogynia order and hexandria class of plants: CAL. cylindrical and loped above; the border six-parted; there are no filaments; FRUIT a hispid apple. Species one only, a Surinam tree.

DUROTRIGES, an ancient British nation, scattered in that part of the country which is now called Dorsetshire. Their name is derived from the two British words *dur*, water, and *trigo*, to dwell; and they got it from the situation of their country, which lies along the sea coast. It is not certain whether the Durotriges formed an independent state under a prince of their own, or were united with their neighbours the Damnonii; as they were reduced by Vespasian under the dominion of the Romans, at the same time, and with the same ease, and never revolted. Dorchester, its present capital, seems to have been a Roman city of some consideration, though our antiquaries are not agreed about its Roman name. It is most probable, that it was the Dur-

novaria, in the twelfth Iter of Antoninus. Many Roman coins have been found at Dorchester; the military way called Jenning Street passed through it; and some vestiges of the ancient stone wall with which it was surrounded, and of the amphitheatre with which it was adorned, are still visible. The country of the Durotriges was included in the Roman province called Flavia Casariensis, and governed by the president of that province, as long as the Romans kept any footing in these parts.

DURY (John), usually called Duraeus, a learned and sanguine divine of the seventeenth century, who, conceiving the project of a union of the reformed churches, obtained leave to travel from place to place in order to bring about this event. He was a native of Scotland, and obtained the countenance of archbishop Laud, and the prelates Bedell and Hall; but, although he met with encouragement in various parts of the continent, it is needless to say that he failed in his plans. And after this he undertook an explanation of the Apocalypse, which was to reunite every order of Christians. He died in 1675.

DUSK, *adj.*, *n. s.*, *v. a.* & *v. n.*

DUSK'ILY, *adv.*

DUSK'ISH, *adj.*

DUSK'ISHLY, *adv.*

DUSK'Y, *adj.*

κίος, from *δασος*, thick, and *σκις*, shadow. Dark; gloomy in color or general appearance; tendency to darkness; to make or grow dark.

Dusked his eye too, and failed his breath.

Chaucer.

From his infernal furnace forth he threw
Huge flames, that dimmed all the heaven's light,
Enrolled in *dusky* smoke, and brimstone blue.

Spenser.

Here lies the *dusky* torch of Mortimer,
Choked with ambition of the meaner sort.

Shakspeare.

It is not green, but of a *dusky* brown colour.

Bacon.

The sawdust burned fair, till part of the candle
consumed: the dust gathering about the snail, made
the snail to burn *dusky*. *Id.* *Natural History.*

Sight is not contented with sudden departments
from one extreme to another; therefore rather a
dusky tincture than an absolute black.

Wotton's *Architecture.*

Only, may the Good Spirit of the Almighty speedily
dispell all those *dusky* prejudices from the minds of
men, which may hinder them from discerning so clear
a light.

Bp. Hall. *Letter from the Tower.*

The hills, to their supply,

Vapour and exhalation, *dusk* and moist,

Sent up amain. *Milton's Paradise Lost.*

Some sprinkled freckles on his face were seen,
Whose *dusk* set off the whiteness of the skin.

Dryden.

There fierce winds o'er *dusky* valleys blow,

Whose every puff bears empty shades away. *Id.*

I will wait on you in the *dusk* of the evening with
my show upon my back.

Spectator.

Through the plains of one continual day,

Six shining months pursue their even way;

And six succeeding urge their *dusky* flight,

Obscured with vapours and o'erwhelmed in night.

Prior.

The surface is of a *dusky* yellow colour.

Woodward.

While he continues in life, this *dusky* scene of hor-
rour, this melancholy prospect of final perdition, will
frequently occur to his fancy. *Bentley's Sermons.*

Umbriel, a *dusky*, melancholy sprite,

As ever sullied the fair face of light,

Down to the central earth, his proper scene,

Repairs to search the gloomy cave of Splen.

Pope.

By mixing such powders, we are not to expect a
strong and full white, such as is that of paper; but
some *dusky* obscure one, such as might arise from a
mixture of light and darkness, or from white and
black; that is, a grey, or dun, or russet brown.

Newton's *Opticks.*

Less bold, Leander at the *dusky* hour

Eyed, as he swam, the far love-lighted tower;

Breasted with struggling arms the tossing wave,

And sunk benighted in the watery grave. *Darwin.*

Hark! through the silence of the cold, dull night,

The hum of armies gathering rank on rank!

Lo! *dusky* masses steal in dubious sight

Along the leaguered wall and bristling bank

Of the armed river, while with straggling light

The stars peep through the vapours dim and dank,

Which curl in curious wreaths. *Byron.*

DUSSARA, a fortified town of Hindostan, in
the province of Gujerat. It is surrounded with
twelve villages, and is the property of a Ma-
hommedan zemindar, of Arabian descent. One
of his ancestors who was put to death about
A. D. 1209, by the rajah of Hulwad, for having
committed gowhattia (cow-killing), is held in
great veneration as a saint, by the adjacent Ma-
hommedan inhabitants. His tomb is on the
banks of a large tank in the neighbourhood,
which is well cultivated. A force of about 2000
excellent cavalry is maintained here.

DUSSAULIN (John), a French writer, born at
Chartres in 1728. He was a military man in
early life, but quitted the army for literary pur-
suits. At the beginning of the revolution he
became a member of the convention; and of the
council of ancients. He died in 1799. His
works are, 1. A Translation of Juvenal, 8vo.
2. De la Passion de Jeu, 8vo. 3. Sur la Sup-
pression des Jeux de Hazard. 4. Eloge de
l'Abbé Blanchet. 5. Memoire sur les Satiriques
Latins. 6. Voyage à Barrege, et dans les hautes
Pyrennees, 8vo. 7. Mes rapports avec J. J.
Rousseau, 8vo.

DUSSELDORF, or DUSSELDORP, a city of
Westphalia, now belonging to Prussia, in the
duchy of Berg, situated on the river Dussel,
near its confluence with the Rhine. It is strong
and well built, the elector palatine having in
the early part of the eighteenth century exempted
from taxes for thirty years whoever should build
a house within its walls. It was taken by the
French in September 1795, when the castle
was greatly damaged; but it has since been re-
paired, and contains a celebrated gallery of paint-
ings, which after being removed, and for some
time kept at Munich, was brought back here. It
is said to comprise the chief d'œuvres of Rubens,
Vandyk, Vanderwerf, and the Flemish masters.
Here are also several elegant churches, an ex-
cellent market-place, extensive barracks, and
pleasant public walks. Dusseldorf has the
academy removed hither from Duisburg in 1806,
and a school for painting: it has also a collection

of casts, a physical cabinet, and a mechanographic establishment. Corn, and the local manufactures of cloth, paper-hangings, glass, and leather are its chief articles of trade. Population about 19,000. The fortifications were demolished after the peace of Luneville in 1801. It became, in 1806, the residence of the grand duke of Berg, and the seat of his government; but, in 1815, it was made over with the rest of that state to Prussia, and is now the capital of a circle with 364,000 inhabitants. Twenty miles N.N.W. of Cologne, thirty north-east of Aix-la-Chapelle, and sixty-two south-west of Munster.

DUST, *n. s. & v. a.* } Goth. and Sax. *dust* ;
DUST'MAN, *n. s.* } Dan. *dyst* ; Belg. *doust* ;
DUST'y, *adj.* } Erse, *duist*. Earth, or earthy matter; hence a mean, low state; the grave; to scatter, and to free from, dust.

And whanne thei crieden and kesten awei her clothis and threwen *dust* into the air, the tribune commaundide him to be led into the castels and to be betun with scourgis. *Wiclif. Dedin. 22.*

God raised up the poor out of the *dust*, to set them among princes. *1 Sam. ii. 8.*

All our yesterdays have lighted fools
The way to *dusty* death. *Shakspeare.*
The sceptre, learning, physick, must
All follow this, and come to *dust*.

Id. Cymbeline.

Dust helpeth the fruitfulness of trees, insomuch as they cast dust upon them: that powdering, when a shower cometh, maketh a soiling to the tree, being earth and water finely laid on.

Bacon's Natural History.

A good heart will rather lie in the *dust*, than rise by wickedness. *Bp. Hall. Contemplations.*

Thou

Out of the ground wast taken, know thy birth;
For *dust* thou art, and shalt to *dust* return. *Milton.*
Proclaim the truth, say what is man!

His body from the *dust* began;
And when a few short years are o'er,
The crumbling fabric is no more.

Cotton. Visions in Verse.

Arms and the *dusty* fields I less admire,
And soften strangely in some new desire. *Dryden.*

And therefore I am no more troubled and disturbed with all the *dust* that is raised against it, than I should be to see from the top of a high steeple, where I had clear air and sunshine, a company of great boys or little boys (for it is all one) throw up the *dust* in the air, which reached not me, but fell down in their own eyes. *Locke.*

Vain wretch, suppress thy knowing pride,
Mortify thy learned lust:
Vain are thy thoughts while thou thyself art *dust*.
Prior.

The *dustman's* cart offends thy clothes and eyes,
When through the street a cloud of ashes flies. *Gay.*

Even Drudgery himself,
As at the car he sweats, or *dusty* hews
The palace stone, looks gay. *Thomson's Summer.*

When stretched in *dust* her gasping panthers lie,
And writhed in foamy folds her serpents die. *Darwin.*

You a soldier!—you're a walking block, fit only to
dust the company's regimentals on! *Sheridan.*

So revolves the scene;
So Time ordains, who rolls the things of pride
From *dust* again to *dust*! *Byron.*

DUTCHESS, *Fr. duchesse*; *Ital. ducessa*; from the low Latin formation (*ducissa*) of *dux*, *ducis*, a general. The lady of a duke.

For certes, lord, ther n' is non of us alle
That sho n' hath ben a *duchene* or a queene;
Now be we caitives, as it is wel sene.

Chaucer. Cant. Tales.

The duke of Cornwall, and Regan his *duchess*, will be here. *Shakspeare. King Lear.*

The duke was to command the army, and the *duchess*, by the favor she possessed, to be near her majesty. *Swift.*

The gen'rous god who wit and gold refines,
And ripens spirits as he ripens mines,
Kept dross for *duchesses*, the world shall know it,
To you gave sense, good humour, and a poet. *Pope.*

DUTCHESS COUNTY, a county of New York, on the east side of Hudson River. It has the state of Connecticut on the east, West Chester on the south, and Colombia county on the north. It is about forty-eight miles long and twenty-three broad, and contains fifteen town-ships, of which Poughkeepsie and Fish-Kill are the chief. Dutchess county sends seven representatives to the assembly of the state. In 1792 a remarkable cavern was discovered in the county, at a place called by the Indians Sepascot, at Rhyneck. The northern part is mountainous, and the eastern hilly, with occasional lofty summits, while the remainder presents a surface much broken. Its agriculture is in the most improved state, and in manufactures it has also made considerable progress. Iron ore abounds, and some ores of copper, zinc, tin, lead, and silver, have been found.

DUTCHY, *n. s. Fr. duché*. The territory of a duke.

Different states border on it: the kingdom of France, the *dutchy* of Savoy, and the canton of Bern. *Addison on Italy.*

France might have swallowed up his whole *dutchy*. *Swift.*

DUTENS (Louis), was born in France in 1729, and obtained orders in the church of England; he was appointed chaplain to the embassy at Turin, where he also held for some time the situation of chargé des affaires. In 1766 he published at Paris his *Recherches sur l'Origine des Decouvertes*, of which a translation soon appeared in London. The same year he was presented to the rectory of Elsdon in Northumberland. In 1768 he travelled with lord Algernon Percy; and while abroad published an edition of Leibnitz, in 6 vols. 4to. He died in 1812. He published besides the above: 1. *Explications des quelques Medailles des Grecques et Pheniciennes*, 4to. 2. *Journal d'un Voyage aux Villes Principales de l'Europe*. 3. *Histoire de ce qui s'est passe pour etablissement d'une Regence en Angleterre*, 8vo. 4. *Recherches sur le tems reculé de l'usage des Voûtes chez les Anciens*. 5. *Memoires d'un Voyageur*, 5 vols.: this he likewise published in English. He also wrote the French text of the second volume of the *Marlborough Gems*.

DUTTAR, a district of the Seik territories, Hindostan, in the province of Labore, situated between the thirty-first and thirty-second degrees of north latitude. The chief towns are Begwarah, Horizpoor, and Malpoorah.

DUTY, in the military art, is the exercise of those functions that belong to a soldier; with this distinction, that mounting guard and the like, where there is no enemy directly to be engaged, is called duty; but marching to meet and fight an enemy is called going on service.

DUTY, in polity and commerce, signifies the impost laid on merchandises, at importation or exportation, commonly called the duties of customs; also the taxes of excise, stamp-duties, &c. Peculiar duties once laid upon aliens are now repealed. See CUSTOMS.

DUVAL (Valentine Jamerai), a person of uncommon natural talents and singular fortune, born in the province of Champagne, in 1695. After serving a farmer and shepherd several years, when about eighteen years of age he became keeper of the cattle belonging to hermits of St. Anne, near Luneville. Here he took every opportunity of purchasing books, with what money he received, and attending to the instructions of these brothers, under whom he made a rapid progress in his studies. In this situation, he was accidentally discovered by two noblemen, while he was studying geography, under a tree, and they were so pleased with his conversation, that they introduced him to the duke of Lorraine, who placed him in the college of Pont a' Mousson. The duke afterwards appointed him his librarian, and gave him the professorship of history in the academy of Luneville. He now gratefully remembered his original benefactors by rebuilding the hermitage of St. Anne, and adding a chapel and some ground to it. In 1738 he followed the grand duke Francis to Florence, and on the marriage of that prince, with the heiress of the house of Austria, he accompanied him to Vienna, where the emperor took a great delight in his conversation, and made him keeper of his cabinet of medals. He died in 1775.

DUUMVIRATE, the office or dignity of the duumviri. See the next article. The duumvirate lasted till A. U. C. 388, when it was changed into a decemvirate. See DECENVIRI.

DUUMVIRI, in Roman antiquity, a general appellation given to magistrates, commissioners, and officers, where two were joined together in the same functions: such as, 1. Duumviri capitales, the judges in criminal causes. From their sentence it was lawful to appeal to the people, who alone had the power of condemning a citizen to death. These were taken from the body of the decuriones; they had great power and authority, were members of the public council, and had two lictors to walk before them. 2. Duumviri municipales, two magistrates in some cities of the empire, answering to what the consuls were at Rome. They were chosen out of the body of the decuriones; their office lasted commonly five years, upon which account they were frequently termed quinquennales magistratus. Their jurisdiction was of great extent; they had officers who walked before them, carrying a small switch in their hands; and some of them assumed the privilege of having lictors, carrying axes and the fasces, or bundles of rods, before them. 3. Duumviri navales, two commissaries of the fleet, first created at the request of M. Decius, tribune of the people, in the time of the war

with the Samnites. Their duty consisted in giving order for the fitting out of ships, giving commissions to marine officers, &c. 4. Duumviri sacrorum, two magistrates created by Tarquin II. for performing the sacrifices, and keeping the Sibyls' books. They were chosen from among the patricians, and held their office for life; they were exempted from serving in the wars, and from the offices imposed on the other citizens; and without them the oracles of the Sibyls could not be consulted.

DUXBOROUGH, a town of Massachusetts, in Plymouth county, with a harbour for small vessels, and a light-house at the south extremity of the beach. It is situated south by east of Plymouth, three miles across Plymouth Bay.

DUYVELAND, **DUYVELAND**, or **DIVELAND**, an island of the late Batavian republic, in the department of the Meuse, and ci-devant province of Zealand, lying south-east of Schonen, from which it is separated by a narrow channel. It is nine miles long from west to east, and six broad.

DWARACA (the gate), a town and celebrated temple in the province of Gujrat, Hindostan, situated at the south-west extremity of the Peninsula. It has twenty-one dependent villages belonging to Dwaraca, containing 2560 houses, and a population of about 10,240 souls subject to it. This place is, at present, possessed by Mooloo Manick, who is more powerful than any other of the Oacka chieftains. The sacredness of the place attracts a rich and numerous population, and presents a safe asylum from danger. By an agreement of the 14th of December, 1807, Mooloo Manick Sumyancee, of Dwaraca, engaged with the British government not to permit, instigate, or connive at any act of piracy committed by any person under his authority; and also to abstain from plundering vessels in distress. On their part, the British engaged to afford the temple at Dwaraca every suitable protection and encouragement; a free and open commerce to be permitted to vessels paying the regulated duties.

'The original and most sacred spot in this quarter of India,' says Mr. Hamilton, 'is Dwaraca; but, about 600 years ago, the valued image of their god Runchor (an incarnation of Krishna), by a manoeuvre of the brahmins, was conveyed to Daccor, in Gujrat, where it still remains. After much trouble, the brahmins at Dwaraca substituted another in its stead, which, unfortunately, also took a flight across a narrow arm of the sea, to the island of Bate, or Shunkodwar, about 130 years ago, and another new one was placed in the temple here.

'Dwaraca is also designated by the name of the island; and, having been long the residence of Krishna, the favorite Hindoo deity, is a celebrated place of pilgrimage for the sectaries of that religion. In performing this pilgrimage, the following ceremonies take place:—On the arrival of the pilgrim at Dwaraca he bathes in a sacred stream named the Goomty, from its windings; for permission to do which he pays the Dwaraca chief four rupees and a quarter; but brahmins pay only three and a half. After this purification a visit is made to the temple, where

offerings are presented, according to the circumstances of the devotee, and a certain number of brahmins are fed.

'The pilgrim next proceeds to Aramra, where he receives the stamp from the hands of a brahmin, which is made with an iron instrument, on which are engraved the shell, the ring, and the lotos flower, which are the insignia of the gods. This instrument is made hot, and impressed on any part of the body, but generally on the arms; and, by not being over-heated, generally leaves an impression on the spot. It is frequently impressed on young infants; and a pilgrim may receive, not only his own stamp, but also stamps on his body for any absent friend. This stamp costs a rupee and a half.

'The pilgrim next embarks for the island of Bate, where, on his arrival, he must pay a tax of five rupees to the chief, present liberal offerings to the god, and dress him in rich clothes and ornaments. The chief of Bate, who is a holy person, receives charge of the present, and retails it again to other pilgrims at a reasonable rate, who present it again to the deity, and it performs a similar revolution. The average number of pilgrims resorting annually to Dwaraca has been estimated to exceed 15,000, and the revenues derived to the temples a lack of rupees.

'Notwithstanding this existing place of pilgrimage, the most authentic Hindoo annals assert, that Dwaraca was swallowed up by the sea a few days after the decease of Krishna. This incarnation of Vishnu spent much of his time at Dwaraca, both before and after his expulsion, by Jarasandha from Mathura, on the banks of the Jumna, in the province of Delhi, which would indicate a greater intercourse between these distant places, than could have been expected at so remote a period. The chalk with which the brahmins mark their foreheads comes from this place, where it is said to have been deposited by Krishna; and from hence, by merchants, is carried all over India.' (*M'Murdo, &c.*)

DWARF, *n. s. & v. a.* } Sax. *dwergr*; Dut. *DWARFISH, adj.* } Dan. and Scotch, *dí-
DWARFISHNESS, n. s.* } *verg*, or *dwaerg*; Ger. *zwerg*, *zwersch*, crooked. A small and generally deformed person; often, in ancient times and early poetry, a supernatural being, of no small powers; an elf or fairy. The verb means to lessen; make dwarfish.

The champion stout,
Eftsoones dismounted from his courser brave,
And to the dwarf awhile his needless spear he gave.
Spenser.

Behind her farre away a dwarfse did lag,
That lasie seemed, in ever being last. *Id. Sonnets.*

Get you gone, you dwarf!
You minimus, of hind'ring knot-grass made.
Shakespeare.

This unheard sauciness, and boyish troops,
The king doth smile at; and is well prepared
To whip this dwarfish war, these pigmy arms,
From out the circle of his territories. *Id. King John.*

It is reported that a good strong canvas, spread over a tree grafted low, soon after it putteth forth, will dwarf it, and make it spread.

Bacon's Natural History.

'Tis no wonder that science hath not outgrown the

dwarfishness of its pristine stature, and that the intellectual world is such a microcosm.

Glanville's Scopsis.

They, but now who seemed
In bigness to surpass earth's giant sons,
Now less than smallest dwarfs, in narrow room
Throng numberless. *Milton's Paradise Lost.*

In a delicate plantation of trees, all well grown,
fair, and smooth, one dwarf was knotty and crooked,
and the rest had it in derision. *L'Estrange.*

We should have lost oaks and cedars, and the other
tall and lofty sons of the forest, and have found nothing but dwarfish shrubs, and creeping moss, and despicable mushrooms. *Bentley.*

The whole sex is in a manner dwarfed, and shrunk
into a race of beauties, that seem almost another species. *Addison.*

Saw off the stock in a smooth place; and, for dwarf
trees, graft them within four fingers of the ground. *Mortimer.*

Other dramatists can only gain attention by hyperbolic or aggravated characters, by fabulous and unexampled excellence or depravity, as writers of barbarous romances invigorated the reader by a giant and a dwarf. *Johnson.*

From giant oaks, that wave their branches dark,
To the dwarf moss that clings upon their bark,
What beaux and beauties crowd the gaudy groves,
And woo and win their vegetable loves. *Darwin.*
This massy portal stood at the wide close

Of a huge hall, and on its either side
Two little dwarfs, the least you could suppose,
Were sate, like ugly imps, as if allied
In mockery to the enormous gate, which rose
O'er them in almost pyramidal pride. *Byron.*

DWARFS. The Romans were passionately fond of dwarfs, whom they called nani, or nanæ, inasmuch that they often used artificial methods to prevent the growth of boys designed for dwarfs, by enclosing them in boxes, or by the use of tight bandages. Augustus's niece, Julia, was extremely fond of a dwarf called Sonopas, who was only two feet and an hand-breadth high. We have many other accounts of human dwarfs, but most of them deformed in some way or other, besides the smallness of their size. Many relations, also, concerning dwarfs we must consider as fabulous, as well as those concerning giants. 1. Jeffery Hudson, the famous English dwarf, was born at Oakham in Rutlandshire, in 1619; and about the age of seven or eight, being then only eighteen inches high, was retained in the service of the duke of Buckingham who resided at Burleigh on the hill. Soon after the marriage of Charles I., the king and queen being entertained at Burleigh, little Jeffery was served up to table in a cold pye, and presented by the duchess to the queen who kept him as her dwarf. From seven years till thirty he never grew taller; but after thirty he shot up to three feet nine inches, and there fixed. Jeffery became a considerable part of the entertainment of the court. Sir William Davenant wrote a poem called Jeffreidos, on a battle between him and a turkey cock; and in 1638 was published a very small book called The New Year's Gift, presented at court by the lady Parvula to the lord Minimus (commonly called Little Jeffery), her majesty's servant, written by Microphilus, with a little print of Jeffery prefixed. Before this period, Jeffery was sent to France to fetch a midwife for the queen; and, on his

return with this gentlewoman and her majesty's dancing master, he was taken by the Dunkirkers. Jeffery had borne, with little temper, the teasing of the courtiers and domestics, and, at last, being provoked by Mr. Crofts, a young gentleman of family, a challenge ensued: and Mr. Crofts, coming to the rendezvous armed only with a squirt, the little creature was so enraged, that a real duel ensued; and the appointment being on horseback with pistols, to put them more on a level, Jeffery, at the first fire, shot his antagonist dead. This happened in France, whither he had attended his mistress during the troubles. He was again taken prisoner by a Turkish rover, and sold into Barbary. He probably did not remain long in slavery, for, at the beginning of the civil war, he was made a captain in the royal army and in 1644, attended the queen to France, where he remained till the Restoration. At last, upon suspicion of his being privy to the popish plot, he was taken up in 1632, and confined in the Gatehouse of Westminster, where he ended his life in the sixty-third year of his age. 2. In the Memoirs of the Royal Academy of Sciences, a relation is given by count de Tressau, of a dwarf called Bebe, kept by Stanislaus III. king of Poland, who died in 1764, aged twenty-three, when he measured only thirty-three inches. At his birth he measured only between eight and nine inches.

DWEIL, *v. n. & v. a.* } Saxon, dwelian,
DWEILER, *n. s.* } dwolian; Goth. *dwō*
DWE'LING, } (delay); *dwala*, olc.
DWE'LING-HOUSE, } Teut., is to stay or
DWE'LING-PLACE, } delay. To remain;
continue: hence to be in fixed attention on a person or thing; to continue peaking: as an active verb, to inhabit.

And he gede out and myghte not speke to hem; and thei knewen that he hadde seyn a visoun in the temple, and he bekenide to hem: and he *dwelide* stille doumbe. *Wiclif.*

If thy brother that *dwelleth* by thee be waxen poor, and be sold unto thee, thou shalt not compel him to serve as a bond servant. *Lev. xxv. 39.*

Hazor shall be a *dwelling* for dragons, and a desolation for ever. *Jer. xlix. 33.*

You lovers axe I now this question,
Who hath the worse, Arcite or Palamon?
That on may see his lady day by day,
But in prison moste he *dwelleth* alway:
That other wher him lust may ride or go,
But sen his lady shall he never mo.

Chaucer. Cant. Tales.

He in great passion all this while did *dwelt*;
More busying his quick eyes her face to view,
Than his dull ears to hear what she did tell.

Spenser.

People do often change their *dwelling-places*, and some must die, whilst other some do grow up into strength. *Id.*

The seed of God, which *dwelleth* in them that are born of God, neither will nor can, nor never will nor can, trespass or sin against God; by reason whereof, they that are born of God have great cause to rejoice, seeing in themselves, through God's goodness, not only a friend, but friendliness itself towards and with God.

MS. Note of Bradford the Martyr, in Coverdale's Bible.

'Tis safer to be that which we destroy,
Than by destruction *dwelt* in doubtful joy.

Shakespeare.

The houses being kept up did of necessity enforce a *dweller*; and the proportion of land for occupation being kept up, did of necessity enforce that *dweller* not to be beggar or cottager, but a man of some substance. *Bacon's Henry VII.*

Why are you vexed, lady? Why do you frown?
Here *dwelt* no frowns, no anger; from these gates Sorrow flies far. *Milton.*

All *dwellings* else

Flood overwhelmed, and them with all their pomp
Deep under water roll'd; sea covered sea,
Sea without shore! *Id. Paradise Lost.*

I saw and heard; for we sometimes
Who *dwelt* this wild, constrained by want come forth
To town or village nigh. *Id. Paradise Regained.*

Their cries soon waken all the *dwellers* near;
Now murmuring noises rise in every street. *Dryden.*

He preached the joys of heaven, and pains of hell,
And warned the sinner with becoming zeal;
But on eternal mercy loved to *dwelt*.

Id. Good Parson.

The force of fire ascended first on high,
And took its *dwelling* in the vaulted sky. *Id. Ovid.*

We have *dwelt* pretty long on the considerations of space and duration. *Locke.*

Such was that face, on which I *dwelt* with joy,
Ere Greece assembled stem'd the tide to Troy.

Pope.

A person ought always to be cited at the place of his *dwelling-house*, which he has in respect of his habitation and usual residence, and not at the house which he has in respect of his estate, or the place of his birth. *Ayliffe's Parergon.*

And the soft quiet hamlet where he *dwelt*
Is one of that complexion which seems made
For those who their mortality have felt,
And sought a refuge from their hopes decayed
In the deep umbrage of a green hill's shade. *Byron.*

The Scriptor's tomb contains no ashes now;
The very sepulchres lie tenantless
Of their heroic *duellers*: dost thou flow,
Old Tiber! through a marble wilderness?
Rise, with thy yellow waves, and mantle her distress!

Id.

DWIGHT (Timothy), J.L.D., a learned American divine, was born at Northampton, in the state of Massachusetts, 4th May, 1752. His father being an opulent merchant, he was entered, at the age of thirteen, at Yale College, of which he subsequently became the distinguished tutor and president. He twice represented his native town in the state legislature, and, in 1795, became minister at Greenfield in Connecticut. He obtained great reputation as a biblical critic and preacher. Besides his theological works, consisting of 5 vols. 8vo., he composed, in early life, two poems, entitled *The Conquest of Canaan*, and *Greenfield Hill*; deemed, at that time, the best productions of the American muse. Dr. Dwight died January 11th, 1817, at the age of sixty-five.

DWINA, a large river of European Russia, rising in a lake of the same name, on the borders of the governments of Pskov and Tver. It passes by Veliz, Witensk, Polotsk, Drissa, and Dunaburg, and falls into the gulf of Riga at Dunamunde, a few miles below Riga. It also communicates with the lake of Ladoga, and with St.

Petersburgh, by a canal which joins it to the river Louat, and is navigable throughout.

DWINA, another large river of Russia, is formed by the union of the Juchona and Jug, near the town of Ustjug, in the government of Vologda. It falls, by two arms, into the White Sea, a little to the north-west of Archangel, and is a broad and deep stream, but its mouths are choked with mud.

DWIN'DLE, *v. n.* } Sax. *dwinan*; Dut. *dwynen*; Isl. *dweyna*.

DWIN'DLED, *adj.* } To decay; to shrink; wear away; degenerate: as an active verb, to make less; to break down, or into parts; disperse.

Weary sev'nights nine times nine,
Shall he *dwindle*, peak, and pine.

Shakspeare. Macbeth.

Under Greenvil, there were only five hundred foot and three hundred horse left; the rest were *dwindled* away.

Clarendon.

Thy *dwindled* legs seem crawling to the grave.

Dryden.

We see, that some small part of the foot being injured by a wrench or a blow, the whole leg or thigh thereby loses its strength and nourishment, and *dwindles* away.

Locke.

If there have been such a gradual diminution of the generative faculty of the earth, that it hath *dwindled* from nobler animals to puny mice and insects, why was there not the like decay in the production of vegetables?

Bentley.

Proper names, when familiarized in English, *dwindle* to monosyllables; whereas in other languages they receive a softer turn, by the addition of a new syllable.

Addison.

Physicians, with their milky cheer,
The love-sick maid and *dwindling* beau repair.

Gay.

Religious societies, though begun with excellent intentions, are said to have *dwindled* into factious clubs.

Swift.

He found the expected council was *dwindling* into a conventicle, a packed assembly of Italian bishops, not a free convention of fathers.

Atterbury.

Our drooping days are *dwindled* down to nought,
Their period finished ere 't is well begun.

Thomson.

Lost in thoughtless ease and empty show,

Behold the warrior *dwindled* to a beau;

Since freedom, piety, refined away,

Of France the mimic, and of Spain the prey.

Johnson. London.

In its preventive police it ought to be sparing of its efforts, and to employ means, rather few, unfrequent, and strong, than many, and frequent, and, of course, as they multiply their puny politic race, and *dwindle*, small and feeble.

Burke.

Will they thank the noble lord for reminding us how soon these lofty professions *dwindled* into little jobbing pursuits for followers and dependants, as unfit to fill the offices procured for them, as the offices themselves unfit to be created.

Sheridan.

DYEING.

DYE, *v. a. & n. s.* } Sax. *deagan*, to color.
DYE, *n. s.* } Often written *die*. To
DYE'ING. } tinge; color; stain.

His look was stern, and seemed still to threat
Cruel revenge, which he in heart did hyde,
And on his shield Sansloy in blood lines was *dyde*.

Spenser. Faerie Queene.

It will help me nothing

To plead mine innocence; for that *die* is on me,
Which makes my whit'st part black.

Shakspeare. Henry VIII.

We have dainty works of feathers of wonderful lustre, excellent *dies*, and many.

Bacon's New Atlantis.

So much of death her thoughts

Had entertained, as *died* her cheeks with pale.

Milton.

He (an obstinate man) will rather suffer self-martyrdom than part with the least scruple of his freehold; for it is impossible to *dye* his dark ignorance into a lighter color.

Butler.

A translator *dyes* an author, like an old stuff into a new colour, but can never give it the lustre of the first tincture; as silks that are twice *died* lose their glosses, and never receive a fair color.

Id.

The fleece, that has been by the *dier* stained,
Never again its native whiteness gained.

Waller.

All white, a virgin saint she sought the skies;
For marriage, though it sullies not, it *dies*.

Dryden.

Darkness we see emerges i'to light,

And shining suns descend to sable night:

Even heaven itself receives another *die*,

When wearied animals in slumbers lie

Of midnight ease; another, when the grey

Of morn precludes the splendour of the day.

Id.

There were some of very low rank and professions who acquired great estates: cobblers, *diers*, and shoemakers gave publick shows to the people.

Arbuthnot on Coins.

It is surprizing to see the images of the mind stamped upon the aspect; to see the cheeks take the *die* of the passions, and appear in all the colours of thought.

Collier of the Aspect.

Flowers fresh in hue, and many in their class,

Implore the pausing step, and with their *dyes*

Dance in the soft breeze in a fairy mass.

Byron.

PART I.

THE THEORY OF DYEING.

1. Dyeing is a chemical art which has for its object the extracting of the coloring particles from such substances as afford them, and transferring them to certain stuffs of wool, silk, cotton, or linen. No art has profited so much from the improvements of modern chemistry as the art of dyeing has; and it cannot be, nor ought it to be forgotten, that while we owe much to the discoveries of our own countrymen, and the application of those discoveries to the useful arts, the art of dyeing is highly indebted to the national operations of the French chemists.

2. The origin of this art seems to be of high antiquity; a circumstance which renders it impossible to say to whom or to what it is to be attributed: conjecture, therefore, is all we can pretend to. As most of the materials from which coloring matter is derived are, of themselves, either of dark and disagreeable colors, or else destitute of any particular color, it is probable that, even in the very earliest ages, the love of

ornament, which is natural to mankind, and which is founded on the love of distinction, one of the most active principles of the human mind, would induce them to stain their vestments with various coloring ingredients, especially with vegetable juices. But the means of imparting permanent dyes to cloth, and affixing to its fibres such coloring materials, as could not easily be washed out by water, or be obliterated or greatly changed by the action of air, or of certain saline substances, to which they are liable to be exposed, and which are necessary to render them clean when soiled, was an art which required the knowledge of principles not within the reach of untutored men, and only to be obtained by gradual investigation, and by the lapse of a considerable portion of time.

3. According to Pliny, the Egyptians had discovered a mode of dyeing, somewhat resembling that which we use for coloring printed linens: the stuffs, probably after having been impregnated with different mordants, were immersed in vats, where they received various colors. And M. Delaval is of opinion, that they were possessed not only of the art of dyeing, but even of that of printing on cloths.

4. The Phœnicians seem to have a strong claim to the invention of this art, and they held a decided pre-eminence in the practise of it for many ages: their purple and scarlet cloths were sought after by every civilised nation; and the city of Tyre, enriched by its commerce, increased to an amazing extent. But her career was stopped by the vanity and folly of the eastern emperors; under whose dominion this opulent city had unfortunately fallen. Desirous of monopolising the wearing of the beautiful cloths of Tyre, these tyrants issued most severe edicts, prohibiting any one from appearing in the Tyrian blue, purple, or scarlet, except themselves, and their great officers of state. To this injudicious restriction is to be attributed the destruction of the Tyrian dyes. For under the impolitic restraint imposed on the consumption of the Phœnician cloths, the manufacturers and dyers were no longer able to carry on their trade; it grew languid and expired: and, with the trade, the art itself also perished. It is generally supposed from the name, that the Tyrian purple, so much celebrated among the ancients, was discovered at Tyre, and that it contributed not a little to the opulence of that celebrated city. The liquor which was employed in dyeing the purple was extracted from two kinds of shell-fish, one of which, the larger, was called the purple, and the other was a species of whelk. Each of these species was subdivided into different varieties, which were otherwise distinguished, according to the places where they were found, and as they yielded more or less of a beautiful color. It is in a vessel in the throat of the fish that the coloring liquor is found. Each fish only afforded a single drop. When a certain quantity of the liquor had been obtained, it was mixed with a proportion of common salt, macerated together for three days, and five times the quantity of water added. The mixture being kept in a moderate heat, the animal parts which happened to be mixed with it separated, and rose to the surface. At the end of ten days, when these opera-

tions were finished, a piece of white wool was immersed, by which means they ascertained whether the liquor had acquired the proper shade. Various processes were followed to prepare the stuff to receive the dye. By some it was immersed in lime-water, and by others it was prepared with a kind of fucus, which acted as a mordant to give it a more fixed color. Alkanet was used by some for the same purpose. The liquor of the whelk did not alone yield a durable color. The liquor from the other shell-fish served to increase its brightness; and thus two operations were in use to communicate this color. A first dye was given by the liquor of the purple, and a second by that of the whelk; from which it was called by Pliny *purpura dibapha*, or purple twice dipped. The small quantity of liquor which could be obtained from each shell-fish, and the tedious process of its preparation and application to the stuffs, raised the price of purple so high, that in the time of Augustus a pound of wool of the Tyrian purple dye, could not be purchased for one thousand *denarii*, equal to about £36 sterling.

5. Among the Greeks the knowledge of dyeing must have been very imperfect, and little assisted by science; for the art of dyeing linen appears not to have been known in Greece before Alexander's invasion of India, where, according to Pliny, they dyed the sails of his vessels of different colors. The Greeks seem to have borrowed this art from the Indians.

6. India seems to have been the nursery of the arts and sciences, which were afterwards spread and perfected among other nations. Accidents, which had a tendency to improve the art, could not fail to be multiplied rapidly, in a country,—rich in natural productions; requiring little labor for the support of its inhabitants; and the population of which was favored by the bounty of nature, and simplicity of manners, till it was opposed by the tyranny of succeeding conquerors. But religious prejudices, and the unalterable division into castes, soon shackled industry; the arts became stationary; and it would seem, that the knowledge of dyeing cotton in that country (for silk was then unknown, or at least very scarce) was as far advanced in the time of Alexander, as it is at the present period.

7. The beautiful colors, which are observable in some Indian linens, would lead one to suppose that the art of dyeing had there attained a high degree of perfection; but we find by the description which Beaulieu, at the request of Dufay, gave of some operations performed under his own eye, that the Indian processes are so complicated, tedious, and imperfect, that they would be impracticable in any other country, on account of the great difference in the price which is paid for labor.

8. It is unquestionably true, that European industry has far surpassed them in correctness of design, variety of shade, and facility of execution; and, if we are inferior to them with respect to the liveliness of some colors, it is only to be attributed to the superior quality of some of their dyes, or perhaps to the length and multiplicity of their operations and processes. In our own country, however, the art of dyeing made no considerable progress till about the beginning of the

seventeenth century. Before that period our cloths were sent to Holland, to be dressed and dyed. This, however, was probably practised only in the case of particular colors. The dyeing of woollen and silken goods has indeed long since attained a considerable degree of excellence; but the manufactures of cotton, owing to the small attraction of that substance for coloring matters, have been very deficient in this point. Till within these few years, the colors employed in the dyeing of fustians and cotton velvets were few; and, even at this day, many of them are fugitive. But it must be allowed that great improvements have been made within these few years, from the application of chemical principles, and by a diligent investigation of the nature of coloring substances. There is however still much room for the improvement of the art, but this can only be effected by the practical dyer acquiring chemical knowledge, an acquisition now happily placed within the reach of every dyer who is capable of reading and understanding the English language. It will not be necessary for our present purpose to enter into a minute examination of the various theories that have been advanced of the nature of colors; at the same time it may be proper, before we deduce a general theory of dyeing, to make a few observations on the common properties of coloring substances.

9. In explaining the cause of color, and the nature of coloring particles, two great inconveniences have arisen. First, from an attempt to illustrate the action, which the particles of coloring substances have on the rays of light, in consequence of their density and thickness, without having any means of ascertaining this, and without any regard to the attractions which result from their chemical composition; in comparing the coloring particles to mucilages and resins, from some very faint resemblances; and in attempting to explain their coloring properties by conjectures, formed respecting their component parts, while these properties ought rather to be ascertained by direct experiment than explained by an imaginary composition. It was also departing from true theory, to ascribe to laws purely mechanical, the adhesion of the coloring particles to the substances dyed, the action of the mordants, the difference between the true or durable, and the false or fugitive dyes.

10. Hællot, who has written an excellent treatise on dyeing, seems to have erred on this subject; and Macquer, who was amongst the first who entertained just notions respecting chemical attractions, seems to have been led astray by his ideas. It appears, however, that Dufay had before observed, that the coloring particles were naturally disposed to adhere more or less firmly to the filaments which receive them; and had very justly remarked, that without this disposition, stuffs would never assume any color but that of the bath, and would always divide the coloring particles equally with it: whereas the liquor of the bath sometimes becomes as limpid as water, giving off all the coloring particles to the stuff; which, he observes, seems to indicate that the ingredients have less attraction for the water than for the particles of the wool.

11. Bergman seems to have been the first who

referred the phenomena of dyeing entirely to chemical principles. Having dyed some wool and some silk in a solution of indigo, in very dilute sulphuric acid, he explains the effects he observed in the operation, by attributing them to the precipitation, occasioned by the blue particles having a greater affinity for the particles of the wool and silk, than for those of the acidulated water. He remarks that this affinity of the wool is so strong, as to deprive the liquor entirely of the coloring particles; but that the weaker affinity of the silk can only diminish the proportion of these particles in the bath, and he shows that on these different affinities depend both the permanence and intensity of the color.

12. This is the true light in which the phenomena of dyeing should be viewed; they are real chemical phenomena, which ought to be analysed in the same way as all those dependent on the actions which bodies exert, in consequence of their peculiar nature. It is evident, that the coloring particles of bodies possess chemical properties, that distinguish them from all other substances; and that they have attractions peculiar to themselves, by means of which they unite with acids, alkalis, metallic oxides, or calces, and some earths, principally alumine or pure clay. They frequently precipitate oxides and alumine, from the acids which held them in solution; at other times they unite with the salts, and form supercompounds which combine with the wool, silk, cotton, or linen. And with these their union is rendered much more close by means of alumine or metallic oxide, than it would be without their intermedium.

13. The difference in the affinity of the coloring particles for wool, silk, and cotton, is sometimes so great, that they will not unite with one of these substances, while they combine very readily with another; thus, cotton receives no color in a bath which dyes wool scarlet. Dufay prepared a piece of stuff, the warp of which was wool and the woof cotton, which went through the process of fulling, that he might be certain, that the wool and the cotton received exactly the same preparation; but the wool took the scarlet dye, and the cotton remained white. It is this difference of affinity which renders it necessary to vary the preparation and the process, according to the nature of the substance which is intended to be dyed of a particular color. And these considerations ought to determine the means to be pursued for the improvement of the art of dyeing. It is highly proper to endeavour to ascertain what are the constituent principles of the coloring particles. And in this enquiry, the most essential circumstances are, to determine the affinities of a coloring substance; first, with the substances which may be employed as menstrua; secondly, with those which may, by their combinations, modify the color, increase its brilliancy, and help to strengthen its union with the stuff to be dyed; thirdly, with the different agents which may change the color, and principally with the external agents—air and light.

14. The qualities of the uncombined coloring particles are modified when they unite with a substance; and, if this compound unites with a stuff, it undergoes new modifications. Thus the

properties of the coloring particles of cochineal are modified, by being combined with the oxide of tin, and those of the substances resulting from this combination are again modified by their union with the wool or silk; so that the knowledge we may acquire by the examination of coloring substances in their separate states, can only inform us respecting the preparations that may be made of them; that which we acquire respecting their combinations with substances which serve to fix them, or to increase their beauty, may inform us what processes in dyeing ought to be preferred or tried; but it is only by direct experiment made with the different substances employed in dyeing, that we can confirm our conjectures, and properly establish the process.

15. These facts show, that the changes produced by acids and alkalis on many vegetable colors, such as the chemists employ, in order to discover the nature of different substances, are owing to the combinations, which take place between these coloring particles and the acids and alkalis. The compounds resulting from these may be compared to neutral salts, which possess qualities different from those of their component parts, but in which one of these parts may be in excess, and its qualities consequently predominant. This state of combination is observable between the coloring particles of cochineal and acidulous tartrate of potassa, or cream of tartar: by evaporating slowly a solution of this salt in a decoction of cochineal, crystals are formed, which retain a fine ruby color, much more bright and intense than that of the liquor which formed them.

16. It was the opinion of Berthollet that some of the acids, particularly the nitric, after combining with the coloring particles, changed the color which they at first produced, making it yellow, and finally destroying it; after which they act by means of one of their principles, viz. the oxygen. But this theory, Dr. Ure remarks, is not now tenable, since it is known that dry chlorine does not bleach dry litmus paper. When moisture intervenes, muriatic acid is formed, and oxygen evolved; to the action of which body on the color the bleaching effect is to be ascribed. Water is the source of the discoloration, both in the ancient and modern process of bleaching. Blue colors are not the only ones which become red by the addition of acids, and green by that of alkalis; most red colors, as that of the rose, for instance, are heightened by acids, and made green by alkalis; and some green colors, such as that of the green decoction of burdock, according to the experiments of Mr. Nose, and the green juice of Buckthorn, as is evident from the trials of Mr. Becker, are rendered by acids.

17. This property, which is common to most of the ordinary colors of vegetables, seems to prove that there is a close analogy between their coloring particles; and it is not without foundation, that Linnæus supposed, that the red in vegetables was owing to an acid, and indicated its presence; but there are also many vegetables which contain acid in a disengaged state, without their possessing a red color. It is therefore evident, that the coloring particles have affinities for acids,

alkalis, earths, and metallic oxides, which constitute a part of their chemical properties; and in consequence of which, their colors are more or less varied; therefore these particles form, with the stuff on which they are fixed, a compound which retains only some of their original properties; they are also modified by their union with alumine, or pure clay, metallic oxides, and some other substances; as are also those new compounds, when they are further combined with the stuff.

OF MORDANTS.

18. The term mordant is derived from the French word *mordre*, which signifies to bite or corrode. In the art of dyeing, it is applied to designate all those substances employed for the purpose of facilitating or modifying the combination of the coloring particles with the stuff dyed. Dr. Bancroft, and Dr. Henry of Manchester, proposed to denominate these substances by the term *basis*, since the action of many of them does not depend on the acid or corroding principle; but this alteration has not been adopted. Mordants deserve the greatest attention; as by their means colors are varied, brightened, made to strike, and rendered more durable. We shall, therefore, examine the nature of the action of the principal bases or mordants, and endeavour to determine how their attractions serve to unite the coloring particles with the stuff, and how they affect the qualities of the colors.

19. A mordant is not always a simple agent, for new combinations are sometimes formed by the ingredients that compose it; so that the substances employed are not the immediate agents, but the compounds which they have formed. Sometimes the mordant is fixed with the coloring particles, and sometimes the stuff is impregnated with it; on other occasions, both these modes are united; and we may dye successively with liquors containing different substances, the last of which only can act on the particles with which the stuff is impregnated. The art of printing linen affords many processes, in which it is easy to observe the effects of mordants; to elucidate this subject, therefore, we shall mention a few examples.

20. The basis employed for linens intended to receive different shades of red, is prepared by dissolving in eight pounds of hot water, three pounds of alum, and one pound of acetite of lead, or sugar of lead, to which two ounces of potassa, and afterwards two ounces of powdered chalk are added. The alum is decomposed by the acetite of lead, because the oxide or calx of lead combines with the sulphuric or vitriolic acid, and forms an insoluble salt which is precipitated; the base of the alum, alumine, at the same time combines with the acetic acid, or vinegar, and produces an acetite of alumine; and the chalk and potassa answer the purpose of saturating the excess of acid. One of the advantages which result from the formation of the acetite of alumine is, that the alumine is retained in it by a much weaker affinity than in the alum; so that it more easily quits its menstruum, to combine with the stuff and coloring particles. Another

advantage is, that the acid liquor, from which lumine is separated, has much less action on the color when it consists of the acetous, than when it consists of a stronger acid, such as the sulphuric. In short, the acetite of alumine not having the property of crystallising, the mordant, which is thickened with starch or gum, to prepare it for being applied to the block on which the design is engraved, does not curdle, as it would if it contained alum capable of crystallising. By attending to the operation performed upon a piece of linen cloth, we find, that when it has been impregnated by the mordant, in the manner determined by the design, it is put into a bath of madder; the whole of the cloth becomes colored, but the tinge is deeper in those parts which have received the mordant; there the coloring particles have combined with the alumine and the cotton, so that a triple compound has been formed, and the acetous acid separated from its basis remains in the bath.

Thus the coloring particles, combined with the alumine and the stuff, are much more difficultly affected by external agents, than when they are in a separate state, or combined only with the stuff, without any intermediate bond of union; and on this property the operations, to which the cloth is afterwards subjected, are founded. After it has been maddered, it is boiled with bran, and spread upon the grass; and these operations are alternately repeated until the ground becomes white. The coloring particles, which have not united with the alumine, are altered in their composition, dissolved, and separated, while those that have combined with it remain, and are preserved, without alteration; and thus, the design alone remains colored. It seems that this decomposition of the coloring particles, by exposure on the grass and boiling with bran, is accomplished in the same manner as that of the coloring particles of flax, and admits of the same explanation. The only difference consists in substituting bran for alkalis, because they would dissolve a part of the coloring matter, which is fixed by the alumine, and would change its color; instead of which, the bran, having a much weaker action on this substance, affects only the coloring particles, which, by the action of the air, have been disposed more easily to solution. If, however, instead of the mordant, a solution of iron be employed, similar phenomena are exhibited. The coloring particles decompose the solution of iron, and form a triple compound with the stuff; but, instead of red, we obtain from the madder, brown colors of different shades, down even to black; and, by uniting these two mordants, alum and iron, we have mixed colors, inclining to red on the one hand, and to black on the other, such as mordoré, and puce color. Other colors are also procured by substituting dyers-weed for madder; and by means of these two coloring substances, indigo, and the two mordants above mentioned, we obtain most of the different shades that are observable in stuffs which are printed.

21. The different substances which enter into the composition of a mordant remain in combination till a new action is induced by the application of another substance. Thus the affinity of the stuff for one of their constituent parts pro-

duces a decomposition and new combinations. But even this effect is sometimes incomplete, or does not at all take place without the action of another affinity, namely, that of the coloring particles. We have an example of this in the mixture of alum and tartar, which is one of the most common mordants in the dyeing of wool.

22. M. Berthollet, having dissolved equal weights of alum and tartar, found that the solubility of the tartar was increased by the mixture. By evaporation and a second crystallisation, the two salts were separated, so that no decomposition had taken place. Half an ounce of alum and one ounce of wool were then boiled together for an hour, and a precipitate was formed, which, being carefully washed, was found to consist of filaments of wool incrustated with earth. To this sulphuric acid was added, and the solution being evaporated to dryness, crystals of alum were produced, with the separation of some particles of carbonaceous matter. The liquid in which the wool had been boiled being evaporated, yielded only a few grains of alum; what remained would not crystallise. This being again dissolved, and precipitated by means of an alkali, the alumina which was thrown down was of a slate color, became black when placed on red-hot coals, and emitted alkaline vapors. From this experiment it appears that the alum was decomposed by the wool, and that part of the alumina had combined with its most detached filaments which were least retained by the force of aggregation; that part of its animal substance had been dissolved and precipitated by the alkali from the triple compound thus formed.

23. M. Berthollet made the same experiment with half an ounce of alum and two drams of tartar; no precipitation took place: he obtained by evaporation a small portion of tartar, and some very irregular crystals of alum; the remainder would not crystallise: this, on being diluted with water, and precipitated by potassa, gave by evaporation a salt which burned like tartar. The wool which had been boiled with the alum felt harsh, but the other retained its softness. The first had acquired from the madder a more dull, though lighter tint, but the color of the latter was more full and bright.

24. From these experiments it appears, in the first place, that the wool had begun a decomposition of the alum; that it had united with a part of the alumine; and that even the part of the alum which retained its alumine had dissolved some of the animal matter. In the second place, that the tartar and alum, which cannot decompose each other solely by their own affinities, become capable of acting on each other when their affinities are assisted by that of the wool. And, in the third place, that the tartar appears principally useful for moderating the too powerful action of the alum upon the wool, whereby it is injured; for tartar is not used in the alumining of silk and thread, which have less action on the alum than wool has. As the decomposition of alum by the tartar and wool takes place in consequence of affinities which nearly balance each other, and the process must therefore go on slowly, it is useful to keep the stuff impregnated with alum and tartar for some days in a moist

place, as is generally recommended. The final effect of aluming, in whatever manner performed, and whatever chemical changes may have taken place in it, consists in the combination of alumine with the stuff: this union has probably been imperfect, and the acids only partially separated, but becomes complete when the cloth has been boiled with madder, as in the case of printed stuffs. But an acid or an alkali may form a supercompound with the stuff, the coloring matter, and the alumine; for there are some colors which are changed by an acid, and restored by alkalis, or by calcareous earths, which take the acid from them, or vice versa; but this supercomposition does not take place with respect to those colors which are esteemed durable, being unchangeable by alkalis or acids, which are not strong enough to destroy their composition.

25. The attraction of alumine for animal substances is not, however, merely indicated by uncertain appearances, nor supposed for the purpose of being employed in explanations, but is proved by direct experiment. M. Berthollet united them together, by mixing an animal substance with a solution of alum; a double exchange took place, the alkali entered into combination with the acid of the alum, and the alumine, combining with the animal substance, was precipitated. He also proved the affinity of alumine for animal substances by another experiment: having mixed a solution of glue with a solution of alum, he precipitated the alumine by an alkali, and the glue with which it had combined fell down along with it. This compound has the appearance of a semitransparent jelly, and dries with difficulty. Thus, in the preceding experiments, the alkali precipitated the alumine combined with the animal substance, from the uncrystallisable residue of the alum which had been boiled with the wool.

26. The affinity of alumine for most coloring substances, may also be shown by direct experiment. If a solution of a coloring substance be mixed with a solution of alum, a precipitation sometimes takes place; but if to the liquor we add an alkali, which decomposes the alum, and separates the alumine, the coloring particles are then precipitated, combined with the alumine, and the liquor remains clear: this compound has obtained the name of lake. In this experiment, too much alkali must not be added, because alkalis are capable of dissolving lakes in general. No direct experiment has however yet shown, that alumine attracts any vegetable substance except the coloring particles: its affinity for them seems much weaker than that which it has for animal substances; hence the acetite of alumine is a better basis for cotton and linen than alum is, and upon this depend the different means employed to increase the fixity of the coloring particles of madder in the dyeing of these substances.

27. Metallic oxides have so great an affinity for many coloring substances, that they quit the acids in which they were dissolved, and are precipitated in combination with them. On the other hand, all metallic oxides have the property of uniting with animal substances; and these different compounds may be formed by mixing an alkali, saturated with an animal substance,

with metallic solutions. It is not surprising, therefore, that metallic oxides should serve as a bond of union between the coloring particles and animal substances; but, besides the attraction of the oxides for the coloring particles, and for animal substances, their solutions in acids possess qualities which render them more or less fit to act as mordants: thus, those oxides which easily part with their acids, such as that of tin, are capable of combining with animal substances, without the aid of coloring particles; it is sufficient to impregnate the wool or silk with a solution of tin, although they be afterwards carefully washed, which is not the case with other metallic solutions. Some metallic substances afford, in combination, only a white and colorless basis; and some by the admixture of their own color, modify that which is proper to the coloring particles; but in many metallic oxides, the color varies according to the proportion of oxygen they contain, and the proportion of this is easily liable to change. Upon these circumstances their properties in dyeing chiefly depend.

28. The affinity of metallic oxides for substances of vegetable origin, seems much weaker than that which they have for animal substances: metallic solutions are, therefore, not well adapted to serve as mordants for colors in cotton or linen, except iron, the oxide of which unites firmly with vegetable substances, as is shown by iron-moulds, which are owing to a real combination of this oxide. Whenever the coloring particles have precipitated a metallic oxide from its menstruum, the supernatant liquor contains the disengaged acid, which is commonly capable of dissolving a portion of the compound of the coloring substance and oxide, so that the liquor remains colored; but sometimes the whole of the coloring particles are precipitated, when the proportions have been accurately adjusted: this precipitation is facilitated, and rendered more complete, by the presence of the stuff, which assists, by the tendency it has to unite with the compound of oxide and coloring particles. Uncombined metallic oxides have also a very evident action on many coloring substances when boiled with them, and modify their color; the oxide of tin in particular increases the brightness and fixity of many.

29. The compounds of oxides and coloring substances are similar to many other chemical compounds, which are insoluble, when the principles of which they are formed are properly proportioned; but which are capable of being supersaturated by an excess of one of the principles, and thence of becoming soluble. Thus a metallic oxide, united with a coloring substance to excess, produces a liquor, the color of which will be modified by the oxides; whereas, when the coloring matter is not in excess, the compound will be insoluble, or nearly so; these effects are very evident in the combination of iron with the astringent principle. Neutral salts such as nitre, and particularly muriate of soda, or common salt, act as mordants, and modify colors; but it is difficult to ascertain the manner in which they act. M. Berthollet found that the muriate of soda was contained, in substance, in the precipitates produced by some species of

coloring particles, and that these precipitates retained a considerable degree of solubility; it would seem that a small part of the salt becomes fixed with the coloring particles and the stuff. Salts with calcareous bases also modify colors; but, as these modifications are nearly similar to those which would be produced by the addition of a small quantity of lime, it is probable that they are decomposed, and that a little of the lime enters into combination with the coloring particles and the stuff. By attention to this, we shall easily discern what combinations are formed by the agency of the different reactives, employed in the analysis of coloring substances; but we must not forget, that the mordants and the coloring particles have a mutual action on each other, which may change their properties. It is evident that, by varying the mordants, we may greatly multiply the shades obtained from a coloring substance; even to vary their mode of application may be sufficient: thus we shall obtain different effects by impregnating the stuff with the mordant, or by mixing the mordant with the bath; by applying heat, or using exsiccations, for we operate upon three elective attractions; that of the coloring particles, that of the stuffs, and that of the principle of the mordant; and many circumstances may cause variations in the result of these attractions; circumstances which merit further explanation. Exsiccation, or drying, favors the union of the substances which have an affinity for the stuff, and the decompositions which may result from that union; because the water which held these substances in solution, by its attraction, opposed the action of the stuff; but the exsiccation should be slow, in order that the substances may not be separated before their mutual attractions have produced their effect.

30. Considerable differences must be observed in the manner of employing the mordant, as the force of affinity between the stuff and the coloring matter is greater or less. When this affinity is strong, the mordant and the coloring substance may be mixed together; the compound thus formed, immediately enters into combination with the stuff. But, when the affinity between the stuff and the coloring particles is weak, the compound formed of the latter and the mordant may separate, and a precipitation take place, before it can be attached to the stuff; and hence it is, that the mordant which is to serve as the medium of union between the stuff and the coloring matter, must be combined with the former, before the application of the latter. It is from these differences that different processes must be followed in fixing coloring matters on animal and vegetable productions.

31. In judging of the effects of mordants, and the most advantageous manner of applying them, it is necessary to attend to the combinations which may be formed, either by the action of the ingredients of which they are composed, or by that of the coloring matter and the stuff. It is necessary, also, to take into consideration the circumstances which may tend to bring about these combinations with more or less rapidity, or that may render them more or less perfect. The action which the liquor in which the stuff is immersed

may have, either on its color or texture, must also be considered; and to be able accurately to judge of the extent of this action, we must know the proportions of the principles of which the mordant is composed; which of these principles remains in an uncombined state in the liquor, and the proportion or quantity which is separated.

32. The coloring particles have been hitherto considered only as substances capable of forming different combinations, by which their properties are modified; but they may be altered in their composition, either by other external agents, or by the substances with which they unite. The stability of a color consists in its power of resisting the action of vegetable acids, alkalis, soap, and more especially that of the air and light; but this power varies exceedingly, according to the nature of the color and the species of the stuff; for the same durability is not required in the colors of silk as in those of wool. There is not much obscurity in the action of water, acids, alkalis, or soap: it is a solution brought about by these agents: and it appears that a small quantity of acid, or of alkali, sometimes unites with the compound which gives the color; because the color is not destroyed, but only changed, and may be restored by taking away this acid; for instance, by chalk and ammoniac, or volatile alkali. But this is not the case with respect to the action of air and light.

33. Scheele observed, that the oxygenated muriatic acid rendered vegetable colors yellow, and he attributed that effect to the property it had of taking up the phlogiston which entered into their composition. Berthollet has shown, that the properties of the oxygenated muriatic acid were owing to the combination of its oxygen with the substances exposed to its action; that it commonly rendered the coloring particles yellow; but that, by a continuance of its action, it destroyed their color; without determining in what this action consisted. Fourcroy afterwards made several observations on the action of oxygen on the coloring particles, which throw a great deal of light on the nature of the changes they undergo, chiefly when watery solutions of them are left exposed to the air, or have been subjected to a boiling heat. He observed that, in consequence of the action of the air, vegetable decoctions formed pellicles, which lost their solubility, and underwent successive changes of color; he marked the gradations of color thus produced, and concluded, from his observations, that oxygen entered into the composition of the coloring particles; that when it combined with them, their shade was changed; that the more they received, the more fixed did their color become; and that the best method of obtaining permanent unchangeable colors, for painting, was to choose such as had been exposed to the action of the oxygenated muriatic acid.

34. In considering the effects of air on colors, it is necessary to make a distinction between those produced by metallic oxides, and those produced by the coloring particles. Berthollet is of opinion that the modifications of the former are entirely owing to different proportions of oxygen, but from observation he has been led to

form a different opinion respecting the modifications of the latter. He observed, that the oxygenated muriatic acid exhibited different phenomena with the coloring particles; that sometimes it discharged their colors, and rendered them white; that most frequently it changed them to a yellow, fawn, or root-colored, brown, or black, according to the intensity of its action; and that, when their color appeared only discharged or rendered white, heat, or a length of time, was capable of rendering them yellow. He compared the effect produced by the oxygenated muriatic acid, when the particles are rendered yellow, fawn-colored, or brown, with the effect of a slight degree of combustion, and showed that they were the same; that they were owing to the destruction of the hydrogen, which, combining with the oxygen, more easily, and at a lower temperature than charcoal does, leaves it predominant, so that the natural color of charcoal is more or less blended with that which before existed. This effect becomes very evident, when sugar, indigo, or the infusion of the gall-nut, or of sumach, are exposed to the action of oxygenated muriatic gas; the sugar and the indigo assume a deep color, and afford indisputable marks of a slight combustion; the infusion of the gall-nut, and that of sumach, let fall a precipitate, which is not far from being pure charcoal or carbon. These appearances are analogous to those which are observed in the distillation of organised substances; in proportion as the hydrogen is extracted in the form of oil, or of gas, the substance grows yellow and at length there remains only a black coal. If the hydrogen be expelled from an oil, by heat, it grows brown, evidently in the same way.

35. Berthollet also found, by other experiments made on alcohol and ether, that the oxygen united to the marine acid, had the property of combining with the hydrogen, which abounds in these substances, and of thereby forming water. He therefore supposes, that when the oxygenated marine acid renders a color yellow, fawn-colored, or brown, the effect proceeds from the coloring matter having undergone a slight combustion, by which more or less of its hydrogen has been converted into water; and that the charcoal, thus rendered predominant, has communicated its own color. The art of bleaching linen by means of the oxygen of the atmosphere, of the dew, and of the oxygenated marine acid, he also supposes to depend on this change of the coloring matter. The coloring particles of the flax are rendered soluble in the alkaline lixivia, the action of which ought to be alternate with that of the oxygen. These coloring particles may be afterwards precipitated from the alkali, and by evaporation and drying become black, and prove the truth of this theory, both by the color they have acquired, and by the quantity of charcoal which they yield on being analysed. But the alkaline solution of the coloring matter of linen which is of a dark brown color, loses its color almost entirely, by the addition of a certain quantity of oxygenated muriatic acid; and the same effect is observable in many other substances, which have assumed a color originating from a commencement of combustion. A piece of linen, which appears white, may grow yellow in process of time, particularly

if exposed to a certain degree of heat, if the oxygenated parts have not been removed by a sufficiently strong lixivium. In the same manner, the green parts of vegetables are rendered white by the oxygenated muriatic acid, but become yellow when boiled.

36. From these facts it appears, that oxygen is capable of whitening, or rendering paler, the coloring matters with which it unites, perhaps by having produced the effects of a slight combustion upon them; or possibly these effects take place only afterwards in a gradual manner, but more rapidly, when the whole is exposed to a certain degree of heat. It is extremely probable, that in all cases a part of the oxygen unites with the coloring matter, without being combined with the hydrogen in particular, and that it is in this way that oxygen acts, in rendering the coloring matter of flax more easily soluble in alkalis. In many other cases oxygen has evidently an influence on the changes which take place in the coloring particles of vegetables; these particles are formed chiefly in the leaves, flowers, and inner bark of trees; by degrees they undergo a slight combustion, either from the action of the atmospheric air which surrounds them, or from that of the air which is carried by a particular set of vessels into the internal parts of vegetables.

37. Berthollet, therefore, supposes we may explain how the air acts upon coloring matters, of an animal, or a vegetable nature; it first combines with them, renders them weaker and paler, and by degrees occasions a slight combustion, by means of which the hydrogen which entered into their composition is destroyed; they change to a yellow, red, or fawn-color; their attraction for the stuff seems to diminish; they separate from it, and are carried off by water: all these effects vary, and take place more or less readily, and more or less completely, according to the nature of the coloring particles; or rather, from the nature of the properties which they possess, in the state of combination into which they have gone. The changes which occur in the colors, produced by the union of the coloring particles with metallic oxides, are effects compounded of the change which takes place in the coloring particles, and of that which is undergone by the metallic oxide.

38. The light of the sun considerably accelerates the extinction of colors. It ought, therefore, if this theory be well founded, to favor the combination of oxygen, and the combustion thereby induced. Sennebier, who has given many interesting observations on the effects of light on different substances, and particularly on their colors, attributes these effects to a direct combination of light with the substances. And the effects of light on the color of wood, have long ago been noticed; it preserves its natural appearance while kept in the dark, but when exposed to the light, it becomes yellow, brown, or of other shades. The same writer also remarked the varieties which occur in this particular in different kinds of wood, and found, that the changes are proportioned to the brightness of the light, and that they take place even under water, but that wetted wood underwent these changes less quickly than that which was dry;

that several folds of riband were required to defend the wood completely, that a single leaf of black paper was sufficient, but that, when paper of any other color was substituted, the change was not prevented; a single covering of white paper was insufficient, but two intercepted the action of the rays of light.

39. He extended his experiments to a great number of vegetable substances, in a manner that may serve to illustrate different phenomena of vegetation. If a well-made solution of the green parts of vegetables in alcohol, which has a fine green color, be exposed to the light of the sun, it very soon acquires an olive hue, and loses its color in a few minutes. If the light be weak, the effect is much more slow; and in perfect darkness, the color remains without alteration, or, if any change does take place, it requires a great length of time. An alkali restores the green color; but if the change of color in the liquor has been completed, the alkali has no effect. No change of color takes place in azotic gas, nor in a bottle which is exactly full. A bottle half full of this green solution was inverted over mercury, by Berthollet, and exposed to the light of the sun; when the color was discharged, the mercury was found to have risen in the bottle, and consequently vital air had been absorbed, the oxygen having united with the coloring matter. The precipitate which M. Sennebiez mentions was not evident; the liquor had continued transparent, and retained a slight yellow tinge. On evaporating this liquor, its color was immediately rendered darker, and became brown; the residuum was black, and in a carbonaceous state.

40. Light, therefore, acts by favoring the absorption of oxygen, and the combustion of the coloring matter. At first, the marks of combustion are not evident; the liquor retains only a slight yellow tinge; but, by the assistance of heat, the combustion is completed, the liquor becomes brown, and leaves a black residuum. If the vessel which holds the liquor contains no oxygen gas, the light has no effect on the coloring matter; azotic gas in this situation suffers no diminution. The observation, that ribands, or a single leaf of white paper, do not prevent the action of light, deserves attention, as it shows that light can pass through coverings which appear to be opaque, and exert its energy a considerable depth within. Beccaria and Sennebiez have compared the effects of light on ribands of various colors; but the differences they have observed are rather to be attributed to the nature of the coloring matters, than to the colors; for a riband dyed with Brasil-wood will lose its color much sooner than one dyed with cochineal, though the shade should be exactly the same in each.

41. Although light greatly accelerates the combustion of the coloring particles, and seems even necessary for their destruction in some cases, in others it is not required. It was found, by putting some plants into a dark place, in contact with vital air, that that air was absorbed by some of them; and, also, that the rose suffers a change, and becomes of a deeper hue, when it is not in contact with vital air, probably because it contains a little oxygen, the combination of which

then becomes more intimate. But many flowers, when in azotic gas, retain their color in perfection. The tincture of turnsole was placed in contact with vital air over mercury, both in the dark, and exposed to the light of the sun; the former continued unchanged for a considerable length of time, and the vital air had suffered no diminution; the other lost much of its color; became red; and the air was, in a great measure, absorbed, and a small quantity of carbonic acid was produced, which undoubtedly had occasioned the alteration of color from blue to red. From this we may form an idea of some of the changes of color, produced by a particular disposition of the component principles of vegetable substances, when, by their combination with oxygen, they undergo the effects of a slight combustion, which may generate an acid, as in the leaves in autumn, which grow red before they become yellow, and in the streaks which are seen in flowers, the vegetation of which is becoming weak.

42. On the whole it is evident, that coloring substances resist the action of the air more or less, according as they are more or less disposed to unite with oxygen, and thereby to suffer more or less quickly a smaller or greater degree of combustion. Light favors this effect, which in many cases is not produced without its assistance; but the coloring matter, in its separate state, is much more prone to this combustion, than when united to a substance, such as alumine, which may either defend it by its own power of resisting combustion, or, by attracting it strongly, weaken its action on other substances, which is the chief effect of mordants. This last compound acquires still greater durability, when it is capable of combining intimately with the stuff upon which it is deposited. Thus the coloring matter of cochineal is easily dissolved in water, and its color is quickly changed by the air; but when united to the oxide of tin, it becomes much brighter, and almost insoluble in water, though it is still easily affected by the air, and by oxygenated muriatic acid; it resists the action of these better, however, when it has formed a triple compound with a woollen stuff. But still it is not to be inferred, that all yellow colors are owing to the carbonaceous part of the coloring substance; very different compounds are capable of producing the same colors; thus, indigo is very different from the blue of our flowers, from that of oxide of copper, and from that of Prussian blue. Berthollet does not even suppose, that oxygen may not unite in a small proportion with some coloring substances, without weakening their color, or changing it to yellow. Indigo becomes green by uniting with an alkali, with lime or a metallic oxide; but resumes its color, and quits these substances, when it recovers a small portion of the oxygen which it had lost. The liquor of the whelk, employed to dye purple, is naturally yellowish; but when exposed to the air, and more especially to the sun, it quickly passes through various shades, and at length assumes the exquisite purple color of the ancients; and which, according to the testimony of Eudocià, derived its lustre and perfection from exposure to the sun's rays.

43. It may then be considered as a general

fact, that colors become brighter by their union with a small portion of oxygen. It is on this account found necessary to air stuffs when they come out of the bath, and sometimes even to take them out of it from time to time, expressly for this purpose; but the quantity of oxygen which, thus becoming fixed, contributes to the brightness of the color, is very considerable in some cases and the deterioration of shade soon begins. But the action of the air affects not only the coloring matter and the stuff, but also metallic oxides, when they are employed as intermedia; because the oxides, which have at first been deprived of a part of their oxygen by the coloring particles, may absorb it again. Those then, the color of which varies according to their proportion of oxygen, have thereby an influence in effecting the changes which the stuff undergoes. It is undoubtedly to this cause that the change observable in the blue given to wool, by sulphate of copper, or blue vitriol, and logwood, is to be attributed. This blue soon becomes green by the action of the air: now copper, which has a blue color, when combined with a small proportion of oxygen, assumes a green one by its union with a larger quantity. The change which the coloring particles undergo, may indeed contribute to this effect; but the coloring particles of the logwood, which have themselves a dark color, should rather become brown by combustion, than grow yellow, which would be necessary in order to produce a green with the blue. It has been observed, that coloring particles in a state of combination were less disposed to be changed by the action of the air, than in an uncombined state. This is generally the case, but there are some exceptions; an alkali, for instance, produces a contrary effect. A matrass half filled with an infusion of cochineal, was exposed to the light, over mercury; a similar matrass contained an infusion of cochineal made with a little tartar; and in a third, a small quantity of alkali had been added to the infusion. The second matrass appeared least altered in the same space of time, and in it the absorption had been least considerable. In the third, the color of the liquor became first brown, and was then discharged; and the absorption of air, though inconsiderable, was greater than in the two others. On evaporation it assumed a brown color; and left a residuum of a yellowish brown.

44. Similar experiments having been made on different coloring substances, the alkali was found to darken their color, which grew more and more brown, and promoted the absorption of air. Madder appeared to be the only exception to this rule: its color, which became darker at first, stood better than that of the infusion made without alkali. The general effect of alkalis on the coloring particles is consonant to that which it produces on many other substances, such as sulphur; it favors the absorption of air, because it has a strong affinity for the substance which is the result of that absorption. From this effect of alkalis, a fact which has been observed by Becker may be explained; viz. that a vegetable infusion, rendered green by an alkali, becomes gradually yellow, if left exposed to the air, and that when the yellow is completely formed, acids cannot restore the original color: but that this is not the

case, when a vegetable color, reddened by an acid, has been kept in like manner for some time. Those instances in which acids have been employed, which act by giving off their oxygen, must be excepted, for in these there is an extraction of the color.

45. From the above remarks on mordants it must appear very obvious that the practical dyer ought to be exceedingly careful in his selection of substances, giving the preference to those that most readily resist the action of the causes which we have specified.

46. It may not be improper to notice the action of these acids on animal substances, in consequence of its intimate connexion with the subject of mordants. It was observed by M. Brunwiser, that wood, on being exposed to the action of the air, assumed different colors: this led him to endeavour to ascertain whence those colors arose, and to produce them by artificial means. He remarked that on moistening the surface of wood, particularly young wood, with nitric acid, it assumed a yellow color; and that, by applying in the same way the muriatic and sulphuric acids, the wood assumed a violet color. Hence he inferred that, as all colors are produced by a mixture of yellow, blue, and red, all those colors which are seen in the leaves, fruits, and flowers of trees, are owing to the coloring particles which exist in the wood, and are there kept in a state of disguise, by the action of an alkali; that the mineral acids, by taking up this alkali, set the coloring particles at liberty; and that the fixed air, by penetrating the leaves, fruits, and flowers, produces naturally the same effect, by combining with the alkali which kept them disguised.

47. M. de la Folie informs us that having immersed a skein of white silk in nitrous acid of the strength generally used in commerce, the silk in three or four minutes assumed a fine jonquille yellow. He washed it several times in water, that it might not be affected by any adhering acid; the color sustained several trials to which he submitted it, and the silk preserved its lustre unimpaired. When dipped into an alkaline solution, a fine orange color was the result. Dr. Gmelin observes, that he has given a fine brimstone color to silk, by keeping it for a day in cold nitric acid, or some hours only, when the acid was warm. Boiling with soap and water diminished the brightness of this color; and it was changed to a fine lemon color, by being kept for twelve hours in an alkaline solution; but, when the solution was employed hot, a fine gold color was produced. The different solutions of metals in nitric acid communicated a more or less deep yellow to silk, as did also the solution of alumine in the same acid; but those of the calcareous earth and magnesia had no effect whatever.

48. M. Berthollet also found, that the oxygenated muriatic acid has the property of tinging animal substances yellow; but that it does not give them so deep a color as the nitrous acid, and it weakens them much more than that acid when properly diluted; so that the nitrous acid is far preferable for the different purposes of art. It, therefore, appears that the nitrous acid, diluted with a certain quantity of water, gives silk

a yellow color, which is more or less deep, according to the concentration of the acid, its temperature, and the time of immersion; that the silk must be carefully washed as soon as taken out of the acid; that this color possesses considerable brightness; and that it may be made deep without sensibly weakening the silk, which may render the process really useful. The color may also be modified by the use of alkalis. The solutions of calcareous earth and magnesia produce no effect upon silk, because they do not contain an excess of acid; but the solutions of alumine and of all metallic substances, produce a more or less deep yellow, because they all contain more or less excess of acid, which acts upon the silk like uncombined acid.

49. It appears likewise to have been the acid alone that dyed the animal substances yellow, in the experiments of M. Brunwiser, and not the matter extracted from the wood, as he supposed. Nor is the yellow color in these cases owing to iron, as De la Folie supposed; for the purest nitrous acid, which contains no iron, produces it, as well as that in which the presence of that metal may be supposed to exist. Silk, when put into concentrated nitrous acid, quickly assumes a deep yellow color, loses its cohesion, and is dissolved; during this solution, the azote, which enters into the composition of animal substances, is extricated, with a long continued effervescence; if heat be applied, it expels much nitrous gas, and the liquor immediately acquires a deep color and grows brown. At this time, the oxygen of the nitric acid combines with the hydrogen which abounds in animal substances, forming the oil which is obtained from them by distillation, and which renders them so inflammable. When the acid begins to act, and to render the silk yellow, the same effect should also begin to take place. M. Berthollet therefore supposes, that the yellow color arises from a commencement of combustion; but that this combustion being very slight, does not sensibly weaken the silk; if, however, the acid be a little too strong, or the immersion too long continued, or if the whole of it be not carried off by careful washing, the silk immediately becomes weak, and is burnt. It is, therefore, evident why the nitrous acid is preferable in this operation to that which is saturated with nitrous gas; for, in the former, the proportion of oxygen being greater, it is better fitted to produce the effects of combustion, than it becomes in the state of nitrous acid. The same explanation ought to apply to the action of the oxygenated muriatic acid on animal substances; it differs, however, in some essential circumstances, which are not easily explained.

50. Silk has been observed to receive a yellow color when the oxygenated muriatic acid is employed, which is much lighter than when the nitrous acid is made use of; the sulphurous acid discharges it in a great degree, but has no effect on the yellow produced by the diluted nitrous acid. The oxygenated muriatic acid has, however, a much stronger action on the silk; it soon weakens, and even dissolves it; and if it be left for some time in this fluid, the yellow which at first appeared grows lighter, agreeably to what has already been remarked, that oxygen,

by accumulation, is capable of disguising the yellow color occasioned by the combustion, which it had originally induced. Berthollet has endeavoured to explain the effects which the sulphurous acid produces on colors, by the facility with which it gives off its oxygen, and has compared them to those of the oxygenated muriatic acid; but, although it be true that oxygen adheres much more weakly to the sulphurous than to the sulphuric acid, he does not believe that that explanation is founded in truth.

51. It appears from the observation of De la Folie, that roses, whitened by the vapor of burning sulphur, become green in an alkaline lixivium, and red in acids; and M. Berthollet has himself observed, that the sulphurous acid reddened the tincture of turnsole, which has a very fading color, but that it acted only like other acids, on infusions of fustic, Brasil-wood and logwood; and further, that silk which has been exposed to the vapor of sulphur, exhaled the smell of sulphurous acid, when moistened with sulphuric acid, although it could not be perceived before that odor existed. He therefore supposes, that the sulphurous acid commonly unites with the coloring particles, and with the silk, without giving off its oxygen to them, and consequently without producing any combustion; that the product of that combination sometimes loses its color entirely, which is probably owing to the semi-elastic state of the oxygen; but sometimes combustion may, and even commonly should take place by degrees, so that the coloring particles, which have been disguised for some time, ought ultimately to leave a yellow color.

OF ASTRINGENTS.

52. Astringents deserve particular attention, not only from their great use in dyeing, but as possessing a property common to many vegetables. Perhaps, says Berthollet, there is no property in vegetables concerning which such vague ideas have been currently received. A slight relation in taste has frequently been deemed enough to rank them in the class of astringents; and every substance has been commonly regarded as astringent, or acerb, which turned a solution of iron black. This effect has been presumed to arise from one identical principle residing in all the bodies that produce it. Experience has subsequently shown, that two species of astringents ought to be admitted, viz. tannin and gallic acid. The gallic acid is obtained from gall-nuts, in which it is found in great plenty.

53. The gall-nut is an excrescence found on the young branches of the oak, and produced by the puncture of an insect. Different kinds of the gall-nut are met with, some inclining to white, yellow, green, brown, or red; others, ash-colored or blackish. They also differ greatly in magnitude, and are either round or irregular, heavy or light, smooth or covered with protuberances. Those which are small, blackish, knotted, and heavy, are the best; and are known by the name of Aleppo galls. These astringent substances are almost totally soluble in water by long ebullition. Sixteen drachms afforded Neumann fourteen of extract; from the remaining two drachms, only four grains could be extracted

by alcohol. And the same quantity treated first with alcohol, and then with water, afforded twelve drachms and two scruples of spirituous extract, and four scruples of watery extract; the residuum weighed half a scruple more than in the preceding experiment. In the spirituous extract, the taste is more strong and disagreeable than in the watery extract.

54. Many other very interesting observations have been made on astringent substances, by Messrs. Scheele, Monnet, and Berthollet. The latter seems to have proved, that it is not the gallic acid which communicates the astringent properties to the substances that possess it; that the acid itself possesses that property, in a degree inferior to other astringents; and that sumach, treated like the galls, in the manner described by Scheele, affords no gallic acid, though it possesses a high degree of astringency; walnut peels, treated in the same way, do not afford any. The property which the infusion of common galls has, of reddening certain vegetable colors, appears to proceed only from the gallic acid. The infusions of sumach, or of sloe-bark, which very readily produce a black precipitate, that of walnut-tree bark, or of quinquina, did not exhibit this property; and thence it is evident, that the gallic acid does not exist in white galls; for the infusion of these, though it deposit a copious sediment on exposure to the air, is not the gallic acid.

55. If the astringent property were owing to an individual principle distributed in different vegetables, the precipitates obtained by their means, from a solution of iron, would constantly form the same compounds, and exhibit the same appearances and properties; but the precipitate produced by galls is of a blackish blue; that by logwood has a different shade of blue; that by oak is of a fawn color, or blackish brown; that by quinquina, a blackish green. They fall down with different attendant circumstances, and when fixed on stuffs, are discharged by alum and tartar, some much more easily than others; and, probably, by multiplying experiments, many other remarkable differences may be discovered in the properties of these different precipitates. Astringents form with iron different species of compounds, and consequently do not derive their properties from one principle; but there must be a property common to different substances, to enable them to act uniformly on solutions of iron, and to produce precipitates more or less black, and thus appearing of the same nature.

56. The metallic oxides, which unite with the coloring particles, modify their colors; but some metallic oxides, and particularly that of iron, have colors which vary according to the quantity of oxygen they contain. Iron, when united with only a small quantity of oxygen, has a black color. If any substance, by uniting with the oxide of iron, had the property of taking from it a part of the oxygen, which it has when precipitated from its solution in an acid, this would be sufficient to give it a black color; and if the peculiar color of this substance were not predominant, or of itself inclining to black, the compound formed would have a black color; thus ni-

trous gas, either uncombined or weakly attached to the nitrous acid, renders solutions of iron black, and even precipitates the metal, by depriving it of a portion of its oxygen. By acting in the same manner, ammoniac produces a black precipitate with the solutions of iron; in this case, the hydrogen of the ammoniac forms water, by combining with the oxygen that is disengaged from the oxide of the iron. Galls precipitate gold and silver from their solutions, by reducing them to their metallic state; they, therefore, have the property of separating the oxygen from those metals, to which it adheres but slightly; and, from others, that portion which is retained in the weakest degree. Any infusion of galls, of itself, readily assumes a deep brown color, by exposure to the air; though it absorbs but a small quantity of vital air. The infusion of sumach, and that of woods and barks, also acquire a dark color by exposure to the air; so that when acting upon the oxide of iron, by separating a part of its oxygen, an astringent ought itself to acquire a darker color, by which the black should be assisted.

57. Various substances, which have in other respects different properties, produce black with solutions of iron. Among these, some are real coloring particles, and employed as such in dyeing. Logwood, and even most kinds of coloring particles, form brown or blackish precipitates with iron. Sometimes the astringent effect is not instantaneous; the color of the precipitate is at first light; it grows deeper gradually, being darkened in proportion as the iron loses its oxygen. The infusion of fustic produces, with the solution of iron, a yellow precipitate, that grows brown by degrees, and becomes black after a considerable time. But though the property of precipitating solutions of iron black, does not indicate the presence of the same individual principle in the substances which possess it, there can be no inconvenience in calling it by the name of astringent, provided by that term is meant only a property, which is common to a great number of substances, and which they may have in various proportions.

58. The astringent principle is found to precipitate iron from all acids. The acids of phosphorus and arsenic only have a stronger attraction than it has for iron. The phosphoric acid was known to have the property of separating iron from the sulphuric acid; but all acids, except the acetous, and probably some other vegetable acids which have not been tried, redissolve the precipitate, and make the color disappear, until they are saturated with an alkali. It is not surprising, that the astringent principle can unite with metallic oxides, without having the qualities of an acid; for animal substances, oils, even alkalis, and lime, have this property. It is well known, that it is the precipitate composed of iron and the astringent principle, which, by remaining suspended in the liquor, forms ink.

59. But although chemists considered the astringent principle as always the same, experience shows, that all astringent substances are not equally proper for producing a beautiful and durable black; it is of importance to determine which of them may be employed with the greatest success; it is, however, very difficult to make

comparative experiments on this subject with perfect accuracy, because some substances require much longer boiling than others to extract their astringency; because a difference in their coarseness or fineness, when subjected to ebullition, is sufficient to produce differences in the results; and because the coloring particles have a greater or less disposition to combine with the stuff, according to the proportion of sulphate of iron that has been made use of. Solutions of iron in different acids may produce differences in the results, according to the state of oxygenation of the iron in them, according as the proportion of that metal is greater or less, and according to the degree of strength which the different acids, when disengaged, are capable of exerting on the newly-formed compound.

60. In the dyeing of stuffs also some differences will be found to arise from their greater or less attraction for the coloring particles. Dr. Lewis has proved in his excellent observations on the process of making ink, that no known astringent, not even sumach, can be substituted for gall-nuts. If, says M. Berthollet, too large a proportion of sulphate of iron be added to the galls, the ink becomes speedily brown, and then passes to yellow, because the astringent is destroyed by the action of the oxygen, which the sulphate of the iron affords, or progressively attracts from the atmosphere; for we see that oxygen eventually destroys those coloring substances with which it is combined in too great quantities. When this accident happens from age, Dr. Lewis found that an infusion of galls passed over the faded characters restored them. According to Dr. Ure, the best restorative for faded writing is a solution of ferropotassium of potash, faintly acidulated, or sulphuretted hydrogen water. Dr. Lewis ascertained, by repeated experiments, that the best proportion for ink is three parts of gall-nuts to one of sulphate of iron; that cherry-gum, and plum-tree gum, are as good as gum-arabic for giving the necessary consistence, and for keeping suspended the black molecules which tend to fall; and that decoction of logwood employed instead of water for the infusion of the galls improves the beauty of the ink.

61. Mr. Beunie made many experiments to determine the best process for giving cotton a durable black. He first tried what solution of iron gave the finest black to galled cotton; he afterwards combined different solutions, and examined the durability of the blacks which he produced; and made the same experiments on galled cotton, with other metals and semimetals; he employed in like manner a great number of astringents, and tried with them cotton which had received different preparations. He found that out of twenty-one species of astringents, oak saw-dust, the galls of the country, and yellow myrobolans, were the only substances which produced a fine black, but which was still neither so fine nor so durable as that obtained by the common galls. He also found that the oak saw-dust is preferable to the bark, employed by the dyers of thread, and, being cheaper, may be substituted with advantage.

62. Messrs. Lavoisier, Vandermonde, Four-

croy, and Berthollet, made experiments on galls, oak-bark, raspings of heart of oak, the external part of oak, of logwood, and sumach, for the purpose of forming a comparison of their qualities. To ascertain the portion of astringent principle contained in these different substances, they took two ounces of each separately, which they boiled half an hour in three pounds of water; after the first water they added a second, which underwent a similar ebullition; and continued these operations until the substances appeared exhausted: they then mixed together the decoctions that had been successively obtained. A transparent solution of sulphate of iron, in which the proportions of water and sulphate had been exactly determined, was used. They first estimated the quantity of the astringent principle, by the quantity of sulphate which each liquor could decompose, and afterwards by the weight of the black precipitate which was formed. In order to stop precisely at the point of saturation, they proceeded very slowly in the precipitation, and towards the end added the solution of sulphate only drop by drop, and ceased at the moment when the last added quantity no longer augmented the intensity of the black color. When the liquor is too opaque to allow its shade of color to be distinguished, a small quantity of it is largely diluted with water, and, by adding to this a little of the solution of sulphate of iron at the end of a glass tube, it is discovered whether or not the point of saturation has been attained: if we then wish to get the precipitate which is formed, the whole must be diluted with water very copiously.

63. This operation is an easy and accurate mode for manufacturers to determine the proper proportions of astringents, and solutions of iron. To saturate the decoction of two ounces of galls, three drachms and sixty-one grains of iron were required; the precipitate weighed seven drachms and twenty-four grains, when collected and dried. The color of the decoction of oak bark is a deep yellow; a very small portion of sulphate of iron gives it a dirty reddish color, and a larger one changes it to a deep brown. The quantity of sulphate required to saturate the decoction of two ounces of this bark, was eighteen grains. The precipitate, collected and dried, formed coarser and more compact grains, and weighed twenty-two grains; the inner bark of the oak afforded nearly the same result. But the decoction of the raspings of the heart of oak required for its saturation one drachm and twenty-four grains, and the precipitate weighed one drachm and twenty-four grains; the decoction of the external wood of the oak produced very little precipitate. The decoction of sumach acquired a reddish violet color, when a small quantity of the sulphate of iron was added. The quantity required for its saturation was two drachms eighteen grains. The precipitate exactly resembled that afforded by the galls. And the decoction of logwood became of a sapphire blue color, by the addition of sulphate of iron: if the point of saturation be exceeded, the blue becomes greenish and dirty. The exact quantity required for saturation was found to be one drachm forty-eight grains, and the weight of the precipitate was two drachms twelve

grains. The different precipitations made by oak take place readily; that by logwood, a little more difficultly, but still more easily than that which is effected by galls.

64. It was next ascertained, by trials made with cloth, that the quantity of astringent substances required to give a black color of intensity, to an equal weight of the same cloth, was proportional to the quantities of astringent principle, which had been already estimated in each kind from the foregoing experiments; but the black obtained by the different parts of the oak does not resist proofs of color, nearly so well as that which is produced by galls. Logwood alone seems not capable of producing so intense a black as galls or oak; nor does the color which it produces stand the test of proofs so well as that produced by galls.

65. We shall now consider the astringent principle in regard to its property of combining with vegetable and animal substances, particularly the latter. Silk acquires by galling, which is an operation that consists in macerating a stuff in a decoction of some astringent substance, a weight which cannot be taken from it, or diminished beyond a certain degree, by repeated washing; after which operation the stuff when put into a solution of iron is dyed black, because the astringent principle, decomposing the sulphate of iron, forms a triple compound with the oxide of iron and the stuff which is dyed. A stuff that is galled is likewise capable of combining with other coloring particles, the colors of which thereby acquire fixity, if they do not naturally possess it; so that the astringent communicates its durability to the triple compound, or perhaps the more complex one which is formed; but by this union the color generally becomes of a deeper shade. The astringent principle, by combining with animal substances, renders them incapable of corruption, and tends to render their texture more compact; and in this the art of tanning consists.

66. It may be proper to take some notice here of the substance denominated tannin, which, while it has some properties in common with the gallic acid, differs from it in others. Seguin was the first who showed that astringents contained a peculiar substance, which, in combining with skin, gave it the properties of tanned leather, and that the tanning effect arose from the combination thus formed. Tannin may be procured by digesting gall-nuts, grape-seeds, oak-bark, or catechu, in a small quantity of cold water. The solution, when evaporated, affords a substance of a brownish-yellow color, highly astringent, and soluble in water and in alcohol. According to Mr. Brand, the purest form of tannin appears to be derived from bruised grape-seeds; but even here, he observes, it is combined with other substances, from which it is, perhaps, scarcely separable. I have never, says he, been able to obtain it of greater purity than by digesting powdered catechu in water at 33° or 34°, filtering and boiling the solution, which, on cooling, becomes slightly turbid, and is to be filtered again, and evaporated to dryness; cold water, applied as before, extracts nearly pure tannin. The most distinctive cha-

racter of tannin is that of affording an insoluble precipitate when added to a solution of isinglass, or any other animal jelly. On this property the art of tanning depends, for which oak bark is generally employed; but the barks of many other trees are frequently employed for the same purpose. Professor Proust recommends the precipitation of a decoction of galls by powdered carbonate of potassa, for obtaining tannin, washing well the greenish-gray flakes that fall down with cold water, and drying them in a stove. This precipitate becomes brown in the air, brittle and shining like a resin, and yet remains soluble in hot water. In this state the tannin, he says, is very pure. According to Berzelius, tannin consists of hydrogen 4.186 + carbon 51.160 + oxygen 44.654.

67. M. Berthollet considers the abundance of charcoal as the essential characteristic of the astringent principle; the hydrogen, which it contains only in small quantity, is however very much disposed partially to combine with oxygen: Hence, when an infusion of galls is left in contact with vital air, a small quantity of the air only is absorbed, and yet the color of the infusion becomes much deeper; for, in conformity with the theory already laid down, the charcoal readily becomes predominant in consequence of the slight combustion, and the color is rendered deeper, and becomes brown.

68. Substances which contain much charcoal, and can undergo only a slight degree of combustion, ought to possess considerable durability, because charcoal does not combine with oxygen in the ordinary temperature of the air, unless its union be assisted by other attractions, and because slight variations of temperature produce no change in the dimensions of charcoal; but, on the contrary, substances which contain much hydrogen, and in which the particles of the hydrogen are in a state of division, ought to be easily decomposed, by the combination of the hydrogen with azote or oxygen. The disunion of their parts ought to take place from small variations of temperature, because hydrogen is dilatable by heat, which the carbonaceous particles are not. When, therefore, the astringent principle is combined with an animal substance, it communicates to it the properties which it derives from the charcoal; the animal substance becomes less liable to change from slight variations of temperature; instead of growing putrid, it suffers a slight degree of combustion, by the action of the air; for the process of tanning probably could not go on in a perfectly close vessel.

69. On examining the analyses that have been made of indigo, which may be looked upon as the coloring matter least liable to change of any with which we are acquainted, it will be found that this substance leaves, in distillation, a greater proportion of charcoal than even galls themselves. M. Berthollet supposes that it is also to this abundance of charcoal, that the durability of the color of indigo is to be attributed, and that the proportion of this principle is the chief cause of the difference observed in the durability of colors; but the force of adhesion may also have great influence, for a principle

which combines intimately with another substance, ought to form with it a more permanent compound, than one which has only a slight disposition to unite with it; now the astringent principle possesses a very strong disposition to form intimate combinations, especially with animal substances.

70. Upon the same principles may be explained the fixity communicated to coloring particles by alumine, and by those metallic oxides which are not liable to contain different proportions of oxygen, such as the oxide of tin, and some others. The different coloring substances, capable of uniting with metallic oxides, have an action upon them, analogous to that of astringents. The oxides are deprived of more or less of their oxygen, according to the force with which they retain it, the strength of attraction with which the coloring particles tend to combine with them, the proportions in which they meet with each other, and the greater or less disposition of the coloring particles towards combustion.

71. The coloring particles also suffer a change in their constitution from these circumstances: thus the solutions of iron render brown all the colors into which oxide of iron can enter, although it has only a green or yellow color in the state in which it is held in solution by acids, and this effect goes on increasing to a certain degree; but the alteration of the coloring particles may afterwards be carried so far as to spoil their color, and to diminish their tendency to combination; the oxide of iron is then brought back to the yellow color by the oxygen which it attracts, and is capable of retaining. The action of metallic oxides and the coloring particles on each other, explains the changes observed in solutions of the coloring particles, when mixed with metallic solutions. The effect is gradual, as has been shown with respect to fustic. It sometimes happens that the mixture does not even grow turbid immediately, but loses its transparency by degrees, the precipitation begins; the sediment is formed; and its color becomes gradually deeper. In producing these effects, light has sometimes a considerable share.

72. Upon the whole, we may conclude, that metallic colors should be distinguished from those which are peculiar to substances of the vegetable and animal kind: that the colors of metals are modified and changed by oxidation, and by the proportion of oxygen with which they are combined; and that vegetable and animal substances may themselves possess a peculiar color, which varies in the different states through which they pass, or they may owe their colors to colored particles, either combined, or simply mixed with them. These are the particles which are extracted from different substances, and which undergo different preparations, in order to render them proper for the various purposes of dyeing. And the coloring particles possess chemical properties which distinguish them from all other substances: the affinities which they have for acids, alkalis, earths, metallic oxides, oxygen, wool, silk, cotton, and linen, from the principal of these properties. In proportion to the affinity which the coloring

particles have for wool, silk, cotton, and linen, they unite more or less readily and intimately with them: and thence arises the first cause of variation in the processes employed, according to the nature of the stuff, and of the coloring substance employed. And by the affinity which the coloring particles have for alumine and metallic oxides, they form compounds with these substances, in which their color is more or less modified, and becomes more fixed, and less affected by external agents than before. This compound being formed of principles which have separately the power of uniting with vegetable substances, and more especially with animal substances, preserves this property, and forms a triple compound with the stuff; and the color, which has been again modified by the formation of this triple union, acquires a greater degree of fixity, and of indestructibility, when exposed to the action of external agents.

73. The coloring particles have often so great an affinity for alumine and metallic oxides, that they separate them from acids which held them in solution, and fall down with them; but the affinity of the stuff is sometimes necessary, in order that this separation may take place. The oxides of metals, which combine with the coloring particles, modify their colors, not only by their own, but also by acting upon their composition by their oxygen. The change which the coloring particles thereby suffer, is similar to that occasioned by the air, which injures every color in a greater or less degree. In the two different principles which constitute the air or the atmosphere, it is only the oxygenous gas that acts upon the coloring particles. It combines with them, weakening their color, and rendering it paler; but presently its action is principally exerted on the hydrogen, which enters into their composition, and it then forms water. This effect, continues M. Berthollet, ought to be considered as a true combustion, whereby the charcoal which enters into the composition of the coloring particles becomes predominant, and the color commonly changes to yellow, fawn color, or brown; or the injured part, by uniting with what remains of the original color, causes other appearances of a different kind. The combustion of the coloring particles is increased by light, and frequently cannot take place without its aid; it is indeed in this way that it contributes to the destruction of colors. Heat promotes it also, but less powerfully than light, provided its intensity be not very great. The effects of the nitric acid, the oxygenated muriatic acid, and even the sulphuric acid, when they make the color of the substances upon which they act pass to a yellow and even to black, are to be attributed to a combustion of a similar nature.

74. The effects of combustion may, however, be concealed, by the oxygen combining with the coloring particles, without the hydrogen being particularly acted upon by it. But colors are more or less fixed, in proportion to the greater or less disposition of the coloring particles to suffer this combustion. There are some substances also capable of acting on the color of stuffs, by a stronger affinity, or by a solvent power; and in this consists the action of acids, alkalis, and soap.

A small quantity of these agents, however, may sometimes form supercompounds with the stuff, and its color may be altered in that way. The oxides of metals produce in the coloring particles, with which they unite, a degree of combustion proportioned to the quantity of oxygen which these particles can take from them. Therefore the colors, which the compounds of metallic oxides and coloring particles assume, are the product of the color peculiar to the coloring particles, and of that peculiar to the metallic oxide: but the coloring particles and metallic oxides must be considered in that state to which they have been reduced by the diminution of oxygen in the oxide, and the diminution of hydrogen in the particles that produce the color. It follows from this, that the metallic oxides, to which the oxygen is only slightly attached, are not fit to serve as intermedia for the coloring particles, because they produce in them too great a degree of combustion; instances of this kind are the oxides of silver, gold, and mercury. The oxides which undergo considerable alterations of color, by giving off more or less of their oxygen, are also bad intermedia, particularly for light shades, because they produce changeable colors; examples of this kind are the oxides of copper, of lead, and of bismuth. The oxides which strongly retain their oxygen, and undergo very little change of color by the loss of a proportion of it, are the most suitable for this purpose; such is particularly the oxide of tin, which quits its menstruum easily, which has a strong affinity for the coloring particles, and which affords them a basis that is very white, and proper for giving a brightness to their shades, without altering them by the mixture of another color. The oxide of zinc is possessed of some of these properties in a considerable degree.

75. To account for the colors, which proceed from the union of the coloring particles with the basis which a mordant gives them, we must attend to the proportion in which the coloring particles unite to that basis. Thus the solution of tin, which produces a very copious precipitate with a solution of coloring particles, and which thereby proves that the oxide of tin enters in a large proportion into the precipitate, has a much greater influence on the color of the precipitate, by the whiteness of its basis, than the solution of zinc, or that of alum, which generally produce much less copious precipitates. The precipitates produced by these two last substances retain very nearly the natural tint which the coloring particles afforded. It is therefore necessary to distinguish, in the action of mordants, the combinations that may take place by their means, between the coloring particles, the stuff, and the intermedium; the proportions of the coloring substances and intermedium; the modifications of color, which may arise from the mixture of the color of the coloring particles, and of that of the basis to which they are united; and the changes which the coloring particles may suffer, from the combustion that may be produced by the substance that is employed as an intermedium. It is evident also, that astringents do not differ essentially from coloring particles; but the latter take this name, especially when employed

to produce black with oxide of iron, by restoring this metal to the state of a black oxide, and by their assuming a dark color from the action of oxygen.

76. The notion of an astringent supposes, moreover, the property of combining in a certain quantity with animal substances, giving them thus solidity and incorruptibility; because these two properties are most commonly united. These again are derived from their large share of carbon, a circumstance in their composition which gives them increased tendency to solidity, and greater stability.

77. On this ingenious theory of Berthollet, Dr. Bancroft, an able writer on dyeing, has made some remarks that deserve attention. In his opinion M. Berthollet, in ascribing the decays of vegetable and animal coloring matters in general, to effects or changes similar to those of combustion, has gone much farther than is warrantable by facts. It cannot, he thinks, be his intention, that we should apply the term of combustion to alterations which result from a simple addition of oxygen to coloring matters, with a destruction or separation of any of their component parts; though many of the decays and extinctions of these colors evidently arise only from such simple additions of oxygen. The nitric, sulphuric, and other acids, containing oxygen, have the power not only of weakening, but of extinguishing, for a time, the colors of many tingent matters; not by any effect which can properly be denominated a combustion, but rather by a change in their several attractions for particular rays of light; but none of their parts being destroyed, or carried away, the addition of an alkali, or of calcareous carbonate, will generally undo such alteration, and restore the original color, by decomposing and neutralising the acid or oxygen which had caused the alteration.

78. Of this numerous instances might be given, it being the case of almost all vegetable or animal coloring matters. It will be sufficient to mention, that ink dropped into a glass of diluted nitric, vitriolic, or other acid, will lose its color, and that it may be again restored by adding a suitable portion of vegetable or fossil alkali; and that this may be done several times with the same ink, and therefore the change, or loss of color, could not have been the effect of combustion. If, however, this ink had not been fixed by dyeing in the substance either of wool, silk, linen, or cotton, and the substance so dyed had been dipped into a glass of diluted acid, a considerable part of the coloring matter would have been dislodged, and separated from the dyed substance, by its affinity with the oxygen or acid; although no combustion had taken place, the color so separated and lost could not be again restored without a second dyeing. This loss of color would be similar to what frequently happens to colors from exposure to the sun and air, by which they are gradually weakened, many of them without any other change of tint than the simple diminution of their original quantity of coloring matter; and this continuing in the more fugitive colors, particularly that of turneric, the cloth is soon left as white as before it had been

died, without any thing like combustion having ever taken place in it, or in the matter with which it was dyed. It may also be presumed, that colors are not generally impaired by any thing like combustion, from this fact, that there are but few of them which the common muriatic acid does not injure, as much as either the nitric or the sulphuric; and as there can be no combustion without oxygen, and as the common muriatic acid either contains none, or what it does contain is confessedly combined with it by an affinity too powerful to be overcome by any known substance or means, it follows, that the oxygen (if it contain any) cannot be liberated so as to act in the way of combustion upon any other matter; and therefore, when the common muriatic acid changes or destroys the colors, it changes or destroys the affinities upon which they depend, by producing effects different from those of combustion; and as the changes which it produces on colors are in most cases similar to those produced by the nitric, sulphuric, and other acids known to contain oxygen, it is reasonable to conclude, that these also act upon colors, by producing other effects than those of combustion.

79. M. Sennebler exposed a great variety of woods to the action of the sun and air, and found all their colors very soon affected. The white woods generally became brown, and the red and violet changed either to yellow or black. Guaiacum was rendered green; the oak and the cedar were whitened, as were the brown woods generally; effects which certainly do not resemble those of combustion, any more than the bleaching of wax or tallow by exposure to the air. It is therefore evident, argues Dr. Bancroft, that the color of each particular substance depends on its constitution, producing in it a particular attraction for certain rays of light; and a disposition to reflect or transmit certain other rays; and in this respect it may doubtless suffer very considerable changes from the action or combination of oxygen, without any effects similar to those of combustion. And, indeed, the changes of color which arise from the access of atmospheric air, seldom resemble those which the mere predominance of blackness (the supposed natural color of carbon) would produce; though this may have been the case with the coloring matter of brown or unbleached linen, upon which the experiments of M. Berthollet seem principally to have been made. But whether the action of vital air, or its basis, in promoting the decays and colors, ought to be denominated a combustion or not, Dr. Bancroft is confident, that at least some of them are liable to be impaired, not so much by an accession of oxygen, as by the loss of it. The difference of color in arterial and venous blood had been long noticed, and numerous experiments have shown that the fine vermilion color of the former is produced solely by vital air, which it is capable of acquiring through bladders, the coats of blood-vessels, &c. And Mr. Hassenfratz seems to have proved, that, as this fine red color is gained by a dissolution of oxygen in the arterial blood, so it is lost, and the dark color of the venous blood restored, by a separation of the oxygen, in consequence of its forming a new combination with the hydrogen and carbon of the same.

80. Dr. Bancroft is also of opinion, that the blue color of indigo depends upon a certain portion of oxygen, for he has found that a solution of indigo, by losing its oxygen, may become as pellucid, and, excepting a very slight yellowish tinge, as colorless as water, and afterwards speedily return through all the shades of yellow and green to its original deep blue, by exposure to atmospheric or vital air. Similar to this, he remarks, is the fact long since observed by the abbé Nollet, of the tincture of archil employed to color the spirit of wine used in thermometers, and which after some time loses its color, but recovers it again upon being exposed to atmospheric air. This also happens to the infusion of turnsole, and to syrup of violets, which lose their colors when secluded from air, and regain them when placed in contact with it. He has also observed various animal and vegetable colors, produced solely by the contact of atmospheric air; and some others, which, when given by dyeing or callico-printing to wool, silk, cotton, &c., though unable to sustain a single day's exposure to the sun and air without manifest injury, were found to receive none from the action of strong nitric or sulphuric acids, but, on the contrary, were perceived by being wetted with them, and even with oxygenated muriatic and sulphuric acids. But the same colors, if covered with linseed oil, were found to decay more quickly from exposure to the sun and air, than if uncovered. These colors, therefore, he contends, could not owe their decay to the contact or combination of oxygen, because they were not only unhurt, but benefited by its concentrated powers in the nitric, the oxygenated muriatic, and sulphuric acids; and also because they were soonest impaired when defended from the access of oxygen, by being covered with linseed oil. Probably the decays of these colors were occasioned by a loss of at least some part of the oxygen which was necessary to their existence, and which the linseed oil assisted in depriving them of, by the strong affinity it has with oxygen.

81. Dr. Bancroft further observes, that, in forming systems, we are apt to draw general conclusions from only a partial view of facts. This M. Berthollet seems to have done, not only in ascribing the decays of vegetable and animal colors, exclusively to effects similar to those of combustion, but also in representing the oxygenated muriatic acid, as an accurate test for anticipating, in a few minutes, the changes which these colors are liable to suffer by long exposure to the action of sun and air; for, says he, though it is true, that the oxygenated muriatic acid, in weakening or destroying colors, gives up to them more or less of the oxygen which it had received by distillation from manganese; and that, by this new combination of oxygen, those affinities for particular rays of light, upon which their colors depend, are liable to be destroyed; it is nevertheless true, that the changes of color so produced are no certain indication of those, which the combined influence of light and air will occasion upon colors in general; there being several colors which are very speedily destroyed by the latter of these causes, though they resist the strongest action of the oxygenated muriatic acid, without suffering any degree of

injury or hurt. The Dr. adds, that M. Berthollet well knows, since nobody has contributed more to ascertain, how much the properties of oxygen are diversified by each particular basis to which it unites; and that it does not, therefore, seem warrantable to imagine, that its action will not be modified by a basis so powerful as that of the common muriatic acid, or that the united properties of both should represent or resemble those of atmospheric air upon colors, any more than they do in the lungs by respiration; where, instead of supporting life, they would instantly put an end to it.

82. These observations were made in reference to the manner in which M. Berthollet had expressed himself on the subject in his *Elemens de l'Art de la Teinture*, published in 1791. A new edition of this work was published about the year 1804, in which the author has fully noticed Dr. Bancroft's arguments; refuted some of them; admitted the force of others in part; and, in some respects, has availed himself of the important improvements of Dr. Bancroft.

OF THE DIFFERENCES BETWEEN ANIMAL AND VEGETABLE SUBSTANCES.

83. Before we proceed to treat of the practice of dyeing, it will be necessary to consider some of the leading differences that exist between several of the substances to be dyed, and to point out the processes through which they must pass before they will receive the colors required. The following is the substance of M. Berthollet's opinion relative to this subject:—It is now known, that the composition of animal substances is distinguished from that of vegetables, by their abounding in a particular principle called azote, which is found only in small quantities in vegetables, as well as by their containing much more hydrogen, or base of inflammable air, than is found in the other. From these two causes, the differences observed in the distillation of animal and vegetable substances proceed: the former yield a large quantity of ammoniac or volatile alkali; the latter afford very little, and sometimes yield an acid: the former yield a great deal of oil, the predominant principle in which is hydrogen, which is very volatile and disposed to fly off by a small increase of temperature; while the latter sometimes do not yield it in the least sensible quantity.

84. Dr. Ure in a note, p. 151, vol. I. of his translation of Berthollet's treatise, has the following remarks on this theory. Modern researches do not justify this position of M. Berthollet. Sugar and starch, by the analyses of M.M. Gay Lussac and Berzelius, contain about as much hydrogen as fibrin does, and very little less than gelatin and albumen; while, by my analyses, wool and silk contain less hydrogen than cotton and flax. See *Phil. Trans.* for 1822.

I subjoin the results of my analytical experiments on the four principal subjects of dyeing.

	Carbon.	Hydrogen.	Oxygen	Azote.
Wool	53.70	2.80	31.20	12.30
Silk	50.69	3.94	34.04	11.33
Cotton	42.11	5.06	52.83	
Flax	42.81	5.50	51.70	

The first two, independently of the azote, possess a marked difference of composition, from their excess of carbon and deficiency of oxygen.

85. In consequence of this composition, animal substances, when set on fire, produce a bright flame, which breaks out at the beginning, but is soon stifled by the charcoal which is formed, and which has peculiar properties; their combustion is accompanied with a penetrating odor, owing to the ammoniac and oil which escape unconsumed; they are liable to putrefaction, in which process ammoniac is produced, as well as in their distillation, by a more intimate union of the azote and hydrogen; while vegetable substances, on the contrary, undergo the vinous and acetous fermentation. It is evident, that, as animal substances contain a considerable quantity of principles disposed to assume an elastic form, they have less cohesive force among their particles than vegetables, and a greater disposition to combine with other substances; hence they are more liable to be destroyed by different agents, and are more disposed to combine with coloring particles.

86. The consequence of this action on animal substances is, that they cannot bear lies, and that alkalis should be used with great caution in the processes employed for dyeing them; whereas no danger is to be apprehended from the use of alkalis with substances of the vegetable kind. Nitric and sulphuric acids have also a considerable action on animal substances: the former decomposes them, extricates the azote, separates the fatty matter, and forms carbonic acid or fixed air, and oxalic acid or the acid of sugar with a part of the hydrogen and a part of the charcoal; the latter extricates the inflammable gas, probably azotic gas, and reduces the other principles to the state of carbon. Silk bears some resemblance to vegetable substances, from its being less disposed to combine with coloring particles, and by resisting the action of alkalis and acids more powerfully; which may arise either from the same principles being more intimately combined in it than in wool, or more probably, from its containing less azote and hydrogen. But, though the action of alkalis and acids upon silk be weaker than upon wool, they should still be employed with great caution, because the brightness of color required in silk appears to depend upon the smoothness of its surface, which should, on that account, be preserved unimpaired, with every possible attention. Cotton withstands the action of acids much better than flax or hemp. Even the nitric acid does not destroy it without great difficulty.

OF WOOL.

87. The value of wool, and its fitness for the different kinds of manufacture, depend upon the length and fineness of its filaments. Wool is naturally covered with a kind of grease, which preserves it from moths; so that it is not scoured until it is about to be dyed, or formed into yarn. To scour wool, it is generally put for about a quarter of an hour into a kettle, containing a sufficient quantity of water, mixed with one fourth of putrid urine, heated to such a degree as the hand can just bear, and it must be stirred from time to time with sticks. It is then taken

out, put to drain, and carried in a large basket to a running water, where it is moved about until the grease is entirely separated, and no longer renders the water turbid; it is afterwards taken out, and left to drain. It sometimes loses in this operation more than a fifth of its weight. This operation should be conducted with much care, since the more correctly it is performed, the better is the wool fitted to receive the dye. In this process the ammonia or volatile alkali which exists in the urine, readily combines with the oil of the wool, and forms a soap, which, being soluble in water, is dissolved and carried off.

88. Wool is dyed in the fleece before it is spun, when it is intended to form cloths of mixed colors; it is dyed after being spun, when intended principally for tapestry: but it is most generally dyed after having been manufactured into cloth. If wool be dyed in the fleece, its filaments, from being separate, absorb a larger quantity of the coloring particles than when it is spun; for the same reason, woollen yarn takes up more than cloth: but cloths themselves vary considerably in this respect, according to their degree of fineness, or the closeness of their texture. Besides, the variety in their dimensions, the different qualities of the ingredients employed in dyeing, and a difference of circumstances in the process, prevent us from relying upon the precise quantities recommended for the processes. This ought in all dyes to be attended to. It is a fact well known to dyers and others, that the coarse wool from the thighs and tails of some sheep receives the coloring particles with great difficulty. The finest cloth is never fully penetrated with the scarlet dye, hence the interior of the cloth appears always of a lighter shade when cut, and sometimes almost white. For the generality of colors, wool requires to be prepared by a bath, in which it is boiled with saline substances, principally with alum and tartar; but there are some dyes for which the wool does not require such a preparation; then it must be well washed in warm water, and wrung out, or left to drain.

89. The surface of the filaments of wool or hair is not quite smooth; for, although no roughness or inequality can be discovered, yet they seem to be formed of fine laminae placed over each other in a slanting direction, from the root of the filament towards the point, resembling the arrangement of the scales of a fish, which cover each other from the head of the animal to its tail. This peculiarity of structure is proved by a simple experiment. If a hair be held by the root in one hand, and drawn between the fingers of the other hand, from the root towards the point, hardly any friction is perceived, and no noise is heard; but if it be seized by the point, and passed in the same manner between the fingers from the point towards the root, a resistance is felt, and a tremulous motion is perceptible to the touch, while the ear perceives a slight noise. Thus it appears, that the texture is not the same from the root towards the point, as it is from the point towards the root. This is farther confirmed by another experiment. If a hair be held between the thumb and fore-finger,

and they be rubbed against each other in the longitudinal direction of the hair, it acquires a progressive motion towards the root. This effect depends not on the nature of the skin of the finger, or on its texture, for if the hair be turned and the point placed where the root formerly was, the motion is reversed, that is, it will still be towards the root.

90. On this peculiarity of structure, which was observed by M. Monge, depend the processes of felting and fulling of hair and wool for different purposes. In the process of felting, the flocculi of wool are struck with the string of the bow, by which the filaments are detached, and dispersed in the air. These filaments fall back on each other in all directions, and, when a layer of a certain thickness is formed, they are covered with a cloth, on which the workman presses with his hands in all parts. By this pressure the filaments are brought nearer to each other; the points of contact are multiplied; the progressive motion towards the root is produced by the agitation; the filaments entangle each other; and the laminae of each taking hold of those of the others, which are in an opposite direction, the whole is retained in a state of close contexture.

91. Connected with this operation is that of fulling. The roughness on the surface of the filaments of wool, and their tendency to acquire a progressive motion towards the root, produce great inconvenience in the operations of spinning and weaving. This inconvenience is obviated by covering the filaments with a coat of oil, which fills up the pores, and renders the asperities less sensible. When these operations are finished, the stuff must be freed from the oil, which would prevent it from taking the color with which it is to be dyed. For this purpose it is taken to the fulling-mill, where it is beaten with large beetles, in a trough of water, through which clay has been diffused. The clay unites with the oil, which, being thus rendered soluble in water, is carried off by fresh portions of water, conveyed to it. In this way the stuff is scoured; but this is not the sole object of the operation. By the alternate pressure of the beetles, an effect similar to that of the hands of the workman, in the operation of felting, is produced. The filaments composing a thread of warp or woof, acquire a progressive motion; are entangled with the filaments of the adjoining threads; those of the latter into the next, and so on, till the whole become felted together. The stuff is now contracted in all its dimensions, and, participating both of the nature of cloth and of felt, may be cut without being subjected to ravel; and, when employed to make a garment, requires no hemming. In a common woollen stocking web, after this operation, the stitches are no longer subject to run, and, the threads of the warp and woof being less distinct from each other, the whole stuff is thickened, and forms a warmer covering.

OF SILK.

92. Silk in its natural state is coated over with a substance which has generally been considered as a kind of gum or varnish. To this

substance the silk is supposed to owe its elasticity and stiffness. Besides this varnish, the silk usually met with in Europe is impregnated with a substance of a yellow color, and, for most of the purposes for which silk is required, it is necessary to free it from both the varnish and the coloring matter. To effect this, the silk is subjected to the operation of scouring; but it is very obvious that when the silk is to be dyed, the scouring need not be carried so far as is required where it is to remain white. Different colors, also, will require different degrees of scouring; and this difference is generally regulated by the quantity of soap employed: 100 pounds of silk boiled in a solution of twenty pounds of soap, for three or four hours, supplying a little water occasionally because of the evaporation, will be sufficiently prepared to receive the common colors. For blue colors the proportion of soap must be greater; and scarlet, cherry color, &c., require a still greater proportion, because for those colors the ground must be whiter.

93. When silk is to be employed white, it must undergo three operations. The first consists in keeping the hanks of silk in a solution of thirty pounds of soap to 100 of silk: this solution ought to be very hot, but not boiling; when any part of the hanks immersed is entirely free from its gum, which is known by the whiteness it acquires, the hanks are to be shaken over, as the dyers term it, so that the part which was not before immersed, may undergo the same process. They are then taken out and wrung, as the process is finished.

94. In the second operation the silk is put into bags of coarse cloth, each bag containing from twenty-five to thirty pounds. A solution of soap is prepared as in the former case, but with a smaller proportion of soap. In this the bags are boiled for an hour and a half; and that they may not receive too much heat by resting on the bottom of the vessel, they must be constantly stirred during the operation.

95. The third operation is to communicate to the silk different shades, that the white may be rendered more pleasing. These shades are known by different names, as China-white, silver-white, azure-white, or thread-white. For this purpose a solution of soap is also prepared, of which the proper degree of strength is ascertained by its manner of frothing by agitation. For the China-white, which is required to have a slight tinge of red, a small quantity of anatto is added, and the silk is shaken over in it till it has acquired the shade required. In other whites, a blue tinge is given by adding a little blue to the solution of soap. The azure-white is produced by means of indigo. To prepare the azure, fine indigo is well washed in moderately warm water, after which boiling water is poured upon it. It is then left to settle, and the liquid part only, which contains the finer and more soluble parts, is employed.

96. Some use no soap in the third operation, but, when the second is completed, they wash the silks, fumigate with sulphur, and azure them with river water, which should be very pure. But all these operations are not sufficient to give

silk that degree of brightness which is necessary, when it is to be employed in the manufacture of white stuffs. For this purpose it must undergo the process of sulphuration, in which the silk is exposed to the vapor of sulphur. But before the silk which has been thus treated is fit for receiving colors, and retaining them in their full lustre, the sulphur which adheres to it must be separated by immersion and agitation for some time in warm water, otherwise the colors are tarnished and greatly injured.

97. It has long been an object of considerable importance, to deprive silk of its coloring matter, without destroying the gum, on which its stiffness and elasticity depend. A process for this purpose was discovered by Beauné, but, as it was not made public, others have been led to it by conjecture and experiment. The following account, given by Berthollet, is all that has transpired concerning this process. A mixture is made with a small quantity of muriatic acid and alcohol. The muriatic acid should be in a state of purity, and entirely free from nitric acid, which would give the silk a yellow color. In the mixture thus prepared, the silk is to be immersed.

98. One of the most difficult parts of the process, especially when large quantities are operated upon, is to produce a uniform whiteness. In dyeing the whitened silk, there is also some difficulty in preventing its curling; hence, it is recommended to keep it constantly stretched during the drying. The muriatic acid seems to be useful in this process, by softening the gum, and assisting the alcohol to dissolve the coloring particles which are combined with it. The alcohol which has been impregnated with the coloring matter may be again separated from it and purified, and may thus serve in future operations, and render the process more economical. This may be effected by distillation with a moderate heat, in glass or stone-ware vessels.

The preparation with alum is a very important preliminary operation in the dyeing of silk. Without this process, few colors would have either beauty or durability. Forty or fifty pounds of alum, dissolved in warm water, are mixed in a vat, with forty or fifty pails of water; and, to prevent the crystallisation of the salt, the solution must be carefully stirred during the mixture. The silk being previously washed and beetled, to separate any remains of soap, is immersed in this alum liquor, and after eight or nine hours is wrung out, and washed in a stream of water: 150 pounds of silk may be prepared in the above quantity of liquor; but when it begins to grow weak, which may be known by the taste, twenty or twenty-five pounds of alum are to be added, and the addition repeated till the liquor acquires an offensive smell. It may then be employed in the preparation of silk intended for darker colors, till its whole strength is dissipated. This preparation of silk with alum must be made in the cold; for when the liquor is employed hot, the lustre is impaired.

OF COTTON.

99. Cotton is the down or wool obtained from the pods of the gossypium, a shrubby plant which

grows in warm climates. Cottons differ principally in the length of their filaments, their fineness, strength, and color. This substance has different shades, from a deep yellow to a white. The most beautiful is not always the whitest; it is necessary to bleach it, by processes similar to those employed in the bleaching of linen. Or, instead of these, oxygenated muriatic acid may be employed; and a more beautiful white thus produced, than by the ordinary way of bleaching. M. Berthollet succeeded in bleaching the yellow cotton of St. Domingo, which very obstinately retains this bad color. But, that cotton may be disposed to receive the dye, it must undergo scouring. Some boil it in sour water, but more frequently alkaline lie is used; the cotton must be boiled in it for two hours, and then wrung out; after which it must be rinsed in a stream of water, till the water comes off clear; it must then be carefully dried. The cotton stuffs, which are to be prepared, must be soaked for some time in water, mixed with at most one-fiftieth of sulphuric acid; after which, they must be carefully washed in a stream of water, and dried. M. Berthollet has observed, that the acid which had been used in this operation, had taken up a quantity of calcareous earth and iron, which would have injured the colors very much. Aluming and galling are generally employed in the dyeing of cotton and linen. In the preparation with alum, about four ounces of it are required to each pound of stuff; it must be dissolved with the precautions above-mentioned. Some add a solution of soda in the proportion of one-sixteenth of the alum; others a small quantity of tartar and arsenic. The thread is well impregnated by working it pound by pound in this solution; it is then put altogether into a vessel, and what remains of the liquor is poured upon it. This is left for twenty-four hours, and then removed to a stream of water, where it remains for about two hours, to extract a part of the alum, and is then washed. Cotton, by this operation, gains about one-fortieth of its own weight.

100. In the operation of galling, it is usual to employ different quantities of galls or other astringents, according to their quality, or the effect to be produced. Powdered galls are boiled for about two hours, in a quantity of water proportioned to that of the thread to be galled; the liquor is then allowed to cool to a temperature which the hand can bear, after which it is divided into a number of equal parts, that the thread may be wrought pound by pound; and what remains is poured upon the whole together. It is then left for twenty-four hours, when intended for black, but for other colors twelve or fourteen hours are sufficient. It may then be wrung out, and carefully dried. When stuffs are galled, which have already received a color, the operation is to be performed in the cold, that the color may suffer no injury. M. Berthollet found that cotton which had been alumed, acquired more weight in the galling than that which had not undergone that process; although alum adheres but in a small quantity to cotton, it communicates to it a greater power of combining, both with the as-

tringent principle and with the coloring particles of different substances.

OF FLAX.

101. Flax must undergo several preparations before it be fit to receive the dye. Of these, the watering is an operation of much consequence, from its influence on the quality and quantity of the product, and from its deleterious effects on the air. In this operation, a glutinous juice, which holds the green coloring part of the plant in solution, undergoes a greater or less degree of decomposition, according to the mode of conducting the operation. This matter seems to resemble the glutinous part, that is held dissolved in the juice procured from green plants by pressure, which is separated along with the coloring particles by a heat approaching to that of ebullition, which becomes putrid, and which affords ammonia by distillation; but it is probable, that water alone cannot sufficiently separate it from the cortical parts: whence the hemp, which has been watered in too strong a current, is deficient in its softness and pliability, &c. But if the water employed be stagnant and putrid, the hemp acquires a brown color, loses its firmness, and emits highly noxious vapors. This process is therefore performed to the greatest advantage, in watering pits situated on the banks of rivers, where the water may be changed often enough to prevent a putrefaction, that would injure the hemp, and be prejudicial to the workmen; yet not so often as to hinder the degree of putrefaction which is necessary to render the water capable of dissolving the glutinous substance. To prepare flax for the dye, it must also be subjected to the operations of scouring, aluming, and galling, in the same manner as cotton.

PART II.

THE PRACTICE OF DYEING.

102. Before we proceed to give directions for the various processes to be observed in the practice of dyeing, we shall take a brief view of M. Berthollet's observations on dyeing operations in general, which cannot fail to be interesting to the practical dyer.

103. 'It may be regarded,' says he, 'as a general principle, that processes performed in a great manufactory are more advantageous than those which are insulated, since, from the subdivision of labor, each workman, occupied with a single object, acquires celerity and perfection in his employment, by which means the saving of time and labor becomes very considerable.'

104. This principle is particularly applicable to the art of dyeing, as the preparation which remains after one operation may often be advantageously employed in another. A bath from which the coloring matter has been nearly extracted in the first operation may be used as a ground for other stuffs, or, with the addition of a fresh portion of ingredients, may form a new bath. The galls which have been applied to the galling of silk may answer a similar purpose for cotton or wool. From this it is evident that the limitations under which the art of dyeing labors

in some countries must tend to obstruct its progress and improvement.

105. A dye-house should be situated as near as possible to a stream of water, and should be spacious and well lighted. It should be floored with lime and plaster; and proper means should be adopted to carry off water or spent baths by forming channels or gutters, so that every operation may be conducted with the greatest attention to cleanliness.

106. The size and position of the boilers are to be regulated by the nature and extent of the operations for which they are designed. Excepting for scarlet and other delicate colors, in which tin is used as a mordant, in which case tin vessels are preferable, the boilers should be of brass or copper. Brass, being less apt than copper to be acted on by means of chemical agents, and to communicate spots to the stuffs, is fitter for the purpose of a dyeing vessel. It is scarcely necessary to say that it is of the greatest consequence that the coppers be well cleaned for every operation; and that vessels of a large size should be furnished at the bottom with a pipe and stop-cock for emptying them; there must also be a contrivance above each copper to support the poles for the purpose of draining the stuffs which are immersed, so that the liquor may fall back into the vessel, and prevent waste.

107. Dyes for silk, where a boiling heat is not necessary, are prepared in troughs or backs, which are long copper or wooden vessels. The colors which are used for silk are extremely delicate. They must therefore be dried quickly, that they may not be long exposed to the action of the air, and that there may be no risk of change. For this purpose, it is necessary to have a drying room heated with a stove. The silk is stretched on a moveable pole, which by the dyers is called a shaker. This is hung up in the heated chamber, and kept in constant motion to promote the evaporation.

108. For pieces of stuffs, a winch or reel must be used; the ends of which are supported by two iron forks which may be put up at pleasure in holes made in the curb on which the edges of the copper rest. The manipulations in dyeing are neither difficult nor complicated. Their object is to impregnate the stuff to be dyed with the coloring particles, which are dissolved in the bath. For this purpose, the action of the air is necessary, not only in fixing the coloring particles, but also in rendering them more vivid; while those which have not been fixed in the stuff are to be carefully removed. In dyeing whole pieces of stuff, or a number of pieces at once, the winch or reel mentioned above must be employed. One end of the stuff is first laid across it, and, by turning it quickly round, the whole passes successively over it. By turning it afterwards the contrary way, that part of the stuff which was first immersed will be the last in the second immersion, and by this means the coloring matter will be communicated as equally as possible.

109. In dyeing wool in the fleece, a kind of broad ladder with very close rounds, called by the dyers of this country a scraw, or seray, is used. This is placed over the copper, and the wool is

put upon it for the purpose of draining and exposure to the air, or when the liquor is to be changed.

110. To separate the superabundant coloring particles, or those which have not been fixed in the stuff, after being dyed, it must be wrung out. This operation is performed with a cylindrical piece of wood, one end of which is fixed in the wall, or in a post. This operation is often repeated a number of times successively, for the purpose of drying the stuffs more rapidly, and communicating a brighter lustre. When, after a certain quantity of fresh ingredients is added to a liquor, and it is stirred about, it is said to be raked, because it is mixed with the rake. In dyeing, one color is frequently communicated to stuffs, with the intention of applying another upon it, and thus a compound color is produced. The first of these operations is called giving a ground. When it is found necessary to pass stuffs several times through the same liquor, each particular operation is called a dip. A color is said to be rosed, when a red color, having a yellow tinge, is changed to a shade inclining to a crimson or ruby color; and the conversion of a yellow red to a more complete red, is called heightening the color.

111. In addition to these general remarks, we might give more minute details of the different operations which are employed in dyeing; but, as we cannot presume that they would be of much advantage to the practical dyer, we shall not indulge in useless description. Although the manipulations of dyeing are not very various, and appear extremely simple, they require very particular attention, and an experienced eye, in order to judge of the qualities of the bath, to produce and sustain the degree of heat suited to each operation; to avoid all circumstances that might occasion inequalities of color, to judge accurately whether the shade of what comes out of the bath suits the pattern, and to establish the proper gradations in a series of shades.

112. We shall here make a few observations on the qualities and effects of different kinds of water, which may be considered as one of the most essential agents in the art of dyeing. It is almost unnecessary to remark that water which is muddy, or contains putrid substances, should not be employed; and, indeed, no kind of water which possesses qualities distinguished by the taste, ought to be used. Water which holds in solution earthy salts, has a very considerable action on coloring matters, and it is chiefly by means of these salts. Such, for instance, are the nitrates of lime and magnesia, muriate of lime and magnesia, sulphate of lime, and carbonate of lime and of magnesia.

113. These salts, which have earthy bases, oppose the solution of the coloring particles, and by entering into combination with many of them cause a precipitation, by which means the color is at one time deeper, and at other times duller than would otherwise be the case. Waters impregnated with the carbonates of lime and magnesia, yield a precipitate when they are boiled; for the excess of carbonic acid which hold them in solution is driven off by the heat; the earths are thus precipitated, and adhering to the stuffs

to be dyed, render them foul, and prevent the coloring matter from combining with them.

114. It is of much consequence to be able to distinguish the different kinds of water which come under the denomination of hard-water, that they may be avoided in the essential operations of dyeing; but to detect different principles contained in such waters, and to ascertain their quantity with precision, require great skill, and very delicate management of chemical operations, which the experienced chemist only can be supposed to possess.

115. One of these tests is the soap solution, by which it may be discovered whether water contain so large a portion of any of these saline matters as may be injurious to the processes. Salts which have earthy bases have the property of decomposing soap by the action of double affinity. The acid of the salt combines with the alkali of the soap, and remains in solution, while the earth of the salt and the oil of the soap enter into combination, and form an earthy product which is insoluble in water, and produces the curdling appearance which is the consequence of this new combination. Water, then, which is limpid, which has no perceptible taste or smell, and has the property of dissolving soap without decomposition, is sufficiently pure for the processes of dyeing. All waters which possess these qualities will be found equally proper for these purposes.

116. But, as it is not always in the power of the dyer to choose pure water, means of correcting the water which would be injurious, and particularly for the dyeing of delicate colors, have been proposed. Water in which bran has been allowed to become sour, is most commonly employed for this purpose. This is known by the name of sours, or sour water. The method of preparing sour water is this: Twenty four bushels of bran are put into a vessel that will contain about ten hog-heads. A large boiler is filled with water, and when it is just ready to boil, it is poured into the vessel. Soon after the acid fermentation commences, and in about twenty hours the liquor is fit for use. Water which is impregnated with earthy salts, after being treated in this way, forms no precipitate when boiled.

117. Mucilaginous plants are sometimes boiled in the water for the purpose of correcting it, when a froth forms that is to be carefully skimmed off as it rises. The mucilage coagulates, carrying with it the earths which separate on the volatilisation of the carbonic acid, as well as those that are merely mixed with the water and which render it turbid.

The salts, however, which have an earthy base, and which are in general injurious to dyeing, do, in certain cases, serve to modify the colors when the object of the dyer is to obtain deep shades. In this way, for example, a crimson hue is given to the color produced by cochineal.

OF DYEING BLACK.

118. We now proceed to give an account of the most useful and advantageous processes for dyeing different colors, and begin with the method of dyeing black.

It has been justly observed, by an able writer on this subject, that absolute black being a complete privation of all color, can scarcely be ascribed to any body in nature, since it must then become invisible. The color so named, as communicated by dye-stuffs, is, indeed, rather an intense blue or brown, and is generally produced by the union of these coloring matters with a ferruginous mordant, and hence it may not improperly be termed a compound color. The juice of the cashew nut communicates a black that will not wash out, and which resists boiling with soap or alkalis. The anacardium occidentale and the toxicodendron afford a durable dye, but it is of a brownish hue. The juice of the sloe affords a pale tint of a brownish cast, which becomes deeper after having been repeatedly washed with soap, and afterwards wetted with a solution of alkali. On boiling sloes, their juice becomes red, and the red tinge, which in that state it imparts to linen, is converted by washing with soap into a bluish color of some durability. But these methods of obtaining a black color cannot be employed in dyeing, because these substances are not to be obtained in sufficient quantity, and the black which they afford is not equal to that formed by the common processes. All black colors, therefore, are the effects of combination. To produce them, the black particles formed by the union of the astringent principle with the oxide of iron, held in solution by an acid, are fixed on the stuff that is intended to be dyed.

119. There are very few substances which have the property of producing of themselves a permanent black color. The juice of some plants is found to produce this effect on cotton and linen.

120. When the particles are precipitated from the mixture of an astringent and a solution of iron, they have only a blue color; if they be then left exposed to the air, and moistened with water, their color becomes deeper, but still the blue is distinguishable. The stuff itself then contributes to increase the intensity of the black, whether it be that in this state of combination it undergoes a slight combustion, or that the coloring particles undergo a further degree of combustion, from presenting a larger surface to the air. Without the action of the air, however, a fine black cannot be produced; on which account the operations are performed at different intervals, during which the stuff is taken out of the bath, that it may be exposed to the air. M. Berthollet has ascertained, that black stuffs placed in contact with pure air diminish its volume, and consequently absorb a certain portion of it.

121. *Of Dyeing Woollen Black.*—From the process described by Hellot, woollen cloth, to be dyed black ought to receive the deepest blue tint, or mazarine blue, to be washed in the river as soon as taken out of the vat, and afterwards cleansed by the fulling mill.

For every hundred pounds of stuff, ten pounds of logwood, and ten pounds of galls reduced to powder, are put into a bag, and boiled with a sufficient quantity of water, for twelve hours. A third of this liquor is put into another copper, with two pounds of verdigris. The stuff is im-

mersed in this, and continually stirred for two hours. The liquor should be kept hot, but it ought not to boil. At the end of two hours the stuff is taken out, and a similar portion of the liquor is put into the copper, with eight pounds of sulphate of iron. During the solution of the copperas, the fire is diminished, and the liquor is allowed to cool for half an hour, stirring it well the whole time. The remainder is then to be added, and, after making this addition, the bag containing the astringent matters should be strongly pressed, to separate the whole. A quantity of sumach, from fifteen to twenty pounds, is now to be added, and the liquor is just raised to the boiling temperature; and when it has given one boil, it is to be immediately stopped with a little cold water. A fresh quantity of sulphate of iron, to the amount of two pounds, is then added, and the stuff is kept in it for another hour, after which it is taken out, washed and aired; it is again put into the copper, and constantly stirred for an hour. It is then carried to the river, well washed, and fullered. To soften the black color, and make it more firm, another liquor is prepared with weld. This is made to boil for a moment, and when it is cooled the stuff is passed through it. By this process, which is indeed somewhat complicated, a beautiful black color is produced.

122. But the methods usually followed for dyeing black, are more simple. Cloth, which has been previously dyed blue, is merely boiled in a vat of galls for two hours. It is then kept two hours, but without boiling, in the vat of logwood and sulphate of iron, and afterwards washed and fullered. According to Hlloot's process, a liquor is to be prepared of a pound and a half of yellow wood, five pounds of logwood, and ten pounds of sumach, for every fifteen yards of deep blue cloth; and, the cloth having boiled in this for three hours, ten pounds of sulphate of iron are added; the cloth is allowed to remain for two hours longer, when it is taken out and aired, after which it is again returned to the vat for an hour, and then washed and fullered.

When stuffs are to be dyed at less expense, instead of the blue ground, a brown or root-colored ground may be substituted. This brown or fawn color is communicated by means of the root of the walnut-tree, or green walnut-peels. The stuffs are then to be dyed black, according to some of the methods already described.

123. The proportions of the ingredients employed by the English dyers are, for every hundred pounds of cloth previously dyed a deep blue, about five pounds of sulphate of iron, five pounds of galls, and thirty of logwood. The first step in the process is to gall the cloth, after which it is passed through the decoction of logwood, to which the sulphate of iron has been added.

124. As a substitute for galls, the leaves of the arbutus, ura ursi, have been recommended, and employed. The leaves must be carefully dried, so that the green color may be preserved: 100 pounds of wool are boiled with sixteen pounds of sulphate of iron, and eight of tartar, for two hours; the following day the cloth is to be rinsed as after aluming; 150 pounds of the

leaves are then to be boiled for two hours in water, and after being taken out, a small quantity of madder is to be added to the liquor, putting in the cloth at the same time, which is to remain about an hour and a half. It is then taken out and rinsed in water. By this process, it is said, that blue cloth receives a tolerably good black, but white cloth becomes only of a deep brown.

125. After the operations for dyeing the cloth have been finished, it is washed in a river, and fullered, till the water runs off colorless. Soap suds are recommended by some in fulling fine cloths, but it is rather difficult to free the cloth entirely from the soap. After the cloth has come from the fulling mill, some propose to give it a dip in a bath of weld, by which it is said to be softened, and the color better fixed; but, according to Lewis, this operation, which in other cases is of advantage, is useless after the cloth has been treated with the soap suds.

126. *Of Dyeing Silk Black.*—In communicating a black color to silk, different operations are necessary, such as boiling, galling, repairing the vat, dyeing, and softening. To give a deeper shade to silk, it is necessary to deprive it of the gummy substance of which we have already spoken. This is done by boiling it four or five hours with one-fifth of its weight of white soap, and afterwards beetling and carefully washing it. The gummy substance, before mentioned, which silk in its natural state contains, does not increase the strength of the silk, which is then called raw; but renders it more liable to wear out, from the stiffness it imparts to it: and though raw silk takes a black color with more facility, than silk which has been scoured or divested of its gum, that black is much less perfect, and resists the re-actives calculated to dissolve the coloring matter, in a much less forcible manner.

127. In the process of galling silk, three-fourths of its weight of galls are to be boiled for three or four hours, but the proportion must depend on their quality. After the boiling, the liquor is allowed to remain at rest for two hours; the silk is then put into the bath, and left there from twelve to thirty-six hours, when it is to be taken out, and washed in the river. But as silk is capable of combining with a great proportion of the astringent principle, or tan, from which it receives a considerable increase of weight, it is allowed to remain for a longer or shorter time, as the silk is required to have more or less additional weight. Hence to communicate to silk, what is called a heavy black, it is allowed to remain longer in the gall-liquor; the process is repeated oftener, and the silk is dipped in the dye a greater number of times.

128. While silk is preparing for the process of dyeing, the vat is to be heated, and should be occasionally stirred, that the grounds which fall to the bottom may not acquire too much heat. It should always be kept under the boiling temperature. Gum and solution of iron are added in different proportions, according to the different processes. When the gum is dissolved, and the liquor near the boiling temperature, it is left to settle for about an hour. The silk, which in general is previously divided into three parts,

that each may be successively put into the vat, is now immersed in it. Each part is then to be three times wrung, and, after each wringing, hung up to air. The silk, being thus exposed to the action of the air, acquires a deeper shade. This operation being finished, the bath is again heated, with the addition of gum and sulphate of iron, and this is repeated two or three times, according as the black required is light or heavy. When the process is finished, the silk is rinsed in a vessel with some cold water, by turning or shaking it over.

129. Silk, after it has been taken out of the dye, is extremely harsh, to remove which it is subjected to the operation of softening. A solution of four or five pounds of soap for every 100 pounds of silk, is poured through a cloth into a vessel of water. The solution being completed, the silk is immersed, and allowed to remain in it for about fifteen minutes; it is then to be wrung out and dried.

130. When raw silk is to be dyed, that which has a natural yellow color is preferred. The galling operation must be performed in the cold, if it be desired to preserve the whole of the gum, and the elasticity which it gives to the silk; but if part only of it is wished to be preserved, the galling is to be performed in the warm vat.

131. The dyeing is also performed in the cold. All that is necessary is to add the sulphate of iron to the water in which the stuff is rinsed. By this simple process, the black dye is communicated. It is then washed, beetled once or twice, and dried without wringing, that its elasticity may not be destroyed. Raw silk may be dyed by a more speedy process. After galling, it may be turned or shaken over in the cold bath; and thus by alternately dipping and airing the stuff, the operation may be completed. It is then to be washed and dried as before.

132. The method of dyeing velvet at Genoa, which has been simplified and improved in France, is thus described by Macquer. For every 100 pounds of silk, twenty pounds of Aleppo galls, reduced to powder, are boiled in a sufficient quantity of water for an hour. The bath is allowed to settle till the galls have fallen to the bottom; they are then taken out, and two pounds and a half of sulphuric acid, twelve pounds of iron filings, and twenty pounds of gum, are put into a copper, pierced with holes in all directions. This vessel is suspended by means of two rods passed through its handles, in the boiler, but so as not to touch the bottom. The gum is left for an hour to dissolve, but must be stirred occasionally. If after this time the gum has not all left the pierced copper, it is a proof that the liquor is saturated with it; but if, on the contrary, the whole has disappeared, from two to four pounds more may be added. This cullender should remain constantly suspended in the boiler, except when the dyeing is going on, during which time it must be removed. During these operations the boiler must be kept hot, but not allowed to boil. The galling of the silk is performed with one-third of its weight of Aleppo galls. The silk is allowed to remain in the liquor for six hours the

first time; then for twelve; and for the rest, *secundum artem*.

133. Dr. Lewis remarks, that though white silk may be dyed a good black, without using either logwood or verdigris, the addition of those two ingredients contributes greatly to improve the color both in silk and in wool. But as the great use of galls in dyeing silk black renders it very expensive, it is of consequence to find some method of diminishing their quantity. M. Anglès proposes the following process:—When the silk has been carefully boiled and washed in the river, it is to be immersed in a strong decoction of green walnut-peels, and left in it till the color of the bath is exhausted. It is then taken out, slightly wrung, dried, and washed in the river. The decoction of walnut-peels is made by boiling a full quarter of an hour, when it is taken from the fire, and suffered to subside before dipping the silk, which has been previously immersed in warm water. A blue ground is next given by means of logwood and verdigris. For every pound of silk, an ounce of verdigris is dissolved in cold water: the silk is left in this solution two hours; it is then dipped in a strong decoction of logwood, wrung out slightly, and dried before it is washed at the river. For light blacks, galling may be altogether omitted; but for a heavy black, half a pound of galls must be employed for every pound of silk intended to be dyed. To prepare the liquor, two pounds of galls and three of sumach are macerated in twenty-five gallons of water over a slow fire, for twelve hours. After straining, three pounds of sulphate of iron, and as much gum arabic are dissolved in it. In this solution the silk is dipped at two different times, leaving it in two hours each time, taking care to air it after the first dipping, and to dry it before giving the second fire, when it is to be again aired and dried: it is then beetled twice at the river; after which a third fire is given it, in the same manner as before, except that it is left in the liquor four or five hours. When drained and dried, it is again beetled twice at the river. The heat during the operation must not exceed 120° of Fahrenheit's thermometer; and before the last two fires, an addition of half a pound of sulphate of iron and as much gum arabic is to be made.

For removing the harshness that silk acquires from the black dye, M. Anglès proposes that a decoction of weld should be preferred to a solution of soap; and observes that if silk be dyed blue with indigo, previous to its being dipped for black, it will take only a mealy black, but that a velvety black will be obtained, if it be prepared with logwood and verdigris; and that green walnut-peels soften the silk.

134. *Of Dyeing Cotton and Linen Black.*—To impart to cotton and linen a deep black dye that will resist the action of soap, is attended with considerable difficulty. Several methods have been proposed as improvements on the old process; the following, practised at Rouen, is thus described by M. d'Apligny. The stuffs are first dyed sky-blue in the usual manner, and are then wrung out and dried. After this they are galled for about twenty-four hours, allowing four ounces

of galls to every pound of stuff; they are then again wrung, and well dried.

The liquor, known among dyers by the name of the black cask, is then poured into a tub, five quarts for every pound of stuff, and in this the stuffs are worked by the hand, in small portions, for about a quarter of an hour, when they are again wrung out and dried. This operation is repeated twice; adding each time a fresh quantity of the black liquor, well scummed. After this it is again aired, wrung out, washed at the river, and dried carefully. For the finishing process, a pound of alder bark for every pound of stuff is boiled for an hour, in a sufficient quantity of water. About half the liquor that was used for the galling, and half as much sumach as alder bark are then added, and the whole boiled together for two hours, and then strained through a sieve. When the liquor is cold, the stuffs are worked through it for some time, occasionally airing them; after which they are suffered to remain immersed in it for twenty-four hours, when they are wrung out and dried.

For softening them, when dry, it is customary to soak and work them in the remains of a weld bath that has been used for other colors, adding to it a little logwood. From this they are taken out and wrung, and instantly put into a tub of warm water, into which has been poured an ounce of olive oil for every pound of stuff. They are then wrung out and dried carefully.

The same author has described another process for imparting to cotton and linen stuffs a fine and durable black. In this process the stuffs are first to be scoured as usual, galled, then alumed, and afterwards dipped in the weld bath. When taken out of this bath, they are to be dyed in a decoction of logwood, to which a quarter of a pound of sulphate of copper has been added for every pound of stuff. After this they must be washed in the river, wrung several times but not too hard; and dyed in a madder bath, in the proportion of half a pound to each pound of stuff. That the black may not be liable to be discharged, the thread must be dipped in a bath of a solution of soap.

135. The following method practised at Manchester is given by Mr. Wilson. A galling is made with galls or sumach; after which the stuff is dyed with the liquor of the bath, consisting of a solution of iron in vegetable acid, frequently composed of alder bark and iron, and then dipped in a decoction of logwood with a little verdigris. This process is repeated till a deep black is obtained; and it is necessary to wash and dry after each of these different operations.

136. Dr. Bancroft, says Berthollet, had announced that the acid of tar was employed at Manchester for black dyes on cotton. Chaptal, in his dyes, used pyrolignous acid; but to Bosc we owe the details of the operation by which he himself obtained a fine black by means of that acid.

137. Fill, says he, a cast-iron boiler with pyrolignous acid; add to it old iron, well oxidised, and boil. The solution of the oxide will take place rapidly. When the iron grows clean, and the solution becomes black as ink, throw the whole into a cask to be employed at need.

Prepare your cotton as usual, by giving it a blue ground. Gall; turn the hanks of cotton through a bath of a solution of pyrolignite of iron, diluted with tepid water.

Renew the gallings, and the turnings through the bath of pyrolignite of iron, till you have obtained a deep and brilliant black. Finish by passing your cotton through olive oil. This operation is simple. Throw on some tepid water a little olive oil; pass the cotton through this bath; it absorbs the oil; but it must be worked for a long time in the bath to diffuse the oil equally. This process softens and gives suppleness to the cotton, as well as a great deal of brilliancy. Dry in the shade. The cottons are now of a perfect and very durable black. Every time that the bath of pyrolignite of iron has been employed, it must be thrown away as useless, and the old baths are never to be added to the cask.

Bosc intimates, that the stuffs dyed by means of pyrolignous acid, retain, with much tenacity, the odor of this acid, and that they must be exposed to the air for some time to rid them of it, before folding them up for packing.

The application of oil, which heightens the black, and imparts softness to the stuffs, is given to those which are woven, for example, to cotton velvet, by means of brushes, which are slightly imbued with it at their surface.

Hermstadt recommends a process of Vogler, which consists in making use for a mordant of a solution of nitrate of lead, in turning the stuff through a solution of glue, and in dyeing it in a bath composed of gall-nuts, logwood, and sulphate of iron, for which last the acetate may be substituted.

OF DYEING GRAY.

138. Gray colors are properly the shades of black from the deepest to the lightest. They may be produced in several ways; the two following are the most approved methods.

In the first method a decoction of bruised galls, and a solution of sulphate of iron are used. These ingredients must be prepared separately; and then a part of it added to a quantity of water of a sufficient degree of heat, such as the hand can bear; and in this the cloth or wool is to be dipped.

When it has attained the shade desired, it is taken out, and more of the decoction and solution must be added to the same bath. Into this the cloth is dipped, to give it a deeper shade. In the same manner the operator proceeds to the deepest shades, always adding some of each of the liquors: though, for black-gray and other deep shades, it is best to give the cloth previously a blue ground, more or less deep according to circumstances.

139. The second process for dyeing gray, and which is, by Mallet and others, preferred to the preceding, in consequence of the stuff taking the decoction of galls more firmly, is this. Such a quantity of powdered galls as may be thought requisite is enclosed in a linen bag and boiled in water for two hours. In this decoction the stuffs must be boiled for an hour and then taken out. Some solution of iron is then added to the

liquor, and the stuff passed through it, so as to produce a light shade; more solution of iron is then to be added to produce a deeper shade, and so on till the stuff acquire the requisite color.

If in this operation we go beyond the mark, the color must be darkened as before; but repeating these operations is prejudicial to the stuff, so that we should endeavour to catch the proper shade at once, by taking it occasionally out of the bath. Care must be taken that the bath do not boil, and that it be rather warm than too hot.

In whatever manner grays are dyed, they should be immediately washed in a large body of water, and the darkest may even require soap to cleanse them. It is sometimes required to give grays a tint of another color, as a nut, agate, or reddish cast. In this case, having given a tint more or less blue according to the object intended, the stuffs are dipped in the remains of some cochineal liquor, that has served for dyeing either scarlet or violet, adding galls, logwood, madder, &c.; they are then browned more or less deep with a solution of iron. For the nut gray, yellow wood and logwood are added to the galls, and the stuff is to be dyed from white.

140. *Silk* takes all grays, except black-gray, without previous aluming. The bath is composed of fustic, logwood, archil, and sulphate of iron. These ingredients are varied according to the tint to be given. Thus more archil is employed for grays that are to have a reddish cast, more fustic for those that should incline to a russet or green, and more logwood for those that are to be of a darker gray. For iron-gray logwood and solution of iron are only employed. But black-gray requires aluming; after which the silk is taken to the river, and then dipped in the weld bath. A part of this bath is thrown away, and its place supplied with logwood liquor. When the silk is impregnated with this, a sufficient quantity of solution of iron is added, and, as soon as it has acquired the proper shade, it is to be washed and wrung carefully. If the gray should happen to be too dark, the silk is dipped in a solution of tartar, and afterwards in warm water; and, if by these means the color be weakened too much, the silk is again dipped in a bath of dye that is quite fresh.

141. *Linen* and *Cotton* should have a blue ground imparted to them for black-gray, iron-gray, and slate-gray, but for no other. All the shades require a galling proportionate to the gray to be produced. Gall baths that have before served for other purposes are often employed. When the stuff has been galled, wrung, and dried, it is dipped in a vessel of cold water, to which is added a proper quantity of the bath from the black cask, and of a decoction of logwood. The stuff is worked in separate portions, and afterwards washed and dried properly. Two other processes for dyeing gray are given by M. Pileur d'Apligny, which, according to him, produce a more permanent color. They are these.

1. The yarn is galled, dipped in a very weak bath of the black cask, and then madderred.
2. The yarn is dipped in a very hot solution of tartar, wrung gently and dried. It is then dyed in a decoction of logwood. After this operation

it appears black; but, on working it attentively in warm soap suds, the surplus of the dye is discharged, and it remains of a durable slate-gray.

142. A process, says M. Berthollet, the success of which is known to us, consists in taking a very diluted solution of acetate of iron (it is sufficient to add a little of this acetate to a quantity of water), and a decoction of sumach, also very dilute. The cotton is passed in succession from one liquor to the other, till the wished for shade be attained. The finish is given by passing through a water slightly acidulated by sulphuric acid, otherwise the sumach gives a russet hue. By the same process may be obtained with nutgalls less lively grays; and the alder bark affords an agreeable one, which borders on hazel.

A skilful manufacturer of Rouen has communicated to us the following process, which he makes use of successfully for cotton velvets. A galling is given with an equal quantity of gall-nuts and logwood, after which a bath of cold water is administered, and next another bath of water, in which there has been dissolved a weight of sulphate of iron, equal to the one-half of the preceding ingredients. After working the cotton about a quarter of an hour in this bath, it is rinsed in cold water, and brightened.

For this purpose a bath of tepid water is used, to which one-eightieth of decoction of weld, and a little alum, are added. The cotton is left about twenty minutes in this bath, after which it is washed in cold water, and dried.

By modifying the doses of the ingredients, grays, from pearl-gray to the deepest gray, may be thereby obtained.

For grays on printed goods, the same mordant is impressed as for a clear violet, and sumach or gall-nuts are employed according to the shade that is desired.

OF DYEING BLUE.

143. *Of Dyeing Wool Blue.*—There are various processes employed for dyeing wool, silk, &c., of blue color, but the principal coloring matters made use of are indigo and woad. Archil, cochineal, turmeric, and logwood, are occasionally used as auxiliaries. Prussian blue also has, in some cases, been successfully employed in producing some very beautiful but fugitive shades of blue.

The vessels in which blue is dyed are called vats; they were formerly made of wood; in many instances they are still constructed of that material; lead, however, has been found superior, and in modern practice, cast iron is generally used. When the vat is made of wood, the liquor must be raised to the requisite heat in another vessel, and then transferred to it, a process attended with many inconveniences; when made of lead it is surrounded with brick work, of a single brick in thickness, which admits of a fire being placed under it for the purpose of warming the liquor.

144. Some dyers make use of iron vats which are warmed by steam, applied to the exterior of the vat; but the more common method is to use a vessel of cast iron, and to apply a gentle fire under it as occasion may require.

Before the introduction of indigo, blue was dyed with woad, this produced a color which was tolerably permanent, but rather faint; a very rich blue however is now obtained by the union of the two substances. The proportions in which these are used, vary according to the depth of shade required. The following is the process of preparing a vat as given by Quatremere.

145. Into a vat of about seven feet and a half deep, and five and a half in diameter, are thrown two bales of pastel or woad, previously broken, and together about 400 pounds weight; thirty pounds of weld are boiled in a copper for three hours, in a sufficient quantity of water, to fill the vat. To this decoction are added twenty pounds of madder and a basket of bran. The boiling is then continued half an hour longer. This bath is cooled with twenty buckets of water, and after it is settled, and the weld taken out, it is poured into the vat, which must be stirred with a rake all the time that it is running in, and for fifteen minutes longer.

146. The vat is then covered, and allowed to stand for six hours, when it is uncovered, and raked again for half an hour. The same operation must be repeated every three hours. When the appearance of blue streaks is perceived on the surface, eight or nine pounds of quick lime are added; the color then becomes of a deeper blue, and the vat exhales more pungent vapors. Immediately after the lime, or along with it, the indigo, which has been previously ground in a mill, with a small quantity of water, is put into the vat. The quantity is to be regulated by the intensity of the shade required. If, on striking the vat with a rake, a fine blue scum arises, no other preparation is required than to stir it with the rake twice in the space of six hours, to mix the ingredients completely. Great care should be taken not to expose the vat to the air, except during the time of stirring it.

147. Vats of this description are sometimes liable to accidents. A vat is said to be repelled, when, having previously afforded fine shades of blue, it appears black, without any blue streaks; and if on being stirred the black color becomes deeper, the vat at the same time exhales a pungent odor; and the stuff dyed in it comes out of a dirty gray color. These effects are ascribed to an excess of lime.

148. Different means are employed to recover a repelled vat. Some merely reheat it; while others add tartar, bran, urine, or madder. Hellot recommends bran and madder as the best remedy. If the excess of lime be not very great, it is sufficient to leave it at rest five or six hours, putting in a quantity of bran and three or four pounds of madder, which are to be sprinkled on the surface, and then it is to be covered up, and after a certain interval to be tried again. But if the vat has been so far repelled as to afford a blue only when it is cold, it must be left at rest to recover, and sometimes must remain whole days without being stirred with the rake.

149. When it begins to assume a tolerable pattern, the bath must be reheated. In general this revives the fermentation; or it may be excited with bran and madder, and even with a basket or two of fresh pastel.

Hecquet d'Orval and Ribacourt advise to rest satisfied without raking up, if the bath be but slightly thrown back; but if the evil has made more progress, to put into it some pounds of bran enclosed in a bag, and to diffuse through it at the same time three or four pounds of tartar in powder. The bag, after five or six hours, begins to float and is withdrawn, and the rake is used. If the vat be not yet restored, the same operation is repeated.

Quatremere says, that he has re-established a vat which he had thrown back by a surcharge of lime; and that for this effect he contented himself with heating twice, and leaving it then in repose for two days, after which it afforded a well characterised flower or bloom. He left it again in repose for three days; and lastly, heating it for the third time, he found it to be restored.

150. The second accident, to which the pastel vat is subject, is putrefaction. When this accident occurs, the veins and the bloom disappear, its color becomes russet, the paste which is at the bottom rises up, the smell becomes fetid.

Quatremere asserts, that, if a pattern of a dark blue be plunged into a vat thus deteriorated, its color becomes several shades lighter. Putrefaction takes place in a vat, because it has not been sufficiently furnished with lime. Whenever the marks of putrefaction appear, we must hasten to correct it, by adding lime and raking up. This operation must be repeated till the vat be restored; but great care is required to avoid the opposite extreme.

It appears, adds M. Berthollet, that a just distribution of lime is the object which demands most attention in the conduct of a pastel vat. It moderates the fermentation of the pastel, and of the other substances that serve to disoxygenate the indigo; for this effect, pushed too far, destroys the coloring particles. But too strong an action of the lime becomes too great an obstacle. It is therefore proper to wait till the excess of lime disappears, undoubtedly by the successive formation of carbonic acid, or the source of the fermentation must be increased, or a portion of the lime be saturated by a vegetable acid. Another use of the lime is to hold in solution the coloring particles of indigo and of the pastel, which are disoxygenated. Woad is employed as well as pastel, but it appears that the preliminary preparation, to which both are subjected, is not essential. We have seen a skilful dyer of Rouen employ for his vat the plant of woad simply dried; and assert that he derived more advantage from it than from ordinary woad.

151. The vat must be raked about two hours before dyeing, and to prevent the sediment, called paste, from occasioning inequalities in the color, a kind of lattice formed of large cords, termed a cross, is introduced; and when wool is to be dyed in the fleece, a net with small meshes is placed over this.

The wool or cloth being thoroughly wetted with clear water, a little warm is pressed out, and dipped into the vat, where it is moved about a longer or shorter time, according as the color is required to be more or less deep, taking it out occasionally to air. The action of the air is ne-

cessary to change the green color given by the bath to a blue. In a rich bath* it is difficult to give a uniform color to light blues: the best method of obtaining such shades, therefore, is to use vats nearly exhausted, and of a low temperature. Wool and cloth dyed blue, should be washed with great care, to carry off the particles not fixed in the wool, and those which are of a somewhat deep blue, ought even to be carefully cleansed, by fulling with soap, which does not alter the color. Those designed to be dyed black, ought to be treated in the same manner; but it is not so necessary for those which are to be green, to be thus prepared.

152. The indigo vat is that which contains neither pastel nor woad. The vessel used for this preparation is a copper, which, being of a conical figure, leaves between it and the brick-work that surrounds it, and on which its brim rests, an empty space sufficient to admit of the action of the fire. Into this copper are poured about forty pails of water, in which have been boiled six pounds of salt of tartar, twelve ounces of madder, and six pounds of bran. This liquor is to be put into the vat, grounds and all: six pounds of indigo ground in water are then to be put in, and after raking it carefully the vat is to be covered. A slow fire is to be kept up round it. Twelve hours after it is filled, it is to be raked a second time; and so on every twelve hours, till it become blue, which it will be in forty-eight hours. If the bath be well managed, it will be of a fine green, covered with copper colored scales, and have a blue scum or flower at the top. It may be observed, that the theory of this vat is the same as that of the foregoing, except that the indigo is here dissolved by alkali instead of lime. When this vat, which is much more easily managed than that of pastel, is in a proper state, it may be used for dyeing in the same manner as that described above.

153. M. Hellot describes two vats in which the indigo is dissolved by urine. Madder is added to it, and in the one vinegar, in the other alum and tartar, of each a weight equal to that of the indigo. The quantity of urine ought to be considerable. The solution of indigo, deprived of its oxygen by the urine and madder in fermentation, is due to the ammonia formed in the urine, either by the action of heat or fermentation. Hellot remarks, that an effervescence takes place on pouring in the solution of alum and tartar, which probably tends to stop the putrefaction. These vats are by no means comparable with those of pastel, or indigo; much less work being despatched by them; so that they are adapted only for small dye-houses.

154. *Of Dyeing Silk Blue.*—Silk is dyed blue with indigo alone, without any proportion of woad. The proportion of indigo mentioned in the preparation of the indigo vat, and sometimes a larger, is employed, with six pounds of bran, and about twelve ounces of madder. According to Macquer, half a pound of madder for each pound of potassa, renders the vat greener, and produces a more fixed color in the silk. When the vat is come to, it should be refreshed with two pounds of potassa, and three or four ounces of madder; and, after being raked, in the course of four hours it is fit

for dyeing. The temperature should be so moderated that the hand may be held in it.

155. The silk, after being boiled with soap, in the proportion of thirty pounds of soap to 100 of silk, and well cleaned by repeated beetlings in a stream of water, must be dyed in small portions. When it has been turned once, or oftener, in the bath, it is wrung out and exposed to the air, that the green color may change to a blue. When the change is complete, it is thrown into clear water, and afterwards wrung out. Silk dyed blue should be speedily dried. In damp weather, and in winter, it is necessary to conduct the drying in a chamber heated by a stove. The silk should be hung on a frame kept constantly in motion. To dye light shades, some employ vats that are nearly exhausted: but it ought to be observed, that the color thus obtained is less beautiful and less permanent than when fresh vats, containing a smaller quantity of indigo, are employed.

156. Some addition is required to be made to the indigo, to give silk a deep blue. A previous preparation is necessary, by giving it another color or ground. For the Turkey blue, which is the deepest, a strong bath of archil is first prepared. Cochineal is also sometimes used, instead of archil, for the ground, to render the color more permanent. A blue is given to silk by means of verdigris and logwood, but possesses little durability. It might be rendered more permanent, by giving it a lighter shade in this bath, then dipping it in a bath of archil, and, lastly, in the indigo vat.

157. When raw silk is to be dyed blue, such as is naturally white should be selected. Being previously soaked in water, it is put into the bath in separate hanks, as already directed for scoured silks; and, as raw silk combines more readily with the coloring matter, the scoured silk, when it can be conveniently done, should be first put into the bath. If archil, or any of the other ingredients, are required to give more intensity to the color, the mode of application is the same as that directed for scoured silk.

There are various other methods of conducting this part of dyeing, described by M. d'Apligny, Quatremere, Bergman, Scheffer, &c., which we omit as not being of material importance to the practical dyer.

158. *Of Dyeing Cotton and Linen Blue.*—In communicating the blue color to these substances, the principal ingredient employed is indigo; but Prussian blue has been found to answer extremely well. According to Le Pileur d'Apligny, says M. Berthollet, the vat for dyeing cotton and linen is capable of holding about 120 gallons. The quantity of indigo employed is usually from six to eight pounds, finely ground, and boiled in a lee drawn off from double its weight of potassa, with a quantity of lime equal in weight to the indigo. During the boiling, which is to be continued till the indigo is thoroughly penetrated with the lee, the solution must be constantly stirred, to prevent the indigo from being injured by adhering to the bottom of the vessel.

159. During this process, another quantity of quick-lime, equal to the indigo, is to be slaked. Twenty quarts of warm water are added, in which

is to be dissolved a quantity of sulphate of iron, equal to twice the weight of the lime. The solution being completed, it is poured into the vat, which is previously half filled with water. To this the solution of indigo is added, with that part of the lie which was not employed in the boiling. The vat must now be filled up nearly to the top. It must be raked twice or thrice every day till it is completely prepared, which is generally the case in forty-eight hours, and sometimes sooner, as it depends on the temperature of the atmosphere. A small proportion of bran, madder, and woad, is recommended by some to be added to this vat.

160. The process which is followed at Rouen, and described by Quatremere, is more simple. The vats, which are constructed of a kind of flint, are coated within and without with fine cement, and are arranged in one or more parallel lines. Each vat contains four hogsheads of water. The indigo, to the amount of eighteen or twenty pounds, being macerated for a week in a caustic lie, strong enough to bear an egg, is ground in a mill; three hogsheads and a half of water are put into the vat, and afterwards twenty pounds of lime. The lime being thoroughly slaked, the vat is raked, and thirty-six pounds of copperas are added; and, when the solution is complete, the ground indigo is poured in through a sieve. It is raked seven or eight times the same day, and, after being left at rest for thirty-six hours, it is in a state fit for dyeing.

161. In extensive manufactories, it is necessary to have vats set at different times. In conducting the process of dyeing, the stuffs are first dipped in the most exhausted vat, and then regularly proceeding from the weakest to the strongest, if they have not previously attained the desired shade. The stuffs should remain in the bath only about five or six minutes, for in that time they combine with all the coloring matter they can take up. After they have been dipped in a vat, it should not be used again till it has been raked, and stood at least twenty-four hours, unless it has been lately set, when a shorter period is sufficient.

162. After the stuffs have been dipped three or four times in a vat, it becomes black, and no blue or copper-colored streaks are seen on the surface after raking it. It must then be renewed, by adding four pounds of copperas with two of quicklime, after which it must be raked twice. In this way a vat may be renewed three or four times; but the additional quantity of ingredients must be diminished as the strength of the vat is exhausted.

163. A vat which is still more simple and more easily prepared, has been recommended by Bergman. The proportion of the ingredients which he has directed to be employed is the following:—To three drachms of indigo reduced to powder, three drachms of copperas, and three of lime, add two pints of water. Let it be well raked, and in the course of a few hours it will be in a proper state for dyeing.

164. Haussmann employs a still less proportion of indigo. For about 500 gallons of water he takes thirty-six pounds of quicklime, slaked in about twenty-five gallons of water, with which

the indigo is to be mixed in the proportion of from ten to twenty pounds, well ground. He then dissolves thirty pounds of sulphate of iron in about fifteen gallons of water. The whole is left at rest for fifteen minutes; the vat is then filled, and gently and constantly stirred. When a deeper shade is wanted, and particularly when linen is to be dyed, the proportion of indigo should be greater; but the shade depends very much on the time the stuffs remain in the vat, and the times it has been used. When the vat becomes turbid, the process of dyeing must be interrupted, till it has been again raked, and the supernatant liquor become transparent. If the effects of the lime fail, a new quantity must be added; and, if the iron cease to produce the effect on the indigo, a new portion must be also added, observing to have a greater quantity of lime than is necessary to saturate the sulphuric acid.

165. When the indigo appears to be exhausted, fresh portions are to be added; the vat is to be raked several times, and allowed to settle, after which it is again fit for use. In this way Mr. Haussmann says he preserved a vat for two years; and had it not been for the accumulation of sediment, which prevented the stuffs from being immersed to a sufficient depth, it might have been continued in use for a much longer time. It is proper to add, that Mr. Haussmann found, that a pattern of cloth dipped in water acidulated with sulphuric acid, immediately after it was taken out of the bath, became of a much deeper blue than a similar pattern exposed to the air, or another dipped in river water.

166. A remarkably fine blue is produced from a solution of indigo in sulphuric acid, to which the name of Saxon blue is given, from the circumstance of its having been discovered at Grossenhayn in Saxony, by counsellor Barthi, about the year 1740.

167. The following, according to Berthollet, is the process of preparing this dye by Bergman.

He employed one part of indigo to eight parts of acid, keeping the mixture in a temperature of between 86° and 104° of Fahrenheit, and he reckoned that one part of indigo, thus dissolved, was sufficient to give a deep blue color to 260 times its weight of wool. Poerner used one part of indigo to four of sulphuric acid. To prepare the wool or cloth for this bath, it is first boiled with alum and tartar. The wool receives the finest as well as fullest color during the first immersion; but lighter, though duller shades, may be given to other portions by the same bath when partially exhausted. The deeper shades are most advantageously given by adding the solution of indigo to the bath, in successive portions, and raising the stuffs on the winch previously to each addition.

OF DYEING RED.

168. Red colors are known by different names according to their degrees of intensity, as crimson, scarlet, &c., besides innumerable shades that fall under no particular denomination. The substances usually employed in dyeing red, are cochineal, madder, kermes, lac, carthamus, Brasil-wood, archil, and logwood. All these, with

other substances which give a red color, are denominated by Dr. Bancroft *adjective* colors, from their requiring the aid of mordants to give them permanence.

169. *Of Dyeing Wool Red.*—When woollen stuffs are to be dyed, they are first boiled for two or three hours with alum and tartar: they are then left to drain, slightly wrung out, put into a linen bag, and carried into a cool place, where they must remain for some days. The quantities and proportions of the alum and tartar are varied according to the object of the dyer, and the shade of color which is wanted. Some recommend five ounces of alum, and one ounce of tartar to each pound of wool. By increasing the proportion of tartar to a certain degree, a deep and permanent cinnamon color is produced. This arises from the yellow tinge induced by the acid on the coloring particles of the madder. Others propose to diminish the proportion of tartar, and to use only a seventh part. In conducting the process of dyeing with madder, the bath should not be brought to a boiling heat, because, at that temperature, the fawn-colored particles would be dissolved, and a different shade obtained from that which is desired. When the water is at such a temperature as the hand can bear, Hellet recommends the addition of half a pound of grape madder for every pound of wool to be dyed. It must then be well stirred before the wool is introduced, which must remain for an hour without boiling, excepting for a few minutes towards the end of the process, that the combination of the coloring particles with the stuff may be more certain.

170. Madder reds are sometimes rosed, as it is called, with archil and Brasil wood. In this way they become more beautiful and velvety, but this brightness is not permanent. But madder reds, even when at best, are far inferior to those obtained from lac and cochineal, and even to that produced by kermes; but, as the expense of the materials is comparatively small, they are employed for coarse stuffs.

171. Different authors recommend different proportions of madder. Poerner proposes to employ one-third of the weight of the wool, while Scheffer limits the quantity to one-fourth. Poerner added to the alum and tartar a quantity of solution of tin, equal in weight to the tartar, and, after two hours boiling, allowed the cloth to remain in the bath, which had been left to cool for three or four days. He then dyed it in the usual way, and obtained a fine red. On another occasion he prepared the cloth by the common boiling, and dyed it in a bath slightly heated, with a larger proportion of madder, tartar, and solution of tin. The cloth remained twenty-four hours in the bath, and, when it had become cold, he put it into another bath, made with madder only, where it remained for twenty-four hours. By this process he got a fine red, somewhat brighter than the common, but inclining a little to yellow. Scheffer says that he obtained an orange red by boiling wool with a solution of tin, and one-fourth of alum, and then dyeing with one-fourth of madder. A cherry color, says Bergman, is obtained by using one part of a solution of tin, and two of madder, without previously boiling the

wool. By exposure to the air, this color becomes deeper. By boiling the wool for two hours with one-fourth of sulphate of iron, then washing it, and afterwards immersing it in cold water with one-fourth of madder, and boiling it again for an hour, the result is a coffee color. But if the wool has not been soaked, and if it be dyed with one part of sulphate of iron and two of madder, the color is a brown approaching to red.

172. When sulphate of copper is employed as the mordant, the madder dye yields a clear brown, inclining to yellow; and a similar color may be produced by dyeing the wool simply soaked in hot water, with one part of sulphate of copper, and two of madder. But when this mordant and dye-stuff are used in equal proportions, the yellow is somewhat more obscure, inclining to green; and in both these instances, exposure to the air does not produce a darker color. Berthollet says that he employed a solution of tin in various ways, both in the preparation and the application of the madder; and, by the use of different solutions of tin, he found that, although the tint was a little brighter than what is obtained by the common process, it was always more inclined to yellow or fawn color.

173. *Of Dyeing Silk Red.*—The red color obtained from madder has not been found of sufficient brilliancy for dyeing silks; M. De la Folie, however, has given the following process for employing it for this purpose:—Half a pound of alum is to be dissolved in each quart of hot water, to which two ounces of potassa are to be added; after the effervescence is over, and the liquor has begun to grow clear, the silk must be soaked in it for two hours; it is then to be washed and put into the madder bath. Silk dyed in this way, he says, becomes more beautiful by the application of the soap proof. Another process is described by Mr. Gulichie, of which the following is the substance.—

174. For every pound of silk he proposes a bath of four ounces of alum, and one ounce of solution of tin. When the liquor has become clear, it is decanted, and the silk carefully soaked in it for twelve hours, after which it is to be immersed in a bath with half a pound of madder softened by boiling, with an infusion of galls in white wine. The bath must be kept moderately hot for an hour, and then made to boil for two minutes. The silk, being taken from the bath, is to be washed in a stream of water, and dried in the sun. The color thus produced is said to be very permanent; and, if the galls are omitted, its brilliancy is improved.

175. The color obtained when Brasil-wood is used, is denominated *false crimson*, to distinguish it from that produced by cochineal, which is much more durable, and which is styled *grain crimson*. This very beautiful color is obtained by the following process:—The silk, being well cleansed from the soap, is to be immersed in an alum bath of the full strength, and to remain for a night. It is then to be washed, and twice beetled at the river. The bath is prepared by filling a long boiler two-thirds with water, to which are added, when it boils, from half an ounce to two ounces of powdered white galls for every pound of silk. When it has boiled for a few moments, from two

to three ounces of cochineal, also powdered and sifted, for every pound of silk, are put in, and afterwards one ounce of tartar to every pound of cochineal. When the tartar is dissolved, one ounce of solution of tin is added for every ounce of tartar. In the preparation of this solution of tin, the following proportions are recommended by Macquer. For every pound of nitric acid two ounces of sal ammoniac, six ounces of fine grain tin, and twelve ounces of water are employed. When these ingredients are mixed together, the boiler is to be filled up with cold water, and the proportion of the bath, for every pound of silk, is about eight or ten quarts of water. In this the silk is immediately immersed, and turned on the winch till it appear to be of a uniform color. The fire is then increased, and the bath is kept boiling for two hours, observing to turn the silk occasionally. The fire is afterwards put out, and the silk put into the bath, where it is allowed to remain for a few hours longer. It is then taken out, washed at the river, twice beetled, wrung, and dried.

176. Carthamus, says M. Berthollet, is used for dyeing silk poppy, a bright orange red, cherry, rose color, and flesh color. The process differs according to the greater or less tendency to flame color that is wanted. The following is his account of the preparation of the carthamus bath: The yellow matter of the carthamus having been first extracted, the cakes containing the red coloring matter are broken down and put into a trough of fir-wood, where they are several times sprinkled with finely powdered soda in the proportion of six pounds of soda to every hundred pounds of carthamus. The whole is then put into a small trough lined with closely woven cloth, and having a grated bottom; this small trough is then placed over the larger one, and water is poured on the mixture till the larger trough is full. Fresh water is poured over the carthamus and suffered to run into another trough, and so on successively, adding a little fresh soda till all the red color is extracted. These liquors are then mixed, and lemon-juice is added to give a fine cherry color, which the liquor imparts to the silk that is dipped in it. Poppy-color, given in this way, requires that the silk be immersed in a second bath, and that the colors be brightened by turning the silk several times through a bath of hot water impregnated with lemon-juice. The lighter hues of red are given by the weaker solutions of carthamus, and the lightest shades require the addition of a little soap. In dyeing silk with carthamus the silk, after being scoured, should, for poppy or fire color, receive a ground of anatto. The carthamus bath should be prepared at the time of using, and the process of dyeing should be conducted as speedily as possible.

177. Those who have made the nearest approach towards producing a scarlet on silk, says Berthollet, begin with dyeing the silk crimson. It is then dyed with carthamus, and after that dyed yellow in a cold bath. By this process a fine color is produced, but it is not permanent, as the dye of the carthamus is affected by the action of the air. The following is the process given by Dr. Bancroft in his *Philosophy of*

Permanent Colors. 'In a solution of murio-sulphate of tin, diluted with five times its weight of water, the silk is to be soaked for two hours; and, after being taken out, it is to be wrung and partially dried. It is then to be dyed in a bath prepared with four parts of cochineal, and three of quercitron bark. In this way a color approaching to scarlet is obtained. To give the color more body, the immersion may be repeated both in the solution of tin and in the dyeing bath; and the brightness of the scarlet is increased by means of the addition of carthamus. A lively rose-color is produced by omitting the quercitron bark, and dyeing the silk with cochineal only; and, by adding a large proportion of water to the cochineal, a yellow shade is obtained, which changes the cochineal to the compound scarlet color.'

178. *Of Dyeing Cotton and Linen Red.*—Madder is employed for dyeing linen and cotton red, and even for giving them several other colors, by means of different mixtures. It is the coloring drug most useful for this kind of dyeing. It is proper therefore to show, in sufficient detail, the different methods by which this dye may be rendered more permanent, beautiful, and diversified in its effects. Linen takes the color of madder with more difficulty than cotton: but the processes which succeed best, with the one, are also preferable for the other.

179. Two species of madder red, on cotton, are distinguished; the one called simply madder red, the other, possessing far more lustre, is called Turkey-red, or Adrianople-red, because it was for a long time obtained from the Levant.

Vogler tried the effect of a great number of the substances employed as mordants, or in the dyeing bath, and he found that those which produced the best effect were glue, ox-gall, and other animal matters, as sheep's dung. Muriate of soda rendered the color faster, but more dull. Galling likewise procured a richer color. Other astringents, sumach and pomegranate rind, for instance, produced a similar effect. A little alkali added to the alum improves it. When the stuff has passed through the different preliminary operations, it must be dyed with the best madder that can be procured, in the proportion of three-quarters of a pound to each pound of stuff.

The temperature of the madder bath must be raised in a gradual manner, that may require about an hour to boil after the stuff has been immersed in it; and, when it has boiled a few minutes, the stuff is taken out, slightly rinsed and dyed a second time in a second bath, with the same quantity of madder; after the second dyeing, and subsequent rinsing and drying, the stuff is commonly steeped in a solution of white soap, made just milk-warm, in the proportion of two ounces of soap to one pound of stuff. The effect of this process is to remove all the uncombined coloring matter, and, as is supposed, to give a higher degree of brilliancy to what remains. This process is completed by rinsing and drying.

180. Of all the reds produced by the use of madder, the Adrianople or Turkey-red is by far

the 'most beautiful: it possesses a brilliancy which can be communicated to cotton by none of the common processes of dyeing, and has, moreover, the property of more effectually resisting the action of the different re-agents, as alkalis, soap, alum, and acids. For many years the dyeing of this color was confined to the east, and came to us through our Levant trade only. In process of time the art found its way from India to the western parts of Asia, and to Greece; and from Greece to France, whence it was brought to this country by one of the French dyers, M. Papillon, who settled at Glasgow, where, for a considerable time, he carried on with great success the business of dyeing Turkey-red.

181. M. Papillon communicated his process to the commissioners and trustees for manufactures in Scotland, to be by them published at the expiration of a certain term of years. For this he received a handsome premium; and the process was made public in the year 1803.

We need hardly mention the celebrity of the manufactory of Messrs. Monteith and Co. of Glasgow, since it is known to the world at large. The excellency and beauty of their cotton fabrics will not soon be surpassed; the madder-reds which they dye rival, in brilliancy and in solidity, any ever produced at Adrianople; and the white figures, distributed over the cloth by the discharging process, surpass in purity, elegance, and precision of outline, the original Bandana outlines.

182. The art of dyeing Turkey-red has been described by different writers, who vary a little from each other in some particulars, but who agree in the leading features of the process. We prefer inserting here the account of it as given by Dr. Bancroft, as it affords us an opportunity of following it up by the insertion of some of his truly valuable remarks upon the subject in reference to the process observed at Rouen in France.

The process is very tedious, and is divided by the dyers into nine different steps.

Step 1. Cleaning. For 100 pounds of cotton take an equal weight of Alicant barilla, twenty pounds of pearl-ashes, and 100 pounds of quick-lime. The barilla must be mixed with soft water in a deep tub, which has a small hole near the bottom of it, stopped at first with a peg.— This hole is covered in the inside with a cloth supported by two bricks, that the ashes may be prevented from passing through it or stopping it up while the lie filters through it.

Under this tub is another to receive the lie; and pure water is repeatedly passed through the first tub to form lies of different strength, which are kept separate at first until their strength is examined. The strongest required for use must swim an egg, and is called the lie of six degrees of the French hydrometer, or peseliqueur. The weaker are afterwards brought to this strength, by passing them through fresh barilla. But a certain quantity of the weak, which is of 2° of the above hydrometer, is reserved for dissolving the oil and gum, and the salt, which are used in subsequent parts of the process. This lie of 2° is called the weak barilla liquor, the other is called the strong.

* Dissolve the pearl-ashes in ten pails, of four gallons each, of soft water, and the lime in fourteen pails.

Let all the liquors stand till they become quite clear, and then mix ten pails of each.

Boil the cotton in the mixture five hours, then wash it in running water and dry it.

Step 2. Take a sufficient quantity, say ten pails (of four gallons each), of the strong barilla water in a tub, and dissolve or dilute in it two pails full of sheep's dung; then pour into it two quart bottles of oil of vitriol, and one pound of gum arabic, and one pound of sal ammoniac, both previously dissolved in a sufficient quantity of the weak barilla water, and lastly, twenty-five pounds of olive oil, which has been previously dissolved or well mixed with two pails of the weak barilla water.

The materials of this steep being well mixed, tramp or tread down the cotton into it, until it is well soaked; let it steep twenty-four hours, and then wring it hard and dry it.

Steep it again twenty-four hours, and again wring and dry it.

Steep it a third time twenty-four hours, after which wring and dry it, and lastly wash it well and dry it.

Step 3. This part of the process is precisely the same with the last, except that the sheep's dung is omitted in the composition of the steep.

Step 4. Boil twenty-five pounds of galls, bruised, in ten pails of river water, until four or five are boiled away; strain the liquor into a tub, and pour cold water on the galls in the strainer, to wash out of them all their tincture.

As soon as the liquor is become milk-warm, dip your cotton hank by hank, handling it carefully all the time, and let it steep twenty-four hours.

Then wring it carefully and equally, and dry it well without washing.

Step 5. Dissolve twenty-five pounds of Roman alum in fourteen pails of warm water, without making it boil; skim the liquor well, and add two pails of strong barilla water, and then let it cool until it be lukewarm.

Dip the cotton, and handle it hank by hank, and let it steep twenty-four hours, and wring it equally and dry it well without washing.

Step 6. Is performed in every particular like the last; but after the cotton is dry, you steep it six hours in the river, and wash and dry it.

Step 7. The cotton is dyed by about ten pounds at once, for which take two gallons and a half of ox blood, and mix it in the copper with twenty-eight pails of milk-warm water, and stir it well; then add twenty-five pounds of madder, and stir all well together. Then, having beforehand put the ten pounds of cotton on sticks, dip it into the liquor, and move and turn it constantly one hour, during which you gradually increase the heat, until the liquor begin to boil at the end of the hour. Then sink the cotton, and boil it gently one hour longer; and, lastly, wash it and dry it.

Take out so much of the boiling liquor, that what remains may produce a milk-warm heat with the fresh water with which the copper is again filled up, and then proceed to make up a

dyeing liquor as above, for the next ten pounds of cotton.

Step 8. Mix equal parts of the gray steep liquor, and of the white steep liquor, taking five or six pails of each. Tread down the cotton into this mixture, and let it steep six hours, then wring it moderately and equally, and dry it without washing.

Step 9. Ten pounds of white soap must be dissolved most carefully and most completely in sixteen or eighteen pails of warm water; if any little bits of the soap remain undissolved they will make spots in the cotton. Add four pails of strong barilla water, and stir it well. Sink your cotton in this liquor, keeping it down with cross sticks, and cover it up and boil it gently two hours, then wash and dry it, and it is finished.

Such is the process of M. Papillon, on which Dr. Bancroft makes the following observations.

Step 1. At Rouen two courses of operations are practised to produce the Turkey-red. One is called the gray course, and the other the yellow course. In the former, the cotton, after being alumed, receives no more oil, but goes to the dyeing vessel, retaining the gray color, which naturally results from its being impregnated with alum and galls in combination. But, in the yellow course, the cotton, after being alumed, is again immersed in the oleaginous mixtures or steeps, by which it acquires a yellow color. The gray course may consist either of fifteen steeps or of nineteen, and the yellow of twenty. The first of these courses has most similitude to that of M. Papillon. At Rouen, the cleansing operation is performed with a very weak lie of soda, of only one degree of the areometer, employing 150 gallons to 100 pounds of cotton, which is to be boiled therein six hours, then drained, well rinsed in running water, and afterwards dried. This operation is intended to free the cotton from all impure or extraneous matter; but not to produce effects like those of bleaching by exposure upon the grass, which, until lately, it was believed, would lessen the durability of the colors to be subsequently dyed.

Step 2. The steep here described contains three ingredients not employed by any other person; and one of these, the sulphuric acid, seems to indicate a want of chemical knowledge in M. Papillon, because, by neutralising the soda, it must obstruct the effect which the latter is intended to produce (that of rendering the oil miscible with water), or at least render a greater proportion of it necessary in order to obtain that effect. In regard to the other two ingredients, viz. the gum and sal ammoniac, the quantity of the former is by much too small to produce any considerable effect, and it is not easy to form any conjecture what purpose the latter is to answer. At Rouen, this steep is prepared by steeping twenty-five or thirty pounds of sheep's dung several days in a lie of soda, marking four degrees, which is to be diluted until it amounts to forty gallons; and the dung being squeezed and broken by the hands, is afterwards made to pass through a copper pan, provided with numerous small holes, into a tub containing twelve pounds and a half of fat oil, and in this the oil and dung

are, by sufficient stirring, to be well mixed with the lie and with each other; and, in the mixture which contains but half the quantity of oil prescribed by M. Papillon, the cotton is to be steeped, &c., as directed by the latter. It is highly important that, after this and each of the succeeding operations, the cotton should be thoroughly and completely dried by a stove heat.

Step 3. At Rouen this steep is prepared by mixing thirty-eight gallons of lie of soda with ten pounds of olive oil, stirring until the mixture becomes uniformly milky; which it will do without any separation of the oil, if the quality of the oil be suited to this use; this they add to what may have been left of the former steep, and, after mixing them properly, they impregnate the cotton by the usual treatment, drying it, after an interval of twelve hours, first in the open air, and afterwards by a stove heat. This steeping and subsequent drying must be repeated once, twice, or three times, according to circumstances.

Between this white steep and the following gall steep, it is the practice at Rouen to employ three salt steeps and one cleansing operation. In the first, twenty-four gallons of the lie of soda, marking two degrees and a half, are mixed in a tub with the remnant of the white steep; and the cotton is impregnated and dried, as in the former operations. In the next the remnant of the last steep is mixed with twenty gallons of the lie of soda, marking three degrees; and the cotton is steeped and dried as before. In the third, the remnant of the preceding steep is mixed with twenty-four gallons of the lie of soda, marking three degrees and a half, and with this the cotton is impregnated and dried as before. The residuum of this steep is preserved to be used in the brightening operation.

In the cleansing operation, the cotton is steeped one hour in lukewarm water, then wrung by hand, and afterwards washed in a stream of water to remove any superfluous oil which might obstruct the equal application and uniform effect of the following gall-steep, and thereby render the color unequal. After being so washed, the cotton is dried first in the open air, and afterwards by a stove-heat.

Step 4. This constitutes the eighth operation in the gray course at Rouen, where, as well as in M. Papillon's process, galls, in sorts, seem now to be employed. At Rouen, the cotton, as soon as it has sufficiently imbibed the soluble matter of the galls, and been very moderately wrung, is spread as expeditiously as possible in the open air, if the weather be dry, or, if not, under cover; but the drying is always finished by a stove heat.

Step 5. At Rouen, thirty or thirty-five pounds of the purest alum are commonly employed for this steep, with only seven pails of hot-water, adding, when the alum has been dissolved, two gallons only of the lie of soda, marking four degrees. But when these proportions are employed, the cotton is not subjected to a second steep with alum. Sometimes, however, at Rouen, two steeps with the aluminous mordants are employed; and in that case twenty pounds of alum are dissolved for the first, and fifteen for the se-

cond, leaving an interval of two days between them, during which the cotton should retain its moisture after being slightly wrung from the first steep. It should, however, be well dried before it goes into the second.

Step 6. At Rouen, the cotton is dyed in parcels of twenty-five pounds each, and the dyeing vessel is of a quadrangular form, containing about 100 gallons of liquor. One quart of ox-blood is employed for each pound of cotton, with two pounds of Provence madder, or one pound of this with one of Smyrna madder. Some persons, however, think it best to effect the dyeing by two separate operations, employing half the above proportion of madder for one dyeing, and half for the other; but always taking care not to dry the cotton between the dyeings. There are some at Rouen who give cotton another alum steep between these dyeing operations, employing for that purpose half as much alum as was used for the first steep, and afterwards washing, &c.

Step 8. For this steep they employ at Rouen the residuum of the third salt-steep before mentioned; but the application of it is considered a part of the following step.

Step 9. This constitutes the fourteenth operation in the first set of gray courses at Rouen; where, after having macerated the cotton with the sikioi, they boil it for the space of five or six hours with six or eight pounds of white soap, previously dissolved in 145 gallons of water, in a vessel covered at the top, so as to leave only a very small opening for the necessary escape of the steam, which might otherwise occasion an explosion. The effect of this boiling with soap, is to dissolve and separate from the cotton all the yellowish-brown matter of the madder color which may have been applied to it in the dyeing operation, and thus to change the color from the dull brownish-red which it would otherwise retain, to a bright lively color, nearly equal to that of the finest cochineal scarlet. It is only by the singular degree of fixity which the pure red part of the madder color acquires, in consequence of the operations just described, that this beautiful red can be obtained. Such, indeed, is the stability of the Turkey-red when well dyed, that it is said to sustain boiling with soap for thirty-six hours without injury.

In addition to the steps prescribed by M. Papillon, they employ another at Rouen, which is intended to make the red incline more to the rose color, and at the same time increase its vivacity. For this operation, with the former quantity of 100 pounds of cotton they dissolve, in 145 gallons of water, sixteen or eighteen pounds of white soap, and as soon as the liquor begins to boil, they add to it from one pound and a half to two pounds of the crystallised muriate of tin, previously dissolved in two quarts of water, and mixed with eight ounces of single aqua-fortis; and having equally dispersed this mixture through the boiling solution of soap, by stirring, &c., the cotton is put in and boiled with the same precautions as in the brightening operation, till the desired effect has been obtained, which is to be discovered by frequent examinations. Care must be taken not to employ more nitric acid or aqua-fortis than the quantity here

mentioned, lest it should decompose the soap, and cause the oil to separate and rise to the surface of the liquor.

183. We cannot leave this truly important branch of dyeing without noticing the ingenious remarks of Mr. Thomson of Glasgow, published in the eighth volume of the *Annals of Philosophy*, on the theory of the Turkey-red process.

He observes that silk and worsted have a natural varnish which cotton does not possess. To supply this defect, the repeated immersions, followed by exposure to the atmosphere, and to the heated air of a stove, may give the oil the proper consistency, by the absorption of oxygen, for forming a varnish, with which the coloring matter unites, and through which it may be said to shine, which causes that superior brilliancy which the goods attain when they are cleared, or, as it may be called, polished. I therefore presume, that the fixedness and brilliancy of the color will depend on the quantity of oil imbibed, as every repetition of drying presents new fibres to be varnished with an additional quantity; for I have always found, that the permanency was in proportion to the number of manipulations in the saponaceous liquor, and a proportionable freedom could also be used in reducing or clearing. The white immersions, omitting the sheep's dung, are just applying successive coats of varnish. Clearing is never attempted from the madder copper, without immersing the goods again in soda and oil, and drying them in a stove, which I consider to be also supplying them with an additional coat.

The alkaline lie occasions a greater separation in the particles of the oil, by which it combines more closely with the fabric of the cloth. The sheep's dung in the first immersions may serve as a covering, to keep the goods moist for a considerable time, that they may more fully imbibe the liquor, by preventing the evaporation from being too quick in the great heat to which they are exposed.

After the frequent immersions the cloth feels like leather, no doubt from a superfluity of liquor. It is then steeped in a lie of carbonate of soda, and afterwards well washed and dried, as a preparation for the galling and aluming. The astringent principle has been long known for darkening and fixing common red colors on cotton, by uniting with the earth of alum, and strengthening the basis. To the use of blood in the madder copper I attribute nothing; as in the rancid and putrid state in which I have seen it used, were it not for the prejudice of the operator, it might be safely dispensed with.

In proof of the above idea, that it is only the oil uniting with the earth of alum that is of use, I may refer to the mode of dyeing that color in the east, quoted by Dr. Bancroft, viz. soaking their cotton in oil (no matter of what description), during the night, and exposing it to the sun and air during the day, for seven successive days, rinsing it only in running water, and then immersing it in a decoction of galls and the leaves of sumach previous to aluming.

I would therefore request the practical dyer, who wishes to arrive at a knowledge of this unaccountable process, to give up the idea of ani-

malisation, if by it be meant impregnating the cloth with an animal matter, and by the power of the microscope, or any better method, look for the whole truth from some other source than chemical analysis. I am at present inclined to believe that it is a mechanical operation united to a chemical, and that the frequent immersions in the imperfect soap are equivalent to laying on the first, second, third, &c., coats, preparatory to finishing a fine painting in oil. A very eminent calico manufacturer, whom I consulted on the Turkey-red process, assured me that the only essential mordants are oil and alumina; and that bright and fast reds, equal to any produced by the usual complicated process with sheep's dung, galls, and blood, may be obtained without these articles.

OF DYEING SCARLET.

184. Scarlet may be regarded as one of the compound colors arising from a mixture of the red and yellow coloring matters. Scarlet is the finest and most splendid of all the colors, and the great demand for it has excited several chemists of distinction to improve and facilitate the process of producing it. We shall here briefly notice the old method of dyeing scarlet, which is still practised by some dyers, both in this country and on the continent, and then give the improved method proposed by Dr. Bancroft in his excellent treatise already mentioned.

185. We cannot, says M. Berthollet, expect to obtain the desired shade from the doses prescribed in the processes, from variations in the quantity of the coloring particles contained in the different kinds of fine cochineal, and particularly from the solutions of tin that are used differing considerably from each other; but the just proportions of the ingredients to be employed may be readily determined by trials in the small way, so as to obtain the shade called for; and, if the pieces which are dyed be above or below this shade, it is not difficult to find the suitable proportions.

186. In the process of dyeing scarlet two operations are observed, viz. the boiling, and the reddening. The first or boiling operation is thus conducted:—For 100 pounds of cloth, a quantity of soft water is heated in a tinned boiler, till it be rather more than lukewarm, after which six pounds of cream-of-tartar are dissolved in it. When the water is a little warmer, half a pound of finely powdered cochineal is added and well mixed with the solution of tartar. Immediately after, five pounds of very clear solution of tin are poured in, and carefully mixed. When the bath begins to boil, the cloth is put in, and rapidly turned two or three times with the winch; then more slowly, and is left to boil for two hours, after which it is taken out, drained, exposed to the air, and washed in the running stream.

187. In preparing for the second bath the boiler must be emptied, filled again with fresh water, and, when this is near the boiling heat, five pounds and three quarters of powdered cochineal are put in and carefully mixed, and when, on ceasing to stir the liquor, a crust forms on the surface, and begins to break, thirteen or fourteen pounds of solution of tin are poured in.

Sometimes, after this, the liquor begins to rise above the brim of the boiler, which must be prevented by putting in some cold water. When the solution is well mixed in the bath, the cloth is immersed, taking care to turn the winch rapidly for the first two or three turns. It is then to be boiled for about an hour, pressing it down as often as it rises to the surface. After this it is taken out, exposed to the air to cool, washed in the stream, and dried.

188. On examining the proportions of cochineal and of solution of tin, used either in the boiling, or in the reddening, it appears that they are by no means fixed. There are some dyers, who, according to Hellot's account, succeed very well by putting two-thirds of the composition, and a fourth of the cochineal, into the boiling, and the remaining third of the composition, with the remaining three-fourths of the cochineal, into the reddening. He also asserts that it does no harm to use tartar in the reddening, provided not more of it than half the weight of the cochineal be put in; and he thinks, that it even renders the color more permanent. Some dyers do not take the cloth out of the boiling, but simply refresh it to make the reddening in the same bath, by pouring in an infusion of cochineal, which they have made apart, and with which they have mixed the proper quantity of composition. In this way they save time and fuel: and they affirm that the scarlet is equally fine.

189. Different authors recommend different proportions of the materials used in the boiling process. Scheffer prescribes one part of solution of tin for ten parts by weight of cloth, with an equal quantity of starch and of tartar as of solution. He remarks, that the starch tends to make the color more uniform, and he recommends to throw into the water, when it boils, $\frac{1}{2}$ of cochineal; to agitate well; to let the wool boil in it for an hour, and then to wash it. He prescribes next, the boiling for half an hour in the bath, which serves for the reddening, with $\frac{1}{2}$ of starch, $\frac{1}{2}$ of solution of tin, $\frac{1}{2}$ of tartar, and $\frac{1}{8}$ of cochineal.

It appears, that Scheffer employs a much smaller quantity of solution of tin than Hellot; but what he does employ contains much more tin.

190. Poerner describes three principal processes, according as the shade is to be more or less deep, or more or less of an orange hue, which he wishes to give to the scarlet. He varies the proportions of the solution of tin, of cochineal, and tartar, or omits the last ingredient.

For conducting the process of the scarlet dye in the most beneficial manner, and for varying its results, according to the end in view, the effect of each of the ingredients employed in it must be ascertained. We need not however proceed with a detail of processes which have been superseded by others that are from experience found to be much superior; we shall therefore pass on to notice the important improvements in this branch of dyeing made by Dr. Bancroft, and which have obtained the approbation of the most eminent chemists, British and foreign.

191. Dr. Bancroft was struck with the thought that for a whole century no improvements had

been made in the art of dyeing scarlet. On this object he seems to have fixed his mind, and, about the year 1786, he instituted a set of experiments which were attended with the most gratifying success.

192. Having, by frequent affusions of boiling water, extracted the whole of the coloring matter from powdered cochineal, he found that the addition of a little potash to the sediment, and a fresh quantity of boiling water, extracted a new portion of coloring matter, equal to about one-eighth of what had been given out to the pure water. He repeatedly extracted this coloring matter by means of potassa, and afterwards dyed small pieces of cloth scarlet with it, which he found similar to others dyed with cochineal. It was in the course of these enquiries that he perceived scarlet to be a compound color, consisting of about three-fourths of pure crimson, and one-fourth of pure bright yellow. He conceived, therefore, that when the natural crimson of the cochineal is made scarlet, by the usual process, there must be a change produced, equivalent to a conversion of one-fourth of the coloring matter of cochineal from its natural crimson to a yellow color. From this he concluded that there might be a great saving of cochineal, by substituting a cheaper substance, which, at the same time, might yield a better yellow color. It was therefore his object to combine with this crimson or rose color, a suitable portion of a lively golden yellow, capable of being permanently fixed, and reflected by the same basis. This yellow Dr. Bancroft found in quercitron bark; and ascertained that it possessed the advantage of being not only the cheapest, but the brightest of all the yellows he had tried.

193. For the purpose of diminishing the quantity of cochineal employed in producing a scarlet dye, Dr. Bancroft made a number of experiments under the authority of government. In these experiments, the mordant used was the common dyers' spirit, or the nitro-muriate of tin, but he found that they were not attended with the advantages which he expected. In some of his earliest experiments, he remarks, that the solution of tin by means of sulphuric acid destroys the cochineal color, and this led him to reject the use of this acid, till accident brought him to dissolve a quantity of tin in muriatic acid, combined with one-fourth of sulphuric acid. The application of this solution in dyeing, was not accompanied with the corrosive effects of the muriate and nitro-muriate which he had employed in the experiments, and which proved unsuccessful. After trying different proportions of these acids, he found the following to answer best. In a mixture of two pounds of sulphuric acid of the ordinary strength, and about three pounds of muriatic acid, he dissolved about fourteen ounces of tin. The muriatic acid is first poured upon a quantity of granulated tin in a suitable vessel, and the sulphuric acid is added by degrees. This solution is more quickly effected by means of a sand heat; it is perfectly colorless, and may be kept for years without precipitation. It has double the power of the common dyers' spirit; and is produced at about one-third of the expense.

VOL. VII.

It also raises the colors more than even the tartrate of tin; and does not incline the cochineal crimson to the yellow shade.

194. In using this solution as a mordant, to produce the compound scarlet color, Dr. Bancroft advises the following process. Nothing, says he, is necessary, but to put the cloth, suppose 100 pounds, into a proper tin vessel, nearly filled with water, in which has been mixed eight pounds of the murio-sulphuric solution of tin; and, having brought the mixture to a boiling heat, about 100 pounds of cloth are immersed and turned through it as usual, by the winch, for a quarter of an hour. Then the cloth is removed, and four pounds of cochineal and two pounds and a half of quercitron-bark, both powdered, are introduced and well mixed. After this, the cloth is returned into the bath; the liquor is made to boil, and the cloth is turned as usual for fifteen or twenty minutes, by which time, in general, the color will be properly raised and the bath exhausted, when the cloth is taken out and rinsed in the ordinary way.

By this method the time, labor, and fuel, necessary for filling and heating the boiler a second time are saved, the process finished much sooner than in the common way, and there is a saving of all the tartar, as well as of two-thirds of the cost of spirit, or nitro-muriatic solution of tin, which, for dyeing 100 pounds of wool, commonly amount to ten shillings, whereas eight pounds of the murio-sulphuric solution cost only about three shillings. There is, besides, a saving of at least one-fourth of the cochineal usually employed, and the color produced does not prove inferior in any respect to that dyed with much more expense and trouble in the ordinary way.

195. When a rose color is wanted, it may be readily obtained in this way, only omitting the quercitron bark, instead of the complex method of first producing a scarlet, and then changing it to a rose by the volatile alkali contained in stale urine, set free by potash or by lime; and should any one still choose to continue the practice of dyeing scarlet without the quercitron bark, it is only necessary to employ the usual proportions of tartar and cochineal, with a suitable quantity of the murio-sulphate of tin, which, while it is cheaper, is much more effectual than the dyers' spirit.

196. The scarlet, produced from cochineal crimson and quercitron, is also attended with this advantage, that it may be dyed upon wool and woollen yarn, without any danger of its being changed to a crimson color by the process of fulling, which always happens to scarlet dyed in the common way. Indeed, this last is nothing but a crimson or rose color, rendered yellow by some particular action of the tartaric acid; and is hence liable to be reduced to crimson by many chemical agents, especially by soap, alkaline salts, salts of lime, &c. But where the coloring matter of cochineal is applied and fixed merely as a crimson or rose color, and is rendered scarlet by adding a very permanent yellow, capable of resisting the strongest acids and alkalis, when used with solutions of tin, no such

2 R

change takes place, because the color given by cochineal, having never ceased to be crimson, cannot be rendered more so, and therefore cannot suffer by those impressions or applications which frequently change or spot scarlets dyed according to the ordinary practice. There is also a remarkable property attending the compound scarlet dyed with cochineal and quercitron bark, viz. that if a piece of cloth dyed in this way be compared with another piece dyed by the usual process, both will by day-light appear exactly of the same shade; but, if they be afterwards compared together by candle-light, the former will appear at least several shades higher and fuller than the latter;—a circumstance of some importance, when it is considered how much this and other gay colors are worn and exhibited by candle-light, during a considerable part of the year.

197. To illustrate more clearly, continues Dr. Bancroft, the effects of the murio-sulphuric solution of tin with cochineal in dyeing, I shall state a very few of my numerous experiments therewith; observing, however, that they were all several times repeated, and always with similar effects.

1st, I boiled 100 parts of woollen cloth in water, with eight parts of the murio-sulphuric solution of tin, during the space of ten or fifteen minutes; I then added to the same water four parts of cochineal, and two parts and a half of quercitron bark in powder, and boiled the cloth fifteen or twenty minutes longer; at the end of which time it had nearly imbibed all the color of the dyeing liquor, and received a very good, even, and bright scarlet. Similar cloth dyed of that color at the same time in the usual way, and with a fourth part more of cochineal, was found upon comparison to have somewhat less body than the former; the effect of the quercitron bark in the first case having been more than equal to the additional portion of cochineal employed in the latter, and made yellow by the action of tartar.

2d, To see whether the tartrate of tin would, besides yellowing the cochineal crimson, contribute to raise and exalt its color more than the murio-sulphate of that metal, I boiled 100 parts of cloth with eight parts of the murio-sulphuric solution, and six parts of tartar, for the space of one hour; I then dyed the cloth, unrinsed, in clean water, with four parts of cochineal, and two parts and a half of quercitron bark, which produced a bright aurora color, because a double portion of yellow had been here produced, first by the quercitron bark, and then by the action of tartar upon the cochineal coloring matter. To bring back this aurora to the scarlet color, by taking away or changing the yellow produced by the tartar, I divided the cloth whilst unrinsed into three equal parts, and boiled one of them a few minutes, in water slightly impregnated with potassa; another in water with a little ammoniac; and the third in water containing a very little powdered chalk, by which all the pieces became scarlet; but the two last appeared somewhat brighter than the first, the ammoniac and chalk having each rosed the cochineal color rather more advantageously

than the potassa. The best of these, however, by comparison, did not seem preferable to the compound scarlet dyed without tartar, as in the preceding experiment; consequently this did not seem to exalt the cochineal color more than the murio-sulphate of tin; had it done so, the use of it in this way would have been easy, without relinquishing the advantages of the quercitron yellow.

3d, I boiled 100 parts of woollen cloth with eight parts of the murio-sulphuric solution of tin, for about ten minutes, when I added four parts of cochineal in powder, which, by ten or fifteen minutes more of boiling, produced a fine crimson. This I divided into two equal parts, one of which I yellowed, or made scarlet by boiling it for fifteen minutes with a tenth of its weight of tartar in clean water; and the other, by boiling it with a fortieth part of its weight of quercitron bark, and the same weight of murio-sulphuric solution of tin; so that in this last case there was an addition of yellow coloring matter from the bark, whilst in the former no such addition took place, the yellow necessary for producing the scarlet having been wholly gained by a change and diminution of the cochineal crimson; and the two pieces being compared with each other, that which had been rendered scarlet by an addition of quercitron yellow, was, as might have been expected, several shades fuller than the other.

4th, I dyed 100 parts of woollen cloth scarlet, by boiling it first in water with eight parts of murio-sulphate of tin, and twelve parts of tartar, for ten minutes, and then adding five parts of cochineal, and continuing the boiling for fifteen minutes. This scarlet cloth I divided equally, and made one part crimson, by boiling it with a little ammoniac in clean water; after which I again rendered it scarlet, by boiling it in clean water, with a fortieth of its weight of quercitron bark, and the same weight of murio-sulphate of tin; and this last, being compared with the other half to which no quercitron yellow had been applied, was found to possess much more color, as might have been expected. A piece of the cloth, which had been dyed scarlet by cochineal and quercitron bark, as in the first experiment, being at the same time boiled in the same water with ammoniac, did not become crimson, like that dyed scarlet without the bark.

In this way of compounding a scarlet from cochineal and quercitron bark, the dyer will at all times be able, with the utmost certainty, to produce every possible shade between the crimson and yellow colors, by only increasing or diminishing the proportion of bark. It has indeed been usual at times, when scarlets approaching nearly to the aurora color were in fashion, to superadd a fugitive yellow either from turmeric, or from what is called young fustic; but this was only when the cochineal color had been previously yellowed as much as possible by the use of tartar, as in the common way of dyeing scarlet; and therefore that practice ought not to be confounded with my improvement, which has for its object to preclude the loss of any part of the cochineal crimson, by its conversion towards yellow color, which may be so much more cheaply

obtained than the quercitron bark. By sufficient trials, I have satisfied myself that the cochineal colors, dyed with the murio-sulphuric solution of tin, are in every respect at least as durable as any which can be dyed with any other preparation of that metal; and they even seem to withstand the action of boiling soap lie somewhat longer, and therefore I cannot avoid earnestly recommending its use for dyeing rose and other cochineal colors, as well as for compound-
ing a scarlet with the quercitron bark.

OF DYEING CRIMSON.

198. The different processes employed for obtaining the various shades of crimson, from the deepest to the lightest, may be reduced to two. Either the shade of crimson required is given to cloth previously dyed scarlet, or the cloth is at once dyed crimson. Alum, salts with earthy bases, and fixed and volatile alkalis, have the property of changing the color of scarlet to crimson, which is the natural color of cochineal. Nothing more, therefore, is necessary, than to boil cloth dyed scarlet for about an hour in a solution of alum, proportioned in strength to the deepness of the color desired. But as other salts with earthy bases have the same property, and water contains more or less of these salts, whence it gives a proportionate rosy tinge to scarlet passed through it, particularly if it be worn, the quantity of alum necessary to obtain a crimson varies according to the nature of the water employed; and, when well charged with these salts, it will answer the purpose of itself, without the addition of alum. If a piece of scarlet have any defects, it is most convenient to convert it into a crimson.

199. Hellot says, that he has tried soap, soda, potassa, and crude potassa; that all these substances produced the crimson desired, but saddened it, and gave it less lustre than alum. Ammonia, on the contrary, produced a very good effect; but, as it evaporates quickly, a considerable quantity must be put into the bath a little more than warm, a little ammoniacal muriate, or sal ammoniac, and common potash. By this method the cloth instantly took a very bright rosy color. He thinks that it heightens the color so much as to render less cochineal necessary. But M. Poerner, who gives the same process, directs the scarlet to be left twenty-four hours in a cold solution of potassa and ammoniacal muriate.

200. To dye crimson at once, a solution of two ounces and a half of alum, and one ounce and a half of tartar, to every pound of cloth, is used for the boiling: and the cloth is afterwards dyed with an ounce of cochineal. Solution of tin is commonly added, but in less proportion than for scarlet. The processes employed vary greatly, according as the shade required is deeper or lighter, or more or less distant from scarlet. Common salt is also used for the boiling by some dyers. For saddening crimsons, and giving them more bloom, archil and potassa are frequently used, but the bloom thus imparted is not permanent. Sometimes the boiling for crimson is made after a scarlet reddening, by adding tartar and alum: and it is said, that the

wine soup color has more bloom, if both its boiling and reddening be made after scarlet, than when it is dyed in a fresh bath. For these colors the wild cochineal may be used instead of the fine, but in greater quantity. The reddening which has been used for crimson may also be employed for purples, and other compound colors.

Both scarlets and crimsons in half-grain are made by substituting madder for half the quantity of the cochineal, giving the same boiling as for scarlet in grain, and following in other respects the processes for reddening the scarlet or crimson. Other proportions of madder may be used instead of half, according to the effect desired. The common madder red also acquires a greater lustre, when its boiling is made after a reddening for scarlet.

201. In silk the grain crimson, produced by cochineal, is distinguished from false crimson, which is obtained by Brasil-wood. Silks that are intended to be dyed crimson with cochineal, should not be boiled with more than twenty pounds of soap to 100 pounds of silk, as the slight yellow cast which silk has, when only so far scoured, is advantageous to the color. After the silk has been well cleansed from the soap, it is to be put into an alum liquor of the full strength. In this it is commonly left from the evening till the next morning; it is then washed, and twice beetled at the river. In preparing the bath, an oblong boiler is filled with water, to about one-half or two-thirds; and, when the water boils, white galls powdered are thrown in, from half an ounce to two ounces for every pound of silk. After boiling a few moments, from two to three ounces of cochineal, powdered and sifted, for every pound of silk, according to the shade required, are put in, adding afterwards an ounce of tartar, to every pound of cochineal; and, when the tartar is dissolved, an equal quantity of the solution of tin. This solution ought to contain more tin than that used for scarlet, otherwise the colors will be too bright. Macquer directs this solution to be made with sixteen parts of nitric acid, two of ammoniacal muriate, as much fine grain tin, and twelve of water. These ingredients are mixed and the boiler is filled up with cold water. In this the silk is immediately dipped, and turned on the skein sticks till it appears to be of a uniform color. The fire is then increased, and the bath made to boil for two hours, turning the silk from time to time. After this the fire is put out, and the silk put into the bath, where it is kept a few hours longer. The silk is afterwards washed at the river, twice beetled, wrung and dried. When crimsons are to be browned, they must be passed, after having been washed, through a solution of sulphate of iron, more or less strong according to the shade required. If it should have a yellow tinge, the solution must be charged with a greater or less proportion of decoction of fustet or Venus's sumach. White galls should be chosen, because black ones would dull the color of the crimson; and even too large a quantity of the white will produce the same effect. Macquer says, that the galls serve only to increase the weight of the silk: yet their general effect is to render colors

more permanent, and they are essentially necessary for crimsons that are intended to be browned. Vinegar is employed as a test in distinguishing grain crimsons from false: but it will not detect colors obtained from Brasil-wood, if they be fixed by means of solution of tin; for in this case they resist vinegar as well as those made with cochineal. A very small quantity of solution of tin is, therefore, put into the bath for dyeing silk crimson. If the same process as that for dyeing wool scarlet were employed, the silk would lose its bloom, and acquire only a faint color. Macquer and Scheffer have, however, detailed processes which differ from it only in a few circumstances, for dyeing silk rose and poppy colors by solution of tin, used cold, that its action on the silk might not be too powerful.

202. Brasil-wood is used for dyeing silk what is called false crimson, to distinguish it from that produced by cochineal, which is much more permanent. For this process the silk should be boiled with soap, in the proportion of twenty pounds of the latter to 100 pounds of the former, and afterwards alumed. Less aluming is required for this than for grain crimson. Having washed it in running water, it is dipped in a bath, more or less charged with Brasil juice, according to the shade to be given. In the preparation of the bath hard water is preferable to soft, as it produces with the dye-stuffs a fuller crimson. Washing the silk in hard water will produce nearly the same effect. In order to make false crimson deeper, or dark red, a decoction of logwood is added to the Brasil bath, after the silk has been impregnated with the latter. A little alkali may also be put in according to the shade required. But to imitate poppy or fire color, the silk must have an anotta ground, even deeper than when it is to be dyed with carthamus: after which it is washed, alumed, and dyed with the decoction of Brasil-wood, to which a small portion of soap is generally added. We might here enumerate several other processes for imparting the crimson color, but the above, with what we have said respecting the dyeing of reds in general, and of scarlet in particular, render it unnecessary to enlarge.

OF DYEING YELLOW.

203. *Of Dyeing Wool Yellow.*—The yellow communicated to wool by weld has little permanency, if the wool be not previously prepared by some mordant. For this purpose alum and tartar are used, by means of which this plant gives a very pure and durable yellow. For the boiling, which is managed in the common way, Hellot advises four ounces of alum to every pound of wool, and only one ounce of tartar; many dyers, however, use half as much tartar as alum. Tartar renders the color paler, but more lively. The weld is boiled in a fresh bath, enclosing it in a bag of thin linen, and keeping it from rising to the top by a heavy wooden cross. Some dyers boil it till it sinks to the bottom of the copper, and then let a cross down upon it: others, when it is boiled, take it out with a rake, and throw it away. From three to four pounds of weld, and,

in some instances less, are allowed for every pound of stuff; but the quantity must be regulated by the depth of shade required. Some dyers add a little quick-lime and ashes, which are found to promote the extraction of the coloring matter, and at the same time heighten the color; but they thus render it more liable to the action of acids.

204. Both lighter and brighter shades may be obtained by dyeing after deeper ones, adding water at each dipping, and keeping the bath boiling: but light shades procured in this way are not so lively as when fresh baths are used, proportioning the quantity of weld to the depth of the shade intended to be procured. If common salt be added to the weld bath, it renders its color richer and deeper: sulphate of lime, or gypsum, also deepens it: but alum renders it paler and more lively; and tartar, still paler. Sulphate of iron or vitriol makes it incline to brown.

205. According to Scheffer, by boiling the stuff for two hours with one-fourth of its weight of a solution of tin, and the same proportion of tartar, and then washing it and boiling it for about a quarter of an hour with an equal weight of weld, it will assume a fine yellow, which, however, will not penetrate the substance of cloth.

206. Poerner recommends a process similar to that used in dyeing scarlet, by which means the color is brighter and more permanent.

207. Since the introduction of the use of quercitron bark, the process of dyeing yellow has been much simplified, as may be seen from the following directions of Dr. Bancroft on the subject. He proposes that the bark should be boiled with about its own weight, or one-third more of alum, in a suitable quantity of water, for about ten minutes.

208. The substances to be dyed are previously scoured, and then immersed in the bath, observing to give the higher colors first, and afterwards the paler straw colors. By this cheap and expeditious process, colors which are not wanted to be of a full or bright yellow, may be obtained. The color may be considerably heightened by passing the unrinsed stuff a few times through hot water, to which a little clean powdered chalk, in the proportion of about a pound and a half for every 100 pounds of stuff has been previously added. The bark, when used in dyeing, being first reduced to powder, should be tied up in a thin linen bag, and suspended in the liquor, so that it may be occasionally moved through it, to diffuse the coloring matter more equally.

209. But although this method possesses the advantages of cheapness and expedition, and is sufficient for communicating pale yellows; to obtain fuller and more permanent colors, the common mode of preparation ought to be preferred. The stuff should be boiled for about one hour, or an hour and a quarter, with one-sixth, or one-eighth of its weight of alum, dissolved in a proper proportion of water. The stuff is then to be immersed, without being rinsed, into the dyeing bath, with clean hot water, and about the same quantity of powdered

bark tied up in a bag, as that of the alum employed in the preparation. The stuff is then to be turned as usual through the boiling liquor, until the color appears to have acquired sufficient intensity. One pound of clean powdered chalk for every 100 pounds of stuff is then to be mixed with the dyeing bath, and the operation continued for eight or ten minutes longer, for the purpose of raising and brightening the color.

210. To communicate a beautiful orange yellow to woollen stuffs, ten pounds of quercitron bark, tied up in a bag, for every hundred pounds of stuff, are to be put into the bath with hot water. At the end of six or eight minutes, an equal weight of murio-sulphate of tin is to be added, and the mixture well stirred for two or three minutes. The cloth, previously scoured, and thoroughly wetted, is then immersed in the dyeing liquor, and quickly turned for a few minutes. By this process the coloring matter fixes on the cloth so effectually, that, after the liquor begins to boil, the highest yellow may be produced in less than fifteen minutes.

211. High shades of yellow, similar to those obtained from quercitron bark by the above process, are frequently given with young fustic and dyers' spirit; but this color is much less beautiful and permanent, while it is more expensive than what is obtained from the bark.

212. A fine bright, or golden yellow is obtained by employing ten pounds of quercitron bark, for each 100 pounds of cloth, the bark being first boiled a few minutes, and then adding seven or eight pounds of murio-sulphate of tin, with about five pounds of alum. The cloth is to be dyed in the same manner as in the process for the orange-yellow. Bright yellows of less body are produced by employing a smaller proportion of bark, as well as by diminishing the quantity of murio-sulphate of tin and alum. And indeed every variety of shade of pure bright yellow may be given by varying the proportions of the ingredients.

213. The lively delicate green shades, so much admired, are produced by the addition of tartar, with the other ingredients. The tartar must be added in different proportions, according to the shade which is wanted. For a full bright yellow, delicately inclining to green, it will be proper to employ eight pounds of bark, six of murio-sulphate of tin, with six of alum, and four of tartar. An additional proportion of alum and tartar renders the yellow more delicate, and inclines it more to the green shade; but when this lively green shade is wanted in the greatest perfection, the ingredients must be used in equal proportions. The delicate green lemon yellows are seldom required to have much fullness or body. Ten pounds of bark, with an equal quantity of the other ingredients, are sufficient to dye 300 or 400 pounds of stuffs.

214. *Of Dyeing Silk Yellow.*—Weld is seldom employed to give a yellow dye to silk, but when this is desired, the process differs a little from the former. The silk being scoured, alumed, and rinsed in the manner usual for dyeing bright colors, a bath is prepared, by boiling weld in water, in the proportion of double the weight of the silk for a quarter of an hour, and straining

off the liquor into a vat, where it is suffered to cool till the hand can be held in it. Then the silk is dipped and turned, till the color is found uniform. While this is going on, the old weld is boiled with a fresh quantity of water, and, after the silk has been dipped, one half of the exhausted bath is taken out, and the vat filled up with the second decoction. The temperature of the fresh bath may be a little higher than that of the former, but should not be too great, lest the color already fixed be dissolved. The stuff is to be turned as before, and then taken out of the bath. Some soda is to be dissolved in a part of the second decoction, and a larger or smaller quantity of the solution is to be added to the bath, according to the intensity of the shade wanted. The color is examined by taking out a skein, and wringing it.

215. To produce shades having more of a gold color, anotta is added in proportion to the depth of color required. Lighter shades, such as pale lemon color, are obtained by previously whitening the silk, and regulating the proportion of the ingredients of the bath by the shade required. To give a yellow, with a green tinge, a little indigo is added to the bath, if the silk has not been previously azured; to prevent the greenish shade being too deep, the silk should be more slightly alumed than usual.

216. Dr. Bancroft informs us that all the shades of yellow can be given at a cheaper rate by quercitron bark than by weld. To dye with this bark, a quantity of it powdered, and enclosed in a bag, in proportion to the shade wanted, from one to two pounds for every pound of silk, is put into the vat while the water is cold. Heat is applied, and when the bath is rather more than blood-warm, or of the temperature 100°, the silk, after being first alumed, is immersed and dyed in the usual way. A deeper shade may be given by adding a small quantity of chalk or pearl-ashes towards the end of the operation. To produce a more lively yellow, a small portion of murio-sulphate of tin may be employed, but it should be used cautiously, as it is apt to diminish the lustre of the silk.

217. To dye silk of an aurora or orange color, after having been properly scoured, it may be immersed in an alkaline solution of anotta, the strength of which is to be regulated by the shade required. The temperature of the bath should be between that of tepid and boiling water. When the desired shade is obtained, the silk is to be twice washed and beetled, to free it from the superfluous coloring matter, which would injure the beauty of the color. When raw silk is to be dyed, that which is naturally white should be selected, and the bath should be nearly cold; for otherwise the alkali, by dissolving the gum of the silk, destroys its elasticity. Silk is dyed of an orange color by anotta, but if a redder shade be wanted, it is procured by alum, vinegar, or lemon juice. These colors are beautiful, but do not possess permanency.

218. *Of Dyeing Cotton and Linen Yellow.*—The process commonly observed in dyeing cotton and linen yellow, is by scouring it in a bath prepared in a lie with the ashes of green wood. It is afterwards washed, dried, and alumed, with

one-fourth of its weight of alum. After remaining in twenty-four hours, it is taken out of the aluming and dried, but not washed. The cotton is then dyed in a weld bath, in the proportion of one pound and a quarter of weld for each pound of cotton, and turned in the bath till it has acquired the desired color.

219. After being taken out of the bath, it is soaked for an hour and a half in a solution of sulphate of copper, in the proportion of one-fourth of the weight of the cotton, and then immersed, without washing, for nearly an hour, in a boiling solution of white soap, after which it is well washed and dried.

220. A deeper yellow is communicated to cotton, by omitting the process of aluming, and employing two pounds and a half of weld for each pound of cotton. To this is added a dram of verdigris, mixed with part of the bath. The cotton is then to be dipped and worked till the color become uniform. It is then taken out of the bath, and a little solution of soda added, after which it is returned, and kept for fifteen minutes. It is then wrung out and dried.

221. Other shades of yellow may be obtained by varying the proportion of ingredients. Thus, a lemon color is dyed by using only one pound of weld for every pound of cotton, and by diminishing the proportion of verdigris, or using alum as a substitute.

222. Dr. Bancroft recommends a superior process, and less expensive. He also objects to the use of salts of copper, as deepening the yellow. One pound of acetate of lead, and three pounds of alum, are to be dissolved in a sufficient quantity of warm water. The cotton or linen, after being properly rinsed, is to be soaked in this mixture, heated to the temperature of 100°, for two hours. It is then taken out, moderately pressed over a vessel, to prevent the waste of the aluminous liquor. It is then dried in a stove heat, and, after being again soaked in the aluminous solution, it is wrung out and dried a second time. Without being rinsed, it is to be barely wetted with lime water, and afterwards dried; and if a full, bright, and durable yellow is wanted, it may be necessary to soak the stuff in the diluted aluminous mordant, and, after drying, to wet it a second time in the lime water. After it has been soaked for the last time, it should be well rinsed in clean water, to separate the loose particles of the mordant, which might injure the application of the coloring matter. By the use of the lime-water, a greater proportion of alumina combines with the stuff, besides the addition of a certain proportion of lime.

223. In the preparation of the dyeing bath, from twelve to eighteen pounds of powdered quercitron bark are enclosed in a bag, for every 100 pounds of stuff, varying the proportion according to the depth of shade required. The bark is put into the water while it is cold; and, immediately after, the stuff is immersed and turned for an hour, or an hour and a half, during which the water should be gradually heated, and the temperature raised to about 120°. At the end of this time the heat is increased, and the dyeing liquor brought to a boiling temperature; but at this temperature the stuff must remain in

it only for a few minutes. It is then taken out, rinsed, and dried.

224. Dr. Bancroft remarks, that, when the aluminous mordant is employed without the addition of water, one soaking only, and an immersion in lime water, may be sufficient; but he is of opinion that greater advantage is derived from the application of a more diluted mordant at two different times, or even by a more frequent immersion of the stuff alternately in the aluminous mordant, and lime water, and drying it after each immersion. By this treatment he found that the color always acquired more body and durability.

225. Chaptal proposes a process for communicating to cotton a nankeen yellow, which, while it affords a durable color, has the advantage of being cheap and simple. When cotton is immersed in a solution of any salt of iron, it has so strong an affinity for the oxide, that it decomposes the salt, combines with the iron, and assumes a yellow color. The process recommended by Chaptal is this:—The cotton to be dyed is put into a cold solution of sulphate of iron, of the specific gravity of 1.02. It is afterwards wrung out, and immediately immersed in a lie of potassa of the specific gravity of 1.01. This lie must previously have been saturated with a solution of alum. When the stuff has been kept for four or five hours in this bath, it may be taken out, washed, and dried. By varying the proportion of sulphate of iron, every variety of shade may be obtained.

226. The following curious process for dyeing linen of a durable yellow, as practised in the east, is given in the *Encyclopædia Britannica*. The object of this process, which is tedious, is to increase the affinity between the alumina and the stuff, so that it may adhere with sufficient force to produce a permanent color. For this purpose three mordants are employed: these are oil, tan, and alum. The cotton is soaked in a bath of oil, mixed with a weak solution of soda. Animal oil, as it is found to answer best, is preferred. Glue has also been tried, and is found to answer very well. The soda must be in the caustic state, as it then combines with the oil, and produces on the cloth an equal absorption. The stuff is then to be washed, and afterwards put into an infusion of nut-galls of the white kind; the infusion should be used hot. The tin combines with the oil, while the gallic acid carries off any alkali which may adhere to the cloth. When the stuff is removed from the bath, it should be quickly dried; too great an excess of galls beyond a proper proportion with the oil should be avoided, as it is apt to darken the color. After this preparation the stuff is to be immersed in a solution of alum; and, in consequence of the affinity which exists between tan and alumina, the alum is decomposed, and its earth combines with the tan

OF DYEING BROWN.

227. The substances employed in dyeing browns are very numerous, but those chiefly used are sumach, walnut-peels, and walnut-roots.

On separating the bark from the ligneous substance of the walnut-root, says Berthollet, in relating some experiments on the subject, the former

yielded in equal weight a liquor much more charged with color. The bark of the wood of walnut also exhibited properties approaching to those of walnut-peels, but its decoction formed a blackish precipitate with sulphate of iron.

Walnut-peels exercise a lively action on oxide of iron, dissolving it, and forming a liquor as black as ink. If boiled along with clean filings they do not attack them; but, if left exposed to the air, the liquor becomes soon black.

The coloring matter of walnut-peels has a great disposition to combine with wool. It gives it a very durable walnut or dun color, and mordants appear to add little to its permanence, but they may vary its shades, and give them more lustre. By preparing the stuff with alum, a richer and livelier color may be obtained.

Walnut-peels are of excellent use, because they give agreeable and very durable shades, and, being employed without any mordant, they preserve the softness of the wool, and require but one simple, and not expensive, operation. Walnut-peels are gathered when the nuts are entirely ripe. Large casks or tubs are filled with them, and a sufficiency of water is poured on them to cover their surface. In this state they may be kept a year and upwards. At the Gobelins, where a very extensive and varied use is made of this ingredient, it is kept for two years before it is employed. It is found then to furnish much more color. It has a very unpleasant putrid odor.

The peels may also be used which are taken from the nuts before they are ripe; but they do not keep so long.

228. The following are the results of M. Berthollet's experiments on sumach (*rhus coriaria*):—

The infusion of sumach is of a dun color, bordering on green. It speedily becomes green in the air. When it is recent, the solution of potassa produces little change on it. The acids clear up its color, and render it yellow. Solution of alum makes it turbid, producing a scanty yellow precipitate, while the liquor remains yellow.

Acetate of lead forms instantly an abundant yellowish precipitate, which takes a brown color on its surface; the liquor remains of a clear yellow.

Sulphate of copper affords a copious yellowish-green precipitate, which, after some hours, changes to a brown-green. The liquor remained clear, and a little yellow.

Sulphate of zinc of commerce rendered the liquor turbid, blackening it, and forming a deep blue precipitate.

Pure sulphate of zinc deepened the color much less; only a slight dun deposit, verging on brown, took place.

Muriate of soda produced no sensible change at first; but, after some hours, the liquor was a little turbid, and its color had become somewhat clearer.

Sumach acts like nut-galls on solution of silver, whose metal it reduces; a result promoted by the action of light. We have already dwelt at sufficient length on the explanation of this phenomenon, as well as the general properties of astrin-gents. Sumach affords of itself a fawn-color bordering on green; but it communicates to cot-

ton stuffs several very permanent colors, when they are combined with mordants.

229. Sanders, or sandal-wood, is also employed for the purpose of giving a fawn-color. There are three kinds of this wood, the white, the yellow, and the red. The last only, which is a compact heavy wood, brought from the Coromandel coast, is used in dyeing. By exposure to the air it becomes of a brown color; when employed in dyeing, it is reduced to fine powder, and it yields a fawn-color with a brownish shade, inclining to red.

The quantity of coloring matter, however, which it yields of itself is small, and it is said that it gives harshness to woollen stuffs. When it is mixed with other substances, as sumach, walnut-peels, or galls, the quantity of coloring matter is increased; it gives a more durable color, and produces considerable modifications in the coloring matter with which it is mixed. Sandal-wood yields its coloring matter to brandy, or diluted alcohol, more readily than to water.

230. Soot communicates to woollen stuffs a fawn or brown color, of a lighter or deeper shade, in proportion to the quantity employed; but the color is fading, and its affinity for wool is not great; and, besides leaving a disagreeable smell, it renders the fibres harsh. In some manufactories, it is employed for browning certain colors, and it produces shades which could not otherwise be readily obtained.

231. In dyeing with walnut-peels, a quantity proportioned to the quantity of stuff, and the intensity of shade wanted, is boiled for fifteen minutes in a copper. All that is necessary in dyeing with this substance is, to moisten the cloth or yarn with warm water, previously to their immersion in the copper, in which they are to be carefully stirred till they have acquired the proper shade. This is the process, if the aluminous mordant be not employed. In dyeing cloth, it is usual to give the deepest shades first, and the lighter ones afterwards; but, in dyeing woollen yarn, the light shades are given first, and the deeper ones afterwards. A fresh quantity of peels is added each time.

232. Berthollet made a number of experiments to ascertain the difference of color obtained from the simple decoction of walnut-peels, and the addition of metallic oxides as mordants. The oxide of tin, he informs us, yielded a clearer and brighter fawn-color than that of the simple decoction. The oxide of zinc produced a still clearer color, inclining to ash or gray. The color from oxide of lead had an orange cast, while that from oxide of iron was of a greenish brown.

233. A fawn-color, which has a shade of green, is obtained from sumach alone; but to cotton stuffs, which have been impregnated with printers' mordant, or acetate of alumina, sumach communicates a good and durable yellow.

234. Vogler employed the tincture of sanders-wood for dyeing patterns of wool, silk, cotton, and linen, having previously impregnated them with a solution of tin, and afterwards washing and drying them. Sometimes he used the solution unmixed, and at other times added six or ten parts of water, and in whatever way he em-

ployed it, he obtained a poppy color. When the mordant employed was solution of alum, the color was a rich scarlet; with sulphate of copper it was a clear crimson, and with sulphate of iron a beautiful deep violet.

OF DYEING COMPOUND COLORS.

235. On this branch of dyeing, M. Berthollet remarks, that simple colors form, by their mixture, compound colors; and if the effects of the coloring particles did not vary, according to the combinations which they form, and the actions exercised on them by the different substances present in a dyeing bath, we might determine with precision the shade that ought to result from the mixture of two other colors, or of the ingredients which afford these colors separately: but the chemical action of the mordants, and of the liquor of the dye bath, often changes the results; theory, however, may always predict these effects to a certain degree.

It is not the color peculiar to the coloring matters which is to be considered as the constituent part of compound colors, but that which they must assume with a certain mordant, and in a certain dye bath. Hence, our attention ought to be principally fixed on the effects of the chemical agents employed.

It is in this department of dyeing that the intelligence of the operator may be most useful, by enabling him to vary his processes, and to arrive at the proposed end by the simplest, shortest, and least expensive way.

The processes for compound colors are very numerous. We shall mention only those which most merit attention, and shall establish the principles on which they ought to be conducted by particular examples.

236. *Of Dyeing Wool Green.*—Green is obtained by the mixture of yellow and blue; and it is distinguished into many different shades; but it requires experience to obtain this color uniform and without spots, especially in the light shades. It is possible to produce green by beginning either with the yellow or the blue dye; but the first method is attended with some inconveniences; for the blue soils the linen, and a part of the yellow being dissolved in the vat, changes and makes it green; the second method is, therefore, preferable. It is common to employ the pastel vat, but for some kinds of green, solution of indigo in the sulphuric acid is used; and then the blue and yellow are either dyed separately, or all the ingredients are mixed together, to dye by a single operation.

237. Solutions of copper with yellow substances may also be employed. The blue ground must be proportioned to the green which is desired; thus, for the green like that of a drake's neck, a ground of deep royal blue is given; for parrot green, a ground of sky-blue; for verd naissant, a ground of white-blue is necessary. After the cloths have received the proper ground, they are washed in the fulling-mill, and boiled as for common welding, but for the lighter shades the proportion of salts is diminished. Most commonly the cloths intended for the light shades are boiled first; and, when these are taken out tartar and alum are added.

238. The process of welding is conducted in the same manner as for yellow; but a larger quantity of weld is employed, except for the lighter shades, which, on the contrary, require a still smaller proportion. For the most part, a succession of shades from the deepest to the lightest is dyed at the same time, beginning with the deepest and proceeding to the lightest; between each dip, which lasts half an hour, or three quarters, water is added to the bath. Some dyers give each parcel two dips, beginning the first time with the deep shades, and the second with the light ones; in that case, each parcel should remain a shorter time in the bath: for the very light shades, care should be taken that the bath does not boil. A browning with logwood and a little sulphate of iron is given to the very deep greens.

The green obtained by means of the solution of indigo in sulphuric acid, is denominated Saxon green, from its having been first practised in Saxony. We shall here give the process directed by Dr. Bancroft for this color.

239. The most beautiful Saxon greens may be produced very cheaply and expeditiously, by combining the lively yellow which results from quercitron bark, murio-sulphate of tin, and alum, with the blue afforded by indigo dissolved in sulphuric acid, as for dyeing the Saxon blue.

To produce this combination most advantageously, the dyer, for a full-bodied green, should put into the vessel after the rate of six or eight pounds of powdered bark in a bag, for every hundred pounds of cloth, with only a small proportion of water as soon as it begins to grow warm; and when it begins to boil, he should add about six pounds of murio-sulphate of tin, with the usual precautions, and a few minutes after about four pounds of alum. These having boiled together five or six minutes, cold water should be added, so as to bring the heat of the liquor down to what the hand is able to bear. Immediately after this, as much sulphate of indigo is to be added, as will suffice to produce the shade of green intended to be dyed, taking care to mix it thoroughly with the first solution by stirring, &c.; and this being done, the cloth, being previously scoured and moistened, should be expeditiously put into the liquor, and turned very briskly through it for a quarter of an hour, in order that the color may apply itself equally to every part, which it will certainly do in this way with proper care. By these means, very full, even, and beautiful greens may generally be dyed in half an hour; and, during this space, it is best to keep the liquor at rather less than a boiling heat. Murio-sulphate of tin is greatly preferable for this use to the dyers' spirit; because the latter consists chiefly of nitric acid, which, by its highly injurious action upon indigo, would render that part of the green color very fugitive. But no such effect can result from the murio-sulphate of tin, since the muriatic acid has no action upon indigo; and the sulphuric is that very acid which alone is proper to dissolve it for this use.

Respecting the beauty of the color thus produced, those who are acquainted with the unequalled lustre and brightness of the quercitron yellows, dyed with the tin basis, must necessarily

conclude, that the greens composed therewith, will prove greatly superior to any which can result from the dull muddy yellow of old fustic; and, in point of expense, it is certain that the bark, murio-sulphate of tin, and alum, necessary to dye a given quantity of cloth in this way, will cost less than the much greater quantity (six or eight times more) of fustic, with the alum necessary for dyeing it in the common way, the sulphate of indigo being the same in both cases. But in dyeing with the bark, the vessel is only to be filled and heated once; and the cloth, without any previous preparation, may be completely dyed in half an hour; whilst in the common way of producing Saxon greens, the copper is to be twice filled; and to this must be joined the fuel and labor of an hour and a half's boiling and turning the cloth, in the course of preparation, besides nearly as much boiling in another vessel to extract the color of the fustic; and after all, the dyeing process remains to be performed, which will be equal in time and trouble to the whole of the process for producing a Saxon green with the bark; so that this color obtained from bark will not only prove superior in beauty, but in cheapness, to that dyed with old fustic.

210.—*Of Dyeing Silk Green.*—In communicating to silk the green color, it requires very great caution to prevent the stuff from being spotted and striped. Silk intended for greens is boiled as for the ordinary colors; for light shades, however, it should be boiled thoroughly as for blue.

Silk is not first dyed blue like cloth; but, after a strong aluming, it is washed slightly in the river, and distributed into small hanks, that it may take the dye equably; after which it is turned carefully round the sticks, through a bath of weld. When it is thought that the ground is sufficiently deep, a pattern is tried in the vat, to see if the color has the wished-for tone; if it has not ground enough, decoction of weld is added; and, when it is ascertained that the yellow has reached the proper degree, the silk is withdrawn from the bath, and passed through the vat as for blue.

To render the color deeper, and at the same time to vary its tone, there are added to the yellow bath, when the weld has been taken out, juice of Brasil-wood, decoction of fustet, and anotta. For the very light shades, such as apple-green and celadon-green, a much weaker ground is given than for the other colors. For the light shades, if not for sea-green, it is preferable to dye yellow in baths which have already been used, but in which there is no Brasil-wood or fustet, because the silk, perfectly alumed, dyes too rapidly in fresh baths, and is thence subject to take an uneven color. Dr. Bancroft recommends the following process for producing Saxon green at one operation, as the most commodious and certain:—

241. A bath is prepared of four pounds of quercitron bark, three pounds of alum, and two pounds of murio-sulphate of tin, with a sufficient quantity of water. The bath is boiled ten or fifteen minutes, and when the liquor is in temperature till the hand can bear it, it is fit for dyeing. By adding different proportions of sul-

phate of indigo, various and beautiful shades of green may be obtained, and the color thus produced is both cheap and uniform. Care should be taken to keep the bath constantly stirred, to prevent the coloring matter from subsiding. Those shades which are intended to incline most to the yellow, should be dyed first; and, by adding sulphate of indigo, the green, having a shade of blue, may be obtained.

242. To produce what is called an English green, and which is more beautiful than the ordinary greens, and more durable than Saxon green, Gulliche recommends the following process:—He gives the silk, first of all, a clear blue in the cold vat; he steepes it in hot water; washes it in running water; passes it through a weak solution of alum; prepares a bath with the sulphuric solution of indigo, a little of the solution of tin, and a tincture of Avignon berry, made with a vegetable acid. He keeps the silk in this bath till it has assumed the wished-for shade; he then washes and dries in the shade. The lighter hues may be dyed in the sequel. The shades may be varied with more or less blue, or more or less yellow, by the proportions of the indigo solution, and of the yellow substance. When it is wished to give a goslin-green to silk, a light blue is communicated to it, either in the hot vat or in the cold; it is passed through hot water, washed in running water, and while moist it is passed through a bath of anotta.

243. *Of Dyeing Cotton and Linen Green.*—To give a green color to linen and cotton yarns, it is proper to begin with scouring them well; then they must be dyed in the blue vat, cleansed in water, and passed through the weld process.

The strength of the blue and the yellow is proportioned to the color that is wanted. As it is difficult to give uniformity to the cotton velvets in the ordinary blue vat, they are usually dyed yellow with turmeric, and the green is produced with solution of indigo in sulphuric acid.

244. To dye beautiful greens upon cotton, Chaptal recommends that it be first dyed of sky-blue color with indigo, dissolved by potassa and orpiment, then macerated in a strong solution of sumach, then dried and soaked in a solution of acetate of alumina, dried again, rinsed, and finally dyed with quercitron bark, in the proportion of twelve pounds to every fifty pounds of cotton. The quercitron is preferred to weld for this purpose, because the color of the former combines better with that of sumach.

245. M. D'Apigny recommends a method of dyeing cotton and linen of a fine sea or apple-green by means of a single bath; it is in substance as follows:—The liquor is prepared by mixing verdigris with a sufficient quantity of vinegar, and keeping the mixture in a bottle well stoppered for fifteen days in the heat of a stove, and adding to it, about four hours before using it, a solution of potassa equal in weight to that of the verdigris, keeping it still hot. The cotton goods are first soaked in a warm solution, made by dissolving one ounce of alum in five quarts of water for every pound of cotton. The goods are again taken out, and, after adding the verdigris mixture, they are returned, and passed through the bath till sufficiently dyed.

Linen is dyed of the shades of olive and drake's neck green, by first giving it a blue ground, then galling and dipping it in a bath of acetate of iron; afterwards passing it through a bath of weld, combined with verdigris; and through another containing sulphate of copper, finally brightening the color by immersion in a solution of soap.

246. The green, says M. Berthollet, obtained by giving a yellow color to a stuff which has been previously dyed blue, and afterwards washed, presents nothing obscure. The color inclines more or less to yellow, or to blue, according to the tint of blue given, and the strength of the yellow bath. The intensity of the yellow is increased by alkalis, by sulphate of lime, by ammoniacal salts. It is diminished by acids, alum, and solution of tin. The shades vary likewise from the nature of the yellow substance employed.

These different effects will be obtained with the same ingredients in the formation of the Saxon green, according to the process adopted. If the Saxon blue be first dyed, and the yellow color be next given separately, the effects will be analogous to those just mentioned. But if solution of indigo be mixed with the yellow ingredients, the results are not the same, because the sulphuric acid acts in this case on the coloring particles, impairing the intensity of the yellow. If a succession of shades be dyed in a bath composed of yellow and the solution of indigo, the last approach more and more to yellow, because the particles of indigo become attached to the stuff in preference to the yellow ones, which therefore become predominant in the bath.

OF DYEING VIOLET COLOR, &c.

247. *Of Dyeing Wool Violet, &c.*—From the mixture of red and blue are obtained violet, purple (columbine), dove-color, pansy, amaranth, lilac, mallow, and a great many other shades, determined by the nature of the substances, whose red color is combined with a blue color, of which one becomes more or less predominant over the other, according to the proportions of the ingredients, and the other circumstances of the process. Hellet observes, that stuff which has been dyed scarlet, takes an unequal color when blue is to be united with it. The blue is therefore given first, which, even for violet and purple, ought not to be deeper than the shade distinguished by the name of sky-blue; a boiling is given with alum mixed with two-fifths of tartar; the stuff is then dipped in a bath composed of nearly two-thirds as much cochineal as for scarlet, to which tartar is always added.

248. The circumstance which distinguishes the process for purple from that for violet, is that for the former a lighter blue ground is given, and a larger proportion of cochineal is employed. These colors are frequently dyed after the reddening for scarlet, such quantities of cochineal and tartar being added as are necessary; the operation is managed in the same way as for scarlet. But lilacs, pigeon's necks, &c., are commonly dipped in the boiling, which has served for violet, after alum and tartar have been added to it: the blue ground having been proportioned

to the shade required, the quantity of cochineal is also adjusted in a similar manner; a little solution of tin is added for some reddish shades, such as peach blossom. It is to be observed, that, though the quantity of cochineal is diminished according to the lightness of the shade required, the quantity of tartar is not lessened, so that the proportion of it, compared with that of the cochineal, is so much the greater, as the color required is lighter.

249. M. Pœrner is of opinion, that, to procure the colors composed of red and blue, it is advantageous to employ the solution of indigo in sulphuric acid, because a great variety of shades is thus more easily obtained, and the process is not so long or expensive. But the colors thereby obtained are less durable than when the blue vat is employed. He says, however, that they have sufficient permanence, if a solution of indigo be used to which some alkali has been added.

The effects may be easily varied, by giving a preparation to the stuff with different proportions of alum and tartar, or with solution of tin; and by dyeing with different proportions of cochineal and solution of indigo.

250. A process for dyeing wool of a purple color is given by M. Berthollet, as having been communicated to him by Descroizilles. It is this:—If it be wool in the fleece which is to be dyed, one-third of its weight of mordant is required; if it be a woven stuff, only a fifth is necessary. A bath is prepared at a temperature which the hand can bear; the mordant is well mixed with it; and the wool or stuff is then immersed. It is to be properly agitated, and the same degree of heat is to be kept up for two hours, which may be even increased a little towards the end. It is then lifted out, aired, and very well washed. A new bath of pure water at the same heat is prepared; a sufficient quantity of violet wood is added to it; the stuff is then let down, and agitated; and the heat is urged to the boiling point, at which it is maintained for a quarter of an hour. The stuff is then lifted out, aired, and carefully rinsed. The dye is now completed. If a decoction of one pound of log-wood has been used for three pounds of wool, and proportionately for the stuffs which require a smaller dose, a beautiful violet is obtained, to which a sufficient quantity of Brasil-wood gives the shade known by the name of prune de monsieur.

251. The ingenious author from whom we quote the above, thus endeavours to explain the process:—

If we may venture an opinion, without having made direct experiments on a complicated process, such as that communicated by Descroizilles, and which is still employed advantageously in some manufactories with modifications which we do not know, we would suggest the following explanation.

The muriate of soda is decomposed by the sulphuric acid, and the muriatic acid set at liberty dissolves the tin.

A portion of the tin is precipitated by the tartaric acid, whence the deposit is occasioned. But a portion which remains in solution serves to modify the effect, as we have seen with regard

to cochineal. The oxide of copper, present in this preparation, forms blue with the coloring particles of the indigo; the oxide of tin with the same wood gives violet, and red with the coloring matter of Brasil-wood.

252. *Of Dyeing Silk Violet, &c.*—There are two kinds of violet colors given to silk, these are, by the French writers on dyeing, distinguished into the fine and the false. The fine violet may be given by dyeing the silk with cochineal, and afterwards passing it through the indigo vat. The preparation and dyeing of the silk with cochineal are the same as for crimson, with the omission of tartar and solution of tin, by means of which the color is heightened. The quantity of cochineal made use of is always proportioned to the required shade; but the usual proportion for a fine violet color is two ounces of cochineal for every pound of silk. When the silk is dyed, it is washed at the river, twice beetled, dipped in a vat of a strength proportioned to the depth of the violet shade, and then washed and dried with precautions similar to those which all colors require that are dyed in a vat. If the violet is to have greater strength and beauty, it is usual to pass it through the archil bath, a practice which, though frequently abused, is not to be dispensed with for light shades, which would otherwise be too dull.

253. When silk has been dyed with cochineal, as above directed, a very light shade of blue must be given it for purple. Only the deepest shades are passed through a weak vat. For those which are less so, cold water is had recourse to, into which a little of the blue vat is put, because they would take too much blue in the vat itself, however weak it may be. The light shades of this color, such as pink, gridelin, and peach-blossom, are made in the same manner, with a diminution of the proportion of cochineal.

254. The spurious violets are given to silk in various ways. The most beautiful, and those most in use, are prepared with archil. The strength of the archil bath is proportioned to the color wished for: the silk, to which a beetling in the river has been given on its coming out of the soap, is turned through it round the skein sticks. When the color is thought to be deep enough, a trial is made on a pattern in the vat, to see if it takes the violet that is wanted. If it is found to be at the proper pitch, a beetling is given to the silk at the river, and it is passed through the vat as for fine violets. Less blue, or less archil, is given, according as the violet is wished to incline to red or to blue.

255. A violet color may be imparted to silks by immersing them in water impregnated with verdigris, as a substitute for aluming, and then giving them a bath of logwood, in which they assume a blue color; which is converted into a violet, either by dipping them in a weaker or stronger solution of alum, or by adding it to the bath; the alum imparts a red shade to the coloring matter of the logwood. This violet possesses but little beauty, or permanence, but if the alumed silk be immersed in a bath of Brasil-wood, and next in a bath of archil after washing it at the river, a color is obtained possessing a much higher degree of beauty and intensity.

M. Decroizilles' process, above related, for dyeing wool, was found to succeed equally well, according to his account, in communicating a violet color to silk.

256. *Of Dyeing Cotton and Linen Violet, &c.*—The process in most common use for dyeing cotton and linen of the violet colors is the following:—The stuffs have first a blue ground communicated to them in the indigo vats according to the shade required; they are then dried. After this they must be galled in the proportion of three ounces of galls to a pound: they are left for twelve or fifteen hours in the gall bath, after which, they are wrung and dried again. They are then passed through a decoction of logwood, and when well soaked are taken out, and two drachms of alum, and one of dissolved verdigris, for each pound of stuff are added to the bath; the skeins are then redipped on the sticks, and turned for a full quarter of an hour, when they are taken out to be aired; after which they are again completely immersed in the bath for a quarter of an hour, then taken out and wrung. The vat which has been employed is then emptied; half of the decoction of logwood which had been reserved is poured in; two drachms of alum are added, and the stuff dipped afresh, until it is brought to the shade required. The decoction of logwood ought to be stronger or weaker according to the shade required; this violet stands the action of the air tolerably well, but is not so durable as that obtained by madder.

257. Permanent purple and violet colors may be given to cotton stuffs that have been dyed a Turkey-red, by adding to the alum steep a proportion of sulphate of iron suited to the shade required. Cotton also that has been dyed a light blue with indigo, may be changed to purple or violet by passing the stuff through a bath prepared with the aluminous mordant, and dyeing with madder.

OF DYEING ORANGE.

258. *Of Dyeing Wool Orange.*—Orange colors are produced by the mixture of red and yellow; and, by varying the proportions of the ingredients, an almost endless variety of shades may be obtained.

Poerner describes a great many varieties which he obtained by employing weld, saw-wort, dyers' broom, and some other yellow substances; as also by introducing into the preparation of the cloth, or into the bath, tartar, alum, sulphate of zinc, or sulphate of copper.

Different colors may in like manner be procured from the madder, which is associated with yellow substances. It is thus that the mordores and the cinnamons are dyed; colors commonly formed in two baths. The madding is first given, preceded by a bath of alum and tartar as for ordinary madding; and then a bath of weld is employed.

For cinnamon a weaker madding is given, and commonly a bath is used which had served for the mordore. The proportions are varied according as the red or the yellow is wished to predominate. Sometimes nut-galls are added, and sometimes the color is deepened by a brown-
ing.

Occasionally the sole object is to give a reddish tone to the yellow; the stuff just dyed yellow may, in this case, be passed through a bath of madder, more or less charged according to the intention.

Brasil-wood is likewise employed along with the yellow substances, and sometimes it is associated with cochineal and madder.

When, instead of weld or other yellow substances, root of walnut, walnut-peels, or sumach, are used, tobacco, snuff, chestnut, musk colors &c., are produced.

259. *Of Dyeing Silk Orange.*—Morrone, cinnamons, and all the intermediate shades are given to silk, by logwood, Brasil, and fustic: a bath is prepared by mixing decoctions of these three woods made separately; the proportion of each is varied according to the shade required, but that of fustic ought to prevail; the bath should be of a moderate temperature; and the silk, after being scoured and alumed in the usual manner, is immersed in it. The silk is turned on the skein sticks in the bath, and when taken out, if the color be uniform, it is wrung and dipped in a second bath of the three ingredients, the proportions of which are regulated according to the effect of the first bath, in order to obtain the shade required.

For some colors blue is united to red and yellow, it is thus olives are produced: a blue ground is first given, then the yellow dye, and lastly, a slight madding. Olive may be dyed without using the blue vat, by dipping the silk in a very strong weld bath, after being first alumed; to this a decoction of logwood is afterwards added, and, when the silk is dipped, a little solution of alkali is put in, which turns it green, and gives the silk the olive color. The silk is repeatedly dipped in this bath until it has acquired the proper shade.

260. For the color termed russet olive, or rotten olive, fustet and logwood, without alkali, are added to the bath after the welding. If a more reddish color be wished for, only logwood is added. A kind of reddish olive is also made by dyeing the silk in a bath of fustet, to which more or less sulphate of iron and logwood are added.

261. *Of Dyeing Cotton and Linen Orange.*—The usual combinations of scarlet and orange, are produced with difficulty. On this head Dr. Bancroft remarks, that, as cochineal and the tin mordant cannot be advantageously employed to dye linen or cotton, it is necessary for these substances solely to rely on the aluminous mordant, and to select the red coloring matter from other dye stuffs, especially from madder, with which the yellow of weld, quercitron bark, or fustic, may be combined in such proportions as may be sufficient for the required color. M. Berthollet gives some processes for colors, which he regards as mixtures of red and yellow, though some of them may more properly be considered browns or greens. The various shades of morrone are given to cotton, by first galling, and then dipping it in a bath of acetate of iron, formed by the pyroligneous acid, and afterwards in a bath of weld and verdigris, after which it is dyed with fustic, sometimes with the addition of soda and alum. It is then completely washed, passed through a strong madder bath; then dipped in a weak solution of sulphate of copper; and, lastly, passed through a bath containing soap.

262. The shades cinnamon and mordore are thus given: the stuffs are first dyed with verdigris and weld, then dipped in a solution of sulphate or acetate of iron, out of which they are wrung and dried. After this they are galled, allowing three ounces of galls to each pound of stuff, again dried, alumed, and passed through a madder bath. They are then washed and immersed in a warm soap lie, through which they are turned till the color is sufficiently bright.

263. The shades of color usually denominated gray, have already been treated of, and the processes for dyeing them need not here be repeated.

264. Several highly respectable writers who have done great justice to the subject of dyeing have connected with their treatises on it a brief view of the process of calico printing: we should have followed their example in the present instance, had we not considered the subject, in its present highly improved state, as meriting a distinct notice, which will be found in another part of our work. See PRINTING, CALICO.

DYER (John), the son of Robert Dyer, Esq. a Welsh solicitor, was born in 1700. He passed through Westminster school under the care of Dr. Friend, and was then called home to be instructed in his father's profession. His genius, however, led him a different way; for, besides his early taste for poetry, having a passion no less strong for design, he determined to make painting his profession. With this view, having studied

awhile under his master, he became an itinerant painter in South Wales, and about 1727 printed Grongar Hill. He then made the tour of Italy, where, besides the usual study, he often spent whole days in the country about Rome and Florence, sketching those picturesque prospects with facility and spirit. Images from hence naturally transferred themselves into his poetical compositions: the principal beauties of The Ruins of

Rome are perhaps of this kind; and the various landscapes in *The Fleece* have been particularly admired. On his return to England he published *The Ruins of Rome*, 1740. As his turn of mind was rather serious, he was advised to enter into holy orders; and he found no difficulty in obtaining them. He was ordained by the bishop of Lincoln. About the same time he married a lady of Coleshill named Ensor, whose grandmother was a Shakspeare, descended from a brother of the great Shakspeare. His ecclesiastical provision was, for a long time, but slender. His first patron, Mr. Harper, gave him, in 1741, Calthorp in Leicestershire, of £80 a year, on which he lived ten years; and in April 1751 exchanged it for Belchford in Lincolnshire, of £95 which was given him by lord chancellor Hardwicke. His condition now began to mend. In 1752 Sir John Heathcote gave him Coningsby, of £140 a year; and in 1756, when he was LL.B. without any solicitation of his own, obtained for him from the chancellor, Kirkby on Bane, of £110. In 1757 he published *The Fleece*, his greatest poetical work; but a consumptive disorder, with which he had long struggled, carried him off in 1758. Mr. Dyer's character, as a writer, has been fixed by three poems, *Grongar Hill*, *The Ruins of Rome*, and *The Fleece*; wherein a poetical imagination, perfectly original, a natural simplicity connected with and often productive of the true sublime, and the warmest sentiments of benevolence and virtue, have been universally observed and admired. These pieces were published separately in his lifetime; but, after his death, they were collected and published in one volume 8vo. in 1761, with a short account of him prefixed.

DYER (Sir James), an eminent English lawyer, chief judge of the court of common pleas in the reign of queen Elizabeth. He died in 1581, and, about twenty years after, was published his large collection of Reports, which have been highly esteemed for their succinctness and solidity. He also left other writings behind him relative to his profession.

DYNAMICS, from *δυναμις*, power, that branch of mechanics which has for its object the action of forces on solid bodies, when the result of that action is motion; and in which, since all motion occupies some portion of time, we introduce time into our investigations. See MECHANICS.

DYNASTY, *n. s.* *Δυναστεία*. Government; sovereignty.

Some account him fabulous, because he carries up the Egyptian *dynasties* before the flood, yea, and long before the creation. *Hale's Origin of Mankind*.

Greece was divided into several *dynasties*, which our author has enumerated under their respective princes. *Pope*.

I was detained repairing shattered thrones,
Marrying fools, restoring *dynasties*,
Avenging men upon their enemies,
And making them repent their own revenge.

Byron.

DYNASTY; from *δυναστες*, Gr. a sovereign; among ancient historians, signifies a race or succession of kings of the same family. Such were the *dynasties* of Egypt. The Egyptians reckon thirty *dynasties* within the space of 36,525 years;

but most chronologers look upon them as fabulous.

DYRRACHIUM, in ancient geography, a town on the coast of Illyricum, before called Epidamnus, or Epidamnus, changed by the Romans to Dyrrachium; a name taken from the peninsula on which it stood. It was originally built by the Corcyreans, and, according to Pliny, was a Roman colony. It is famous in history: its port answered to that of Brundisium, and the passage between them was very ready and expeditious. It was also a very celebrated mart for the people of the Adriatic; and the free admission of strangers contributed much to its increase.

DYSÆ, in the Saxon mythology, inferior goddesses, messengers of Woden, whose province it was to convey the souls of such as died in battle to his abode, called Valhalla, i. e. the hall of slaughter; where they were to drink with him and their other gods, cerevisia, a kind of malt liquor, in the skulls of their enemies. The Dysæ conveyed those who died a natural death to Hela, the goddess of hell, where they were tormented with hunger, thirst, and every kind of evil.

DYSART, a royal borough in a parish of the same name, on the north shore of the Frith of Forth, three miles east of Kinghorn, and eleven north of Edinburgh. Its charter was granted about the beginning of the sixteenth century, and it is mentioned, at that time, as one of the principal trading towns in Fife. Before the middle of the eighteenth century, however, its trade had greatly declined, and it only began to revive about 1756. The church is very ancient, and is said to have been built by the Picts. The harbour is good, and the trade considerable; employing about thirty-six vessels in the coal and foreign trade. So early as 1483 salt was manufactured here and exported to Holland. The ship-building also employs a considerable number of hands. Dysart has a weekly market, and fairs in May, June, August, and November.

DYSCRASIA, *n. s.* *Δυσκρασία*. An unequal mixture of elements in the blood or nervous juice; a distemperature, when some humor or quality abounds in the body.

In this pituitous *dyscrasy* of blood, we must vomit off the pituita, and purge upon intermissions.

Floyer on the Humours.

DYSENTERY, *n. s.* Fr. *dysenterie*, from *δυσεντερία*. A looseness, wherein very ill humors flow off by stool, and are also sometimes attended with blood.

From an unusual inconstancy of the weather, and perpetual changes of the wind from east to west, produced epidemical *dysenterics*. *Arbuthnot on Air*.

DYSENTERY, DYSENTERIA; from *δυσ*, difficulty, and *εντερα*, the bowels. The flux. A genus of disease in the class pyrexia, and order profluvia of Cullen's Nosology. It is known by contagious pyrexia; tenesmus; mucous stools, sometimes mixed with blood, the natural faeces being retained or voided, in small hard scybala, loss of appetite, and nausea. It occurs chiefly in summer and autumn, and is often occasioned by much moisture quickly succeeding intense heat, whereby the perspiration is suddenly checked; but the cause which most usually gives rise to it, is a

specific contagion; and when it once makes its appearance, it not unfrequently spreads with great rapidity. A peculiar disposition in the atmosphere seems often to predispose, or give rise to the dysentery, in which case it prevails epidemically. The disease, however, is much more prevalent in warm climates than in cold ones. When the symptoms produce great loss of strength, and are accompanied with a putrid tendency and a fætid involuntary discharge, the disease often terminates fatally in the course of a few days; but when they are more moderate, it is often protracted to a considerable length of time, and goes off at last by a gentle perspiration. When the disease is of long standing, and has become habitual, it seldom admits of an easy cure; and when it attacks a person laboring under an advanced stage of scurvy, or pulmonary consumption, or whose constitution has been much impaired by any other disorder, it is sure to prove fatal. See *MEDICINE*.

DYSOPIA; from *δυσ*, bad, and *ὤψ*, an eye. Depraved sight, requiring certain light, particular distance, or one position. A genus of disease in the class locales, and order dysæsthesiæ of Cullen, containing the five following species:—1. *D. tenebrarum*, requiring objects to be placed in a strong light. 2. *D. lunninis*, in which objects are only discernible in a weak light. 3. *D. dissitorum*, in which distant objects are not perceived. 4. *D. proximorum*, in which objects when near are not perceived. 5. *D. lateralis*, in which objects are not seen, unless placed in an oblique position.

DYSPEPSIA, or **DYSPEPSY**, from *δυσ*, bad, and *πείρω*, to concoct. Indigestion. Dr. Cullen arranges this genus of disease in the class neuroses, and order adynamiæ. It chiefly arises in persons between thirty and forty years of age, who lead either a very sedentary or irregular life.

DYSPHONY, *n. s.* *Δυσφωνία*. A difficulty in speaking, occasioned by an ill disposition of the organs.

DYSPNO'EA, *n. s.* *Δυσπνοία*. A difficulty of breathing; straitness of breath.

DYSURIA; from *δυσ*, difficult, and *ουρον* urine. Difficulty and pain in discharging the urine. A genus of disease in the class locales, and order epischesis of Cullen, containing six species:—1. *D. ardens*, a sense of heat, without any manifest disorder of the bladder. 2. *D. spasmodia*, from spasm. 3. *D. compressionis*, from mechanical compression of the neighbouring parts. 4. *D. phlogistica*, from violent inflammation. 5. *D. calculosa*, from stone in the bladder. 6. *D. mucosa*, from an abundant secretion of mucus.

DYSURY, *n. s.* *Δυσουρία*. A difficulty in making urine.

It doth end in a dysentery, pains of the hæmorrhoids, inflammations of any of the lower parts, diabetes, a continual pissing, or a hot *dysury*, difficulty of making water. *Harvey.*

DYTISCUS, the water-beetle, in zoology, a genus of insects of the order of the coleoptera. The antennæ are slender and setaceous; the hind feet hairy, and formed for swimming.

There are 147 species, distinguished by their antennæ, the color of the elytra, &c. The larvæ of the dytiscus are often met with in water. They are oblong, and have six scaly feet. Their body consists of eleven segments. The head is large, with four filiform antennæ, and a strong pair of jaws. The last segments of their body have rows of hairs on the sides; and the abdomen is terminated by two spines charged with the like hairs, forming a kind of plumes. These larvæ are frequently of a greenish variegated brown: they are lively, active, and extremely voracious: they devour and feed upon other water insects, and often tear and destroy each other. The perfect insect is little inferior to its larvæ in voraciousness, but it can only exercise its cruelty on the young larvæ; the perfect larvæ, like himself, being sheltered by the kind of scaly cuirass with which they are armed. This creature must be touched cautiously; for, besides its power of giving a severe gripe with its jaws, it has under the thorax a long sharp spine, which it will drive into the fingers by the effort it makes to move backwards. The eggs of the dytisci are rather large, and are inclosed in a kind of silky duskish cod, of a strong and thick texture, in form round, and terminated by a long slender tail, of the same substance. These cods are often found in the water, and from them are brought forth the eggs and larvæ of the dytisci. The strength of these cods serves the insect to defend their eggs from the voraciousness of several other aquatic insects, and even from that of their fellow dytisci. Many species of the perfect insect are common in stagnated waters, which they quit in the evening to fly about. They swim with incredible agility, using their hinder legs as oars. The elytra of the females are in general furrowed, and those of the males plain. When they first arrive at their perfect state, their elytra are almost transparent, and in many species of a beautiful dun color, mingled with shades of a greenish-brown. The best method of catching them is with a hand-net, or sieve; for they are so nimble, and exercise their defensive weapons so often, and with such painful success to those who endeavour to catch them, that they are very often obliged to let them escape; the easiest way to kill them, is to let them fall into boiling hot water, which instantly destroys them.

DYVOUR, or bare-man, in Scots law, a person who, being involved in debt, and unable to pay, to avoid imprisonment, makes cession of his effects in favor of his creditors; and does his devoir and duty to them, proclaiming himself bare-man and indigent, and becoming debt-bound to them of all he has. The word is used in the same sense as *BANKRUPT*: see that article.

DZIDZA, a town of Albania, situated on the declivity and top of a barren mountain. The Albanian Christians have a monastery and several churches here. The arable land in the neighbourhood is laid out in vineyards, and the situation being warm, very fine wine is produced, but there is a scarcity of fresh water. It is eighteen miles from Delvinaki.

E.

E, the fifth letter of the Hebrew, Phœnician, Syriac, Samaritan, Sanscrit, Greek, Latin, Armenian, Coptic, Georgian, German, Italian, Spanish, French, and English languages, is derived, say Ainsworth and Minshew, from the Heb. ה, turned, and the small line fixed to the foot; but it seems more naturally deduced from the Phœnician ג, altered by the Greeks to Ε? Ε has two sounds; long, as scēne, and short, as mēn. It is the most frequent vowel in the English language; for it not only is used like the rest in the beginning or end of words, but has the peculiar quality of lengthening the foregoing vowel, as cān, cāne; mǎn, mǎne; gǎp, gǎpe, &c. Yet it sometimes occurs final, where yet the foregoing vowel is not lengthened; as gōne, knowlédge, édge, gíve. Anciently almost every word ended with *e*, as for can, canne; for year, yeare; for great, greate; for need, neede; for flock, flocke. It is probable that this *e* final had at first a soft sound, like the female *e* of the French; and that afterwards it was in poetry either mute or vocal, as the verse required, till at last it became universally silent. *Ea* has the sound of *e* long: the *e* is commonly lengthened rather by the immediate addition of *a* than by the apposition of *e* to the end of the word; as mēn, mēan; sēl, sēal; mēt, mēat; nēt, nēat.

EACH, *pron.* Goth. *cilih*; Sax. *aech*; Dut. *elch*; Scot. *ilk*; Gr. *uka*; from Heb. אֵשׁ, *aish*, each.—Minshew. Either of two; every one of a number; corresponding with other.

Woo to you farisees that tithen mynte and ruwe and *ech* erbe; and leenen doom and the charite of God; for it bihoſte to do these thingis and not to leeue tho. *Wicklif. Luke xi.*

Let *each* esteem other better than themselves.

Phil. ii. 3.

But wel I wote he lied right in dede;
Of cursing ought *ech* gilti m in him drede,
For curse wol sle right as assouling saveth.
And also ware him of a significavit.

Chaucer. Prolog. to Cant. Tales.

'Tis said they eat *each* other.

Shakspeare. Macbeth.

Now I feel by proof,
That fellowship in pain divides not smart,
Nor lightens ought *each* man's peculiar load.

Milton.

Wise Pluto said, the world with men was stored,
That succour *each* to other might afford. *Denham.*
Go, dear; *each* minute does new danger bring.

Dryden.

Loveliest of women! heaven is in thy soul;
Beauty and virtue shine for ever round thee,
Bright'ning *each* other! Thou art all divine.

Addison's Cato.

They are in such small spheres as to repel *each* other; that is, they are applied to *each* other by such very small surfaces, that the attraction of the particles of *each* drop to its own centre is greater than its attraction to the surface of the drop in its vicinity.

Darwin.

Whate'er of wonder Reynolds now may raise,
Raphael still boasts contemporary praise:
Each dazzling light and gaudies bloom subdued,
With undiminished awe his works are viewed.

Sheridan.

EACHARD (John), an eminent English divine, born in Suffolk about 1636. He was educated at Cambridge, and became fellow of Catherine Hall. In 1670 he published, without his name, a piece entitled *The Grounds and Occasions of the Contempt of the Clergy and Religion* enquired into. He blended considerable humor with his remarks, which gave rise to a long controversy. In 1675 he was chosen master of Catherine Hall upon the decease of Dr. John Lightfoot; and in 1676 was created D. D. by royal mandate. Besides the above work, he wrote some tracts on Mr. Hobbes's Notions. He died in 1697.

EACHARD (Laurence), an eminent English historian of the eighteenth century. He was educated in the university of Cambridge, and presented to the living of Welton and Elkington in Lincolnshire, where he spent above twenty years, and distinguished himself by his writings, especially his *History of England*, which was attacked by Dr. Calamy and by Mr. Oldmixon. His *General Ecclesiastical History*, from the Nativity of Christ to the first Establishment of Christianity by Human Laws, under the emperor Constantine the Great, has passed through several editions. He was installed archdeacon of Stowe and prebend of Lincoln in 1712. He died in 1730.

EAD (*ad. ed.*) in the compound, and *eadig* in the simple names, denote happiness or blessedness. Thus Eadward is a happy preserver; Eadulph, happy assistance; Eadgar, happy power; Eadwin, happy conqueror; which Macarius, Eupolemus, Fausta, Fortunatus, Felicianus, &c., do in some measure resemble. *Ead* may also in some cases be derived from the Sax. *cath*, which signifies, easy, gentle, mild.

EADMER, or EADMERUS, an ancient English historian, whose parentage and birth-place are not well known. Being a monk, in the cathedral of Canterbury, he became the bosom friend and companion of two archbishops, St. Anselm and Ralph. To the former he was appointed spiritual director by the pope. In 1120 he was sent for by king Alexander I. of Scotland, to be raised to the primacy of that kingdom; and having obtained leave of king Henry, and the archbishop of Canterbury, he departed for Scotland, where he was kindly received by the king; and on the third day after his arrival was elected bishop of St. Andrew's. But on the day after his election Eadmer told the king that he was determined to be consecrated by none but the archbishop of Canterbury. Alexander declaring that the see of Canterbury had no pre-eminency over that of St. Andrew's, Eadmer at length sent his pastoral ring to the king, and laid his pastoral staff on the high altar, whence he had taken it; and, abandoning his bishopric, returned to England. Some time after, however, he wrote a submissive letter to the king of Scotland, which was accompanied by an epistle to the same purpose from the archbishop; these letters, however, did not produce the desired effect. Eadmer is most worthy of our regard for

his historical works, particularly for his excellent history of the affairs of England in his own time, from A. D. 1066 to A. D. 1122; in which he has inserted many original papers, and preserved important facts, nowhere else to be found. This work has been highly commended, both by ancient and modern writers, for its authenticity, as well as regularity of composition and purity of style. It is indeed more free from legendary tales than any other work of that period.

EA'GER, *adj.* } Sax. eagar; Fr. *aigre*;
EA'GERLY, *adv.* } Span. *agrio*; Ital. *agro*.

EA'GERNESS, *n. s.* } Iye says from the Sax. eggian, to stimulate; a word still used (at least egg, *v. a.*) in vulgar conversation. But Lat. *acer*, sharp, brisk, from Gr. *akis*, seems the more probable derivation of the whole. Keen; sharp; ardent; acrid; hence keenly desirous; quick; vehement; animated; impetuous.

Apt as well to quicken the spirits as to allay that which is too *eager*. *Hooker.*

The air bites shrewdly; it is very cold.
—It is a nipping and an *eager* air.

Shakspeare. Hamlet.
With a sudden vigour it doth posset
And curd, like *eager* droppings into milk,
The thin and wholesome blood. *Id.*

Brutus gave the word too early,
Who having some advantage on Octavius,
Took it too *eagerly*; his soldiers fell to spoil,
Whilst we by Anthony were all inclosed.

Shakspeare.
She knew her distance, and did angle for me,
Maddling my *eagerness* with her restraint. *Id.*
The flesh shrinketh, but the bone resisteth, where-
by the cold becometh more *eager*.

Bacon's Natural History.
Abundance of rain froze so *eagerly* as it fell, that it
seemed the depth of winter had of a sudden been
come in. *Knolles's History of the Turks.*

Covetous men need neither clock nor bell to awaken
them; their desires make them restless. Oh that
we could with as much *eagerness* seek the true riches,
which only can make us happy.

Bp. Hall. Contemplations.
Of action *eager*, and intent of thought,
The chiefs your honourable danger sought.

Dryden's Ovid.
Eager to read the rest, Achates came. *Id. Æneid.*

Have you not seen, when whistled from the list,
Some falcon stooped at what her eye designed,
And, with her *eagerness* the quarry missed. *Dryden.*
I'll kill thee with such *eagerness* of haste,
As fiends, let loose, would lay all nature waste. *Id. **

Gold will be sometimes so *eager*, as artists call it,
that it will as little endure the hammer as glass itself. *Locke.*

The *eagerness* and strong bent of the mind after
knowledge, if not warily regulated, is often an hin-
drance to it. *Id.*

Nor do the *eager* clamours of disputants yield more
relief to eclipsed truth, than did the sounding brass
of old to the labouring moon. *Glanville's Screpis.*

Imperfect zeal is hot and *eager*, without knowledge. *Sprat.*

To the hojy war how fast and *eagerly* did men go,
when the priest persuaded them that whosoever died
in that expedition was a martyr. *South.*

How *eagerly* he flew, when Europe's fate
Did for the seed of future actions wait. *Stepney.*
VOL. VII.

His Numidian genius

Is well disposed to mischief, were he prompt
And *eager* on it; but he must be spurred.

Addison's Cato.

Juba lives to catch

That dear embrace, and to return it too,
With mutual warmth and *eagerness* of love. *Id.*

Detraction and obloquy are received with as much
eagerness as wit and humour. *Id. Freeholder.*

The things of this world, with whatever *eagerness*
they engage our pursuit, leave us still empty and un-
satisfied with their fruition. *Rogers.*

A vulgar man is captious and jealous; *eager* and
impetuous about trifles. He suspects himself to be
slighted, thinks every thing that is said meant at him:
if the company happens to laugh, he is persuaded
they laugh at him: he grows angry and testy, says
something very impertinent, and draws himself into a
scape, by showing what he calls a proper spirit,
and asserting himself. *Chesterfield.*

Snatch not *eagerly* at every advantage offered by
his unskilfulness or inattention; but point out to him
kindly, that by such a move he places or leaves a
piece in danger and unsupported. *Franklin.*

To all places of general resort, where the standard
of pleasure is erected, we run with equal *eagerness*,
or appearance of *eagerness*, for very different reasons. *Johnson.*

She sees a world stark blind to what employs
Her *eager* thought, and feeds her flowing joys:
Though Wisdom hail them, heedless of her call,
Flies to save some, and feels a pang for all;
Herself as weak as her support is strong,
She feels that frailty she denied so long. *Cooper.*

As *eager* runs the market-crowd,
When, 'Catch the thief!' resounds aloud;
So Maggie runs, the witches follow,
Wi' mony an eldritch skreech and hollow. *Burns.*

Then came his fit again, which to o'ercome,
As *eagerly* the barred-up bird will beat
His breast and beak against his wiry dame
Till the blood tinge his plumage, so the heat
Of his impeded soul would through his hosom eat. *Byron.*

EA'GLE, *n. s.* } Fr. *aigle*; Ital. and
EA'GLE-EYED, *adj.* } Lat. *aquila*; Port.
EA'GLE-SIGHTED, } *aguia*. Etymologists
EA'GLE-SPEED, *n. s.* } have sometimes trac-
EA'GLE-STONE, } ed this name to the
EA'GLET, } acuteness of its sight;
EA'GLE-WINGED, *adj.* } sometimes to its
swift flying (*acutè videndo aut volando*, Fest.)
and again to its acute beak and claws (*ab acu-
mine rostri et unguium*. *Id.*) But Ainsworth says
more probably from *aquilus*, dun-colored, i. e.
from *aqua*, water; either because of a common
color or the habits of this bird. A bird of the
falcon genus. The first three compounds are
obvious in their meaning. For eagle-stone, see
ÆTITES, and the extract. An eaglet is a young
eagle.

If you stop the holes of a hawk's bell it will make
no ring, but a flat noise or rattle; and so doth the
æties, or eaglestone, which hath a little stone in with
it. *Bacon.*

This treason of his sons did the king express in an
emblem, wherein was an eagle with three eaglets ty-
ring on her breast, and the fourth pecking at one of
her eyes. *Davies.*

The snake each year fresh skin resumes,
And eagles change their aged plumes;
The faded rose each spring receives
A fresh red tincture on her leaves:
But if your beauties once decay,
You never know a second May.

Carew.

As he was quick and perspicacious, so was he inwardly eagle-eyed, and versed in the humours of his subjects.

Howel.

Every one is eagle-eyed to see
Another's faults and his deformity. Dryden.
There is a lust in man no charm can tame,
Of loudly publishing his neighbour's shame;
On eagles' wings immortal scandals fly;
While virtuous actions are but born and die.

Harvey.

The eaglestone contains, in a cavity within it, a small loose stone, which rattles when it is shaken; and every fossil, with a nucleus in it, has obtained the name. The analogy between a stone, thus containing another within it, or, as the fanciful writers express it, pregnant with another, and a woman big with child, led people to imagine that it must have great virtues and effects in accelerating or retarding delivery; so that, if tied to the arm of a woman with child, it prevents abortion; and if to the leg, it promotes delivery. On such idle and imaginary virtues was raised all the credit which this famous fossil possessed for many ages.

Hill's Materia Medica.

Arts still followed where Rome's eagles flew.

Pope.

Abrupt, with eaglespeed she cut the sky,
Instant invisible to mortal eye. Id.
Draw forth the monsters of the' abyss profound,
Or fetch the' aerial eagle to the ground. Id.

Eagles are said to be extremely sharp-sighted, and, when they take flight, spring perpendicularly upward, with their eyes steadily fixed upon the sun. Calmet.

The moles and bats in full assembly find,
On special search, the keen-eyed eagle blind.
And did they dream, and art thou wiser now?
Prove it—if better, I submit and bow. Cowper.

It has been said (I believe by D'Alembert), that the highest offices in church and state resemble a pyramid, whose top is accessible to only two sorts of animals, eagles and reptiles. My pinions were not strong enough to pounce upon its top, and I scorned, by creeping, to ascend its summit. Bp. Watson.

The EAGLE, in antiquity, was borne by way of ensign by several nations. The first who seem to have assumed the eagle are the Persians, according to Xenophon. It was afterwards assumed by the Romans; who, after a great variety of standards, at last fixed on the eagle, in the second year of the consulate of C. Marius. Till that time, they had used indifferently wolves, leopards, and eagles, according to the humor of the commander. The Roman eagles were not painted on a cloth or flag; but were figures in relief, of silver or gold, borne on the tops of pikes: the wings being displayed, and frequently a thunderbolt in their talons. Under the eagle on the pike, were piled bucklers, and sometimes crowns. Thus much we learn from the medals. Constantine is said to have first introduced the eagle with two heads, to intimate that, though the empire seemed divided, it was yet only one body. This is proved by an eagle with two heads noted by Lipsius, on the Antonine column; as well as by the eagle having only one head on the seal of the golden bull of Charles IV. F. Menestrier

maintains that, as the emperors of the east, when there were two on the throne at the same time, struck their coins with the impression of a cross, with a double traverse, which each of them held in one hand, they did the same with the eagle, but, instead of doubling it, represented it with two heads; in which they were followed by the emperors of the West. F. Papebroche rather inclines to think the use of the eagle with two heads to be merely arbitrary; though he grants it probable, that it was first introduced on the occasion of two emperors at the same time. The eagle on medals, according to M. Spanheim, is a symbol of divinity and providence; but, according to all other antiquaries, of empire. The princes on whose medals it is most usually found are, the Ptolemies, and the Seleucidae of Syria. An eagle with the word Consecratio, expresses the apotheosis of an emperor.

EAGLE, in ancient Irish coinage, a sort of base money, current in Ireland in the first years of Edward I., about A. D. 1272; named, like the lionines, rosades, and many other coins of the same period, from the figures with which they were impressed. The current coin of the kingdom was then a composition of copper and silver, in a certain proportion, but so much below the standard of England that they were not intrinsically worth quite half so much. They were imported out of France and other foreign countries. When Edward was established on the throne, he set up mints in Ireland for coining good money, and decried the use of the eagles and all other kinds of base coins; making it death, with confiscation of effects, to import any more of them.

EAGLE, in architecture, is a figure of that bird, anciently used as an attribute, or cognizance of Jupiter, in the capital and friezes of the columns of temples consecrated to that god.

EAGLE, in astronomy, a constellation of the northern hemisphere, having its right wing contiguous to the equinoctial. See AQUILA, and ASTRONOMY. There are also three stars, denominated, among the Arab astronomers, nasr, i. e. eagle, viz. 1. Nasr sobail, the eagle of canopus; called also sitarch jemen, the star of Arabia Felix, over which it is supposed to preside; 2. Nasr althair, the flying eagle; and 3. Nasr alveke, the resting eagle.

EAGLE, in heraldry, is accounted one of the most noble bearings in armoury; and ought to be given to none but such as greatly excel in generosity and courage, or who have done singular services to their sovereigns; in which cases they may be allowed a whole eagle, or an eagle passant, or only the head or other parts thereof, in proportion to their exploits.

EAGLE, in ornithology. See FALCO.

EAGLE, BLACK, an order of knighthood, instituted in 1701, by the elector of Brandenburg, on his being crowned king of Prussia. The knights wear an orange colored riband, to which is suspended the annexed cross.

EAGLE, WHITE, a Polish order of knighthood, instituted in 1325 by Uladislaus V. on marrying his son Casimir with a daughter of the great duke of Lithuania. The badge of this order, worn by the knights, is a gold cross of eight points, enamelled gules, bordered argent, cantoned with flames of fire; charged in the middle with a white eagle, bearing on his breast a cross of the same, environed with the arms and trophies of the electorate of Saxony; and on the other side is a cypher of the king's name, with this motto, *PRO FIDE, REGE, LEGE*. The whole surmounted with a small crown of diamonds. The collar is composed of golden eagles, crowned and chained. On all days, besides state days, the knights wear the cross at the extremity of a broad blue riband scarf-wise. They have it also embroidered on the left side of their cloaks and coats.

EAGLE, RED, a very ancient order in Baireuth, of which the margrave is sovereign. It is established both for military and civil persons, but is generally conferred on officers who have obtained the rank of lieutenant-general. The badge is a medal of gold, of a quadrangular form, enamelled white, upon which is an eagle displayed red. It is worn scarf-wise, pendent to a broad red watered riband, edged with yellow.

EAGLE, SPREAD, signifies an eagle with two heads, as the example. But it is more heraldic to say, an eagle with two heads displayed. According to Porney, the reason why the emperor of Germany bears an eagle with two necks, is this: on the union of the kingdom of Romania, now a province of Turkey in Europe, its arms, which were an eagle displayed sable, being the same as those of the emperor, were united into one body, leaving it two necks as they are now.

EAGLE ISLAND, an island on the South Pacific Ocean, on the coast of New Holland, visited by captain Cook in his first voyage, is principally inhabited by a monstrous kind of bird, the nest of one of which measured no less than twenty-six feet in circumference and two feet eight inches in height. In the Philosophical Transactions, vol. XX. there is an account of one of these nests still larger; but the bird to which it belonged was not seen. That which our navigators saw was built of sticks, and lay upon the ground.

EAGLESTONE. See *ÆTITES*.

EAGRE, n. s. *Æger*, in Runic, is the ocean; *eggia*, in Islandic, is to agitate; to incite. A tide swelling above another tide, observable in the river Severn. But Dryden himself says he observed the eagre in the Trent, and this term, we well know, expresses, as a provincialism, in other parts of England, the first coming in of the tide.

Dissembled Hate or vanquished Love,
Its more than common transport could not hide,
But like an *eagre* rides in triumph o'er the tide.

Dryden.

EALDERMAN, n. s. Sax. *ealþerman*, a Saxon magistrate; an **ALDERMAN**, which see.

EALLANGHEIRRIG, a small island in Argyleshire, situated at the mouth of Loch Ridden, in the parish of Inverchaolain, memorable in the annals of the seventeenth century. In 1685, when the duke of Monmouth attempted an invasion of the country, the unfortunate Archibald, earl of Argyle, having collected an army of 3000 men, retired to this island, which he fortified very strongly, and here deposited his spare arms and ammunition. Soon after, upon the appearance of some ships of war, the garrison surrendered, and the whole ammunition falling into the hands of the royal party, put an end to any further hostile operations on the part of that unfortunate nobleman, who with his party, found means to escape, but was soon afterwards taken, tried for high treason, and beheaded.

EAME, n. s. Sax. *eain*; Dut. *com*, uncle: a word still used in the wilder parts of Staffordshire.

Daughter, says she, fly, fly; behold thy dame
Foreshows the treason of thy wretched eame!

Fairfax.

EAR, n. s.	Sax. <i>eare</i> ; Goth.
EAR-BORED, adj.	<i>cyr</i> and <i>auso</i> ; Dan.
EAR-DEAFENING,	<i>crc</i> or <i>oore</i> ; Swed.
EAR-DRUM, n. s.	<i>are</i> ; Teut. <i>ahr</i> , <i>ohr</i> ;
EAR-KISSING, adj.	Fr. <i>oreille</i> ; Ital. <i>orec-</i>
EARLESS,	<i>chio</i> ; Lat. <i>auris</i> . Ju-
EAR-MARK, n. s. & v.	nian derives the Go-
EAR-PIERCING, adj.	thic verb <i>haus-jan</i> , to
EAR-RING, n. s.	hear, from the above
EAR-SHOT,	(<i>auso</i>) noun, and both
EAR-WAX,	from the Greek <i>oug</i> .
EAR-WIG,	The organ of hear-
EAR-WITNESS.	ing; and sometimes

the prominent part of that organ only; also the handle or prominent part of a vessel. Attention to a suit or person; the power of ascertaining sounds or harmony: also the spike of corn, or that part which contains the seed. To be, to fall, or go together by the ears, is to quarrel or scuffle, in which those organs sometimes obtain rough treatment. To set by the ears is to excite to strife or quarrelling. To be up to the ears is to be deeply immersed. Ear-bored is, marked in the ear; sometimes to be so marked was a token, as among the Jews and Romans, of servitude. Ear-deafening is stunning. To ear-mark, to mark (cattle, generally) on the ear. Ear-shot is the reach or compass of the ear, with regard to hearing sounds: ear-wig, a species of forficula, imagined to creep into the ear. Ear-witness, one who has heard what he attests. Earless, without ears.

And he began to seye to hem, for in this day this scripture is fulfilled in youre *ecris*. *Wiclif. Luke iv.*

In that tyme Jhesus wente bi cornes in the Sabot dai, and hise discipulis hungriden and bigunnen to plucke the *ecris* of corn, and to ete. *Id. Matt. xii.*

His ears are open unto their cry. *Psal. xxxiv. 15.*

His master shall bore his ear through with an awl

Exod.

The frere arose,
But I suppose,
Amased was his hed,
He shoke his *eares*
And from grete feares,
He thought hym well yfied.

Sir T. More.

Poor naked men laboured one another with shagged sticks, or dully fell together by the *ears* at fisty-cuffs.

More.

Sir J. Perrot ordered the Irish to mark all their cattle with pitch or *ear-mark*, on pain of forfeiture.

Cor. Hist. Ireland.

For feare lest we like rogues should be reputed
And for *earc-marked* beasts abroad be bruited.

Spenser.

All present were made *earwitnesses*, even of each particular branch of a common indictment. Hooker.

With gold and silver they increase his store,
And gave the precious *earrings* which they wore. Sandys.

Their warlike force was sore weakened, the city beaten down about their *ears*, and most of them wounded. Knolles.

An unworthie councillor is a wicked charme in the king's *ears*, a sword of terror in the aduice of tyranny. Breton. 1616.

You have heard of the news abroad : I mean the whispered ones ; for they are yet but *ear-hissing* arguments. Shakspeare.

The burst

And the *eardeafening* voice of the oracle,
Kin to Jove's thunder. Id.

O, farewell !—

The spirit-stirring drum, the *ear-piercing* fife,
The royal banner ; and all quality,
Pride, pomp, and circumstance of glorious war ! Id.

What fire is in my *ears* ? Can this be true ?
Stand I condemned ? Id. Much Ado.

Aristippus was earnest suitor to Dionysius for some grant, who would give no *ear* to his suit : Aristippus fell at his feet, and then Dionysius granted it. Bacon's *Apophthegms*.

Himself he on an *earwig* set ;
Yet scarce he on his back could get,
So oft and high he did curvet. Drayton's *Nymphiad*.

Princes, that will but hear, or give access

To such officious spies, can ne'er be safe :

They take in poison with an open *ear*,

And, free from danger, become slaves to fear. Ben Jonson.

Nor can I bide to pen some hungrie scence
For thick-skin *eares*, and undiscerning eyne.

Bp. Hall. *Satires*.

O age well thriven and well fortunate,
When eech man hath a muse appropriate ;
And shee like to some servile *earc-boarded* slave,
Must play and sing when and what he would have. Id.

This gold is now grown to a calf ; let no man think that form came forth casually out of the melted *earrings* : this shape was intended by the Israelites, and perfected by Aaron. Id. *Contemplations*.

There are some vessels, which, if you offer to lift by the belly or bottom, you cannot stir them ; but are soon removed, if you take them by the *ears*.

Taylor's *Rule of Holy Living*.

He laid his sense closer, and in fewer words, according to the style and *ear* of those times. Denham.

The leaves on trees not more,

Nor bearded *ears* in fields, nor sands upon the shore. Dryden.

Gomez, stand you out of *earshot*.—I have something to say to your wife in private.

Id. *Spanish Friar*.

Better pass over an affront from one scoundrel, than draw the whole herd about a man's *ears*.

Fools go together by the *ears*, to have knaves run away with the stakes. Id.

A mean rascal sets others together by the *ears* without fighting himself. Id.

The *ear* being to stand open, because there was some danger that insects might creep in thereat ; therefore hath nature loricated or plaistered over the sides of the hole with *earwax*, to entangle insects. Ray on the *Creation*.

Be not alarmed, as if all religion was falling about our *ears*. Burnet's *Theory*.

It is usual to set these poor animals by the *ears*. Addison.

All Asia now was by the *ears*,
And gods beat up for volunteers. Prior.

A quilted night cap with one *ear*.

Congreve. *Way of the World*.

A pot without an *ear*.

Swift.

Doll never flies to cut her lace,

Or throw cold water in her face,

Because she heard a sudden drum,

Or found an *earwig* in a plum. Id.

I may say of him (Mr. John Smith) in Antonius's phrase, he was—dipped into justice, as it were, over head and *ears* ; he had not a slight superficial tincture, but was dyed and coloured quite through with it. Bp. Patrick.

In cases where there is little expected but the pleasure of the *ears* and eyes, the least diminution of that pleasure is the highest offence. Steele.

Eloquence, that leads mankind by the *ears*, gives a nobler superiority than power that every dunce may use, fraud that every knave may employ, to lead them by the nose. Bolingbroke.

If on a pillory, or near a throne,

He gain his prince's *ear*, or lose his own. Pope.

Earless on high stood unabashed Defoe,

And Tutchin flagrant from the scourge below. Id.

Valsalva discovered some passages into the region of the *ear-drum* ; of mighty use, among others, to make discharges of bruises. Derhum's *Physico-Theology*.

She used to carry tales from one to another, till she had set the neighbourhood together by the *ears*. Arbuthnot.

A lady bestowed *earrings* upon a favourite lamprey. Id.

The histories of mankind, written by eye or *earwitnesses*, are built upon this principle. Watts's *Logic*.

Earwigs and snails seldom infect timber. Mortimer's *Husbandry*.

From several grains he had eighty stalks, with very large *ears*, full of large corn. Id.

An opera, like a pillory, may be said

To nail our *ears* down, but expose our head. Young.

But corn was housed, and beans were in the stack ;
Now therefore issued forth the spotted pack,
With tails high mounted, *ears* hung low, and throats
With a whole gamut filled of heavenly notes ;
For which, alas ! my destiny severe,
Though *ears* she gave me two, gave me no *ear*. Cowper.

He calls for Famine, and the meagre fiend
Blows mildew from between his shrivelled lips,
And taints the golden *ear*. Id.

Lit by the brilliant spark, from grain to grain
Runs the quick fire along the kindling train ;
On the pained *ear-drum* bursts the sudden crash,
Starts the red-flame, and death pursues the flash. Darwin.

EAR. See **ANATOMY**, **Index**, and **DEAF**, where the structure of this important organ is fully developed. Suetonius mentions the beauties of Augustus's ear; and *Ælian*, describing the beauties of *Aspasia*, observes she had short ears. *Martial* also ranks large ears among deformities. Among the Athenians, it was a mark of nobility to have the ears bored or perforated: but among the Hebrews and Romans it was a mark of servitude. Several naturalists and physicians have held, that cutting off the ear rendered persons barren and unprolific; and this idle notion was what first occasioned legislators to order the ears of thieves, &c., to be cut off, lest they should produce their like.

EAR, in botany, is usually called *spica*. The flowers and seeds of wheat, rye, barley, lavender, &c., grow in ears. The stem of the ear means its tube or straw; the knot of the ear, the lobes or cells wherein the grains are enclosed, &c.

EAR, in music. See **MUSIC**. In music we seem universally to acknowledge a kind of internal sense, distinct from the external one of hearing; which we call a good ear. And the like distinction we should probably acknowledge in regard to our other senses, were our ideas of the differences equally clear. Something like this is universally acknowledged with regard to a critical and accurate perception and judgment of the objects of sight; though, by a familiar metaphor, these sensations are transferred to a sense that has no connexion with them. Thus a greater capacity of perceiving the beauties of painting, architecture, &c., is called a fine taste.

EAR, *v. a. & v. n.* Norm. Fr. *care*; Sax. **EAR'ABLE**, *adj.* } *erian*; Brit. *aeren*; Germ. *eren*; Goth. *arian*; Lat. **EAR'ED**, *adj.* } *aro*. Earth, says Mr. H. Tooke (*Diversions of Purley* ii. 417, 8), is that which one *ereth*, or *eareth*, i. e. plougheth; the third person of the indicative *erian*, *arare*, to *ere*, *ear*, or plough, *Erd*, i. e. *ered*, *er'd*, that which is ploughed; the past tense of the same verb. To till; to plough; to shoot into ears. **Earable** is the origin of our modern word **ARABLE**, which see. **Earing**, a plowing of land.

EAR-TRUMPETS; instruments used by persons partially deaf, to strengthen the sensation of sound. They are of various forms, and are intended to compensate for the want of the external ear, or to augment its power when the internal organs perform their functions but imperfectly. The purpose of the external ear, both in men and beasts, is to collect, by its funnel form, all the rays of sound (if we may be allowed the expression), and conduct them to the internal organs, the seat of the sense of hearing. All the artificial instruments, then, ought to resemble, in form, the natural ear. In ancient times, they were made like a trumpet, of moderate size, and usually provided with handles, by which they might be held up to the ear. They were so fitted that the smaller aperture entered the ear, and the wider was directed to the quarter from which the sound was to proceed. But these instruments were soon found inconvenient, both on account of their size and the necessity of continually holding them to the ear. Another objection was, that they did

not sufficiently conceal the defect they were designed to remedy, and therefore they were soon thrown aside. New instruments were made without these defects. One resembles a small silver funnel, with a long winding channel in its interior, which terminates at the beginning of the auditory passage. On the broad, bent rim there are holes, with ribbons passing through them, to fix the machine to the external ear. A second form consists of a lacerated tin tube, with numerous windings, having the narrow end communicating with the auditory passage, and the exterior, wider end made fast to the external ear. In the same way, two of these instruments might be connected by an elastic hoop, and fitted, at the same time, to both ears. A third instrument consists of a sort of hollow tin case, curving so as to fit the head, having a broad aperture in the middle of the front surface, and terminated by two tubes bent inwards. This hoop is so fixed under the hair, that the aperture in the middle is exactly over the upper part of the forehead, and the lateral tubes communicate with the right and left auditory passages. The great advantage of this last instrument is, that it receives directly sounds which come from before.

EARL, *n. s.*

Sax. *eorl*, which Spelman and others have thought synonymous with *ealdorman*; but see *Turner's Anglo-Sax.* vol. ii. 233. Wachter thinks *eorl* a diminutive of *are*, Sax.; Belg. *eer*; Ger. *er* (*ere*, English): hence seniority and priority. A nobleman who ranks next to a marquis: an earl-marshall is a superintendent of high or military solemnities.

An **EARL** ranks between a marquis and a viscount. The title is so ancient, that its original cannot be clearly traced out. It is, however, certain, that among the Saxons they were called *ealdormen*, quasi elder men, signifying the same with senior or senator among the Romans: and also *schiremen*, because they had each the civil government of a division or shire. On the irruption of the Danes they changed their names to *eorles*, which, according to Camden, signified the same in their language. In Latin they are called *comites* from being the king's companions and associates. After the Norman conquest they were for some time called counts, from the French; but they did not long retain that name, though their shires are thence called counties, and their wives countesses, to this day. It is now become a mere title: their lordships have no official connexion with the government of the county; which is now entirely devolved on the sheriff, the earl's deputy, or vicecomes. An earl is created by cincture of sword, mantle of state put upon him by the king himself, a cap and a coronet put upon his head, and a charter in his hand. An earl's coronet is composed of eight pearls raised upon points, with small leaves between, above the rim, as in the diagram annexed.

EARL MARSHAL. See **MARSHAL**

EARLY, *adj. & adv.* } Sax. *ærlíce*; Goth.
EARLINESS, *n. s.* } *ærlu*, from *ær*; Goth.
 and Sax. *ær*, soon; or *ar*, day-break. Soon;
 precocious; betimes. Earliness is the act or
 quality of being soon.

And all the purple roos *erli* to come to him in the
 temple, and to heere him. *Wiclif. Luk. 21.*

So had I spokin with them every one,
 That I was of ther felaship anone;
 And made forward *erli* for to rise,
 To take our weye, ther as I did devise. *Chaucer.*
 The joyous day 'gan *early* to appear,
 And fair Aurora from her dewy bed
 Of aged Tithone 'gan herself to rear,
 With rosy cheeks, for shame as blushing red.
Spenser.

I am a tainted wether of the flock,
 Meetest for death: the weakest kind of fruit
 Drops *earliest* to the ground, and so let me.

The goodness of the crop is great gain, if the good-
 ness answer the *earliness* of coming up. *Bacon.*

It is a curiosity to have several fruits upon one
 tree; and the more when some of them come *early*,
 and some come late. *Id. Natural History.*

None in more languages can show
 Those arts, which you so *early* know. *Waller.*

The next morning we, having striven with the
 sun's *earliness*, were beyond the prospect of the high-
 est turrets. *Sidney.*

God made all the world, that he might be wor-
 shipped in some parts of the world; and therefore,
 in the first and most *early* times of the church, what
 care did he manifest to have such places erected to
 his honour? *South.*

The princess makes her issue like herself, by in-
 stilling *early* into their minds religion, virtue, and
 honour. *Addison.*

Sickness is *early* old age: it teaches us diffidence
 on our earthly state and inspires us with thoughts of
 a future. *Pope.*

Oh soul of honour!

Oh *early* heroic! *Smith's Phædra and Hippolitus.*

Early submission is the truest lesson to those who
 would learn to rule. *Goldsmith.*

This method fixes the attention of children ex-
 tremely to the orthography of words, and makes them
 good spellers very *early*. *Franklin.*

The great misfortune of my life was to want an
 m. I had felt *early* some stirrings of ambition, but
 they were the blind groupings of Homer's Cyclops
 round the walls of his cave. I saw my father's
 situation entailed on me perpetual labour. *Burns.*

From the *earliest* dawns of policy to this day,
 the invention of men has been sharpening and im-
 proving the mystery of murder, from the first rude
 essay of clubs and stones, to the present perfection of
 gunnery, cannonceering, bombarding, mining. *Burke.*

The year 1731-2, which is the *earliest* date of any
 trials for these offences, that I happen to have met
 with, was only thirty-two years after the act of King
 William had passed, and only sixteen after that of
 Queen Anne, and during that period there had been
 scarcely any sensible diminution in the value of
 money. *Sir S. Romilly.*

With more capacity for love than earth
 Bestows on most of mortal mould and birth,
 His *early* dreams of good outstripped the truth,
 And troubled manhood followed baffled youth.
Byron.

EARN, *v. a.* } From Sax. *earnian*, to pur-
EARN'ING, *n. s.* } sue. To win; deserve; la-
 bor for; gain.

I can't say whore;

It does abhor me, now I speak the word:
 To do the act, that might the' addition *earn*,
 Not the world's mass of vanity could make me.

Shakspeare.

Those that have joined with their honour great
 perils, are less subject to envy; for men think that
 they *earn* their honours hardly. *Bacon's Essays*

Winning cheap the high repute,
 Which he through hazard huge must *earn*. *Milton.*

Men may discern
 From what consummate virtue I have chose
 This perfect man, by merit called my Son,
 To *earn* salvation for the sons of men. *Id.*

So Labeo weens it my eternal shame
 To prove I never *earned* a poet's name.

Bp. Hall. Satires

This is the great expence of the poor, that takes up
 almost all their *earnings*. *Locke.*

The poems gained the plagiarist wealth, while the
 author hardly *earned* his bread by repeating them.

Pope on Homer.

After toiling twenty days,
 To *earn* a stock of pence and praise,
 Thy labour's grown the critick's prey. *Swift.*

EARNE, LOUGH, a lake of Ireland, in Ferma-
 nagh, Ulster, the second in that island for magni-
 tude. It is about thirty-five miles in length, but
 of very unequal breadth, being in some places ten,
 and in others not above one. It is properly two
 lakes, which are joined by a narrow channel at
 the town of Inniskilling, both branches contract-
 ing towards this point. There are a number of
 small rivers, that fall chiefly from the heights of
 the northern and southern confines, which, after
 enriching the country, supply this large basin.
 The only outlet is a short and rapid river that
 runs to the sea by the port of Ballyshannon.
 The Lough abounds with pike, perch, trout, eel,
 and numerous other species of fresh-water fish.
 Salmon emigrate a considerable length, but are
 usually caught at Belleek village. The beauties
 of this lake have long been the boast of the
 country and the admiration of strangers. The
 vast variety of figures and assemblages, in which
 nature is here displayed, can hardly be conceived,
 but from actual observation. The country is of
 that diversified character, which loses not by
 abundance of the same materials. The mingled
 prospect of water, wood, islands, and mountains,
 is inconceivably picturesque and grand. The
 islands are so thickly clustered and interspersed,
 that they are almost innumerable. The natives
 say there are 365, or one for each day in the
 year. They are every where crowned with deep
 aspiring woods and luxuriant pastures, which
 evince the fertility of the soil. The solitary
 recesses of these islands are the habitation of the
 stag and the roebuck; the rocky cliffs, of the
 osprey and the sea eagle. The islands in some
 places slope gradually to the water-edge, and in
 others rise in bold shores. The coasts of the
 lake ascend gradually to lofty eminences, which
 tower in solemn grandeur above the milder beauty
 of the scene below.

EARN'EST, *adj. & n. s.* } Also from the
EARN'ESTNESS, } Sax. verb *earnian*,
 to pursue (see **EARN**). Ardent; intent; warm;
 importunate; serious. As a substantive, *earn-
 est* is reality; seriousness; opposed to joking:

and a pledge given to prove a serious intention, or a bargain made. Earnestness is also seriousness, and synonymous with earnest as a substantive.

Which is the *earnys* of oure eritage into the redempcion of purchasyng into hertyng of his glory.
Wiclif. Effesies. 1.

This Palamon, when he these words herd,
Dispiteously he looked and answerd,
Whether sayest this in *earnest* or in play?

Therewith she laughed, and did her *earnest* end in jest.
Chaucer. Cant. Tales. Faerie Queene.

He which prayeth in due sort, is thereby made the more attentive to hear; and he which heareth, the more *earnest* to pray for the time which we bestow, as well in the one as the other.
Hooker.

The apostles term it the handsel or *earnest* of that which is to come.
Id.

That high All-seer, which I dallied with,
Hath turned my feigned prayer on my head,
And given in *earnest*, what I begged in jest.
Shakespeare.

You have conspired against our person,
Joined with an enemy proclaimed, and from his coffers

Received the golden *earnest* of our death.
Id.

Why so *earnestly* seek you to put up that letter? *Id.*
I observing,

Took once a pliant hour, and found good means
To draw from her a prayer of *earnest* heart,
That I would all my pilgrimage dilate,
Whereof by parcels she had something heard,
But not distinctively.
Id. Othello.

Often with a solemn *earnestness*,
More than, indeed, belonged to such a trifle,
He begged of me to steal it.
Id.

Audacity and confidence doth in business so great effects, as a man may doubt, that besides the very daring and *earnestness*, and persisting and importunity, there should be some secret binding, and stooping of other men's spirits to such persons.
Bacon's Natural History.

My soul, more *earnestly* released,
Will outstrip her's; as bullets flown before,
A latter bullet may o'ertake, the powder being more.
Donne.

Nor can I think that God, Creator wise!
Though threatening, will in *earnest* so destroy
Us, his prime creatures.
Milton.

On that prospect strange,
Their *earnest* eyes they fixed; imagining,
For one forbidden tree, a multitude
Now risen, to work them further woe or shame.
Id.

When *earnestly* they seek
Such proof, conclude they then begun to fail. *Id.*
They are never more *earnest* to disturb us, than
when they see us most *earnest* in this duty. *Duppa.*

Which leader shall the doubtful victory bless,
And give an *earnest* of the war's success. *Waller.*
But the main business and *earnest* of the world is
money, dominion, and power. *L'Estrange.*

With overstraining, and *earnestness* of finishing
their pieces, they often did them more harm than
good. *Dryden.*

Take heed that this jest do not one day turn to
earnest. *Sidney.*

Shame is a banishment of him from the good
opinion of the world, which every man most *earnestly*
desires. *South.*

How a man may know whether he be so in *earnest*
is worth inquiry: and I think there is one unerring

mark of it, viz. the not entertaining any proposition
with greater assurance than the proofs it is built upon
will warrant. *Locke.*

It may be looked upon as a pledge and *earnest*
of quiet and tranquillity. *Smaulridge.*

We shall die in *earnest*, and it will not become us
to live in jest. *Government of the Tongue.*

Sempronius, you have acted like yourself;
One would have thought you had been half in *earnest.*
Addison.

Marcus is overwarm; his fond complaints
Have so much *earnestness* and passion in them,
I hear him with a secret kind of horror,
And tremble at his vehemence of temper.

Pay back the *earnest* penny received from Satan,
and fling away his sin. *Id. Cato. Decay of Piety.*

There never was a charge maintained with such a
shew of gravity and *earnestness*, which had a slighter
foundation to support it. *Atterbury.*

The mercies received, great as they are, were *earn-*
ests and pledges of greater. *Id.*

And then fair Haidee tried her tongue at speaking,
But not a word could Juan comprehend,

Although he listened so, that the young Greek in
Her *earnestness* would ne'er have made an end.

Byron.

EARNEST, ARRHA. By the civil law, he who
recedes from his bargain loses his *earnest*, and if
the person who received the *earnest* give back, he
is to return the *earnest* double. But with us, the
person who gave it, is in strictness obliged to
abide by his bargain; and in case he decline it,
is not discharged upon forfeiting his *earnest*, but
may be sued for the whole money stipulated.

EAR-RING, in the sea language, is that part of
the bolt-rope which at the four corners of the
sail is left open, in the shape of a ring. The two
uppermost parts are put over the ends of the
yard-arms, and so the sail is made fast to the
yard; and into the lowermost ear-rings, the
sheets and tacks are seized or bent at the clew.

EARSH, *n. s.* From *ear*, to plough. A
ploughed field. Not now in use.

Fires oft are good on barren *earshes* made,
With crackling flames to burn the stubble blade.

May's Virgil.

EARTH, *n. s., v. a. & v. n.*) Sax. eard, earth:
EARTH'BOARD, *n. s.*) that which one
EARTH'BORN, *adj.*) eareth, says Mr.
EARTH'BOUND,) Tooke. See EAR,
EARTH'BRED,) *v. a.* But a similar
EARTH'CREATED,) word is found in
EARTH'CREEPING,) the Oriental lan-
EARTH'EN,) guages, as Arab.
EARTH'FED,) *erd*; and Heb. ארץ,
EARTH'FLAX, *n. s.*) from רץ, to break
EARTH'LINESS,) in pieces (Park-
EARTH'LING,) hurst) or crumble.
EARTH'LOVING, *adj.*) The terraqueous
EARTH'LY, *adj.*) globe; the world,
EARTH'MOVING, *n. s.*) or some modifica-
EARTH'NUT, *n. s.*) tion of it. As a
EARTH'QUAKE,) verb active, to hide,
EARTH'SHAKING,) bury, or deposit in
EARTH'WORM,) the earth: as a
EARTH'Y, *adj.*) neuter verb, to re-

tire, or lie hid in the ground. An earth-board is a
particular part of a plough: earth-created is used
by Young for made of the earth: earth-fed means

low, abject; and this term, in composition, frequently expresses the idea of low, or grovelling: earth-flax is a fibrous, flaxy-looking fossil: earthing an inhabitant of earth; a mortal: earthenut, a pignut, or root of the appearance of a nut. The other compounds seem to require no explanation.

Nile ye deme that I came to sende pees into *erthe*: I cam not to sende pees, but swerd.

Wiclif. Matthew 10.

I saigh whanne he hadde opened the sixte seel, and lo a greet *erthemouynq* was maad.

Id. Apocalips 6.

The whole *earth* was of one language. *Gen. xi. 1.*

Whereby he [Virgil] would insinuate that there is an igneous, luminous, or æthereal vehicle alwaies intimately adhering to the soul, though it be much slaked or damped with the gross and crude moisture of the body during this *earthly* peregrination.

Morr. App. to Def. of Phil. Cab. fol. 134.

Our common necessities, and the lack which we all have as well of ghostly as of *earthly* favours, is in each kind easily known.

Hooker.

Great grace that old man to him given had,
For God he often saw, from heaven hight,
All were his *earthly* eyen both blunt and bad.

Spenser.

All the world by thee at first was made,
And daily yet thou dost the same repair:
Ne ought on *earth* that merry is and glad,
Ne ought on *earth* that lovely is and fair,
But thou the same for pleasure didst prepare.

Id.

Nought so vile that on the *earth* doth live,
But to the *earth* some special good doth give.

Shakespeare.

About his shelves

Green *earthen* pots, bladders, and musty seeds

Were thinly scattered.

Id.

Long mayest thou live in Richard's seat to sit,

And soon lie Richard in an *earthly* pit.

Id.

Teach me, dear creature, how to think and speak;

Lay open to my *earthly* gross conceit,

Smothered in errors.

Id.

They can judge as fitly of his worth,

As I can of those mysteries which heaven

Will not have *earth* to know.

Id. Coriolanus.

But I remember now

I'm in this *earthly* world, where to do harm

Is often laudable; to do good, sometime

Accounted dangerous folly.

Id. Macbeth.

Who can impress the forest, bid the tree,

Unfix his *earthbound* root?

Id.

You have scarce time

To steal from spiritual leisure a brief span,

To keep your *earthly* audit.

Id. Henry VIII.

If you be born so near the dull-making character of Nilus, that you cannot hear the planet-like music of poetry, if you have so *earth-creeping* a mind that it cannot lift itself up to look to the sky of poetry;
* * * * * Thus much curse I must lend you in the behalf of all poets, that while you live, you live in love, and never get favour for lacking skill of a sonnet.

Sir P. Sidney.

But from this *earth*, this grave, this dust,

My God shall raise me up I trust.

Raleigh.

The great winding-sheets that bury all things in oblivion are two, deluges and *earthquakes*.

Bacon.

Worms are found in snow commonly, like *earthworms*, and therefore it is not unlike that it may likewise put forth plants.

Id. Nat. Hist.

It is heaven upon *earth* to have a man's mind move in charity, rest in providence, and turn upon the poles of truth.

Lord Bacon.

Such *earth-fed* minds

That never tasted the true beams of love.

B. Jonson.

These tumults were like an *earthquake*, shaking the very foundations of all, than which nothing in the world hath more of horror.

King Charles.

Peasants:—*earth-bred* worms!

Brewer.

Earthly greatness is a nice thing, and requires so much chariness in the managing, as the contentment of it cannot requite.

Hall.

There is many a rich stone laid up in the bowels of the *earth*, many a fair pearl laid up in the bosom of the sea, that never was seen, nor never shall be.

Bp. Hall. Contemplations.

Earth up with fresh mould the roots of those auralas which the frost may have uncovered.

Keelyn's Calendar.

We should affirm, that all things were in all things; that heaven were but *earth* celestified, and *earth* but heaven terrestred; or that each part above had influence upon its affinity below.

Browne's Vulgar Errors.

Nor is my flame

So *earthly*, as to need the dull material force

Of eyes, or lips, or cheeks.

Denham's Sophy.

Wherefore did Nature pour her bounties forth

With such a full and unwithdrawing hand,

Covering the *earth* with odours, fruits, and flocks,

Thronging the seas with spawn innumerable,

But all to please and sate the curious taste?

Milton.

When faith

ed from the

never,

Had ripened thy just soul to dwell with God,

Meekly thou didst resign this *earthly* load

Of death, called life

Id.

By the *earthshaking* Neptune's mace,

And Tethy's grave majestic pace.

Id.

Him lord pronounced, he, O indignity!

Subjected to his service angel-wings,

And flaming ministers to watch and tend

Their *earthly* charge.

Id. Paradise Lost.

The master saw the madness rise;

His glowing cheeks, and ardent eyes;

And, while he heaven and *earth* defied,

Changed his hand and checked his pride.

Dryden.

In ten set battles we have driven back

These heathen Saxons, and regained our *earth*,

As *earth* recovers from the ebbing tide

Id.

The wounds I make but sow new enemies;

Which, from their blood, like *earthborn* brethren rise.

Id.

Was it his youth, his valour, or success,

These might perhaps be found in other men:

'Twas that respect, that awful homage paid me;

That fearful love which trembled in his eyes,

And with a silent *earthquake* shook his soul.

Id.

Those *earthly* spirits black and envious are;

I'll call up other gods of form more fair.

Id.

The fox is *earthed*; but I shall send my two terriers in after him.

Id. Spanish Friar.

This solid globe we live upon is called the *earth*, which word, taken in a more limited sense, signifies such parts of this globe as are capable, being exposed to the air, to give rooting and nourishment to plants, so that they may stand and grow in it.

Locke.

Where there are *earthnuts* in several patches, though the roots lie deep in the ground, and the stalks be dead, the swine will by their scent root only where they grow.

Ray.

Upon a shower, after a drought, *earthworms* and land snails innumerable come out of their lurking places.

Id.

The country, by reason of its vast caverns and subterraneous fires, has been miserably torn by *earthquakes*, so that the whole face of it is quite changed.

Addison on Italy.

The god for ever great, for ever king,
Who slew the *earthborn* race and measures right
To heaven's great habitants!

Prior.

To *earthlings*, the footstool of God, that stage which
he raised for a small time, seemeth magnificent.

Drummond.

Such land as ye break up for harley to sow,
Two *earths*, at the least, ere ye sow it bestow. *Tusser.*
The five genera of *earths* are, 1. Boles. 2. Clays.
3. Marls. 4. Ochres. 5. Tripelass.

Hill's Mat. Medica.

Of English tale, the coarser sort is called plaister or
parget; the finer, *earthflax*, or salamander's hair.

Woodward.

As a rustick was digging the ground by Padua, he
found an urn, or *earthen* pot, in which there was
another urn, and in this lesser a lamp clearly burning.

Wilkins.

Lamps are inflamed by the admission of new air,
when the sepulchres are opened, as we see in fat
earthy vapours of divers sorts. *Id. Math. Mag.*

It must be our solemn business and endeavour, at
fit seasons, to turn the stream of our thoughts from
earthly towards divine objects. *Atterbury.*

The plow reckoned the most proper for stiff black
clays, is one that is long, large, and broad, with a
deep head and a square *earthboard*, so as to turn up a
great furrow. *Mortimer.*

Hence foxes *earthed*, and wolves abhorred the day,
And hungry churls ensnared the nightly prey.

Tickel.

Sudden he viewed, in spite of all her art,

An *earthly* lover lurking at her heart. *Popr.*

Now scarce withdrawn the fierce *earthshaking* power,
Jove's daughter Pallas watched the fav'ring hour;
Back to their caves she bade the winds to fly,

And hushed the blustering brethren of the sky. *Id.*

Poor, *earth-created* man! *Young.*

— a thousand furies more did shake
Those weary realms, and kept *earth-loving* man awake.

Armstrong.

It is no uncommon thing for the honour of an
earthly monarch to be wounded through the sides of
his ministers. *Mason.*

The only amaranthin flower on *earth*

Is virtue; the only last ag treasure, truth.

Oneper.

Behold your bishop! well he plays his part,

Christian in name, and infidel in heart;

Ghostly in office, *earthly* in his plan,

A slave at court, elsewhere a lady's man. *Id.*

Man mounts on man, on camels camels rush,

Hosts march o'er hosts, and nations nations crush,—

Wheeling in air the winged islands fall,

And one great *earthly* ocean covers all! *Darwin.*

Earthquakes have raised to heaven the humble vale,
And gulfs the mountain's mighty mass embowbed;
And where the Atlantic rolls wide continents have
bloomed. *Beattie.*

Earth's coarsest bread, the garden's homeliest
roots,

And scarce the summer luxury of fruits,
His short repast in humbleness supply
With all a hermit's board would scarce deny. *Byron.*

Impart

The purity of heaven to *earthly* joys,

Expel the venom and not blunt the dart—

The dull satiety which all destroys—

And root from out the soul the deadly weed which
cloys. *Id.*

How tae lit lake shines, a phosphoric sea,
And the big rain comes dancing to the *earth*!
And now again 'tis black,— and now, the glee
Of the loud hills shakes with its mountain-mirth,
As if they did rejoice o'er the young *earthquake's*
birth. *Id.*

EARTH, in ancient philosophy. See CHEMISTRY and ELEMENT.

The EARTH, in astronomy, is one of the primary planets. See ASTRONOMY. 'Although the relative densities of the earth and most of the other planets have been known a considerable time, it is but very lately that we have come to the knowledge of the absolute gravity or density of the whole mass of the earth. This, says Dr. Hutton, I have calculated and deduced from the observations of Dr. Maskelyne, astronomer royal, at the mountain Schehallien in the years 1774, 5, and 6. The attraction of that mountain on a plummet, being observed on both sides of it, and its mass being computed from a number of sections in all directions, and consisting of stone; these data being then compared with the known attraction and magnitude of the earth, gave by proportion its mean density; which is to that of water as nine to two, and to common stone as nine to five; from which very considerable mean density, it may be presumed, that the internal parts contain great quantities of metals. From the density now found,' adds this writer, 'its quantity of matter becomes known, being equal to the product of its density by its magnitude.'

Mr. Boyle suspected that there are great, though slow, internal changes, in the mass of the earth. He argues from the varieties observed in the change of the magnetic needle, and from the observed changes in the temperature of climates. But as to the latter, there is reason to doubt that he could not have diaries of the weather sufficient to direct his judgment. *Boyle's Works, Abr.* Vol. 1, p. 292, &c.

Respecting the figure of the earth, the ancients had various opinions: some, as Anaximander and Leucippus, held it cylindrical, or in the form of a drum: but the most general opinion was, that it was flat; that the visible horizon was the boundary of the earth, and the ocean the boundary of the horizon: that the heavens and earth above this ocean were the whole visible universe: and that all beneath the ocean was Hades. Of this opinion were some of the Christian fathers, as Lactantius, St. Augustine, &c. Such of the ancients, however, as understood any thing of astronomy, and especially the doctrine of eclipses, must have been acquainted with the circular figure of the earth; as the ancient Babylonian astronomers, who had calculated eclipses long before the time of Alexander, and Thales the Grecian, who predicted an eclipse of the sun. It is now indeed agreed on all hands, that the form of the terraqueous globe is globular or very nearly so. See ASTRONOMY. This is equally evident from the eclipses of the sun and of the moon; in all of which the earth's shadow appears circular upon the face of those bodies, what way soever it be projected, whether east, west, north, or south; and howsoever its diameter vary, according to the greater or less distance from the earth. The spherical figure of the earth is also

evinced from the rising and setting of the sun, moon, and stars; all which happen sooner to those who live to the east and later to those living to the west, and that more or less so, according to the distance. So also, going or sailing to the north, the north-pole and northern stars become more elevated, and the south-pole and southern stars more depressed; the elevation northerly increasing equally with the depression southerly; and either of them proportionably to the distance gone. The same thing happens in going to the south. Besides, the oblique ascensions, descensions, emersions, and amplitudes of the rising and setting of the sun and stars, in every latitude, are agreeable to the earth's spherical form: all which could not happen if it were of any other figure. The globular form of the earth is farther confirmed by its having been often sailed round: the first of these important voyages was made in 1519, by Ferdinand Magellan, who accomplished it in 1124 days. In 1557 Sir Francis Drake performed the same voyage in 1056 days: in 1586 Sir Thomas Cavendish performed it in 777 days; Simon Cordes, of Rotterdam, in 1590, in 1575 days: in 1598 Oliver Noort, a Hollander, in 1077 days; Van Schouten, in 1615, in 749 days; Jacob Heremites and John Huygens, in 1623, in 802 days. Many others have since performed it, particularly Anson, Bougainville, and Cook; sometimes sailing round by the east sometimes by the west, till at length they arrived again in Europe, whence they set out; and, in the course of their voyage, observed that all the phenomena, both of the heavens and the earth, correspond to, and prove this spherical figure.

The natural cause of this form of the globe is, according to Sir Isaac Newton, the great principle of attraction, with which the Creator has endued all the matter in the universe; and by which all bodies, and all the parts of bodies, mutually attract one another. This is also the cause of the sphericity of the drops of rain, quicksilver, &c. The inequality of the surface of the earth, by mountains and valleys, is nothing considerable; the highest eminence being scarcely equivalent in its proportion to the bulk of the earth to the minutest protuberance on the surface of an orange. Its difference from a perfect sphere, however, is more considerable in another respect, by which it approaches nearly to the shape of an oblate spheroid; being a little flatted at the poles, and raised about the equatorial parts, so that the axis from pole to pole is less than the equatorial diameter. What gave the first occasion to the discovery of this important circumstance was, the observations of some French and English philosophers in the East Indies, and other parts, who found that pendulums, the nearer they came to the equator, performed their vibrations slower: whence it follows, that the velocity of the descent of bodies, by gravity, is less in countries nearer to the equator; and consequently that those parts are farther removed from the centre of the earth, or from the common centre of gravity. See the History of the Royal Academy of Sciences, by Du Hamel, p. 110, 156, 206; and L'Histoire de l'Academie Roy. 1700 and 1701. These observations having established the fact also stimulated M. Huygens and Sir Isaac Newton to in-

vestigate the cause of this phenomenon; which they attributed to the revolution of the earth about its axis. If the earth were in a fluid state, its rotation round its axis would necessarily make it put on such a figure, because, the centrifugal force being greatest towards the equator the fluid would there rise and swell most; and, that its figure really should be so now, seems necessary, to keep the sea in the equinoctial regions from overflowing the earth about those parts. See this curious subject well treated by Huygens, in his discourse *De Causâ Gravitatis*, p. 154, where he states the ratio of the polar diameter to that of the equator, as 577 to 578. And Newton, in his *Principia*, first published in 1686, demonstrates from the theory of gravity, that the figure of the earth must be that of an oblate spheroid, generated by the rotation of an ellipse about its shortest diameter, provided all the parts of the earth were of a uniform density throughout; and that the proportion of the polar to the equatorial diameter of the earth, would be that of 680 to 692, or nearly that of 229, to 230, or as .9956522 to 1. This proportion of the two diameters was calculated by Newton in the following manner: having found that the centrifugal force at the equator is $\frac{1}{289}$ of gravity, he assumes, as an hypothesis, that the earth is to the diameter of the equator as 100 to 101, and thence determines what must be the centrifugal force at the equator to give the earth such a form, and finds it to be $\frac{1}{289}$ of gravity: then, by proportion, if a centrifugal force equal to $\frac{1}{289}$ of gravity would make the earth higher at the equator than at the poles by $\frac{1}{100}$ of the whole height at the poles, a centrifugal force that is $\frac{1}{289}$ of gravity will make it higher by a proportional excess, which by calculation is $\frac{1}{289}$ of the height at the poles; and thus he discovered, that the diameter at the equator is to the diameter at the poles, or the axis, as 230 to 229. But this computation supposes the earth to be every where of a uniform density; whereas if the earth is more dense near the centre, then bodies at the poles will be more attracted by this additional matter being nearer; and therefore the excess of the semi-diameter of the equator above the semi-axis, will be different. According to this proportion between the two diameters, Newton farther computes, from the different measures of a degree, that the equatorial diameter will exceed the polar by thirty-four mites and $\frac{1}{2}$. Nevertheless, Messrs. Cassini, both father and son, the one in 1701, and the other in 1713, attempted to prove, in the *Memoirs of the Royal Academy of Sciences*, that the earth was an oblong spheroid: and in 1718, M. Cassini again undertook, from observations, to show that, on the contrary, the longest diameter passes through the poles; which gave occasion for Mr. John Bernoulli, in his *Essai d'une Nouvelle Physique Celeste*, printed at Paris in 1735, to triumph over the British philosopher, apprehending that these observations would invalidate what Newton had demonstrated. And in 1720 M. De Mairan advanced arguments, supposed to be strengthened by geometrical demonstrations, farther to confirm the assertions of Cassini. But in 1735 two companies of mathematicians were employed, one for a northern, and another for a southern expedition,

the result of whose observations and measurement plainly proved that the earth was flatted at the poles. The proportion of the equatorial diameter to the polar, as stated by the gentlemen employed on the northern expedition for measuring a degree of the meridian, is as 1 to 0.9891; by the Spanish mathematicians as 266 to 265, or as 1 to 0.99624; by M. Bouguer as 179 to 178, or as 1 to 0.99441. As to all conclusions, however, deduced from the length of pendulums in different places, it is to be observed, that they proceed upon the supposition of the uniform density of the earth, which is a very improbable circumstance; as justly observed by Dr. Horsley in his letter to captain Phipps: 'you finish your article, he concludes, relating to the pendulum with saying, 'that these observations give a figure of the earth nearer to Sir Isaac Newton's computation, than any others that have hitherto been made;' and then you state the several figures given, as you imagine, by former observations, and by your own. Now it is very true, that, if the meridians be ellipses, or if the figure of the earth be that of a spheroid generated by the revolution of an ellipsis, turning on its shorter axis, the particular figure, or the ellipticity of the generating ellipsis, which your observations give, is nearer to what Sir Isaac Newton saith it should be, if the globe were homogeneous, than any that can be derived from former observations. But yet it is not what you imagine. Taking the gain of the pendulum in latitude $79^{\circ} 50'$ exactly as you state it, the difference between the equatorial and the polar diameter is about as much less than the Newtonian computation makes it, and the hypothesis of homogeneity would require, as you reckon it, to be greater. The proportion of 212 to 211 should indeed, according to your observations, be the proportion of the force that acts upon the pendulum at the poles to the force acting upon it at the equator. But this is by no means the same with the proportion of the equatorial diameter to the polar. If the globe were homogeneous the equatorial diameter would exceed the polar by $\frac{1}{250}$ of the length of the latter: and the polar force would also exceed the equatorial by the like part. But, if the difference between the polar and equatorial force be greater than $\frac{1}{250}$ (which may be the case in an heterogeneous globe, and seems to be the case in ours), then the difference of the diameters should, according to theory, be less than $\frac{1}{250}$, and vice versa. I confess this is by no means obvious, at first sight; so far otherwise, that the mistake, which you have fallen into, was once very general. Many of the best mathematicians were misled by too implicit a reliance upon the authority of Newton, who had certainly confined his investigations to the homogeneous spheroid, and had thought about the heterogeneous only in a loose and general way. The late Mr. Clairault was the first who set the matter right, in his elegant and subtle treatise on the figure of the earth. That work has now been many years in the hands of mathematicians, among whom I imagine there are none, who have considered the subject attentively, that do not acquiesce in the author's conclusions. In the second part of that treatise, it is proved, that putting, p for the polar force, Π for the equatorial, δ for the true ellipticity of the

earth's figure, and for the ellipticity of the homogeneous spheroid,

$$\frac{p - \Pi}{\Pi} = 2\epsilon - \delta : \text{therefore } \delta = 2\epsilon - \frac{p - \Pi}{\Pi}$$

and, therefore, according to your observation, $\delta = \frac{1}{251}$. This is the just conclusion from your observations of the pendulum, taking it for granted that the meridians are ellipses: which is an hypothesis upon which all the reasonings of theory have hitherto proceeded. But, plausible as it may seem, I must say that there is much reason from experiment to call it in question. If it were true, the increment of the force which actuates the pendulum as we approach the poles, should be as the square of the sine of the latitude: or, which is the same thing, the decrement, as we approach the equator, should be as the square of the cosine of the latitude. But whoever takes the pains to compare together such of the observations of the pendulum in different latitudes, as seem to have been made with the greatest care, will find that the increments and decrements do by no means follow these proportions; and, in those which I have examined, I find a regularity in the deviation which little resembles the mere error of observation. The unavoidable conclusion is, that the true figure of the meridians is not elliptical. If the meridians are not ellipses, the difference of the diameters may indeed, or it may not, be proportioned to the difference between the polar and the equatorial force; but it is quite an uncertainty, what relation subsists between the one quantity and the other; our whole theory, except so far as it relates to the homogeneous spheroid, is built upon false assumptions, and there is no saying what figure of the earth any observations of the pendulum give.' Dr. Horsley then lays down the following table, which shows the different results of observations made in different latitudes; in which the first three columns contain the names of the observers, the places of observation, and the latitude of each; the fourth column shows the quantity of $p - \Pi$ in such parts as Π is 100,000, as deduced from comparing the length of the pendulum, at each place of observation, with the length of the equatorial pendulum as termed by M. Bouguer, upon the supposition that the increments and decrements of force, as the latitude is increased or lowered, observe the proportion which theory assigns. Only the second and the last value of $p - \Pi$ are concluded from comparisons with the pendulum at Greenwich and at London, not at the equator. The fifth column shows the value of δ corresponding to every value of $p - \Pi$, according to Clairault's theorem:

Observers.	Places.	$p - \Pi$.	δ
Bouguer	Equator	0° 0'	
Bouguer	Porto Bello	9 34 741.8	
Green	Otaheitee	17 29 563.2	$\frac{1}{258}$
Bouguer	San Domingo	18 27 591.0	$\frac{1}{258}$
Abbé de La Caille	Cape of Good Hope	33 55 731.5	
- - -	Paris	48 50 585.1	$\frac{1}{251}$
The Académicians	Pello	66 48 565.9	
Capt. Phipps		79 50 471.2	$\frac{1}{251}$

'By this table it appears, that the observations in the middle parts of the globe, setting aside the single one at the Cape, are as consistent as could reasonably be expected; and they represent the ellipticity of the earth as about $\frac{1}{10}$. But when we come within ten degrees of the equator, it should seem that the force of gravity suddenly becomes much less, and within the like distance of the poles much greater than it could be in such a spheroid.' The following problem communicated by Dr. Leatherland to Dr. Pemberton, and published by Mr. Robertson, serves to find the proportion between the axis and the equatorial diameter, from measures of a degree of the meridian in two different latitudes, supposing the earth an oblate spheroid. Let $A P a p$ (PLATE II. MISCELLANIES) be an ellipse representing a section of the earth through the axis Pp ; the equatorial diameter, or the greater axis of the ellipse, being Aa ; let E and F be two places, where the measure of a degree has been taken; these measures are proportional to the radii of curvature in the ellipse at those places; and if CQ, CR , be conjugates to the diameters whose vertices are E and F , CQ will be to CR in the subtriplicate ratio of the radius of curvature at E to that at F , by Cor. 1, Prop. 4, part 6, of Milnes's Conic Sections, and therefore in a given ratio to one another; also the angles QCP, RCP , are the latitudes of E and F ; so that, drawing QV parallel to Pp , $QXYW$ to Aa , these angles being given, as well as the ratio of CQ to CR , the rectilinear figure $CVQXRY$ is given in species; and the ratio of $VC^2 - ZC^2 (= QX \times XW)$ to $RZ^2 - QV^2 (= RX \times XS)$ is given, which is the ratio of CA^2 to CP^2 ; therefore the ratio of CA to CP is given. Hence, if the sine and cosine of the greater latitude be each augmented in the subtriplicate ratio of the measure of the degree in the greater latitude to that in the lesser, then the difference of the squares of the augmented sine, and the sine of the lesser latitude, will be to the difference of the squares of the cosine of the lesser latitude, and the augmented cosine, in the duplicate ratio of the equatorial to the polar diameter. For Cq being taken in CQ equal to CR , and qv drawn parallel to QV , Cv , and vg , CZ and ZR will be the sines and cosines of the respective latitudes to the same radius; and CV, VQ , will be the augmentations of Cv and Cq in the ratio named. Hence, to find the ratio between the two axes of the earth, let E denote the greater, and F the lesser of the two latitudes, M and N the respective measures taken in each; and

let P denote $\sqrt{\frac{M}{N}}$: then

$$\sqrt{\frac{\cos.^2 F - P^2 \times \cos.^2 E}{P^2 \times \sin.^2 E - \sin.^2 F}} \text{ is } = \frac{\text{less axis}}{\text{greater axis}}$$

It also appears from the above problem, that when one of the degrees measured is at the equator, the cosine of the latitude of the other being augmented in the subtriplicate ratio of the degrees, the tangent of the latitude will be to the tangent answering to the augmented cosine, in the ratio of the greater axis to the less. For, supposing E the place out of the equator, then, if the semi-circle $P l m n p$ be described, and lC

joined, and $m o$ drawn parallel to aC : Co is the cosine of the latitude to the radius CP , and CY that cosine augmented in the ratio before named; YQ being to Yl , that is, Ca to Cn , or CP , as the tangent of the angle YCQ , the latitude of the point E to the tangent of the angle YCl belonging to the augmented cosine. Thus, if M represent the measure in a latitude denoted by E , and N the measure at the equator, let A denote an angle whose measure is

$$\cos. E \times \sqrt{\frac{M}{N}} \text{ Then } \frac{\tan. A}{\tan. E} \text{ is } = \frac{\text{less axis}}{\text{greater axis}}$$

But M , or the length of a degree, obtained by actual mensuration in different latitudes, is known from the following table:—

Name.	Lat.	Value of M.
		Toises.
Mauertuis, &c.	66° 20'	M = 57438
Cassini and }	49 22	M = 57074
La Caille }	45 00	M = 57050
Roscovich }	43 00	M = 56972
De la Caille }	33 18	M = 57037
Juan and Uiloa }	{ at the }	M = 56768
Bougner }	{ equa- }	M = 56753
Condamine }	{ tor. }	M = 56749

Now, by comparing the first with each of the following ones; the second with each of the following; and in like manner the third, fourth, and fifth, with each of the following; there will be obtained twenty-five results, each showing the relation of the axes or diameters; the arithmetical means of all of which will give that ratio as 1 to 0.9951989. If the measures of the latitude of 49° 22', and of 45° which fall within the meridian line drawn through France, and which have been re-examined and corrected since the northern and southern expedition, be compared with those of Mauertuis and his associates in the north, and that of Bougner at the equator, there will result six different values of the ratio of the two axes: the arithmetical mean of all which, is that of 1 to 0.9953467, which may be considered as the ratio of the greater axis to the less: which is as 230 to 228.92974, or 215 to 214, or very near the ratio as assigned by Newton. Now the magnitude, as well as the figure of the earth, that is, the polar and equatorial diameters, may be deduced from the foregoing problem. For, as half the latus rectum of the greater axis Aa is the radius of curvature at A , it is given in magnitude from the degree measured there, and thence the axes themselves are given. Thus, the circular arc whose length is equal to the radius being 57.29578 degrees, if this number be multiplied by 56750 toises, the measure of a degree at the equator, as Bougner has stated it, the product will be the radius of curvature there, or half the latus rectum of the greater axis; and this is to half the less axis in the ratio of the less axis to the greater, that is, as 0.9953467 to 1; whence the two axes are 6533820 and 6564366 toises, or 7913 and 7950 English miles: and the differences between the two axes about thirty-seven miles. See Robertson's Navi-

gation, vol. ii. p. 206, &c. Suite des Mém. de l'Acad. 1718, p. 247, and Maclaurin's Fluxions vol. II. book i. chap. xiv. And very nearly the same ratio is deduced from the lengths of pendulums vibrating in the same time, in different latitudes; provided it be again allowed, that the meridians are real ellipses, or the earth a true spheroid, which, however, can only take place in the case of a uniform gravity in all parts of the earth. Thus, in the new Petersburg Acts, for 1788 and 1789, are accounts and calculations of experiments relative to this subject, by M. Kraft. These experiments were made at different times and in various parts of the Russian empire. This gentleman has collected and compared them, and drawn the proper conclusions from them: thus, he infers, that the length x of a pendulum that swings seconds in any given latitude λ , and in a temperature of 10° of Reaumur's thermometer may be determined by this equation:

$x = 439.178 + 2.321 \sin^2 \lambda$, lines of a French foot,

or $x = 39.0045 + 0.206 \sin^2 \lambda$, in English inches, in the temperature of 53 of Fahrenheit's thermometer. This expression nearly agrees, not only with all the experiments made on the pendulum in Russia, but also with those of Mr. Graham in England, and those of Mr. Lyons in $79^\circ 50'$ N. lat., where he found its length to be 431.38 lines. It also shows the augmentation of gravity from the equator to the parallel of a given latitude λ : for, putting g for the gravity under the equator, G for that under the pole, and y for that under the latitude λ , M. Kraft finds

$y = (1 + 0.0052848 \sin^2 \lambda)g$; and therefore $G = 1.0052848g$. From this proportion of gravity under different latitudes, the same author infers, that, in case the earth is a homogeneous ellipsoid, its oblateness must be $\frac{1}{230}$, instead of $\frac{1}{230}$; which ought to be the result of this hypothesis; but on the supposition that the earth is a heterogeneous ellipsoid, he finds its oblateness, as deduced from these experiments, to be $\frac{1}{230}$; which agrees with that resulting from the measurement of some of the degrees of the meridian. This confirms an observation of M. De la Place, that if the hypothesis of the earth's homogeneity be given up, then the theory, the measurement of degrees of latitude, and experiments with the pendulum, all agree in their result with respect to the oblateness of the earth. See Mémoires de l'Acad. 1783, p. 17. In the Philos. Trans. for 1791, p. 236, Mr. Dalby has given some calculations on measured degrees of the meridian, from whence he infers, that those degrees measured in middle latitudes, will answer nearly to an ellipsoid whose axes are in the ratio assigned by Newton, viz. that of 230 to 229. And as to the deviations of some of the others, viz. towards the poles and equator, he thinks they are caused by the errors in the observed celestial arcs.

The *cosmogony*, or knowledge of the original formation of the earth, the materials of which it was composed, and by what means they were disposed in the order in which we see them, is a subject, which, though perhaps beyond the reach of human sagacity, has exercised the ingenuity of philosophers in all ages. To enter into the

various theories that have been formed upon this subject, would, however, not only swell this article beyond our bounds, but be fatiguing to many readers. As far as human industry has hitherto penetrated, it has been found that the substances of which the earth is composed are neither ranged in a regular series, according to their specific gravities, nor yet thrown together in total disorder, as if by accident or chance. But the depth of the earth, from the surface to the centre, is nearly 4000 miles; and yet the deepest mine in Europe, that at Cotteberg, in Hungary, is not more than 1000 yards deep; so that little is as yet known of its interior parts. From what has been discovered, however, of those parts which lie most contiguous to our observation, naturalists have compared the structure of the earth to the coats of an onion, or the leaves of a book. And indeed, except in some of those immense mountains which have existed from the creation, or at least from the deluge, where the matter, from whatever cause, is more homogeneous, the earth is found to consist of various strata or layers, which differ according to the circumstances of climate and situation. The surface generally consists of a confused mixture of decayed animal and vegetable substances and earths rudely united together but, upon digging below this surface, the materials of the globe are found arranged in a more regular manner. Heaps of stone are indeed frequently found, which do not consist of layers, but are confused masses of unequal thickness and are called rocks. The strata are generally extended through a whole country, and perhaps, with some interruptions and varieties, through the globe itself. When the country is flat, these extensive bodies are found most regular, being in that case nearly parallel to the horizon, though often dipping downwards in a certain angle; in many places the beds have a wave, as where the country consists of gently waving hills and vales; and here also they in general dip. In passing over the ground the soil is found, perhaps to the extent of a mile, mostly composed of sand; and perhaps for another it consists chiefly of clay: which is occasioned by the edges of the different strata lying with an obliquity to the horizon. By a similar projection, mountains, or ridges of mountains, are produced which commonly have what is called a back and a face, the former smoother, and the latter more rugged. It is generally found, also, that the ascent is more gradual on the one side of a mountain than on the other; and this is occasioned by the strata, which have risen above the general level of the country, being abruptly broken off. The order, number, situation with respect to the horizon, depth, intersections, fissures, color, consistence, &c., of these strata have been considered by Dr. Woodward with great attention. The origin and formation of them all is ascribed by him to the deluge. He supposes that, at that dreadful revolution, all sorts of terrestrial bodies had been dissolved and mixed with the waters, forming altogether, a chaos or confused mass; and he also supposes, that this mass of terrestrial particles, intermixed with water, was at length precipitated to the bottom; and that, in general, according to the order of gravity, the

heaviest sunk first, and the lighter afterwards. Thus were the strata formed of which the earth consists; which, gradually attaining their solidity and hardness, have ever since continued distinct. The Doctor farther observes, that these sediments were at first all parallel and concentrical; and the surface of the earth formed of them perfectly smooth and regular; but that, in course of time, divers changes happening, from earthquakes, volcanoes, &c., the order and regularity of the strata were disturbed and broken, and thus was the surface of the earth brought to the irregular form in which it is now beheld.

The notion of the *magnetism* of the earth was started by Gilbert; and Boyle supposes magnetic effluvia moved from one pole to the other. Vol. I. p. 285, 290. Dr. Knight also thinks that the earth may be considered as a great loadstone, whose magnetic parts are disposed in a very strong irregular manner; and that the south pole of the earth is analogous to the north pole in magnets, that is, the pole by which the magnetic stream enters. See MAGNET. He observes that all the phenomena attending the direction of the needle, in different parts of the earth, in a great measure correspond with what happens to the needle, when placed upon a large terrella; if we make allowances for the different dispositions of the magnetic parts, with respect to each other, and consider the south pole of the earth as a north pole with regard to magnetism. The earth might become magnetical by the iron ores it contains, for all iron ores are capable of magnetism. The globe might, notwithstanding, have remained unmagnetical, unless some cause had existed capable of making that repellent matter producing magnetism move in a stream through the earth. Now, the doctor thinks that such a cause does exist; for, if the earth revolves round the sun in an ellipsis, and the south pole of the earth is directed towards the sun, at the time of its descent towards it, a stream of repellent matter will thence be made to enter at the south pole, and issue out at the north. And he suggests, that the earth's being in its perihelion in winter may be one reason why magnetism is stronger in this season than in summer. This cause for the earth's magnetism must continue, and perhaps improve it from year to year. Hence, the doctor thinks it probable, that the earth's magnetism has been improving ever since the creation, and that this may be one reason why the use of the compass was not discovered sooner. See Dr. Knight's *Attempt to Demonstrate*, that all the phenomena in nature may be explained by Attraction and Repulsion, prop. 87.

The *magnitude* of the earth has been variously determined by different authors, both ancient and modern. The usual way has been to measure the length of one degree of the meridian, and multiply it by 360 for the whole circumference. See DEGREE. Diogenes Laertius informs us that Anaximander, who lived about A.A.C. 550, was the first who gave an account of the circumference of the sea and land; and it seems his measure was used by the succeeding mathematicians till the time of Eratosthenes. Aristotle (lib. 2. De Caelo) says, the mathematicians who have attempted to measure the circuit of the

earth make it 40,000 stadia: which it is thought is the number determined by Anaximander. Eratosthenes, who lived about A.A.C. 200, was the next who undertook this business: which, as Cleomedes relates, he performed by taking the sun's zenith distances, and measuring the distance between two places under the same meridian; by which he deduced for the whole circuit about 250,000 stadia, which Pliny states at 31,500 Roman miles, reckoning each 1000 paces. But this measure was accounted false by many of the ancient mathematicians, and particularly by Hipparchus, who lived 100 years afterwards, and who added 25,000 stadia to the circuit of Eratosthenes. Ptolemy, in the time of Cicero, next measured the earth, viz. by the altitudes of a star, and measuring a part of a meridian; and he concluded the circumference at 240,000 stadia, according to Cleomedes, but only at 180,000 according to Strabo. Ptolemy, in his Geography, says that Marinus, a celebrated geographer, attempted something of the same kind; and, in lib. i. cap. 3, he mentions, that he himself had tried to perform the business in a way different from any other before him, which was by means of places under different meridians; but he does not say how much he made the number, for he still made use of the 180,000 which had been found out before him. Snell, professor of mathematics at Leyden, relates, from the Arabian geographer Abulfeda, who lived about A.D. 1300, that about A.D. 800 Al Maïmon, an Arabian king, having collected together some skilful mathematicians, commanded them to find out the circumference of the earth. Accordingly they chose the fields of Mesopotamia, where they measured under the same meridian from north to south, till the pole was depressed one degree lower; which measure they found equal to fifty-six miles, or fifty-six and a half; so that, according to them, the circuit of the earth is 20,160 or 20,340 miles. It was long after this before any more attempts were made. At length, however, the same professor Snell, about A.D. 1620, with great skill and labor, by measuring large distances between two parallels, found one degree equal to 28,500 perches, each of which is twelve Rhinland feet, amounting to nineteen Dutch miles, and so the whole periphery 6840 miles; a mile being, according to him, 1500 perches, or 18,000 Rhinland feet. See his *Eratosthenes Batavus*. The next who undertook this measurement was Norwood, who, in 1635, by measuring the distance from London to York with a chain, and taking the sun's meridian altitude, June 11th, O.S., with a sextant of about five feet radius, found a degree contained 367,200 feet, or sixty-nine miles and a half and fourteen poles; and thence the circumference of a great circle of the earth is a little more than 25,036 miles, and the diameter a little more than 7966 miles. See the particulars in his *Seaman's Practice*. Professor Snell's measurement, though very ingenious, and much more accurate than any of the ancients, being still thought liable to small errors, the business was renewed, after Snell's manner, by Picard and other French mathematicians, by the king's command, using a quadrant of 3½ French feet ra-

dus; by which they found a degree contained 342,360 French feet. See *Mesure de la Terre*, par Picard. M. Cassini, jun. in 1700, renewed the business with a quadrant of ten feet radius for taking the latitude, and another of $3\frac{1}{2}$ feet for taking the angles of the triangles; and found a degree, from his calculation, containing 57,292 toises, or almost sixty-nine and a half English miles. The results of many other measurements are upon record; from the mean of all which, the following dimensions are stated by Dr. Hutton as near the truth. The circumference 25,000 miles; the diameter 7957 $\frac{1}{2}$ miles; the superficies 198,944,206 square miles; the solidity 263,930,000,000 cubic miles. The seas and unknown parts of the earth, by a measurement of the best maps, contain 160,522,026 square miles; the inhabited parts 38,922,180; of which Europe contains 4,456,065; Asia, 10,768,823; Africa, 9,654,807; and America, 14,110,874.

Tacquet draws some curious inferences, in the form of paradoxes, from the round figure of the earth: as, 1. That if any part of the surface of the earth were quite plane, a man could no more walk upright upon it, than on the side of a mountain. 2. That the traveller's head goes a greater space than his feet; and a horseman than a footman, as moving in a greater circle. 3. That a vessel, full of water, being raised perpendicularly, some of the water will be continually flowing out, yet the vessel still remain full; and, on the contrary, if a vessel of water be let perpendicularly down, though nothing flow out, yet it will cease to be full: consequently, there is more water contained in the same vessel at the foot of a mountain than on the top; because the surface of the water is compressed into a segment of a smaller sphere below than above. *Tacquet's Astronomie*, lib. i. cap. 2.

EARTHS, in chemistry, are such bodies as possess the following properties: insoluble in water or nearly so; at least becoming insoluble when combined with carbonic acid: little or no taste or smell; at least, when combined with carbonic acid: fixed, incombustible, and incapable, while pure, of being altered by the fire; not altered when heated by combustibles: not convertible into metals by all the ordinary methods of reduction, or, when reduced by scientific refinements, possessing but an evanescent metallic existence.

Bodies possessing these qualities were ranked, till lately, among the unreducible elements, and the following nine were classified under this belief. 1. Barytes. 2. Strontites. 3. Lime. 4. Magnesia. 5. Alumina, or clay. 6. Silica. 7. Glucina. 8. Zirconia. 9. Ytria. To the above nine earthy substances, Berzelius has added a tenth, which he calls thorina.

But the brilliant discovery by Sir H. Davy, in 1808, of the metallic bases of potassa, soda, barytes, strontites, and lime, subverted the ancient ideas regarding the earths, and taught us to regard them as all belonging, by most probable analogies, to the metallic class. See CHEMISTRY and METALS.

EARTH PUCCERONS. See PUCCERON.

An EARTHQUAKE is a sudden and violent concussion of the earth, generally accompanied with strange noises under ground, or in the air; often destroying whole cities at once, throwing down rocks, altering the course of rivers, and producing the most terrible devastations. Though there is hardly any country known, in which shocks of an earthquake have not at some time or other been felt, yet there are some much more subject to them than others. Northern countries, in general, are less subject to earthquakes than those situated near the equator, or in the southern latitudes; but this does not hold universally. The islands of Japan, which are situated pretty far north, are nevertheless, exceedingly liable to these dreadful convulsions. Islands, in general, are also more subject to them than continents; but neither does this hold without exceptions. Particular parts of continents, and particular islands, are more subject to them than others lying in the neighbourhood, and differing little from them in external appearance. Portugal is more subject to earthquakes than Spain, and the latter much more than France; Mexico and Peru more than the other countries of America, and Jamaica more than the other Caribbee islands. Earthquakes are frequent, though not often violent, in Italy; but in Sicily they are often terribly destructive. Asia Minor has been remarkably subject to them from the remotest antiquity; and the city of Antioch in particular has suffered more from earthquakes than any other in that country. The same phenomena are said also to occur very frequently in the extremities of Asia, even in very high latitudes.

Although no natural phenomenon is more calculated to impress the human mind with terror, and consequently to be well remembered and taken notice of, than an earthquake, yet the philosophy of them is but lately arrived at any degree of perfection; and, even at this day, the history of earthquakes is incomplete. The destruction occasioned by them engrosses the mind too much to admit of philosophical speculations at the time they happen; the same thing prevents the attentive consideration of the alterations that take place in the atmosphere after the earthquake is over, and which might probably throw some light on the causes which produced it; and the suddenness of its coming on prevents an exact attention to those slight appearances in the earth or air which, if carefully observed, might serve as warnings to avoid the destruction. From the observations that have been made, however, the following phenomena may be deduced, and reckoned pretty certain. 1. Where there are any volcanoes or burning mountains, an earthquake may reasonably be expected more frequently than in other countries. 2. If the volcano has been long quiet, a violent earthquake is to be feared, and vice versa. But to this there are many exceptions. 3. Earthquakes are generally preceded by long droughts, but they do not always come on as soon as the drought ceases. 4. They are also preceded by electrical

appearances in the air; such are the aurora borealis, falling stars, &c.; but this does not hold universally. 5. A short time before the shock, the sea swells up and makes a great noise; fountains are troubled, and send forth muddy water; and the beasts seem frightened, as if sensible of an approaching calamity. 6. The air at the time of the shock is generally calm and serene; but afterwards commonly becomes obscure and cloudy. 7. The shock comes on with a rumbling noise, sometimes like that of carriages; sometimes a rushing noise like wind, and sometimes explosions, like the firing of cannon, are heard. Sometimes the ground heaves perpendicularly upwards, and sometimes rolls from side to side. Sometimes the shock begins with a perpendicular heave, after which the other kind of motion commences. A single shock is but of very short duration, the longest scarcely lasting a minute; but they frequently succeed each other at short intervals for a considerable length of time. 8. During the shock, chasms are made in the earth; from which sometimes flames, but oftener great quantities of water, are discharged. Flame and smoke are also emitted from places of the earth where no chasms can be perceived. Sometimes these chasms are but small; but, in violent earthquakes, they are often so large, that whole cities sink down into them at once. 9. The water of the ocean is affected even more than the dry land. The sea swells up to a prodigious height; much more than we could suppose it raised by the mere elevation of its bottom by the shock. Sometimes it is divided to a considerable depth, and great quantities of air, flames, and smoke, are discharged from it. The same irregular agitations happen to the waters of ponds, lakes, and even rivers. 10. The shock is felt at sea as well as on land. Ships are affected by a sudden stroke, as if they had run aground or struck upon a rock. 11. The effects of earthquakes are not confined to one particular district or country, but often extend to very distant regions; though no earthquake has yet been known extensive enough to affect the whole globe at one time. In those places also where the shock is not felt on dry land, the irregular agitation of the waters above mentioned, is perceived very remarkably. All these positions are verified by the account of those earthquakes which have been particularly described by witnesses of the best character.

A terrible earthquake happened at Calabria in 1638, which affords an exception to the second general position above laid down. In Italy there had been an eruption of Mount Vesuvius five years before; and in Sicily there had been an eruption of *Ætna* only two years before this earthquake. The event, however, plainly showed that the cause of the earthquake, whatever it was, had a connexion not only with Mount *Ætna*, which lies in the neighbourhood, but also with the volcano of *Stromboli*, which is sixty miles distant. 'On the 24th of March,' says Kircher, 'we launched, in a small boat, from the harbour of Messina, in Sicily, and arrived the same day at the promontory of *Pelorus*. Our destination was for the city of *Euphemia*, in Calabria; but, on account of the weather, we were

obliged to continue three days at *Pelorus*. At length, wearied with the delay, we resolved to prosecute our voyage; and, although the sea seemed more than usually agitated, yet we ventured forward. The gulf of *Charybdis*, which we approached, seemed whirled round in such a manner as to form a vast hollow, verging to a point in the centre. Proceeding onward, and turning my eyes to Mount *Ætna*, I saw it cast forth large volumes of smoke, of mountainous size, which entirely covered the island, and blotted out even the shores from my view. This, together with the dreadful noise, and the sulphurous stench, which was strongly perceived, filled me with apprehensions that some more dreadful calamity was impending. The sea itself seemed to wear a very unusual appearance; those who have seen a lake in a violent shower of rain, all covered over with bubbles, will have some idea of its agitations. My surprise was still increased by the calmness and serenity of the weather; not a breeze, not a cloud, which might be supposed to put all nature thus into motion. I therefore warned my companion that an earthquake was approaching; and, after some time, making for the shore with all possible diligence, we landed at *Tropæa*. But we had scarcely arrived at the Jesuits' college in that city, when our ears were stunned with a horrid sound, resembling that of an infinite number of chariots driven fiercely forward, the wheels rattling, and the thongs cracking. Soon after this, a most dreadful earthquake ensued, so that the whole tract upon which we stood seemed to vibrate, as if we were in the scale of a balance that continued waving. This motion, however, soon grew more violent; and, being no longer able to keep my legs, I was thrown prostrate upon the ground. After some time, finding that I remained unhurt amidst the general concussion, I resolved to venture for safety, and running as fast as I could, reached the shore. I did not search long here, till I found the boat in which I had landed, and my companions also. Leaving this seat of desolation, we prosecuted our voyage along the coast; and the next day came to *Rochetta*, where we landed, although the earth still continued in violent agitations. But we were scarcely arrived at our inn, when we were once more obliged to return to our boat; and in about half an hour we saw the greatest part of the town, and the inn in which we had set up, dashed to the ground, and burying all its inhabitants beneath its ruins. Proceeding onward in our little vessel, we at length landed at *Lopizium*, a castle midway between *Tropæa* and *Euphemia*, the city to which we were bound. Here, wherever I turned my eyes, nothing but scenes of ruin and horror appeared; towns and castles levelled to the ground; *Stromboli*, though at sixty miles distance, belching forth flames in an unusual manner, and with a noise which I could distinctly hear. But my attention was quickly turned from more remote to contiguous danger. The rumbling sound of an approaching earthquake, which by this time we were grown acquainted with, alarmed us for the consequences. It every moment seemed to grow louder, and to approach more near. The place on which we stood began to shake most

dreadfully; so that, being unable to stand, my companions and I caught hold of whatever shrub grew next us, and supported ourselves in that manner. After some time, the violent paroxysm ceasing, we again stood up, in order to prosecute our voyage to Euphemia, which lay within sight. In the mean time, while we were preparing for this purpose, I turned my eyes towards the city, but could see only a frightfully dark cloud, that seemed to rest upon the place. This the more surprised us, as the weather was so very serene. We waited, therefore, till the cloud was passed: then turning to look for the city, it was totally sunk, and nothing but a dismal and putrid lake was to be seen where it stood.'

In the year 1692 an earthquake happened in Jamaica, attended with almost all the terrible phenomena above stated. In two minutes it destroyed the town of Port Royal, and sunk the houses in a gulf of forty fathoms deep. It was attended with a hollow rumbling noise, like that of thunder: the streets rose like the waves of the sea, first lifting up the houses, and then immediately throwing them down into deep pits. All the wells discharged their waters with the most violent agitation. The sea burst over its bounds, and deluged all that stood in its way. The fissures of the earth were in some places so great, that one of the streets appeared twice as broad as formerly. In many places it opened and closed again, and continued this agitation for some time. Of these openings great numbers might be seen at one time. In some the people were swallowed up at once; in others, the earth caught them by the middle, and crushed them to death, while others, more fortunate, were swallowed up in one chasm, and thrown out alive from another. Other chasms were large enough to swallow up whole streets; and others, still more formidable, spouted up immense quantities of water, drowning such as the earthquake had spared. The whole was attended with stenches and offensive smells, the noise of falling mountains at a distance, &c.; and the sky suddenly turned dull and reddish, like a glowing oven. Yet, greatly as Port Royal suffered, more houses were left standing in it, than on the whole island besides. Scarcely a planting-house, or sugar-house, was left standing in all Jamaica. A great part of them were swallowed up, houses, people, trees, and all in one gap: in lieu of which, afterwards appeared great pools of water; which, when dried up, left nothing but sand, without any mark that ever tree or plant had grown thereon. Although the shock was so violent, that several houses were thrown some yards out of their places, yet they continued standing. A Mr. Hopkins had his plantation removed half a mile from the place where it stood, without any considerable alteration. All the wells in the island, as well as those of Port Royal, from one fathom to six or seven deep, threw their water out at the top with great violence. Above twelve miles from the sea the earth gaped and spouted out, with a prodigious force, vast quantities of water into the air: yet the greatest violences were among the mountains and rocks; and it is a general opinion, that the nearer the mountains

the greater the shock; and that the cause thereof lay among them. Most of the rivers were stopped up for twenty-four hours, by the falling of the mountains; till, swelling up, they formed new channels, tearing up, in their passage, trees, &c. After the great shock, those people who escaped got on board ships in the harbour, where many continued above two months: the shocks all that time being so violent, and coming so thick, sometimes two or three in an hour, accompanied with frightful noises, like a rushing wind, or a hollow rumbling thunder, with brimstone blasts, that they durst not come ashore. The consequence of the earthquake was a general sickness, from the noisome vapors belched forth, which swept away above 3000 people.

In 1693 an earthquake happened in Sicily, which may justly be accounted one of the most terrible of which we have any account. It shook the whole island, and even Naples and Malta shared in the shock. It was impossible for any body in this country to keep on their legs on the dancing earth; nay, those that lay on the ground were tossed from side to side, as on a rolling billow: high walls leaped from their foundations several paces, &c. The mischief it did is amazing; almost all the buildings in the countries were thrown down; fifty-four cities and towns, besides an incredible number of villages, were either destroyed or greatly damaged. Catania, one of the most famous, ancient, and flourishing cities in the kingdom, had the greatest share in the tragedy. Anthony Scerovita, being on his way thither, at the distance of a few miles, observed a black cloud, like night, hovering over the city, when there arose from the mouth of Mont Gibello great spires of flame, which spread all around. The sea all of a sudden began to roar and rise in billows; and there was a blow as if all the artillery in the world had been at once discharged. The birds flew about, the cattle ran crying, and the horses stopped short, trembling; so that he and his companions were forced to alight. They were no sooner off, but they were lifted from the ground above two palms; when looking towards Catania, he with amazement saw nothing but a thick cloud of dust in the air. Of that magnificent city, there was not the least footstep to be seen. S. Bonajutus assures us, that of 18,900 inhabitants, 18,000 perished therein.

The great earthquake, however, which happened on the 1st of November, 1755, at Lisbon, affords the clearest example of all the phenomena above mentioned, having been felt violently in many places both on land and at sea, and extended its effects to the waters in many other places where the shocks were not perceived. At Lisbon, in Portugal, its effects were most severe. In 1750 there had been a sensible trembling of the earth felt in this city: for four years afterwards there had been an excessive drought: in so much that some springs, formerly very plentiful of water, were dried, and totally lost. The predominant winds were north and north-east, accompanied with various, though very small, tremors of the earth. The year 1755 proved very wet and rainy; the summer cooler than usual; and for forty days before the earthquake

the weather was clear, but not remarkably so. The 31st of October the sun was obscured, with a remarkable gloominess in the atmosphere. On the 1st of November, early in the morning, a thick fog arose, which was soon dissipated by the heat of the sun: no wind was stirring, the sea was calm, and the weather was as warm as in June or July in Britain. And thirty-five minutes after nine, without the least warning, except a rumbling noise, like the artificial thunder in our theatres, a most dreadful earthquake shook, by quick but short vibrations, the foundations of all the city, so that many buildings instantly fell. Then, with a pause scarcely perceptible, the nature of the motions was changed, and the houses were tossed from side to side, with a motion like that of a waggon violently driven over rough stones. This second shock laid almost the whole city in ruins, with a prodigious slaughter of the people. The earthquake lasted in all about six minutes. At the moment of its beginning, some persons on the river, nearly a mile from the city, heard their boat make a noise as if it had run aground, though they were then in deep water; and at the same time they saw the houses falling on both sides of the river. The bed of the river Tagus was in many places raised to its surface. Ships were driven from their anchors, and jostled together with great violence; nor did their masters know whether they were afloat or aground. A large new quay sunk to an unfathomable depth, with several hundreds of people upon it; nor was one of the dead bodies ever found. The bar was at first seen dry from shore to shore; but suddenly the sea came rolling in like a mountain; and about Belem Castle the water rose fifty feet almost in an instant. About noon there was another shock, when the walls of several houses that yet remained opened from top to bottom more than a quarter of a yard, and afterwards closed again so exactly, that scarce any mark of the injury was left.

At Colares, about twenty-nine miles from Lisbon, and two miles from the sea, on the 31st October the weather was clear, and uncommonly warm for the season. About four o'clock P.M. there arose a fog from the sea, which overspread the valleys, a thing very unusual at that season. Soon after, the wind changing to the east, the fog returned to the sea, collecting itself, and becoming exceedingly thick. As the fog retired, the sea rose with a prodigious roaring. On the 1st November the day broke with a serene sky, the wind continuing at east; but about nine o'clock the sun began to grow dim; and about half an hour after was heard a rumbling noise like that of chariots, which increased to such a degree, that it became equal to the explosions of the largest cannon. Immediately a shock of an earthquake was felt, which was quickly succeeded by a second and third; and at the same time several light flames of fire issued from the mountains, resembling the kindling of charcoal. In these three shocks the walls of the buildings moved from east to west. In another situation, from whence the sea coast could be discovered, there issued from one of the hills called Fojo, a great quantity of smoke, very thick, but not very black. This increased with the fourth shock,

and afterwards continued to issue in a greater or less degree. Just as the subterraneous rumblings were heard, the smoke burst forth at the Fojo; and the quantity of smoke was always proportioned to the noise. On visiting the place from whence the smoke was seen to arise, no signs of fire could be perceived near it. At Oporto, near the mouth of the river Douro, the earthquake began about forty minutes past nine. The sky was very serene, when a dreadful hollow noise, like thunder, or the rattling of coaches at a distance, was heard; and almost at the same instant the earth began to shake. In the space of a minute or two the river rose and fell five or six feet, and continued to do so for four hours. It ran up at first with so much violence, that it broke a ship's hawser. In some parts the river opened, and seemed to discharge vast quantities of air: and the agitation in the sea was so great about a league beyond the bar, that air was supposed to have been discharged there also. St. Ube's, a sea-port town about twenty miles south of Lisbon, was entirely swallowed up by the repeated shocks and the vast surf of the sea. Huge pieces of rock were detached at the same time from the promontory at the west end of the town, which consists of a chain of mountains, containing fine jasper of different colors. The same earthquake was felt over all Spain, except in Catalonia, Arragon, and Valencia. At Ayamonte (near where the Guadiana falls into the Bay of Cadiz), a little before ten o'clock, on the 1st November, the earthquake was felt; having been immediately preceded by a hollow rushing noise. Here the shocks continued for fourteen or fifteen minutes, damaged almost all the buildings, throwing down some, and leaving others irreparably shattered. In little more than half an hour after, the sea and river, with all the canals, overflowed their banks with great violence, laying under water all the coasts of the islands adjacent to the city, and flowing into the streets. The water came on in vast black mountains, white with foam at the top, and demolished more than one-half of a tower at the bar, named De Canala. In the adjacent strands every thing was irrecoverably lost; for all that was overflowed sunk, and the beach became a sea, without the least resemblance of what it was before. Many persons perished, for, though they went aboard some vessels, yet part of these foundered; and others being forced out to sea, the unhappy passengers were so terrified, that they threw themselves overboard. The day was serene, and not a breath of wind stirring. At Cadiz, some minutes after 9 A.M. the earthquake began, and lasted about five minutes. The water of the cisterns under ground rushed backwards and forwards, so that a great froth arose. At ten minutes after eleven, a wave was seen coming from the sea, at eight miles distance, at least sixty feet higher than usual. It dashed against the west part of the town, which is very rocky. Though these rocks broke a good deal of its force, it at last came upon the city walls, beat in the breast work, and carried pieces of the building, of eight or ten tons weight, to the distance of forty or fifty yards. When the wave was gone, some parts that are deep at low water were left quite dry, for the water returned

with the same violence with which it came. At half an hour after eleven came a second wave, and after that four other remarkable ones; the first at ten minutes before twelve, the second half an hour before one; the third ten minutes after one; and the fourth ten minutes before two. Similar waves, but smaller, and gradually lessening, continued with uncertain intervals till the evening. At Gibraltar the earthquake was not felt till after ten. It began with a tremulous motion of the earth, which lasted about half a minute. Then followed a violent shock: after that a trembling of the earth for five or six seconds; then another shock not so violent as the first, which went off gradually as it began. The whole lasted about two minutes. Some of the guns on the battery were seen to rise, others to sink, the earth having an undulating motion. Most people were seized with giddiness and sickness, and some fell down; others were stupefied: and many that were walking or riding felt no motion in the earth, but were sick. The sea rose six feet every fifteen minutes; and then fell so low, that boats and all the small craft near the shore were left aground, with numbers of small fish. The flux and reflux lasted till next morning, having decreased gradually from 2 P.M. At Madrid the earthquake came on at the same time as at Gibraltar, and lasted about six minutes. At first every body thought they were seized with a swimming in their heads; and afterwards that the houses were falling. It was not felt in coaches, nor by those who walked on foot, except very slightly; and no accident happened, except that two lads were killed by the fall of a stone cross from the porch of a church. At Magala a violent shock was felt, the bells rung in the steeples; the water of a well overflowed, and as suddenly retired. Saint Lucar (at the mouth of the Guadalquivir) was violently shocked, and the sea broke in and did much mischief. At Seville (sixteen leagues above) several houses were shaken down; the famous tower of the cathedral, La Giralda, opened in the four sides; and the waters were so violently agitated, that all the vessels in the river were driven ashore.

This earthquake was also felt almost as severely in Africa as it had been in Europe. Great part of Algiers was destroyed. At Arzilla (a town in Fez), about 10 A.M. the sea suddenly rose with such impetuosity, that it lifted up a vessel in the bay, and dropped it with such force on the land, that it was broken to pieces; and a boat was found two musket shot within land from the sea. At Fez and Mequinez, great numbers of houses fell, and multitudes of people were buried in the ruins. At Morocco, by the falling of houses, many people lost their lives: and about eight leagues from the city the earth opened and swallowed up a village with all the inhabitants, who were known by the name of the Sons of Besumba, to the number of about 8000 or 10,000 persons, together with all their cattle, &c., and, soon after, the earth closed again in the same manner as before. At Sallee, a great deal of damage was done. Near a third part of the houses were overthrown; the waters rushed into the city with great rapidity, and left behind

them great quantities of fish. At Tangier the earthquake began at 10 A.M. and lasted ten or twelve minutes. The sea came up to the walls (a thing never heard of before), and went down immediately with the same rapidity with which it arose, leaving a great quantity of fish behind it. These commotions were repeated eighteen times, and lasted till 6 P.M. At Tetuan the earthquake began at the same time it did at Tangier, but lasted only seven or eight minutes. There were three shocks so extremely violent, that it was feared the whole city would be destroyed. In the city of Funchal, in the island of Madeira, a shock of this earthquake was first perceived at thirty-eight minutes past 9 A.M. It commenced with a rumbling noise in the air, like that of empty carriages passing hastily over a stone pavement. The observers felt the floor immediately after move with a tremulous motion, vibrating very quickly. The shock continued more than a minute; during which space the vibrations, though continual, were weakened and increased in force twice very sensibly. The increase after the first remission of the shock was the most intense. The noise in the air accompanied the shock during the whole of its continuance, and lasted some seconds after the motion of the earth had ceased; dying away like a peal of distant thunder rolling through the air. At three quarters past ten, the sea, which was quite calm, it being a fine day and no wind stirring, retired suddenly some paces; then rising with a great swell, without the least noise, and as suddenly advancing, overflowed the shore, and entered the city. It rose fifteen feet perpendicular above the high water mark, although the tide, which flows there seven feet, was then at half ebb. The water immediately receded; and after having fluctuated four or five times between high and low water mark, it subsided, and the sea remained calm as before. In the northern part of the island the inundation was more violent, the sea there retiring above 100 paces at first, and suddenly returning, overflowed the shore, forcing open doors, breaking down the walls of several magazines and storehouses, leaving great quantities of fish ashore, and in the streets of the village of Machico. All this was the effect of one rising of the sea, for it never afterwards flowed high enough to reach the high-water mark. It continued, however, to fluctuate here much longer before it subsided than at Funchal; and in some places farther to the westward, it was hardly, if at all, perceptible.

Such were the phenomena with which this remarkable earthquake was attended in those places where it was violent. The effects of it, however, reached to an immense distance; and were perceived chiefly by the agitations of the waters, or some slight motion of the earth. The utmost boundaries of this earthquake to the south are unknown; the barbarity of the African nations rendering it impossible to procure any intelligence from them, except where the effects were dreadful. On the north, however, we are assured, that it reached as far as Norway and Sweden. In the former, the waters of several rivers and lakes were violently agitated. In the latter, shocks were felt in several provinces, and

all the rivers and lakes were strongly agitated, especially in Dalecarlia. The river Dala suddenly overflowed its banks, and as suddenly retired. At the same time a lake three miles distant, which had no communication with it, bubbled up with great violence. At Fahlun, a town in Dalecarlia, several strong shocks were felt.

Shocks of this great earthquake were felt in several places of France: commotions of the waters were observed at Angoulesme, Bleville, Havre de Grace, &c.; but considerable shocks were felt at Bayonne, Bourdeaux, and Lyons. In many places of Germany its effects were also very perceptible, and throughout the duchy of Holstein. In Brandenburg, the water of a lake called Libsec, ebbed and flowed six times in half an hour, with a dreadful noise, the weather being then perfectly calm. The same agitation was observed in the waters of the lakes Muplgast and Netzo; and at this last place they emitted an intolerable stench. In Holland, the agitations were more remarkable. At Alphen on the Rhine, between Leyden and Woerden, in the afternoon of November 1st, the waters were agitated to such a degree, that buoys were broken from their chains, large vessels snapped their cables, smaller ones were thrown out of the water upon the land, and others lying on land were set afloat. At Amsterdam, about 11 A. M., the air being perfectly calm, the waters were suddenly agitated in the canals, so that several boats broke loose; chandeliers were observed to vibrate in the churches; but no motion of the earth, or concussion of any building was observed. At Leyden also, between half an hour after 10 and 11 A. M., the waters rose suddenly in the canals, and made several perceptible undulations. Round the island of Corsica, the sea was violently agitated, and most of the rivers of the island overflowed their banks. Throughout the Milanese, shocks were felt; at Turin there was felt a very violent one, and in Switzerland many rivers turned suddenly muddy without rain. The lake of Neufchatel swelled near two feet above its natural level for a few hours. An agitation was also perceived in the waters of the lake of Zurich. At the island of Antigua, there was such a sea without the bar as had not been known in the memory of man; and after it the water at the wharfs, which used to be six feet deep, was not two inches. At Barbadoes, about 2 P. M. the sea ebbed and flowed in an unusual manner; ran over the wharfs and streets into the houses, and continued thus ebbing and flowing till ten at night.

This agitation of waters was perceived in various parts of Great Britain. At Barlborough, in Derbyshire, between 11 and 12 A. M., in a boat house on the west side of a large body of water called Pibley dam, was heard a surprising and terrible noise; a large swell of water came in a current from the south, and rose two feet on the sloped dam-head at the north end of the water. It then subsided; but returned immediately, though with less violence. The water was thus agitated for three quarters of an hour; growing gradually weaker and weaker every time, till it entirely ceased. At Bushbridge and

Cobham in Surry, at Dunstall in Suffolk, in Oxfordshire, Derbyshire, and near the city of Durham, at half after ten in the morning, the like phenomena are recorded to have appeared. At Eyam-bridge, in the Peak of Derby, the overseer of the lead mines, sitting in his writing room about eleven o'clock, felt a sudden shock, which raised him from his chair, and shook the plaster from the sides of the room. The roof was so violently shaken, that he imagined the engine shaft had been falling in. At this time two miners were employed in carting, or drawing along the drifts of the mines, the ore and other materials to be raised up at the shafts. The drift in which they were working was about 120 yards deep, and the space from one end to the other fifty yards or upwards. The miner at the end of the drift had just loaded his cart, and was drawing it along; when he was surprised by a shock, which terrified him from his employment, and while he was consulting with his fellow-workmen what means they should take for their safety, they were surprised by a second shock more violent than the first. Another miner who worked about twelve yards below, told them that the violence of the second shock had been so great, that it caused the rocks to grind upon one another. His account was interrupted by a third shock, which, after an interval of four or five minutes, was succeeded by a fourth; and, about the same space of time after, by a fifth; none of which were so violent as the second. They heard, after every shock, a loud rumbling in the bowels of the earth, which continued about half a minute, gradually decreasing, or seeming to remove to a greater distance. At White Rock in Glamorganshire, about two hours ebb of the tide, and near three quarters after 6 P. M., a vast quantity of water rushed up with a prodigious noise; floated two large vessels, the least of them above 200 tons; broke their moorings, drove them across the river, and almost overset them. The whole rise and fall of this extraordinary body of water did not last above ten minutes, nor was it felt in any other part of the river, so that it seemed to have gushed out of the earth at that very place. At Loch Lomond in Scotland, about half an hour after 9 A. M., all of a sudden, without the least gust of wind, the water rose against its banks with great rapidity, but immediately subsided, till it was as low as any person then present had ever seen it in the greatest summer drought. Instantly it returned towards the shore, and in five minutes rose again as high as before. The agitation continued at the same rate till fifteen minutes after 10 A. M. taking five minutes to rise, and as many to subside. From fifteen minutes after ten till eleven, the height of every rise came somewhat short of that immediately preceding, taking five minutes to flow, and as many to ebb, till the water was entirely settled. The greatest perpendicular height of this swell was two feet four inches. A still more remarkable phenomenon attending the earthquake in this lake was, that a large stone lying at some distance from shore, but in water so shallow that it could easily be seen, was forced out of its place in the lake upon dry land, leaving a deep furrow in the

ground all along the way in which it had moved. In Loch Ness, about half an hour after nine, a very great agitation was observed in the water. About ten the river Oich, which runs on the north side of Fort Augustus, into the head of the loch, was observed to swell very much, and run upwards from the loch with a pretty high wave, about two or three feet higher than the ordinary surface. The motion of the wave was against the wind, and it proceeded rapidly for about 200 yards up the river. It then broke on a shallow, and flowed three or four feet on the banks, after which it returned gently to the loch. It continued ebbing and flowing in this manner for about an hour.

In Ireland the effects of this earthquake were confined to remarkable agitations of the water, similar to those already described.

The above are the most striking phenomena with which the earthquake of November 1st, 1755, was attended on the surface of the earth. Those which happened below ground cannot be known but by the changes observed in springs &c., which were in many places very remarkable. At Colares, on the afternoon of the 31st of October, the water of a fountain was greatly decreased: on the morning of the 1st of November it ran very muddy; and, after the earthquake, returned to its usual state both as to quantity and clearness. On the hills, numbers of rocks were split; and there were several rents in the ground, but none considerable. In some places where formerly there had been no water, springs burst forth, which continued to run. Some of the largest mountains in Portugal were impetuously shaken as it were from their foundation; most of them opened at their summits, split and rent in a wonderful manner, and huge masses of them were thrown down into the subjacent valleys. From the rock Alvidar, near the hill Fojo, a kind of parapet was broken off, which was thrown up from its foundation into the sea. At Varge, on the river Macaas, during the earthquake, many springs of water burst forth, some spouted up eighteen or twenty feet, throwing up sand of various colors, which remained on the ground. A mountainous point, seven or eight leagues from St. Ube's, cleft asunder, and threw off several vast masses of rock. In Barbary a large hill was rent in two; the two halves fell different ways, and buried two large towns. In another place, a mountain burst open and a stream issued from it as red as blood. At Tangier all the fountains were dried up, so that there was no water to be had till night. A remarkable change was observed in the medicinal waters of Toplitz, a village in Bohemia famous for its baths. These waters were discovered in 762; from which time the principal spring of them had constantly thrown out hot water in the same quantity, and of the same quality. On the morning of the earthquake, between 11 and 12 A. M. the principal spring cast forth such a quantity of water, that in half an hour all the baths ran over. About half an hour before this, the spring had flowed turbid and muddy; then, having stopped entirely for a minute, it broke forth again with prodigious violence, driving before it a considerable quantity

of reddish ochre. After this it became clear and flowed as pure as before. It still continues to do so; but the water is in greater quantity, and hotter, than before the earthquake. At Angoulême in France, a subterraneous noise like thunder was heard; and presently after the earth opened, and discharged a torrent of water mixed with red sand. Most of the springs in the neighbourhood sunk in such a manner, that for some time they were thought to be quite dry. In Britain no considerable alteration was observed in the earth, except that, near the lead mine in Derbyshire, a cleft was observed about a foot deep, six inches wide, and 150 yards in length.

The shocks of this earthquake were felt most violently at sea. Off St. Lucar, the captain of the Nancy frigate felt his ship so violently shaken, that he thought she had struck the ground; but, on heaving the lead, found he was in a great depth of water. Captain Clark from Denia, in N. lat. $36^{\circ} 24'$, between 9 and 10 A. M., had his ship shaken and strained as if she had struck upon a rock, so that the seams of the deck opened, and the compass was overturned in the binnacle. The master of a vessel bound to the American Islands, being in N. lat. 25° W. long. 40° , and writing in his cabin, heard a violent noise, as he supposed, in the steerage; and shortly after the ship seemed as if she had been suddenly jerked up and suspended by a rope fastened to the mast head. Coming on deck, he found a violent current crossing the ship's way to the leeward. In about a minute, this current returned with great impetuosity, and, at a league distant, three craggy-pointed rocks appeared throwing up water of various colors resembling fire. These phenomena, in two minutes, ended in a black cloud, which ascended very heavily, and after it had risen above the horizon, no rocks were to be seen. Between 9 and 10 A. M. another ship, forty leagues west of St. Vincent, was so strongly agitated, that the anchors, which were lashed, were thrown up. Immediately after this, the ship sunk in the water as low as the main chains. The lead showed a great depth of water, and the line was tinged of a yellow color and smelt of sulphur. The shock lasted about ten minutes, but they felt smaller ones for twenty-four hours. Such were the phenomena of this very remarkable and destructive earthquake, which extended over a tract of at least 4,000,000 of square miles.

The earthquakes, which in 1783 ruined a great part of Italy and Sicily, though much more confined in their extent, than that of 1755, seem to have been not at all inferior in violence. Sir William Hamilton thus states their effects, 'If on a map of Italy, and with your compass on the scale of Italian miles you measure off twenty-two,' says this writer, 'and then fixing the central point in the city of Opidio, form a circle, the radii of which will be twenty-two miles; you will include all the towns, villages, &c., that have been utterly ruined, the spots where the greatest mortality happened, and where there have been the most visible alterations on the face of the earth: then extend your compass on the same scale to seventy-two miles, preserving the same centre, and form another circle, you will include the

whole country that has any mark of having been affected by the earthquake.' A circumstance was remarked in which this earthquake differed from others, viz. that if two towns were situated at an equal distance from this centre, one on the hill, the other on the plain, or in a bottom, the latter always suffered most. From the most authentic accounts received by the king of Sicily's secretary of state, it appeared that the part of Calabria which had been most affected by this calamity, was comprehended between 38° and 39° of N. lat.; that the greatest force of the earthquake had been exerted from the foot of those mountains of the Apennines called Dijo, Sacro, and Caulene, extending west to the Tyrrhene sea; that the towns, villages and farm-houses nearest these mountains, situated either on the hills or the plain, were totally ruined by the shock of the 5th of February about noon; that even the more distant towns had been greatly damaged by the subsequent shocks of the earthquakes, and effectually by those of the 7th, 26th, and 28th, of February, and that of the 1st of March; that from the first shock of the 5th of February, the earth had been in a continual tremor; and that the motion of the earth had been either whirling like a vortex, horizontal, or by pulsations, or by beatings from the bottom upwards. This variety of motions increased the apprehensions of the miserable inhabitants, who expected every moment that the earth would open under their feet, and swallow them up. These phenomena had been attended with irregular and furious gusts of wind: and from all these causes, the face of that part of Calabria comprehended between 38° and 39° was entirely altered. See CALABRIA. The number of lives lost was estimated at 32,367; but Sir William Hamilton is of opinion, that, including strangers, it could not be less than 40,000. The fate of the inhabitants of Scilla was extremely affecting. On the first shock of the earthquake, February 5th, they had fled to the sea-shore, where they hoped for safety; but in the night a furious wave overflowed the land for three miles, sweeping off in its return 2473 of the inhabitants, among whom was the prince himself, who were at that time either on the strand, or in boats near the shore.

Sir William Hamilton landed on the 6th of May at Pizzo in Calabria Ultra. This town is situated on a volcanic tufa, and had been greatly damaged by the earthquake of February 5th, but completely ruined by that of the 28th March. He was told that the volcano of Stromboli, which is in full view of the town, though distant about fifty miles, had smoked less and thrown up a smaller quantity of inflamed matter during the earthquakes, than it had done for some years before; and that slight shocks still continued to be felt. Sir William had soon a convincing proof that this last information was true; for, sleeping that night in his boat, he was awakened with a smart shock, which seemed to lift up the bottom of the boat, but was not attended with any subterraneous noise. From Pizzo he passed through a most beautiful country to Monteleone, formerly interspersed with towns and villages: but at that time they all lay in ruins. Monteleone had suffered little on the 5th of February, but was greatly damaged on the 28th of March. The

shocks of the earthquake came with a rumbling noise from the west, beginning usually with the horizontal motion, and ending with the vorticose, by which last the greatest part of the buildings in this province were destroyed. Before a shock the clouds seemed to be still and motionless, but, immediately after a heavy shower of rain, a shock quickly followed. During a shock, the peasants told him that the horses and oxen extended their legs wide asunder, that they might not be thrown down; and that they gave evident signs of being sensible of its approach. 'I myself,' says he, 'have observed, that, in those parts which have suffered most by earthquakes, the braying of an ass, the neighing of a horse, or the cackling of a goose, always drove people out of their barracks, and was the occasion of many Pater Nosters and Ave Marias being repeated, in expectation of a shock.' From Monteleone he descended into the plain, passing through many towns and villages which had been more or less ruined according to their vicinity to the plain. The town of Mileto had not a house left standing. At some distance he saw Soriano, and the Dominican convent, a heap of ruins. Passing through the ruined town of St. Pietro, in his way to Rosarno, he had a distant view of Sicily and the summit of *Ætna*, which then sent forth a considerable smoke. Just before his arrival at Rosarno, he passed over a swampy plain, in many parts of which he was shown small hollows in the earth, of the shape of an inverted cone. They were covered with sand, as was the soil near them. He was informed that, during the earthquake of February 5th, a fountain of water, mixed with sand, had been driven up from each of these spots to a considerable height. Before this appearance, he said, the river was dry; but soon after returned and overflowed its banks. The same phenomenon had been constant with respect to all other rivers in the plain, during the dreadful shock of the 5th of February. In the other parts where this phenomenon had been exhibited, the ground was always low and rushy. Between this place and Rosarno they passed the river Metauro on a strong timber bridge, 700 palms long. By the cracks made in the banks and in the bed of the river by the earthquake, it was quite separated in one part; and, the level on which the piers were placed having been variously altered, the bridge had taken an undulated form, so that the rail on each side was curiously scolloped; but, the separated parts having been joined again, it was then passable. The town of Rosarno, with the duke of Monteleone's palace, was entirely ruined; but the walls remained about six feet high, and were at that time fitting up as barracks. The only building that remained unhurt at Rosarno was the town gaol, in which were three notorious villains, who would probably have lost their lives if they had remained at liberty. From Rosarno Sir William proceeded to Laureana, where he was conducted to the place where two tencements were said to have exchanged situations. These were situated in a valley surrounded by high grounds: and the surface of the earth which was removed, had probably been undetermined by rivulets from the mountains, then plainly discernible on the bare spot, which the

tenements had quitted. Their course down the valley was sufficiently rapid to prove that it had not been a perfect level. The earthquake, he supposes, had opened some depositories of rain water, in the clay hills which surround the valley; which water, mixed with the loose soil, taking its course suddenly through the undermined surface, lifting it up with the large olive and mulberry trees, and a thatched cottage, floated the whole piece of ground, with all its vegetation, about a mile down the valley, where it then stood with most of the trees erect. These two tracts were about a mile long and half a mile broad. 'I travelled,' says he afterwards, 'four days in this plain, in the midst of such misery as cannot be described. The force of the earthquake there was so great, that all the inhabitants of the towns were buried, alive or dead, in the ruins of their houses in an instant. The town of Polistene was large, but ill situated between two rivers that were subject to overflow: 2100 out of 6000, lost their lives here on the fatal 5th of February.' At Casal Nuova the princess Gerace Grimaldi, with 4000 of her subjects, perished on the same day by the explosion. Some who had been dug alive out of the ruins, told our author, that they had felt their houses fairly lifted up without having the least previous notice. An inhabitant of Casal Nuova was at that moment on a hill overlooking the plain; when, feeling the shock, and turning round, instead of the town he saw only a thick cloud of white dust like smoke, the natural effect of the crushing of the buildings, and the mortar flying off. Casal Nuova was so effectually destroyed by this dreadful shock, that neither house nor street remained, but all lay in one confused heap of ruins. Castillace, and Milicusco, were both in the same situation. Terra Nuova, situated in the same plain, stood between two rivers, which, with the torrents from the mountains, had cut deep and wide chasms in the soft sandy clay soil of which it is composed. At Terra Nuova the ravine is not less than 500 feet deep, and three quarters of a mile broad. 'Here, from the great depth of the ravine, and the violent motion of the earth, two huge portions of the latter, on which a great part of the town stood, which consisted of some hundred houses, had been detached into the ravine, and nearly across it, at about the distance of half a mile from the place where they formerly stood; and what is very extraordinary, many of the inhabitants who had taken this singular leap in their houses, were nevertheless dug out alive, and some unhurt.' Sir William's guide there, who was both a priest and physician, having been buried in the ruins of his house by the first shock, was immediately blown out of it and delivered by the second. There were many well attested instances of the same circumstance having happened in different parts of Calabria. Part of the rock on which the city stood at Oppido was detached, with several houses, into the ravine: 'But that,' says Sir William, 'is a trifling circumstance in comparison of the very great tracts of land, with plantations of vines and olives, which had been detached from one side of the ravine to the other, though the distance is more than half a mile. It is well attested, that a countryman, who was

ploughing his field in this neighbourhood with a pair of oxen, was transported with his field and team clear, from one side of a ravine to the other, and that neither he nor his oxen were hurt. Having walked over the ruins of Oppido, I descended into the ravine, and examined carefully the whole of it. Here I saw indeed the wonderful force of the earthquake, which has produced exactly the same effects as those described in the ravine at Terra Nuova, but on a scale infinitely greater. The enormous masses of the plain, detached from each side of the ravine, lie sometimes in confused heaps, forming real mountains, and having stopped the course of two rivers, one of which is very considerable, great lakes are already formed; and if not assisted by nature or art, so as to give the rivers their due course, must infallibly be the cause of a general infection in the neighbourhood. Sometimes I met with a detached piece of the surface of the plain, of many acres in extent, with the large oaks and olive trees, with corn or lupins under them, growing as well and in as good order at the bottom of the ravine as their companions, from whence they were separated, do on their native soil, at least 500 feet higher, and at the distance of about three quarters of a mile. I met with whole vineyards in the same order in the bottom, that had likewise taken the same journey. As the banks of the ravine, from whence these pieces came, are now bare and perpendicular, I perceived that the upper soil was a reddish earth, and the under one a sandy white clay, very compact, and like a soft stone. The impulse these huge masses received, either from the violent motion of the earth alone, or that assisted with the additional one of the volcanic exhalations set at liberty, seems to have acted with greater force on the lower and more compact stratum, than on the upper cultivated crust: for I constantly observed, where these cultivated lands lay, the under stratum of compact clay had been driven some hundred yards farther, and lay in confused blocks; and, as I observed, many of these blocks were in a cubical form. The under soil, having had a greater impulse, and leaving the upper in its flight, naturally accounts for the order in which the trees, vineyards, and vegetation fell, and remain at present in the bottom of the ravine. In another part of the bottom of the ravine, there is a mountain composed of the same clay soil, and which was probably a piece of the plain detached by an earthquake at some former period: it is about 250 feet high, and 400 feet diameter at its basis. This mountain, as is well attested, has travelled down the ravine near four miles; having been put in motion by the earthquake of the 5th of February. The abundance of rain which fell at that time, the great weight of the fresh detached pieces of the plain, which I saw heaped up at the back of it, the nature of the soil, of which it is composed, and particularly its situation on a declivity, account well for this phenomenon; whereas the reports which came to Naples, of a mountain having leaped four miles, had rather the appearance of a miracle. I found some single timber trees also, with a lump of their native soil at their roots, standing upright in the bottom of the ravine, and which

had been detached from the bottom of the plain above-mentioned. I observed also, that many confused heaps of the loose soil, detached by the earthquake from the plains on each side of the ravine, had actually run like volcanic lava (having probably been assisted by the heavy rain) and produced many effects much resembling those of lava, during their course down a great part of the ravine. At Santa Cristina, near Oppido, the like phenomena have been exhibited, and the great force of the earthquake of the 5th of February seems to have been exerted on these parts, and at Casal Nuova, and Terra Nuova.' At Reggio the shock had been much less violent than in the places he had hitherto visited; and 'though there was not a house in it inhabited or habitable, yet' says he, 'after having been several days in the plain, where every building is levelled with the ground, a house with a roof, or a church with a steeple, was to me a new and refreshing object.' In this place he had an account from the archbishop of the earthquakes of 1779 and 1780, which obliged the inhabitants, in number 16,400, to remain in barracks for several months, without having done any considerable damage to the town. He was informed also, that all animals and birds are in a greater or less degree much more sensible of an approaching shock of an earthquake, than any human being; but that geese, above all, seem to be the soonest and most alarmed at the approach of a shock; if in the water, they quit it immediately; and will not be driven into it for some time after. The shock which damaged Reggio came on gently, so that the people had time to make their escape, and only 126 were killed; but in the plain this shock was as instantaneous as it was violent and destructive. On the 14th of May, Sir William Hamilton left Reggio, and set sail for Messina. He found that the shock, though very violent there, had been far inferior to what he had seen the effects of in other places. Many houses, even in the lower part of the town, were standing, and some little damaged; but, in the upper and more elevated situations, the earthquakes seemed to have scarce had any effect. 'A strong instance (says our author) of this is, that the convent of Santa Barbara, and that called the Novitiato de Gesniti, both on an elevated situation, have not a crack in them; and that the clock of the latter has not been deranged in the least by the earthquakes, which have afflicted this country for four months past, and which still continue in some degree.' Notwithstanding this comparative mildness, the shock at Messina had been very terrible. All the beautiful front of the palazzate, which extended in very lofty uniform buildings, in the shape of a crescent, had been in some parts totally ruined, in others less; and there were cracks in the earth of the quay, a part of which had sunk above a foot below the level of the sea. During the earthquake, fire had been seen to issue from the cracks of the quay; but our author is persuaded that this was only a vapor charged with electrical fire, or inflammable air. Here also he was informed, that the shock of the 5th of February had been from the

bottom upwards; but the subsequent ones generally horizontal or vorticose. A remarkable circumstance was observed at Messina, and through the whole coast of Calabria, which had been most affected by the earthquake, viz. that a small fish called cicirelli, resembling the English white bait, but larger, and which usually lie at the bottom of the sea buried in the sand, had, ever after the commencement of the earthquakes to the time this account was written, continued to be taken near the surface, and that in such abundance as to be common food for the poorest of the people; whereas before the earthquakes this fish was rare, and reckoned among the greatest delicacies. Fish of all kinds also were taken in greater abundance on these coasts after the commencement of the earthquakes than before; which our author supposes to have been occasioned either by the volcanic matter having heated the bottom of the sea, or that the continual tremor of the earth had forced them out of their retreats. At Messina, Sir William was told that on the 5th of February, and for three days following, the sea, about a quarter of a mile from the citadel, rose, and boiled in an extraordinary manner, and with a most horrid and alarming noise; the water in other parts of the strait being perfectly calm. 'This,' says he, 'seems to point out exhalations or eruptions from cracks at the bottom of the sea, which may probably have happened during the violence of the earthquakes; all of which I am convinced have here a volcanic origin.'

In various parts of South America, earthquakes have been equally tremendous and fatal. It is remarkable that the city of Lima, the capital of Peru, situated in about 12° of S. lat., although scarcely ever visited by tempests, and equally unacquainted with rain as with thunder and lightning, has been singularly exposed to the fury of earthquakes, which happen here so frequently, that the inhabitants are under continual apprehensions of being, from their suddenness and violence, buried in the ruins of their own houses: yet these earthquakes, though so sudden, have their presages; one of the principal of which is a rumbling noise in the bowels of the earth, about a minute before the shocks are felt, that seems to pervade all the adjacent subterraneous part; this is followed by dismal howlings of the dogs, who seem to presage the approaching danger. The beasts of burden passing the streets stop, and by a natural instinct spread open their legs, the better to secure themselves from falling. On these portents, the terrified inhabitants fly from their houses into the streets with such precipitation, that, if it happens in the night, they appear quite naked; the urgency of the danger at once banishing all sense of delicacy or shame. Thus the streets exhibit such odd and singular figures as might afford matter of diversion, were it possible to be diverted in so terrible a moment. This sudden concourse is accompanied with the cries of children waked out of their sleep, blended with the lamentations of the women, whose agonising prayers to the saints increase the common fear and confusion. The men are also too much

affected to refrain from giving vent to their terror; so that the whole city exhibits a dreadful scene of consternation and horror.

The earthquakes that have occurred at the capital of Spanish America are very numerous. The first since the establishment of the Spaniards was in 1582; but the damage was much less considerable than in some of the succeeding. Six years after, Lima was again visited by another earthquake, so dreadful, that it is still solemnly commemorated every year. In 1609 there was a third, which overturned many houses. On the 27th of November, 1630, such prodigious damage was done in the city by an earthquake, that, in acknowledgment of its not having been entirely demolished, a festival on that day is annually celebrated. Twenty-four years afterwards, on the 3rd of November, the most stately edifices in the city, and a great number of houses, were destroyed by a similar attack; but the inhabitants retiring, few of them perished. Another dreadful percussion took place in 1678; but one of the most terrible was on the 28th of October, 1687. It began at four in the morning, and destroyed many of the finest public buildings and houses, in which a great number of the inhabitants perished; but this was little more than a prelude to what followed; for two hours afterwards the shock returned, with such impetuous concussions, that all was laid in ruins, and the inhabitants felt themselves happy in being only spectators of the general devastation by having saved their lives, though with the loss of all their property. During this second shock the sea, retiring considerably, and then returning in mountainous waves, entirely overwhelmed Callao, which is at five miles distance from Lima, and all the adjacent country, together with the miserable inhabitants. From this time six other earthquakes were felt at Lima previous to that of 1746, on the 28th of October, at half an hour after ten at night, when the concussions began with such violence, that, in little more than three minutes, the greatest part, if not all the buildings in the city, were destroyed, burying under their ruins those inhabitants who had not made sufficient haste into the streets and squares, the only places of safety. At length the horrible effects of the first shock ceased; but the tranquillity was of short duration, the concussions swiftly succeeding each other. The fort of Callao also sunk in ruins; but what it suffered from the earthquake in its building was inconsiderable, when compared to the dreadful catastrophe which followed; for the sea, as is usual on such occasions, receding to a considerable distance, returned in mountainous waves, foaming with the violence of the agitation, and suddenly buried Callao and the neighbouring country in its flood. This, however, was not entirely effected by the first swell of the waves; for the sea retiring further, returned with still greater impetuosity, and covered both the walls and other buildings of the place; so that what even had escaped the first inundation, was totally overwhelmed by those succeeding mountainous waves. Twenty-three ships and vessels, great and small, were then in the harbour, nineteen of

which were sunk, and the other four, among which was a frigate named *St. Fermin*, were carried by the force of the waves to a considerable distance up the country. This terrible inundation and earthquake extended to other parts on the coast, and several towns underwent the same fate as the city of Lima; where the number of persons who perished, within two days after it began, amounted, according to the bodies found, to 1300, beside the maimed and wounded, many of whom lived only a short time in great torture.

Various theories have been invented to explain the phenomena of earthquakes. Till lately, the hypotheses of modern philosophers were much the same with those of the ancients. Anaxagoras supposed the cause of earthquakes to be subterraneous clouds bursting out into lightning, which shook the vaults that confined them. Others imagined that the arches, which had been weakened by continual subterraneous fires, at length fell in. Others derived these double convulsions from the rarefied steam of waters heated by some neighbouring fires (an hypothesis revived in modern times by M. Dolomieu); whilst some, among whom was Epicurus, and several of the Peripatetics ascribed them to the ignition of certain inflammable exhalations. This last hypothesis has been adopted by many of the most celebrated moderns, as Gassendus, Kircher, Schottus, Varenus, Des Cartes, Du Hamel, Honori-rius, Fabri, &c. The philosopher last mentioned, indeed supposed, that waters prodigiously rarefied by heat, might sometimes occasion earthquakes. The others supposed, that there are many and vast cavities under ground, which have a communication with one another: some of which abound with waters; others with vapors and exhalations, arising from inflammable substances, as nitre, bitumen, sulphur, &c. These combustible exhalations they supposed to be kindled by a subterraneous spark, or by some active flame gliding through a narrow fissure from without, or by the fermentation of some mixture; and when this happens, that they may necessarily produce pulses, tremors, and ruptures at the surface, according to the number and diversity of the cavities, and the quantity and activity of the inflammable matter. This hypothesis they illustrated by a variety of experiments, such as mixtures of iron filings and brimstone buried in the earth, gun-powder confined in pits, &c., by all which a shaking of the earth will be produced. Dr. Woodward suggests another hypothesis. He supposes that the subterraneous heat or fire, which is continually elevating water out of the abyss, which, according to him, occupies the centre of the earth, to furnish rain, dew, springs, and rivers, may be stopped in some particular part. When this obstruction happens, the heat causes a great swelling and commotion in the waters of the abyss; and at the same time, making the like effort against the superincumbent earth, that agitation and concussion of it is occasioned which we call an earthquake. M. Amontons, supposing the atmosphere to be about forty-five miles high, and that the density of the air increases in proportion to the absolute height of the superincumbent column of fluid,

shows that, at the depth of 43,528 fathoms below the surface of the earth, air is but one-fourth lighter than mercury. Now this depth of 43,528 fathoms is only a seventy-fourth part of the semi-diameter of the earth; and the vast sphere beyond this depth, in diameter 6,451,538 fathoms, may probably be only filled with air; which will be here greatly condensed, and much heavier than the heaviest bodies we know in nature. But it is found by experiment, that the more air is compressed, the more does the same degree of heat increase its spring, and the more capable does it render it of a violent effect; and that, for instance, the degree of heat of boiling water increases the spring of the air above what it has in its natural state, in our climate, by a quantity equal to a third of the weight wherewith it is pressed. Whence we may conclude, that a degree of heat, which on the surface of the earth will only have a moderate effect, may be capable of a very violent one below. And, as we are certain that there are in nature degrees of heat much greater than that of boiling water, it is possible there may be some whose violence, further increased by the immense weight of the air, may be sufficient to break and overturn this solid orb of 43,528 fathoms; whose weight, compared to that of the included air, would be but a trifle.

In March, 1749, an earthquake was felt at London and several other places in Britain. Dr. Stukely, who had been much engaged in electrical experiments, began to suspect that phenomena of this kind ought to be attributed not to vapors or fermentations generated in the bowels of the earth, but to electricity. In a paper published by him on this subject, he rejects all the above hypotheses for the following reasons:—1. That there is no evidence of any remarkable cavernous structure of the earth; but that, on the contrary, there is reason to presume that it is in a great measure solid, so as to leave little room for internal changes and fermentations within its substance; nor do coal-pits, when on fire, ever produce any thing resembling an earthquake. 2. In the earthquake at London, in March 1749, there was no such thing as fire, vapor, smoke, smell, or an eruption of any kind observed, though the shock affected a circuit of fifty miles in diameter. This consideration alone, of the extent of surface shaken by an earthquake, he thought sufficient to overthrow the supposition of its being owing to the expansion of any subterraneous vapors. For, as small fire-balls bursting in the air propagate a sulphureous smell to the distance of several miles, it cannot be supposed that so immense a force, acting instantaneously on that compass of ground, should never break the surface of it, nor become discoverable either to the sight or the smell; besides that such a fermentation would require a long time. That such an effect, therefore, should be produced instantaneously, can be accounted for by electricity only, which acknowledges no sensible transition of time, nor any bounds. 3. If vapors and subterraneous fermentations, explosions, and eruptions, were the cause of earthquakes, they would absolutely ruin the whole system of springs and fountains,

wherever they had once been; which is contrary to fact, even when they have been frequently repeated. In the earthquake in Asia Minor, A. D. 17, which destroyed thirteen great cities, and shook a mass of earth 300 miles in diameter, nothing suffered but the cities; neither the springs nor the face of the country being injured. 4. That any subterraneous power, sufficient to move thirty miles in diameter, must be lodged at least fifteen or twenty miles below the surface; and therefore must move an inverted cone of solid earth, the base of which is thirty miles in diameter, and the axis fifteen or twenty; an effect impossible to any natural power whatever, except electricity. So in Asia Minor, such a cone must have been 300 miles in the diameter of the base, and 200 in the axis: which not all the gun-powder that has been made since the invention of it, much less any vapors generated so far below the surface, could possibly effect. 5. A subterraneous explosion will not account for the manner in which ships, far from land, and even fish, are affected during an earthquake. A subterraneous explosion would only produce a gradual swell, and not give so quick an impulse to the water as would make it feel like a stone. From these circumstances the Doctor concluded, that an earthquake was a shock of the same kind as those in electrical experiments. And this hypothesis was confirmed by the phenomena attending earthquakes, particularly those in 1749 and 1750, which gave rise to this publication. The weather, for five or six months before, had been uncommonly warm; the wind south and south-west, without rain; so that the earth must have been in a state peculiarly ready for an electrical shock. Before the earthquake at London, all vegetables had been uncommonly forward; and electricity is well known to quicken vegetation. The aurora borealis had been frequent about that time; and, just before the earthquake, had been twice repeated in such colors as had never been seen before. It had also removed southerly, contrary to what is common in England; so that the Italians, and those among whom earthquakes were frequent, actually foretold the earthquake. The year had been remarkable for fire-balls, lightning, and coruscations; and these are meteors of an electrical nature. In such circumstances, nothing, he says, is wanting to produce an earthquake, but the presence of some non-electric body; which must be had ab extra from the atmosphere. Hence he infers, that if a non-electric cloud discharge its contents upon any part of the earth, in that highly electrical state, an earthquake must necessarily ensue. As the discharge from an excited tube produces a commotion in the human body, so the discharge of electric matter from many miles of solid earth must needs be an earthquake; and the snap from the contact, the horrid uncouth noise attending it. Dr. Stukely had been informed, that, a little before the earthquake, a large and black cloud suddenly covered the atmosphere, which probably occasioned the shock by the discharge of a shower. A sound was observed to roll from the Thames towards Temple-Bar before the houses ceased to nod, just as the electrical snap precedes the shock. This noise (which generally precedes

earthquakes) he thought could be accounted for only on electrical principles; for, in a subterraneous eruption, the direct contrary would happen. The flames and sulphureous smells, which are sometimes observed in earthquakes, might, he thought, be more easily accounted for on the supposition of their being electrical phenomena, than from their being occasioned by eruptions from the bowels of the earth. So also the suddenness of the concussion, felt at the same instant over such a large surface, and the little damage also which earthquakes generally occasion, sufficiently point out what sort of motion it is; not a convulsion of the bowels of the earth, but a uniform vibration along its surface, like that of a musical string, or a glass, when rubbed on the edge with one's finger. The circumstance of earthquakes chiefly affecting the sea-coast, places along rivers, &c., is a further argument of their being electrical phenomena. This is illustrated by a particular account of the direction in which the earthquake was conveyed. The last argument he uses is taken from the effects which it had on persons of weak constitutions, who were, for a day or two after it happened, troubled with pains in the back, rheumatisms, hysterics, and nervous disorders; just in the same manner as they would have been after an actual electrification: to some, these disorders proved fatal. The same hypothesis was advanced by Signior Beccaria, without knowing any thing of Dr. Stukely's discoveries.

Dr. Priestley, in his History of Electricity, observes, upon these theories, that a more probable hypothesis may be formed out of them both. 'Suppose,' says he, 'the electric matter to be accumulated in one part of the surface of the earth, and on account of the dryness of the season not easily to diffuse itself; it may force its way into the higher regions of the air, forming clouds in its passage out of the vapors which float in the atmosphere, and occasion a sudden shower, which may further promote the passage of the fluid. The whole surface, thus unloaded, will receive a concussion, like any other conducting substance, on parting with, or receiving, a quantity of the electric fluid. The rushing noise will likewise sweep over the whole extent of the country. And upon this supposition also the fluid, in its discharge from the country, will naturally follow the course of the rivers, and also take the advantage of any eminences to facilitate its ascent into the higher regions of the air.' The Dr., making experiments with a battery on the passage of the electrical fluid over different conducting substances, and, among these, over water,—and remarking a resemblance between its passage over the surface of the water, and that which Dr. Stukely supposed to sweep the surface of the earth, when a considerable quantity of it is discharged to the clouds during an earthquake,—immediately suspected that the water over which it passed, and which was visibly thrown into a tremulous motion, must receive a concussion resembling that which is given to the waves of the sea on such occasions. To try this, he himself, and others present, put their hands into the water at the time that the electric flash passed over its surface; and they felt a sudden

concussion given to them, exactly like that which affects ships at sea during an earthquake. This percussion was felt in various parts of the water, but was strongest near the place where the explosion was made. 'This similarity in the effect,' he says, 'is a considerable evidence of a similarity in the cause. Pleased with this resemblance of the earthquake, I endeavoured to imitate that great natural phenomenon in other respects: and, it being frosty weather, I took a plate of ice, and placed two sticks about three inches high on their ends, so that they would just stand with ease; and upon another part of the ice I placed a bottle, from the cork of which was suspended a brass ball with a fine thread. Then, making the electrical flash pass over the surface of the ice, which it did with a very loud report, the nearer pillar fell down, while the more remote stood; and the ball which had hung nearly still, immediately began to make vibrations about an inch in length, and nearly in a right line from the place of the flash. I afterwards diversified this apparatus, erecting more pillars, and suspending more pendulums, &c.; sometimes upon bladders stretched on the mouth of open vessels, and at other times on wet boards swimming in a vessel of water. This last method seemed to answer the best of any; for the board representing the earth, and the water the sea, the phenomena of them both during an earthquake may be imitated at the same time; pillars, &c., being erected on the board, and the electric flash being made to pass either over the board, over the water, or over them both.' The last three hypotheses, though somewhat differing, yet agree in the main; but, if a particular solution of the phenomena is required, every one of them will be found deficient: nor does the theory of this subject appear to have been sufficiently understood to be worth pursuing much further; we only therefore add that the late Dr. Mason Goode attempts to account for the phenomena of earthquakes by the old theory of subterraneous fires.

That fires to an enormous extent, and produced by various causes, may exist at different depths beneath the surface of the earth, must, he thinks, be clear to every one who has attentively considered the subject: and he quotes a curious series of experiments, lately conducted by Sir James Hall, to prove that where the substances in which such fires occur lie profound, and are surmounted by a very deep and heavy superincumbent pressure; and, more especially, where they, at the same time, contain large portions of elastic gases; the effects of such fires will be prodigiously greater, and more diversified, than where these circumstances are absent.

Earthquakes and volcanoes may be reckoned, for the most part, as this writer supposes, among the most powerful and extraordinary of these effects; and, as resulting from those chemical changes which the agency of fire principally produces in the interior of the solid crust of the globe. They have, probably, little further connexion with electricity, he says, than as cause: that occasionally destroy the equilibrium; for although some authors have inferred, from the great velocity with which the shock of an earthquake is transmitted from place to place, that it

nature must be electrical; yet others have, with greater probability, attributed the rapid succession of the effects to the operation of a single cause, acting like subterranean heat, at a great distance below the earth's surface. There are, however, some circumstances which indicate such a connexion between the state of the atmosphere and the approach of an earthquake, as cannot easily be explained by any hypothesis. The shocks of earthquakes, and the eruptions of volcanoes, continues Dr. G., are in all probability modifications of the effects of one common cause; the same countries are liable to both of them; and, where the agitation produced by an earthquake extends farther than there is any reason to suspect a subterraneous commotion, it is probably propagated through the earth nearly in the same manner as a noise is conveyed through the air. See VOLCANO.

EARWAX. See ANATOMY.

EARWIG, in zoology. See FORFICULA.

EASDALE, a small island of the Hebrides, annexed to Argyleshire, about one mile and a half in diameter. It is famous for having afforded a great quantity of slate (*ardesia tegularis*). This, indeed, occupies the whole island, which is also traversed in many places with basaltic veins, and thin layers of quartzose and calcareous stones.

EASE, <i>n. s. & v. a.</i>	Sax. eath; Goth. <i>azek</i> ; Fr. <i>aise</i> ; Ital. <i>agio</i> , which Menage derives from Lat. <i>otium</i> , becoming <i>ocium</i> , <i>ogium</i> , <i>ogeo</i> . Quiet; rest; tranquility; peace; re- pose; freedom from pain, disturbance, labor, or en- gagement. The verb seems to be derived from the noun, and means to relieve, deliver, or rescue from trouble, disturbance, burden, or pain; or to alleviate, soothe, or assuage pain or trouble. Easeful and easy are peaceful; tranquil. Ease- less, the opposite of this. Easement is relief; assistance; support; and in law, a service that one neighbour has of another by charter or pre- scription, without profit; as a way through his ground, a sink, &c.
EASEFUL, <i>adj.</i>	
EASELESS, <i>adj.</i>	
EASE-LOVING,	
EASEMENT, <i>n. s.</i>	
EA'SY, <i>adj.</i>	
EA'SILY, <i>adv.</i>	
EA'SINESS, <i>n. s.</i>	

I see ye to you that to Sodom it schal be *esier* than to that cytee in that day. *Wiclif. Luk. 10.*

I will *ease* me of mine adversaries. *Isaiah i. 24.*

The chambers and the stablis werin wide,
 And well we werin *esid* at the best. *Chaucer.*

She sodeynly enhaunceth them aloft.
 And sodeynly mischeueth all the flokke.
 The head that late lay *easily* and full soft.
 In stede of pylows lyeth after on the blokke.
Sir T. More.

The service of God, in the solemn assembly of saints, is a work, though *easy*, yet withal very weighty, and of great respect. *Hooker.*

Since the custom of *easiness* to alter and change laws is so evil, no doubt but to bear a tolerable sore is better than to venture on a dangerous remedy. *Id.*

Complain, queen Margaret, and tell thy grief;
 It shall be *eased*, if France can yield relief.
Shakspeare.

I spy a black, suspicious, threatening cloud,
 That will encounter with our glorious sun,
 Ere he attain his *easeful* western bed.
Id. Henry VI.

You may sooner, by imagination, quicken or slack a motion, than raise or cease it; as it is *easier* to make a dog go slower, than to make him stand still. *Bacon.*

Sounds move swiftly, and at great distance; but they require a medium well disposed, and their transmission is *easily* stopped. *Id. Natural History.*

We should not find her half so brave and bold
 To lead it to the wars and to the seas;

To make it suffer watchings, hunger, cold,
 When it might feed with plenty, rest with *ease*.
Davies.

Send me some tokens that my hope may live,
 Or that my *easeless* thoughts may sleep and rest.
Donne.

Believe me, friends, loud tumults are not laid
 With half the *easiness* that they are raised.
Ben Jonson.

Old friends are best. King James used to call for his old shoes; they were *easiest* for his feet. *Selden.*

Bold adventure to discover wide
 That dismal world, if any clime perhaps
 Might yield them *easier* habitation. *Milton.*

Baited with reasons not unplaussible,
 Win me into the *easy* hearted man,
 And hug him into snares. *Id.*

An aching head will be no more *eased* by wearing a crown than a common night cap. *Sir W. Temple.*

Is it not to bid defiance to all mankind to condemn their universal opinions and designs, if, instead of passing your life as well and *easily*, you resolve to pass it as ill and as miserable as you can? *Id.*

Is it a small crime to wound himself by anguish of heart, to deprive himself of all the pleasures, or *eases*, or enjoyments of life? *Id.*

That which we call *ease* is only an indolency, or a freedom from pain. *L'Estrange.*

If ere night the gathering clouds we fear,
 A song will help the beating storm to bear;
 And that thou mayest not be too late abroad,
 Sing, and I'll *ease* thy shoulders of thy load.
Dryden.

As if with sports my sufferings I could *ease*. *Id.*

The seeming *easiness* of Pindarick verse has made it spread; but it has not been considered. *Id.*

The priest on skins of offering takes his *ease*,
 And nightly visions in his slumber sees. *Id. Æneid.*

With such deceits he gained their *easy* hearts,
 Too prone to credit his perfidious arts. *Id.*

Lucan, content with praise, may lie at *ease*
 In costly grots and marble palaces. *Id. Juvenal.*

Help and *ease* children the best you can; but by no means bemoan them. *Locke.*

No body feels pain that he wishes not to be *eased* of, with a desire equal to that pain, and inseparable from it. *Id.*

The safest way to secure honesty, is to lay the foundations of it early in liberality, and an *easiness* to part with to others whatever they have or like themselves. *Id.*

Keep your thoughts *easy* and free, the only temper wherein the mind is capable of receiving new informations. *Id.*

I think the reason I have assigned hath a great interest in that rest and *easiness* we enjoy when asleep. *Ray.*

Give to him, and he shall but laugh at your *easiness*; save his life, but, when you have done, look to your own. *South.*

Abstruse and mystick thoughts you must express
 With painful care, but seeming *easiness*;
 For truth shines brightest through the plainest dress.
Roxcommon.

Business and difficulty are relative terms, and relate to some power; and a thing may be difficult to a weak man, which yet may be easy to the same person, when assisted with a greater strength. *Tillotson.*

We plainly feel whether at this instant we are *easy* or uneasy, happy or miserable. *Smalridge.*

Will he for sacrifice our sorrows ease?

And can our tears reverse his firm decrees? *Prior.*

Not soon provoked, she *easily* forgives;

And much she suffers, as she much believes. *Id.*

A marriage of love is pleasant; a marriage of interest *easy*; and a marriage where both meet—happy. *Addison's Spectator.*

When men are *easy* in their circumstances, they are naturally enemies to innovations. *Id. Freeh.*

Though he speaks of such medicines as procure sleep, and *ease* pain, he doth not determine their doses. *Arbutnot.*

True *ease* in writing comes from art, not chance; As those move *easiest* who have learned to dance. *Pope.*

Praise the *easy* vigour of a line,
Where Denham's strength and Waller's sweetness join. *Id.*

This plea, under a colour of friendship to religion, invites men to it by the *easiness* of the terms it offers. *Rogers.*

Give yourselves *ease* from the fatigue of waiting. *Swift.*

He has the advantage of a free lodging, and some other *easements*. *Id.*

They should be allowed each of them such a rent as would make them *easy*. *Id.*

Men make resolves, and pass into decrees,
The motions of the mind! with how much *ease*
In such resolves, doth passion make a flaw,
And bring to nothing, what was raised to law. *Churchill.*

It is the fate of mankind, too often, to seem insensible of what they may enjoy at the *easiest* rate. *Sterne.*

As men have their particular sins, which do most *easily* beset them, so they have their particular temptations which do most *easily* overcome them. *Mason.*

It is *easier* to suppress the first desire than to satisfy all that follow it. *Franklin.*

His scruples thus silenced, Tom felt more at *ease*,
And went with his comrades the apples to seize;
He blamed and protested, but joined in the plan;
He shared in the plunder, but pitied the man. *Cowper.*

EASEL, among painters, the frame whereon the canvas is laid.

EASEL PIECES are such small pieces, either portraits or landscapes, as are painted on the easel; thus called to distinguish them from larger pictures drawn on walls, ceilings, &c.

EASING, in the sea-language, signifies the slackening a rope or the like. Thus, to ease the bow-line or sheet, is to let them go slacker; to ease the helm, is to let the ship go more large, more before the wind, or more larboard.

EAST, <i>n. s. & adj.</i>	Sax. east; Belg. <i>oost</i> ;
EAST'ERLY, <i>adj.</i>	Swed. and Teut. <i>oest</i> ;
EAST'ERLING, <i>n. s.</i>	Goth. <i>aust, cyst (austa,</i>
EAST'ERN, <i>adj.</i>	to put forth). Mr. Tooke
EAST'LAND,	thinks, from <i>yrst</i> , angry,
EAST'WARD.	enraged, 'those who cannot

not pronounce *r*, usually supplying its place with *a*;' but *ustoth* is Mod. Goth. for the morn, and Gr. *εως*, the dawn, much more probable derivations. Minsheu says, ab Heb. מוֹרָא, à rad'ce יָאֵר, to

come or go forth. An easterling is an inhabitant of the east; eastland, pertaining to that quarter of the world; eastward, in that direction.

He oft in battle vanquished

Those spoilful, rich, and swarming *Easterlings*. *Spenser.*

I would not be the villain that thou thinkest

For the whole space that 's in the tyrant's grasp,

And the rich *East* to boot. *Shakespeare. Macbeth.*

When the *easterly* winds or breezes are kept off by some high mountains from the vallies, whereby the air, wanting motion, doth become exceeding unhealthy. *Raleigh.*

The gorgeous *East*, with richest hand,

Pours on her kings barbarick pearl, and gold. *Milton.*

The' angel caught

Our lingering parents, and to the' *eastern* gate

• Led them direct. *Id.*

The moon, which performs its motion swifter than the sun, gets *eastward* out of his rays, and appears when the sun is set. *Browne's Vulgar Errors.*

What shall we do, or where direct our flight?

Eastward, as far as I could cast my sight,

From opening heavens, I saw descending light. *Dryden.*

These give us a view of the most *easterly*, southerly, and westerly parts of England. *Grant's Bills of Mortality.*

They counting forwards towards the *East*, did allow 180 degrees to the Portugals *eastward*. *Abbot.*

The *eastern* end of the isle rises up in precipices. *Addison.*

Melancholy is a kind of demon that haunts our island, and often conveys herself to us in an *easterly* wind. *Id.*

Like *eastern* kings a lazy state they keep. *Pope.*

Water he chuses clear, light, without taste or smell, drawn from springs with an *easterly* exposition. *Arbutnot.*

Eastern tyrants from the light of heaven

Seclude their bosom slaves. *Thomson.*

Eastern Java there

Kneels with the native of the furthest west;

And *Æthiopia* spreads abroad the hand,

And worships. *Cowper.*

There mildly dimpling, Ocean's cheek

• Reflects the tints of many a peak

Caught by the laughing tides that lave

These Edens of the *eastern* wave. *Byron. Bride of Abydos.*

EAST, one of the four cardinal points of the world; being that point of the horizon where the sun is seen to rise when in the equinoctial. In Italy, and throughout the Mediterranean, the east wind is called the levante: in Greek *ανατολη* and *ανατολης*, because it comes from the side of the sun, *ἀπ' ἡλίου*; in Latin, *eurus*.

EASTER, *n. s.* Sax. *eastre*; Dut. *ooster*; Germ. *ostern*. The day on which the Christian church commemorates our Saviour's resurrection. See below.

Didst thou not fall out with a taylor for wearing his new doublet before *Easter*?

Shakspeare. Romeo and Juliet.

Victor's unbrother-like heat towards the *Eastern* churches, in the controversy about *Easter*, fomented that difference into a schism. *Decay of Piety.*

EASTER is called by the Greeks, *Πάσχα*, and by the Latins *Pascha*, from פֶּסַח, a Hebrew word signifying passage, applied to the Jewish feast of

the passover. It is called Easter in English, from the Saxon goddess Eostre, whose festival was held in April. The Asiatic churches kept their Easter upon the very same day that the Jews observed their passover, and others on the first Sunday after the first full moon in the new year. This controversy was determined in the council of Nice; when it was ordained that Easter should be kept upon one and the same day, which should always be Sunday, in all Christian churches in the world. But though the Christian churches differed as to the time of celebrating Easter, yet they all agreed in showing particular respect and honor to this festival. On this day, prisoners and slaves were set free, and the poor liberally provided for. The eve or vigil of this festival was celebrated with more than ordinary pomp, which continued till midnight, it being a tradition of the church that our Saviour rose a little after midnight; but in the east the vigil lasted till cock-crowing. It was in conformity to the custom of the Jews, in celebrating their passover on the fourteenth day of the first month, that the primitive fathers ordered that the fourteenth day of the moon, from the calendar new moon which immediately follows the 21st of March, at which time the vernal equinox happened upon that day, should be deemed the paschal full moon, and that the Sunday after should be Easter-day; and it is upon this account that the English rubric has appointed it upon the first Sunday after the first full moon immediately following the 21st day of March. Whence it appears that the true time for celebrating Easter, according to the intention of the council of Nice, was to be the first Sunday after the first full moon following the vernal equinox, or when the sun entered into the first point of Aries; and this was pope Gregory's principal design in reforming the calendar, to have Easter celebrated according to the determination of the council of Nice. For finding Easter, see CHRONOLOGY.

EASTER ISLAND, an island in the South Sea, thought to have been first discovered, in 1686, by one Davis an Englishman, who called it Davis's Land. It was next visited by commodore Roggewein, a Dutchman, in 1722, who gave it the name of Easter Island, and published many fabulous accounts concerning the country and its inhabitants. It was also visited by a Spanish ship in 1770, the captain of which gave it the name of St. Carlos. The most authentic account of this island, however, which has appeared, is that of captain Cook and Mr. Forster, who visited it in March 1770. According to them, the island is about ten or twelve leagues in circumference, and of a triangular figure; its greatest length from north-west to south-east is about four leagues, and its greatest breadth two. The hills are so high that they may be seen at the distance of fifteen or sixteen leagues. The north and east points of the island are of a considerable height; between them, on the south-east side, the shore forms an open bay, in which captain Cook thinks the Dutch anchored in 1722. He himself anchored on the west side of the island, three miles north from the south point. This, he says, is a good road with easterly winds, but a dangerous one when the wind blows from the contrary quarter,

as the other on the south-east side must be with easterly winds: so that there is no good accommodation to be had for shipping round the whole island. The island is extremely barren; and bears evident marks not only of a volcanic origin, but of having been not very long ago entirely ruined by an eruption. As they approached the south point, Mr. Forster informs us that they observed broken rocks, whose cavernous appearance, and black and ferruginous color, seemed to indicate that they had been thrown up by subterraneous fire. Two detached rocks lie about a quarter of a mile off this point; one of them is singular on account of its shape, and represents a huge column; and both were inhabited by multitudes of sea-fowls. On landing, and walking into the country, they found the ground covered with rocks and stones of all sizes, which appeared to have been exposed to a great fire, where they seemed to have acquired a black color and porous texture. Several shrivelled species of grasses grew among these stones, and softened the desolate appearance of the country. The farther they advanced, the more ruinous the face of the country seemed to be. The roads were intolerably rugged, and filled with heaps of volcanic stones, among which the Europeans could not make their way but with the greatest difficulty; but the natives leaped from one stone to another with surprising agility and ease. As they went northward along the island, they found the ground still of the same nature; till at last they met with a large rock of black melted lava, which seemed to contain some iron, and on which was neither soil nor grass, nor any mark of vegetation. Notwithstanding this general barrenness, however, there are several large tracts covered with cultivated soil, which produces potatoes of a gold yellow color, as sweet as carrots, plantains, and sugar-canes. The soil is a dry hard clay; and the inhabitants use the grass which grows between the stones in other parts of the island as a manure, and for preserving their vegetables when young from the heat of the sun. The most remarkable curiosity belonging to this island is a number of colossal statues; of which however very few remain entire. These statues are placed only on the sea-coast. On the east side of the island were seen the ruins of three platforms of stone work, on each of which had stood four of these large statues; but they were all fallen down from two of them, and one from the third: they were broken or defaced by the fall. One that had fallen measured fifteen feet in length, and six broad over the shoulders: each statue had on its head a large cylindric stone of a red color, wrought perfectly round. Others were found that measured nearly twenty-seven feet, and upwards of eight feet over the shoulders; and a still larger one was seen standing, the shade of which was sufficient to shelter all the party, consisting of nearly fifty persons, from the heat of the sun. The workmanship is rude, but not bad, nor are the features of the face ill formed; the ears are long, according to the distortion practised in the country, and the bodies have hardly any thing of a human figure about them. The water of this island is in general brackish, there being only one well perfectly fresh, which is towards the east.

The people are of a brown color and middle size. In general they are rather thin; go entirely naked; and have punctures on their bodies, a custom common to all the inhabitants of the South Sea Islands. Their greatest singularity is the size of their ears, the lobe of which is so stretched out that it almost rests on their shoulder; and is pierced with a very large hole, capable of admitting four or five fingers with ease. The chief ornaments for their ears are the white down of feathers, and rings made of the leaf of the sugar-cane, which is very elastic, and for this purpose is rolled up like a watch-spring. Some were seen clothed in the same cloth used in Otaheite, tinged of a bright orange color with turmeric. But the most surprising circumstance with regard to these people, is the apparent scarcity of women among them. The nicest calculation that could be made never brought the number of inhabitants in this island to be above 700, and of these the females bore no proportion in number to the males. Either they have but few females, or else their women were restrained from appearing during the stay of the ship. Those who appeared were of a very loose description. The dwellings of the natives are in general low miserable huts, very small, and scarcely capable of containing ten persons; but there are some of capacious size, constructed in the form of an inverted canoe, fifty or sixty feet long, and ten or twelve broad, with several entrances on one side; scarcely any of these exceed three feet in height or width. In addition they have also a kind of subterraneous dwellings. Their canoes are few, and none capable of carrying above four men: in swimming off to vessels, they support themselves on a matting of sugar-canes, neatly covered with rushes, four feet and a half long by fifteen inches broad. The workmanship is tolerably well executed. Voyagers have found them accomplished thieves. Fish are not plentiful on the coast; land and sea birds are far from numerous; the seal is the only quadruped that has been seen here. Easter Island is thirty-six miles in circumference. Long. $103^{\circ} 46'$ W., lat. $27^{\circ} 5'$ S.

EAST MAIN, that part of Labrador, or New Britain, which extends eastward of James's Bay.

EAST MAIN RIVER, a river of Canada, also called Slude, which enters James's Bay, in lat. $52^{\circ} 8'$ N., long. $78^{\circ} 45'$ W.

EAST INDIA COMPANY. See **INDIA**.

EASTON, a town of the United States, in Maryland, the capital of Talbot county, formerly named Talbot Court-House. It is seated on the east side of Chesapeake Bay, near the branches of the river Treadhaven, twelve miles above its confluence with the Choptank; five miles south by west of Williamsburgh; fifty south-east by south of Baltimore, and 118 south-west of Philadelphia.

EASTON, or **EASTOWN**, a township of Massachusetts, in Bristol county, famous for its manufactures in iron and steel, and a manufacture of linseed oil. Easton is seated near the head of the river Raynham, six miles north-west of the town so named, and twelve west of Bridgewater. Also a township of New York, in Washington county; and a town of Pennsylvania, the capital of Northampton county, seated at the mouth of

the Lehigh, on the west side of the Delaware. Twelve miles north-east of Bethlehem, and seventy north of Philadelphia.

EAST RIVER, a river, or channel, of North America, between Long Island and New York Island, and between the state of Connecticut and Long Island. It is often called Long Island Sound. 2. A river of West Florida, which runs into Pensacola Bay, in long. $86^{\circ} 50'$ W., lat. $30^{\circ} 34'$ N. 3. A river of America, which runs into the West River, in the province of Maine, long. $67^{\circ} 20'$ W., lat. $44^{\circ} 48'$ N.

EAT, *v. a.* & *v. n.*

EATABLE, *adj.* & *n. s.*

EATER, *n. s.*

EATING,

EATING-HOUSE.

Sax. *cetan*; Belg. *cetan*; Goth. *etan*, or *ilan*; Sw. *eta*; Erse. *eta*; Lat. *edere*; Gr. *ediv*. To take food; masticate and swallow food; devour: hence, generally, to gnaw; consume; wear or waste away; corrode. Eatable means that may be, or any thing that is, eaten.

And alle *ecten* the same spiritual mete, and alle drunken the same spiritual dryak, thei drunken of the same spyritual stoon folewynghe hem, and that stoon was Crist.

Locusts shall *eat* the residue of that which is escaped from the hail, and shall *eat* every tree which groweth.

Exodus x. 4.

The righteous *eateth* to the satisfying of his soul, but the belly of the wicked shall want.

Prov. xiii. 25.

And will not sufferen hem by non assent,

Neither to ben yberied ne ybrent,

But maketh boundes *ete* hem in despyte.

Chaucer. Cant. Tales.

And as of old time God decreed his wondrous benefites of the deliverance of his people, to be kept in memory by the *eating* of the passover, with his rites and ceremonies.

Homilies of the Church.

Thou art past the tyrant's stroke;

Care no more to cloath and eat.

Shakespeare. Cymbeline.

Thou best of gold art worst of gold;

Other less fine in carat is more precious,

Preserving life in medicine potable:

But thou, most fine, most hallowed, most renowned,

Hast eat thy bearer up. *Id. Henry IV.*

• A knave, a rascal, an *eater* of broken meats. *Id.*

The difference between a rich man and a poor man is this—the former *eats* when he pleases, and the latter when he can get it. *Sir W. Raleigh.*

Other states cannot be accused for not staying for the first blow, or for not accepting Polyphemus's courtesy, to be the last that shall be *eaten* up.

Bacon's War with Spain.

The Caribees and the cannibal, almost all, are *eater*: of flesh. *Abbot's Description of the World.*

They cannot hold, but burst out those words which afterwards they are forced to eat.

Hakewill. On Providence.

As if the lotus grew only here, the virtue of whose fruit is to cause the *eaters* an oblivion of all others oils.

Howell.

As riches increase, says Solomon, so do the mouth that devour them. The master's mouth has no more than before. The owner, methinks, is like Oenus in the fable, who is perpetually winding a rope of hay and an ass at the end perpetually *eating* it. *Cowley.*

If the taste of this fruit maketh the *eaters* like gods why remainest thou a beast?

Browne's Vulgar Errors.

Eating cares,

Lydian airs,

Milton.

Credit were not to be lost
By a brave knight-errant of the post,
That *eats*, perfidiously, his word,
And swears his ears through a two inch board.
Hudibras.

They entail a secret curse upon their estates, which
does either insensibly waste and consume, or *eat* out
the heart and comfort of it.
Tillotson.

An hungry traveller stept into an *eating-house* for
his dinner.
L' Etrange.

If you all sorts of persons would engage,
Suit well your *eatables* to every age.

King's Art of Cookery.

EATH, *adj. & adv.* Sax. *eað*. Easy; not
difficult. An old word.

EATON, or **ETON**, a town of England, in
Buckinghamshire. See **ETON**.

EATAW, a small river of South Carolina,
which runs into the Santee. Near the source
of this river, in 1781, a battle was fought between
the British, under colonel Stuart, and the Amer-
icans under general Greene; in which the former
had 500 men killed and wounded; both sides
claiming the victory.

EAU DE COLOGNE, or water of Cologne,
a fragrant water, made originally, and in most
perfection, in Cologne. Formerly many won-
derful powers were ascribed to this water, but it
was probably never so much in demand as at
present, in Europe and America, and number-
less recipes have been given for its manufacture.
It was invented by a person named Farina, in
whose family the secret, as they say, continues to
be preserved, since chemistry has not been able,
as yet, to give the analysis of it. It is imitated,
however, every where. The consumption of this
perfume has increased much ever since the seven
years' war; and there exist, at present, fifteen
manufactories of it in Cologne, which produce
several millions of bottles yearly; much, also, is
manufactured at Paris, in Saxony, and other
places. One of the many recipes to make *eau*
de Cologne is the following:—

Alcohol, or spirit of wine, at 30°, two pints.

Oleum neroli

- de cedro
- de cedrat
- cort aurant 24 drops.
- citri
- bergamot
- rosmarin

Seed of small cardamum, two drachms.

Distil it in the Mary-bath, until three-fourths of
the alcohol have evaporated.

EAU DE LUCE, a fragrant alkaline liquor which
was some years ago in great repute. We are told
by Mr. Nicholson, in his Journal, that, having
learned from a philosophical friend that the com-
mon recipes for making this compound did not
succeed, and that the use of mastic in it had
hitherto been kept a secret, he made the follow-
ing experiments to procure a good *eau de luce*.
‘One dram of the rectified oil of amber was
dissolved in four ounces of the strongest ardent
spirit of the shops; its specific gravity being .840
at 60° of Fahrenheit. A portion of the clear
spirit was poured upon a larger quantity of
fine powdered mastic than it was judged could
be taken up. This was occasionally agitated

without heat; by which means the gum resin was
for the most part gradually dissolved. One part
of the oily solution was poured into a phial, and
to this was added one part of the solution of
mastic. No opacity or other change appeared.
Four parts of strong caustic volatile alkali were
then poured in and immediately shaken. The
fluid was of a dense opaque white color, afford-
ing a slight ruddy tinge when the light was seen
through a thin portion of it. In a second mix-
ture, four parts of the alkali were added to one
of the solution of mastic; it appeared of a less
dense and more yellowish white than the former
mixture. More of the gum resinous solution
was then poured in; but it still appeared less
opaque than that mixture. It was ruddy by
transmitted light. The last experiment was
repeated with the oily solution instead of that of
mastic. The white was much less dense than
either of the foregoing compounds, and the requi-
site opacity was not given by augmenting the
dose of the oily solution. No ruddiness nor other
remarkable appearance was seen by transmitted
light. These mixtures were left at repose for
two days; no separation appeared in either of
the compounds containing mastic; the com-
pound, consisting of the oily solution and alkali,
became paler by the separation of a cream at the
top.’ In a subsequent number of the same work
we find the following recipe by one of the
author's correspondents, who had frequently
proved its value by experience. ‘Digest ten or
twelve grains of the whitest pieces of mastic,
selected for this purpose and powdered, in two
ounces of alcohol; and, when nearly dissolved,
add twenty grains of elemi. When both the
resins are dissolved, add ten or fifteen drops of
essence of bergamot: shake the whole well
together, and let the faeces subside. The solu-
tion will be of a pale amber color. It is to be
added in very small portions to the best aqua
ammoniac pure, until it assumes a milky white-
ness, shaking the phial well after each addition,
as directed by Macquer. The strength and
causticity of the ammoniac are of essential con-
sequence. If, upon the addition of the first
drop or two of the tincture, a dense opaque
coagulated precipitate is formed, not much
unlike that which appears on dropping a solu-
tion of silver into water slightly impregnated
with common salt, it is too strong, and must be
diluted with alcohol. A considerable proportion
of the tincture, perhaps one to four, ought to be
employed to give the liquor the proper degree
of opacity.’

EAVES, *n. s. plur.* } Sax. *efese*, or *epese*;
EAVES'DROP, *v. n.* } the descents or descend-
EAVES'DROPPER, *n. s.* } ing parts of a thing:
old Fr. *aive*, *eve*, was also water. The edges of
a roof; and, colloquially, the water that drops
from them. To *eavesdrop* is likewise to catch
what comes from the eaves, or to listen under
windows.

Under our tents I'll play the *eavesdropper*,
To hear if any mean to shrink from me.

Shakespeare.

His tears run down his beard like winter drops
From *eaves* of reeds. *Id. Tempest*

Every night he comes
With music of all sorts, and songs composed
To her unworthiness : it nothing stands us
To chide him from our eaves ; for he persists,
As if his life lay on't.

Id. All's Well that Ends Well.

If in the beginning of winter the drops of the eaves
of houses come more slowly down than they use, it
portendeth a hard and frosty winter. *Bacon.*

Ushered with a shower still,
When the gust hath blown his fill,
Ending on the rustling leaves
With minute drops from off the eaves. *Milton.*

The icicles hang down from the eaves of houses.
Woodward.

EAVES DROPPERS are called evil members of
the commonwealth, in the stat. of West. 1. c. 33.
They may be punished either in the court-leet
by way of presentment and fine, or in the quarter-
sessions by indictment and binding to good
behaviour.

EBAL, in ancient geography, a mountain of
Samaria, near Shechem. Between it and Geri-
zim on the south side of it, there is a valley of
200 paces. On Ebal and Gerizim (the former
extremely bare and barren, and the latter
extremely verdant and fertile), the Hebrews
were ranked, six tribes on each, who echoed
Amen to the blessings and curses pronounced
by the priests in the intervening valley. Deut.
xxvii, xxviii. Josh. viii. 30, &c.

EBB, *n. s. & v. n.* } Belg. *ebbe*; Sax. *ebba*;
EBB'ING, *n. s.* } Swed. *ebb*; Fr. *ebe*, de-
scent. The reflux of the tide; and as a verb to
flow back, as the tide toward the sea. Hence,
metaphorically, decline; decay; deterioration:
and to fall off; decline; or waste away.

Thou pinchist at my mutabilitie,
For I the lent a droppe of my richesse,
And now me likith to withdrawin me,
Why shouldist thou my roialtie oppresse?
The so maie *ebbe* and flowin more and lesse,
The welkin hath might to shine, rain, and haile.

Chaucer.

You have finished all the war, and brought all
things to that low *ebb* which you speak of.

Spenser on Ireland.

Though my tide of blood
Hath proudly flowed in vanity till now,
Now it doth turn and *ebb* back to the sea.

Shakespeare.

This tide of man's life, after it once turneth and
declineth, ever runneth with a perpetual *ebb* and fall-
ing stream, but never floweth again.

Raleigh's History.

Since such Love's natural station is, may still
My love descend, and journeying down the hill;
Not panting after growing beauties; so
I shall *ebb* on with them who homeward go.

Donne.

The clear sun on his wide watery glass
Gazed hot, and of the fresh wave largely drew,
As after thirst; which made their flowing shrink
From standing lake to tripping *ebb*, that stole
With soft foot towards the deep.

Milton.

Then with so swift an *ebb* the flood drove backward,
It slipt from underneath the scaly herd.

Dryden's All for Love.

From thence the tide of fortune left their shore,
And *ebb'd* much faster than it flowed before.

Id. Æneid.

Thus all the treasure of our flowing years,
Our *ebb* of life for ever takes away. *Roscommon.*

But oh, he *ebbe*! the smiling waves decay!
For ever lovely stream, for ever stay! *Halifax.*

Hither the seas at stated times resort,
And shove the loaden vessels into port;
Then with a gentle *ebb* retire again,
And render back their cargo to the main.

Addison on Italy.

What is it he aspires to?

Is it not this? To shed the slow remains,
His last poor *ebb* of blood in your defence.

Id. Cato.

I do not think a philosopher obliged to account for
every phenomenon in nature, or drown himself with
Aristotle for not being able to solve the *ebbing* and
flowing of the tide. *Swift.*

Games of chance are traps to catch school boy
nooses and gaping country squires, who begin with a
guinea, and end with a mortgage; whilst the old
stagers in the game keep their passions in check,
watch the *ebb* and flow of fortune, till the booby they
are pillaging sees his acres melt at every cast.

Cumberland.

EBBSFLEET, anciently Wyppedsfleet, a
hamlet of the Isle of Thanet, Kent, at the mouth
of the river Stour, where the Saxons landed in
447 under Hengist and Horsa. In 463 a cele-
brated battle was fought in this vicinity between
the Britons and Saxons, when the former were
defeated. The Saxon leader Wypped, who is
said to have fallen on this occasion, gave name to
this hamlet.

EBENEZER, (Heb. the stone of help), the
name of a field where the Philistines defeated
the Hebrews, and seized on the sacred ark; and
where afterwards, at Samuel's request, God dis-
comfited the Philistines with thunder and hail,
and gave the Hebrews a noted deliverance. On
this occasion Samuel set up a stone, and gave it
this designation, to mark that the Lord had
helped them; and from it the whole field adja-
cent received its name. It is said to have been
about forty miles south-west of Shiloh. 1 Sam.
iv. 1., and vii. 12.

EBENEZER, a town of the United States, in
Georgia, the capital of Effingham county, seated
on the south-west bank of Savannah River.
Twenty-five miles N.N.W. of Savannah, seventy-
five south-east of Louisville, and 860 south-west
of Philadelphia.

EBENUS, the ebony tree. See AMERIMNUM.

EBERSBERG, a town of Upper Austria,
situated on the river, and in the circle of the
Traun, which is here divided into many branches,
and crossed by a bridge of great length. Here
is a castle said to have been built in the year
900; and in the neighbourhood was fought a
severe action between the Austrians and French
in May, 1809. It is eight miles north-west of
Ens.

EBERSDORF, a small town of Lower Aus-
tria, on the right bank of the Danube, where
Bonaparte had his head-quarters previous to the
battle of Aspern in May, 1809. Inhabitants
1165. Eight miles E.S.E. of Vienna.

EBERSTHAL, or EBERSTAL, a town of Ger-
many, in the circle of the Lower Rhine, and
electorate of Mentz, two miles south of Krau-
theim; but on which side of the Rhine, and

consequently whether annexed to the French republic or not, we cannot discover, as neither of these towns is to be found in the maps.

EBION, the author of the heresy of the Ebionites, was a disciple of Cerinthus and his successor. To the errors of his master, he had added new opinions of his own. He began his preaching in Judea; he taught in Asia, and even at Rome. His tenets infected the Isle of Cyprus. St. John opposed both Cerinthus and Ebion in Asia; and it is thought that he wrote his gospel, in the year 97, particularly against this heresy.

EBIONITES, ancient heretics, who rose in the very first age of the church, and formed themselves into a sect in the second century, denying the divinity of Jesus Christ. Epiphanius gives a long and exact account of the origin of the Ebionites, making them to have risen after the destruction of Jerusalem, when the first Christians, called Nazarenes, went out of it to live at Pella. The Ebionites seem to have been a branch of Nazarenes: Origin distinguishes two kinds of Ebionites; the one believing that Jesus Christ was born of a virgin, and the other that he was born after the manner of other men. The first were orthodox in every thing, except that to the Christian doctrine they joined the ceremonies of the Jewish law, with the Jews, Samaritans, and Nazarenes; together with the traditions of the Pharisees. They differed from the Nazarenes, chiefly as to what regards the authority of the sacred writings; for the Nazarenes received all for scripture contained in the Jewish canon; whereas the Ebionites rejected all the prophets, and all St. Paul's epistles. They received nothing of the Old Testament but the Pentateuch; which should intimate them to have descended rather from the Samaritans than from the Jews. They agreed with the Nazarenes in using the Hebrew gospel of St. Matthew, otherwise called the Gospel of the Twelve Apostles; but they had corrupted their copy in many places; and, particularly, had left out the genealogy of our Saviour, which was preserved entire in that of the Nazarenes, and even in those used by the Cerinthians. Some, however, have made this gospel canonical, and of greater value than our present Greek gospel of St. Matthew: See NAZARENES. Besides the Hebrew gospel of St. Matthew, the Ebionites had adopted several other books, under the names of St. James, John, and the other apostles: they also made use of the Travels of St. Peter, which are supposed to have been written by St. Clement.

EBON, *n. s.* } Also formerly written EBEN.
EBONY, } *Lat. ebenus*; *Fr. ebene*, of Gr. *εβενος*, ab Heb. *הבן*, Minshew. A particularly hard, black, and heavy wood: hence any thing remarkably black or dark.

If the wood be very hard, as *ebony*, or *lignum vitæ*, they are to turn, they use not the same tools they do for soft woods. *Moxon's Mech. Exer.*

Oft by the winds extinct the signal lies,

Ere night has half rolled round her *ebon* throne.

Guy.

And now the sorceress bares her shrivelled hand,
And circles thrice in air her *ebon* wand;

Flushed with new life descending statues talk,
The pliant marble softening as they walk. *Darwin.*
There was no want of lofty mirrors, and
The tables most of *ebony* inlaid
With mother-of-pearl or ivory, stood at hand,
Or were of tortoise-shell or rare woods made.

EBONY. There are divers kinds of ebony: the most usual among us are black, red, and green, but authors and travellers give very different accounts of the tree that yields this valuable wood. The real tree, however, from which it is obtained is the *AMERIMNUM EBENUS* of the West Indies, which see. Black ebony is much preferred to that of other colors. The best is a jet black, free of veins and rind, very massive, astringent, and of an acrid pungent taste. Its rind, infused in water, is said to purge pituita, and cure venereal disorders; whence Matthiolus took guaiacum for a sort of ebony. It yields an agreeable perfume when laid on burning coals: when green, it readily takes fire from the abundance of its oil. The Indians make statues of their gods, and sceptres for their princes, of this wood. It was first brought to Rome by Pompey, after he had subdued Mithridates. It is now much less used among us than anciently; since the discovery of so many ways of giving other hard woods a black color. The cabinet-makers, inlayers, &c., make pear-tree and other woods pass for ebony, by giving them a black color, by a few washes of a hot decoction of galls; and when dry, adding ink, and polishing them with a stiff brush, and a little hot wax.

EBORACUM, in ancient geography, a famous city of the Brigantes in Britain, now called York. The emperors Septimus Severus and Constantius Chlorus resided and died in it. It was a Roman colony, and the station of the *Legio Sexta Victrix*. Its name in the ancient British language is *Caer-frocc*, or *Caer-effroc*.

EBRBUHARITES, a sect among the Mahomedans, so named from their founder Ebrbuhar, a disciple of Naschibendi. They profess great sanctity, with a total dereliction of all worldly things; yet they are regarded by the other Mussulmans, as little better than heretics, because they do not go in pilgrimage to Mecca. From this labor they excuse themselves, by pretending that the purity of their souls, their sublime contemplations, extacies, &c., show them Mecca and Mahomet's tomb without stirring from their cells.

EBRI'ETY, *n. s.* } *Fr. ebriété*; *Ital. ebrieta*;
EBRIOS'ITY, *n. s.* } *Lat. ebrietas*. Drunkenness. Ebriosity, *Lat. ebriositas*, is continual drunkenness.

That religion which excuseth Noah in surprisal,
Will neither acquit *ebriosity* nor *ebriety* in their intended perversion. *Broune.*

Here laughs *Ebriety* more fell than arms,
And thins the nations with her fatal charms,
With Gout, and Hydrops groaning in her train,
And cold Debility, and grinning Pain. *Darwin.*

EBRO, a large river of Spain, the ancient Iberus, which rises in the mountains of Santillane, on the confines of Old Castile, runs through Biscay and Arragon, passes by Saragossa, and, continuing its course through Catalonia, falls

with great rapidity into the Mediterranean, about twenty miles below Tortosa. Of its two mouths the one to the south is artificial, and of easier entrance than the other, which is nearly choked with mud. The stream is in general very rapid, and little adapted for navigation, being full of rocks and shoals: it is, however, useful in supplying the great canals of Arragon with water. Its bed is said to have been less obstructed in ancient times.

EBULLIENCY, *n. s.* } *Lat. ebullit, of bulla,*
EBULLIENT, *adj.* } a bubble. Rising or
EBULLITION, *n. s.* } boiling up in bubbles. State of effervescence or swelling.

The dissolution of gold and silver disagree; so that in their mixture there is great *ebullition*, darkness, and, in the end, a precipitation of a black powder. *Bacon.*

Iron, in aqua fortis, will fall into *ebullition* with noise and emication; as also a crasse and fumid exhalation, caused from the combat of the sulphur of iron with the acid and nitrous spirits of aqua fortis.

Browne's Vulgar Errors.

When aqua fortis, or spirit of vitriol, poured upon filings of iron, dissolves the filings with a great heat and *ebullition*, is not the heat and *ebullition* effected by a violent motion of the parts; and does not their motion argue, that the acid parts of the liquor rush towards the parts of the metal with violence, and run forcibly into its pores, till they get between its outmost particles and the main mass of the metal? *Newton.*

A violent cold, as well as heat, may be produced by this *ebullition*, for if sal ammoniac, or any pure volatile alkali, dissolved in water, be mixed with an acid, an *ebullition*, with a greater degree of cold, will ensue.

Arbutnot on Aliments.

Song second was the *ebullition* of that passion which ended the forementioned school business. *Burns.*

EBUSUS, in ancient geography, the greater of the two islands called Pityusæ, in the Mediterranean, near the east coast of Spain, south-west of Majorca. Famous for its pastures and for figs. Now called Ivica.

ECASTOR, or **MECASTOR**, in antiquity, an oath wherein Castor was invoked. It was a custom for men never to swear by Castor, nor the women by Pollux.

ECBATANA, in ancient geography, the royal residence and capital of Media, built by Deioces king of the Medes, according to Herodotus: Pliny says, by Seleucus; but that could not be, because it is mentioned by Demosthenes. It was situated on a gentle declivity, twelve stadia from Mount Orontes, and was in compass 150 stadia. Here stood the royal treasury and tombs. It was an open unwall'd town, but had a very strong citadel, encompassed with seven walls within, and rising above each other. The extent of the utmost was equal to the whole extent of Athens, according to Herodotus; the situation favoring this construction, as being a gentle ascent, and each wall was of a different color.

ECCENTRIC, *adj. & n. s.* } *Fr. eccentric,*
ECCENTRICAL, } *que; Ital. Span.*
ECCENTRICITY, *n. s.* } and *Port. eccentric;*
ico; Lat. eccentricus; Gr. εκκεντρικος, i. e. εκ,
extra, et κεντρον, centrum. Without, or deviating
from, a centre; hence, metaphorically, irregular; anomalous. Eccentricity is oddity; habit
of deviation from established rules or methods.

Whatsoever affairs pass such a man's hands, he crooketh them to his own ends; which must needs be often *eccentric* to the ends of his master.

Bacon's Essays.

Astronomers, to solve the phenomena, framed to their conceits *eccentric*s and epicycles, and a wonderful engine of orbs.

Bacon.

The duke at his return from his *eccentricity*, for so I account favorites abroad, met no good news.

Wotton.

This motion, like others of the times, seems *eccentric* and irregular.

King Charles.

In regard of *eccentricity*, and the epicycle wherein it moveth, the motion of the moon is unequal. *Browne.*

They build, unbuild, contrive,

To save appearances: they gird the sphere

With centrick and *eccentric*, scribbled o'er,

Cycle, and epicycle, orb in orb. *Milton.*

By reason of the sun's *eccentricity* to the earth, and obliquity to the equator, he appears to us to move unequally.

Holder.

A character of an *eccentric* virtue, is the more exact image of human life, because it is not wholly exempted from its frailties.

Dryden.

Then from whate'er we can to sense produce,

Common and plain, or wondrous and abstruse,

From nature's constant or *eccentric* laws,

The thoughtful soul this general inference draws,

That an effect must presuppose a cause. *Prior.*

How few are found with real talents blest!

Fewer with nature's gifts contented rest,

Man from his sphere *eccentric* starts astray;

All hunt for fame, but most mistake the way.

Churchill.

Whence is it that planets 'move all one and the same way in orbs concentrick, while comets move all manner of ways in orbs very *eccentric*?

Newton's Opticks.

Eccentricity of the earth is the distance between the focus and the centre of the earth's elliptick orbit.

Harris.

But on examining it more nearly, you find much *eccentricity* and confusion. It is not a monarchy in strictness.

Burke.

Try now the merits of this blessed exchange

Of modest truth for wit's *eccentric* range. *Cowper.*

ECHELLENSIS (Abraham), a learned Maronite, employed in the Paris edition of the Polyglott Bible. He, however, quarrelled with two of his coadjutors, and was then employed in making an Arabic translation of the Scriptures, at Rome. While he was professor of the Oriental languages at Rome, he was chosen by the great duke Ferdinand II., to translate from Arabic into Latin, the fifth, sixth, and seventh of Apollonius's Conics, in which he was assisted by John Alphonso Borelli, who added commentaries to them. He died at Rome, in 1664.

ECCHYMO'SIS, *n. s.* *Εκχυμωσις.* Livid spots or blotches in the skin, made by extravasated blood.

Ecchymosis may be defined an extravasation of the blood in or under the skin, the skin remaining whole. Laxations are accompanied with tumour and *ecchymosis*.

Wiseman.

ECCHYMO'SIS; from *εκχωω*, to pour out, or from *εκ*, out of, and *χυμος*, juice; an effusion of humors from their respective vessels under the integuments; or, as P'aulus A'gineta says, 'When the flesh is bruised by the violent collision of any object, and its small veins broken, and the blood is gradually discharged from them.' This blood,

when collected under the skin is called an *ecchymosis*, the skin in the mean time remaining entire; sometimes a tumor is formed by it, which is soft and livid, and generally without pain. If the quantity of blood is not considerable, it is usually resorbed; if much, it suppurates; it rarely happens that any farther inconvenience follows; though, in a very bad habit of body, a mortification may be the result.

ECCLESHALL, a market town of Staffordshire, pleasantly situated on a branch of the river Sow, seven miles and a half north-west of Stafford, and 148 north-west from London. The houses are neat, and there is a good church and charity school. It is supposed to be named from the Latin word *ecclesia*, the bishop of Litchfield having formerly had a palace here. In the civil war it was garrisoned for the king, but, being afterwards taken by the parliamentary forces, it was nearly destroyed; after which it was rebuilt by bishop Lloyd. Market on Friday.

ECCLESIASTES, a canonical book of the Old Testament, the design of which is to show the vanity of all sublunary things. It was composed by Solomon; who enumerates the several objects on which men place their happiness, and then shows the insufficiency of all worldly enjoyments. The Talmudists make king Hezekiah to be the author of it; Grotius ascribes it to Zorobabel, and others to Isaiah; but the generality of commentators believe this book to be the produce of Solomon's repentance, after he had experienced the pleasures, follies, and vanities of life.

ECCLESIASTIC, *adj.* & *n. s.* } *Lat. eccle-*
ECCLESIASTICAL, *adj.* } *siasticus*; of,
 or relating to, the church.

Is discipline an *ecclesiastical* matter or civil? If an *ecclesiastical*, it must belong to the duty of the ministers. *Hooker.*

The ambition of the *ecclesiasticks* destroyed the purity of the church. *Burnet's Theory.*

Clergymen, otherwise little fond of obscure terms, yet in their sermons are liberal of those which they find in *ecclesiastical* writers. *Swift.*

A church of England man has a true veneration for the scheme established among us of *ecclesiastick* government. *Id.*

It was justly so called; being thus distinguished, not only from the religion of Moses, the sanctions whereof related to the present life, but also from every human scheme of moral, political, or *ecclesiastical* legislation. *Beattie.*

ECCLESIASTICAL COURTS. In the time of the Anglo-Saxons, there was no distinction between the lay and the ecclesiastical jurisdiction; the county court was as much a spiritual as a temporal tribunal; the rights of the church were ascertained and asserted at the same time, and by the same judges, as the rights of the laity. For this purpose the bishop of the diocese, and the alderman, or the sheriff of the county, sat together in the county court, and had there the cognizance of all causes, as well ecclesiastical as civil; a superior deference being paid to the bishop's opinion in spiritual matters, and to that of the lay judges in temporal: and thus the presence of the bishop added weight and reverence to the sheriff's proceedings. But it soon became an established maxim in the papal system of

policy, that all the ecclesiastical persons, and causes, should be entirely subject to ecclesiastical jurisdiction only; which was alleged to be lodged in the pope, by divine indefeasible right and investiture from Christ himself, and derived from the pope to all inferior tribunals. It was not, however, till after the Norman conquest, that this doctrine was received in England; when William I., (whose title was espoused by the monasteries which he endowed, and by the foreign clergy whom he brought over from France and Italy, and planted in the best preferments of the English church), established this fatal encroachment, and separated the ecclesiastical court from the civil. King Henry I., at his accession, among other restorations of the laws of king Edward the Confessor, revived this of the union of the civil and ecclesiastical courts. This, however, was opposed by the popish clergy, who, under the guidance of that arrogant prelate archbishop Anselm, very early attacked a measure that put them on a level with the profane laity; and therefore in their synod at Westminster, 3 Hen. I., they ordained, that no bishop should attend the discussion of temporal causes; which soon dissolved this newly effected union. And when, upon the death of Henry I., Stephen was brought in and supported by the clergy, one article of the oath imposed upon him was, that ecclesiastical persons and causes should be subject only to the bishop's jurisdiction. As about that time the contest began, about the laws of England and those of Rome, the temporal courts adhering to the former, and the spiritual adopting the latter, as their rule, this widened the breach, and made a coalition afterwards impracticable; which probably would otherwise have been effected at the reformation. Ecclesiastical courts are various; as the ARCHDEACON'S COURT, the COURT of ARCHES, the CONSISTORY, the PECULIARS, the PREROGATIVE, and the great court of appeal in all ecclesiastical causes, viz. the COURT of DELEGATES. See these articles. In these spiritual courts, it must be acknowledged to their honor, that though they continue to decide many questions of temporal cognizance, yet justice is in general so impartially administered, that the boundaries of their power are well known, and no material inconvenience arises from this jurisdiction continuing in the ancient channel. Their ordinary course of proceeding is, first, by citation, to call the party injuring before them. Then by libel, or by articles drawn out in a formal allegation, to set forth the complainant's ground of complaint. To this succeeds the defendant's answer upon oath; when, if he denies or extenuates the charge, they proceed to proofs by witnesses examined, and their depositions taken down in writing by an officer of the court. If the defendant has any circumstances to offer, in his defence, he must propound them in what is called his defensive allegation, to which he is entitled in his turn to the plaintiff's answer upon oath, and may from thence proceed to proofs as well as his antagonist. The canonical doctrine of purgation, whereby the parties were obliged to answer upon oath to any matter, however criminal, that might be objected against them (though long ago over ruled in the court of chancery, the

genius of the English law having broken through the bondage imposed on it by its clerical chancellors, and asserted the doctrines of judicial as well as civil liberty,) continued till the middle of the seventeenth century, to be upheld by the spiritual courts; when the legislature was obliged to interpose, to teach them a lesson of similar moderation. By the statute of 13 Car. II. cap. 12, it is enacted, that it shall not be lawful for any bishop, or ecclesiastical judge, to administer to any person the oath usually called the oath *ex officio*, or any other oath whereby he may be compelled to confess, accuse, or purge himself of any criminal matter, whereby he may be liable to any censure or punishment. When all the pleadings and proofs are concluded, they are referred to the consideration, not of a jury, but of a single judge; who takes information by hearing advocates on both sides, and thereupon forms his interlocutory decree, or definitive sentence, at his own discretion: from which there generally lies an appeal to the several stages mentioned in the articles above referred to; though, if the same be not appealed from by him in fifteen days, it is final by the statute 25 Hen. VIII. cap. 19.

ECCLESIASTICAL STATE, in geography, a name often given to the pope's dominions in Italy. They consisted before the late revolutions of the provinces of Campagna, St. Peter's Patrimony, Umbria, Ancona, Urbino, Romagna, Bologna, and Ferrara. The first five of these were erected by the French into the Roman republic; the last three into the Cisalpine. Avignon, and Venaissin in France, became included in the French republic. See **PAPAL STATES**.

ECCLESIASTICUS, an apocryphal book, so called, from its being read in the church, ecclesia, as a book of piety and instruction, but not of infallible authority. The author was a Jew, called Jesus, or Joshua, the son of Sirach. The Greeks call it the Wisdom of the son of Sirach.

ECCOPROTICKS, *n. s.* *Ec* and *κορυπος*. Such medicines as gently purge the belly, so as to bring away no more than the natural excrements lodged in the intestines.

The body ought to be maintained in its daily excretions by such means as are *eccoprotick*.

Harvey on the Plague.

ECHÉMIN, a river of Lower Canada, rising in the mountains to the southward of the St. Laurence, into which it falls, two miles above Quebec. The margin is a flat rock, with only a shallow covering of soil. But there is some good land in its neighbourhood.

ECHENEIS, the remora, in ichthyology, a genus belonging to the order of thoracici. The head is flat, naked, depressed, and marked with a number of transverse ridges; it has ten rays in the branchiostegæ membrane, and the body is naked. There are three species, of which the following one is the most worthy of note:—*E. remora*, the sucking fish with a forked tail, and eighteen stræ on the head. This species is often found adhering so strongly to the sides of the sharks and other great fish, by means of the structure of its head, as to be got off with difficulty. It was believed, by all the ancients, to have most wonderful powers, and to be able, by adhering to the bottom, to arrest the motion of a

ship in its fullest course; and, in love affairs, to deaden the warmest affections of both sexes.

ECHIEVIN, in the old French and Dutch polity, a magistrate elected by the inhabitants of a city or town, to take care of their common concerns, and the decoration and cleanliness of the city. At Paris, before the revolution, there were a *prevôt* and four *echevins*; in other towns, a mayor and *echevins*. At Amsterdam there were nine *echevins*; and at Rotterdam, seven. In France they took cognizance of rents, taxes, the navigation of rivers, &c. In Holland they judged of civil and criminal causes; and, if the criminal confessed himself guilty, they could see their sentence executed without appeal.

ECHINADES, otherwise called the Nisia Islands, a group of islets at the entrance of the gulf of Lepanto, which they almost seem to close on the side of Epirus.

ECHINITES, in natural history, the name by which authors call the fossile centronia, frequently found in our chalk pits. See **CENTRONIA**.

ECHINOPHORA, in botany, a genus of the digynia order, and pentandria class of plants; natural order forty-fifth, umbellatæ. The male florets are lateral, with the central one hermaphrodite: *seed* one, sunk into an indurated involucre. Species two, found on the south coast of Great Britain.

ECHINOPS, in botany, a genus of the polygamia segregata order, and syngenesia class of plants; natural order forty-ninth, compositæ: *cal.* uniflorous; *cor.* tubulated, and hermaphrodite; receptacle bristly; pappus indistinct. Species six, natives of the Levant, and south of Europe.

ECHINORINCHIUS, a genus of the vermes intestina: the body is round, proboscis cylindrical, retractile, and crowned with hooked prickles. They are found fixed firmly to the viscera of various animals, generally the intestines; and often remain on the same spot during the whole life of the animal; they are mostly gregarious, and are easily distinguished from the tænia by their round inarticulate body. There are forty-eight species, infesting the mammalia, birds, reptiles, and fish.

ECHINUS, *n. s.* } *Lat.* A hedge-hog; a
ECHINATE, *adj.* } shell-fish set with prickles:

ECHINATED. } in botany, the prickly head, cover of the seed, or top of any plant: in architecture, a member or ornament, taking its name from the roughness of the carving, resembling the prickly rind of a chestnut, or the thorny coat of a hedge-hog. Echinated is bristled, or full of prickles. This ornament is used by modern architects in cornices of the Ionic, Corinthian, and Composite orders; and generally set next to the abacus, being carved with anchors, darts, and ovals or eggs.

An *echinated* pyrites in shape approaches the *echynated* chrySTALLINE balls. *Woodward on Fossils.*

Many nodules of flint resemble in colour as well as in form the shells of the *echinus* or sea-urchin; others resemble some coralloids both in form and color.

Darwin.

ECHINUS, in zoology, a genus of insects belonging to the order of vermes mollusca. The body is roundish, covered with a bony crust, and

often beset with moveable prickles; and the mouth is below and consists of five valves. There are 108 species, all natives of the sea.

1. *E. esculentus*, or eatable echinus, is of a hemispherical form, covered with sharp strong spines above half an inch long, commonly of a violet color, moveable, adherent to small tubercles elegantly disposed in rows. These are their instruments of motion by which they change their place. This species is taken in dredging, and often lodges in cavities of rocks just within low-water mark. They are eaten by the poor in many parts of England, and by persons of rank abroad. Anciently they were a favorite dish. They were the first dish in the famous supper of Lentulus, when he was made flamen Martialis, or priest of Mars.

2. *E. lacunosus*, or oval echinus, is of an oval depressed form; on the top it is of a purple color, marked with a quadrefoil, and the spaces between tuberculated in waved rows; the lower side studded, and divided by two smooth spaces. Length four inches. When clothed it is covered with short thick-set bristles, mixed with very long ones.

3. *E. marinus*, the sea urchin, has an arched shell varying in its figure in different individuals: and, besides a great number of protuberances, has two remarkable apertures for the mouth and the anus.

ECHINUS TERRESTRIS, the land urchin. See **ERINACEUS**.

ECHITES, in botany, a genus of the monogynia order, and pentandria class of plants; natural order thirtieth, contortæ. There are two long and straight foliæ: seed pappous; cor. funnel-shaped, with the throat naked.

ECHITES CORYMBOSA, a species of this genus, is said to yield the caoutchouc, or elastic gum according to Jacquin. See **GUM, ELASTIC**.

ECHIU, viper's bugloss, in botany, a genus of the monogynia order, and pentandria class of plants; natural order forty-first, asperifoliæ: cor. is irregular, with the throat naked. Species twenty-seven; none of them have any remarkable property except the *E. vulgari*, or common bugloss, the flowers of which are very grateful to bees. It is a native of many parts of Britain. The stem is rough with hairs and tubercles. The leaves are spear-shaped, and rough with hair. The flowers come out in lateral spikes. They are first red, afterwards blue; sometimes purple or white. Cows and sheep are not fond of the plant; horses and goats refuse it.

ECHO, *n. s., v. n., & v. a.* Span. *echo, eco*; Fr. and Port. *echo*; Lat. *echo*; Gr. *ἠχώ*. A resounding or giving again of the voice or any sound. The sound returned. As a neuter verb, to resound; be sounded back: as a verb active to send back, return, what has been uttered.

At the parting

All the church echoed.

Shakespeare. Taming of the Shrew.

Babbling *echo* mocks the hounds,

Replying shrilly to the well-tuned horns,

As if a double hunt were heard at once. *Id.*

Wilt thou hunt?

Thy hounds shall make the welkin answer them,

And fetch shrill echoes from their hollow earth. *Id.*

The sound filling great spaces in arched lines, cannot be guided; therefore there hath not been any means to make artificial echoes.

Baron's Natural History.

(Pamphlets are) the echoes, whereby what is done in one part of the kingdom, is heard all over

T. Ford.—1647.

O woods, O fountains, hillocks, dales, and bowers,
With other *echo* late I taught your shades

To answer, and resound far other song. *Milton.*

Custom being but a mere face, as *echo* is a mere voice, rests not in her unaccomplishment, until by secret inclination she accorporate herself with error.

Id.

The pleasant myrtle may teach the unfortunate

Echo

In these woods to resound the renowned name of a goddess. *Sidney.*

With peals of shouts the Tyrians praise the song;
Those peals are echoed by the Trojan throng.

Dryden's Æneid.

Hark, how the sound disturbs imperious Rome!
Shakes her proud hills, and rolls from dome to dome!
Her mitred princes hear the echoing noise,
And, Albion, dread thy wrath and awful voice.

Blackmore.

Our separatists do but *echo* the same note.

Decay of Piety.

One great death deforms the dreary ground;
The echoed woes from distant rocks resound.

Prior.

Now the shrill corn-pipe, echoing loud to arms,
To rank and file reduce the straggling swarms.

Tickell.

Through rocks and caves the name of Delia sounds;
Delia each cave and echoing rock rebounds. *Pope.*

'Tis not enough no harshness gives offence;

The sound must seem an *echo* to the sense. *Id.*

You may as well attempt to silence an *echo* by the strength of voice, as a wit by the force of reason. They both are the louder for it: they both will have the last word. *Young.*

The great and popular are very freely applauded; but all soon grow weary of echoing to each other a name which has no other claim to notice, but that many mouths are pronouncing it at once. *Johnson.*

Famine, and Pestilence, her first born son,
Attend to finish what the sword begun;
And echoing praises, such as fiends might earn,
And folly pays, resound at your return. *Comper.*

Ye shelving rocks, dark waves, and sounding shore,—

Ye echoed sweet the tender words he swore!—

Can stars or seas the sails of love retain?

O guide my wanderer to my arms again! *Darwin.*

Lo, from the echoing axe, and thundering flame,
Poison and plague and yelling rage are fled!
The waters, bursting from their slimy bed,
Bring health and melody to every vale. *Beattie.*

No solemn, antique gentleman of rhyme,

Who having angled all his life for fame,

And getting but a nibble at a time,

Still fussily keeps fishing on, the same

Small 'Triton of the minnows,' the sublime

Of mediocrity, the furious tame,

The *echo's echo*, usher of the school

Of female wits, boy bards—in short, a fool!

Byron.

ECHO, or **ECCHO**, is formed from the Greek *ἠχώ*, sound. The ancients being wholly unacquainted with the true cause of the echo, ascribed

it to several causes sufficiently whimsical. The poets pretended it was a person of that name metamorphosed, and that she affected to take up her abode in particular places, for they found that she was not to be met with every where. But the moderns, who know sound to consist in a certain tremor or vibration in the sonorous body communicated to the contiguous air, and by that means to the ear, give a more consistent account of echo. See ACOUSTICS. A tremulous body, striking on another solid body, may be repelled without destroying or diminishing its tremor; and, consequently, a sound may be redoubled by the resiliency of the tremulous body to the air. But a simple reflection on the sonorous air is not enough to solve the echo; for then every plain surface of a solid hard body, being fit to reflect a voice or sound, would redouble it; which we find does not hold. To produce an echo, therefore, it should seem, that a kind of concameration or vaulting were necessary, to collect, and, by collecting, to heighten and increase, and afterwards reflect the sound; as we find is the case in reflecting the rays of light, where a concave mirror is required. In fact, as often as a sound strikes perpendicularly on a wall, behind which is any thing of a vault or arch, or even another parallel wall, so often will it be reverberated in the same line, or other adjacent ones. For an echo to be heard, therefore, it is necessary that the ear be in the line of reflection; for the person who made the sound to hear its echo, it is necessary he be perpendicular to the place which reflects it: and, for a manifold or tautological echo, it is necessary there be a number of walls, and vaults or cavities, either placed behind or fronting each other. A single arch or concavity, &c., can scarcely ever stop and reflect all the sound; but, if there be a convenient disposition behind it, part of the sound propagated thither, being collected and reflected as before, will present another echo: or, if there be another concavity, opposed at a due distance to the former, the sound reflected from the one upon the other will be tossed back again by this last, &c. Any sound, falling directly or obliquely on any dense body of a smooth superficies, whether plain or arched, is reflected, or echoes, more or less. The surface must be smooth, otherwise the air, by reverberation, will be put out of its regular motion, and the sound thereby broken and extinguished. Echoes may be produced with different circumstances. For, 1. A plane obstacle reflects the sound back in its due tone and loudness, allowance being made for the proportionable decrease of the sound, according to its distance. 2. A convex obstacle reflects the sound somewhat smaller and somewhat quicker though weaker, than otherwise it would be. 3. A concave obstacle echoes back the sound, bigger, slower, and also inverted; but always according to the order of words. 4. The echoing body being removed farther off, it reflects more of the sound than when nearer; which is the reason why some echoes repeat but one syllable, some one word, and some many. 5. Echoing bodies may be so contrived and placed, as that reflecting the sound from one to the other, either directly and mutually, or obliquely and by

succession, out of one sound, a multiple echo or many echoes shall arise. A multiple echo may be made by so placing the echoing bodies at unequal distances, that they may reflect all one way, and not one on the other, by which means a manifold successive sound will be heard; one clap of the hands like many; one *ha* like a laughter; one single word like many of the same tone and accent; and so one viol, like many of the same kind, imitating each other. Lastly, echoing bodies may be so ordered, that, from any one sound given, they shall produce many echoes different both as to tone and intention: by which means a musical room may be so contrived, that not only one instrument playing therein shall seem many of the same sort and size, but even a concert of different ones, only by placing certain echoing bodies so that any note played shall be returned by them in thirds, fifths, and eighths.

Echo is also used for the place where the repetition of the sound is produced or heard. In echoes, the place where the speaker stands is called the *centrum phonicum*; and the object or place that returns the voice, the *centrum phonocampticum*. Echoes are distinguished into two kinds; viz. single and tautological, or multiple.

Echo, in architecture, a term applied to certain kinds of vaults and arches, most commonly of the elliptic and parabolic figures used to redouble sounds, and produce artificial echoes.

Echo, in poetry, a kind of composition wherein the last words or syllables of each verse contain some meaning, which, being repeated apart, answers to some question or other matter contained in the verse; as in this beautiful one from Virgil:—

Crudelis mater magis, an puer, improbus ille?

Improbus ille puer, crudelis tu quoque mater.

The elegance of an echo consists in giving a new sense to the last words; which reverberate, as it were, the motions of the mind, and by that means affect it with surprise and admiration.

ECHO, in mythology, a daughter of *Aer* and *Tellus*, who chiefly resided in the vicinity of the *Cephus*. She was once one of *Juno's* attendants, and became the confidant of *Jupiter's* amours. Her loquacity, however, displeased *Jupiter*, and she was deprived of the power of speech by *Juno*, and only permitted to answer the questions which were put to her. *Pan* had formerly been one of her admirers, but he never enjoyed her favors. Echo, after she had been punished by *Juno*, fell in love with *Narcissus*; but being despised by him pined to death, having nothing left but her voice.

ECHOMETER, among musicians, a kind of scale or rule, with several lines thereon, serving to measure the duration and length of sounds, and to find their intervals and ratios.

ECIJA, or EXIJA, a considerable town of Spain, in the province of Seville, beautifully situated on the *Xenil*, and surrounded with small hills, which make it the warmest place of Andalusia. Wool and hemp are its chief riches; but tanning and the manufacture of leather, employ a portion of its inhabitants, who, altogether, amount to 28,000. This town is the *Colonia Augusta Firmia* of the ancients, and many Roman antiquities have been discovered here. It

is said to have been formerly of great importance; at present it contains six churches, sixteen convents, and fifteen hospitals; it has also a large square with a piazza. The Xenil is crossed by a neat modern bridge; and there is along the left bank a delightful public walk, composed of alleys, ornamented with statues. Fifty-five miles E. N. E. of Seville.

ECKHEL (Joseph Hilary), a learned Jesuit, was born at Entzsfeld in Austria in 1737. Becoming a member of the society of St. Ignatius, he was appointed keeper of the imperial cabinet of medals, and professor of archaeology at Vienna. He may be regarded as the modern founder of the science of Numismatics, the principles of which are fully developed in his treatise *Doctrina Veterum Nummorum*. 8 vols. fol. He died in 1798.

ECKIUS (John), a learned divine, professor in the university of Ingoldstadt, memorable for his opposition of Luther, Melancthon, Carolostadius, and other leading Protestants in Germany. He wrote many polemical tracts; and among the rest, a *Manual of Controversies*, printed in 1535, in which he discourses upon most of the heads contested between the Protestants and Papists. He was a man of great learning and zeal, and died in 1543.

ECKDALA, or **AKDALA**, an ancient, but now ruined fortress of the district of Dacca, Bengal, situated on the banks of the Luckya River, which, during the rainy-season, surrounds it with water. In 1353 Ilyas Hiji, the second independent king of Bengal, of the Mahommedan dynasty, took refuge in this place from the army of the emperor of Hindostan, and defended it, till the setting in of the rains compelled the enemy to raise the siege, and the sultan Seyd Hussein made it his constant residence from the year 1499 to 1520, although Pundua was his political capital.

ECLAIRCISSEMENT, *n. s.* Fr. Explanation; the act of clearing up an affair by verbal expostulation.

The *éclaircissement* ended in the discovery of the informer. *Clarendon.*

ECLAT, *n. s.* Fr. Splendor; show; lustre. Not English, says Dr. Johnson.

Nothing more contributes to the variety, surprise, and *clat* of Homer's battles, than that artificial manner of gaging his heroes by each other.

Pope's Essay on Homer.

ECLÉCTIC, *adj.* εκλεκτικός. Selecting; choosing at will. See below.

Cicero was of the *eclectic* sect, and chose out of each such positions as came nearest truth.

Watts on the Mind.

ELECTICS, ancient philosophers, who, without attaching themselves to any particular sect, chose what they judged good and solid from each. Laertius says, that they were also denominated *Analogetici*; but that they call themselves *Philalethes*, i. e. lovers of truth. The founder of the *Electici* was one Potamon of Alexandria, who lived under Augustus and Tiberius; and who, weary of doubting of all things with the Sceptics and Pyrrhonians, formed the *Eclectic* sect; which Vossius calls the *Eclective*.

ELECTICS were also a certain set of physicians among the ancients, of whom Archigenes, under Trajan, was the chief, who selected from the opinions of all the other sects, that which appeared to them best and most rational; hence they were called *eclectics*, and their prescriptions *medicina eclectica*.

ELECTICS, or modern Platonics, a sect of Christians, who arose about the end of the second century. They professed to make truth the only object of their enquiry, and to be ready to adopt from all the different systems and sects, such tenets as they thought agreeable to it. However, they preferred Plato to the other philosophers, and looked upon his opinions concerning God, the human soul, and things invisible, as conformable to the spirit and genius of the Christian doctrine. One of the principal patrons of this system was Ammonius Saccas, who at this time laid the foundation of that sect, afterwards distinguished by the name of the New Platonists, in the Alexandrian school. See **AMMONIUS** and **PLATONISM**.

ECLIPSE, *n. s., v. a. & v. n.* Fr. *eclipse*, Ital. *eclissi, ecclessi*; Span. and Portug. *eclipsi*; Brit. *eclips*; Lat. *eclipsis*; Gr. *εχλειψις*, from *εχλειπω*, to fail or depart. An obscuration of the heavenly bodies; hence, darkness, obscuration generally: to darken a luminary; to extinguish; cloud; obscure; disgrace: to suffer an eclipse.

Sips of yew,

Slivered in the moon's *eclipse*

Shakspeare. Marbeth.

Then here I take my leave of thee, fair son,
Born to *eclipse* thy life this afternoon.

Id. Henry VI.

All the posterity of our first parents suffered a perpetual *eclipse* of spiritual life.

Raleigh's History.

Let the *eclipsed* moon her throne resign. *Sandys.*

Experience we have of the vanity of human glory, in our scatterings and *eclipses*. *King Charles.*

She told the king, that her husband was *eclipsed* in Ireland by the no-countenance his majesty had shew'd towards him. *Clarendon.*

Planets, planet-struck, real *eclipse*

Then suffered. *Milton's Paradise Lost.*

The labouring moon

Eclipses at their charms. *Id.*

So though the sun victorious be,

And from a dark *eclipse* set free,

The influence, which we fondly fear,

Affects our thoughts the following year. *Waller.*

They had seen tokens of more than common greatness, howsoever now *eclipsed* with fortune. *Sidney.*

Praise him to his father:—

—Let the prince's glory

Seem to *eclipse*, and cast a cloud on his. *Denham's Sophy.*

Let other muses write his prosperous fate,

Of conquered nations tell, and kings restored;

But mine shall sing of his *eclipsed* estate,

Which, like the sun's, more wonders does afford. *Dryden.*

An *eclipse* of the moon is when the atmosphere of the earth, between the sun and the moon, hinders the light of the sun from falling upon and being reflected by the moon: if the light of the sun is kept off from the whole body of the moon, it is a *total eclipse*; if from a part only, it is a *partial* one. *Locke.*

He descended from his Father, and eclipsed the glory of his divine majesty with a veil of flesh.

Calamy's Sermons.

Now if the earth were flat, the darkened moon Would seem to all eclipsed as well as one. *Creech.*

The places that have either shining sentiments or manners, have no occasion for them: a dazzling expression rather damages them, and serves only to eclipse their beauty. *Pope.*

ECLIPSE. See ASTRONOMY, Index.

ECLIPTIC, *n. s. & adj.* *Εκλειπτικός.* A great circle of the sphere, supposed to be drawn through the middle of the zodiac, and making an angle with the equinoctial, in the points of Aries and Libra, of 23° 30' which is the sun's greatest declination: relating to or described by the ecliptic.

All stars that have their distance from the ecliptic northwards not more than twenty-three degrees and a half, may, in progression of time, have declination southward, and move beyond the equator.

Brown's Vulgar Errors.

The terraqueous globe had the same site and position, in respect of the sun, that it now hath: its axis was not parallel to that of the ecliptic, but inclined in like manner as it is at present.

Woodward's Natural History.

You must conceive an imaginary plane, which, passing through the centre of the sun and the earth, extends itself on all sides as far as the firmament: this plane is called the ecliptic, and in this the centre of the earth is perpetually carried, without any deviation.

Bentley.

The earth's rotation makes the night and day; The sun revolving through the ecliptic way, Effects the various seasons of the year. *Blackmore.*

Where with vast convolution Draco holds
The ecliptic axis in his scaly folds,
O'er half the skies his neck enormous rears,
And with immense meanders parts the bears.

Darwin.

ECLIPTIC. See ASTRONOMY, Index.

TERRESTRIAL, in geography, a great circle on the terrestrial globe, not only answering to, but falling within, the plane of the celestial ecliptic. See GEOGRAPHY.

ECLOGUE, *n. s.* *Εκλογή.* A pastoral poem, so called because Virgil called his pastorals eclogues.

What exclaiming praises Basilius gave this eclogue any man may guess, that knows love is better than spectacles to make every thing seem great. *Sidney.*

It is not sufficient that the sentences be brief the whole eclogue should be so too. *Pope.*

ECLUSE, FORT DE L', a fort of Switzerland, in the district of Gex, and canton of Geneva, situated on the right bank of the Rhone, about 120 feet above the level of the river. It adheres in appearance to the bare rock of the Jura, which shelves over a part of its fortifications, while the remainder hangs, as it were, suspended above the Rhone. Thirteen miles west of Geneva.

ECONOMIC, *adj. & n. s.* *Gr. οικονομία.*

ECONOMICAL, *adj.* Sometimes written, from its derivation, *œconomia*.

ECO'NOMIST, *n. s.* *Gr. οἰκονομίστης.* A person who manages the household, or government, of a family. Hence frugality, order, regulation,

or disposition, of affairs; system of management generally. Economic is used in the same particular and general way: an economist is a good or frugal manager.

In the Greek poets, as in Plautus, we see the economy and disposition of poems better observed than in Terence.

Ben Jonson.

Her quickening power in every living part,
Doth as a nurse, or as a mother serve;
And doth employ her *economick* art,
And busy care, her household to preserve.

Davies.

Some are so plainly *economical*, as even to desire that the seat be well watered, and well swelled.

Wotton's Architecture.

All the divine and infinitely wise ways of economy that God could use towards a rational creature, oblige mankind to that course of living which is most agreeable to our nature.

Hammond.

St. Paul's economy the heir differs nothing from a servant, while he is in his minority; so a servant should differ nothing from a child in the substantial part.

Taylor.

If this economy must be observed in the minutest parts of an epic poem, what soul, though sent into the world with great advantages of nature, cultivated with the liberal arts and sciences, can be sufficient to inform the body of so great a work?

Dryden's Dedication to the Æneid.

I have no other notion of economy than that it is the parent of liberty and ease.

Swift.

In economical affairs, having proposed the government of a family, we consider the proper means to effect it.

Watts.

The regard one shows economy, is like that we show an old aunt, who is to leave us something at last.

Shenstone.

Economy is the parent of integrity, of liberty, and of ease; and the beauteous sister of temperance, of cheerfulness, and health.

Adventurer.

And from the many heavy taxes required from them by the necessities of the state, have surely reason to be economical.

Franklin.

Mere parsimony is not economy. It is separable in theory from it; and in fact it may, or it may not, be a part of economy, according to circumstances. Expense, and great expense, may be an essential part in true economy. If parsimony were to be considered as one of the kinds of that virtue, there is however another and a higher economy. Economy is a distributive virtue, and consists not in saving, but in selecting.

Burke.

The age of chivalry is gone, and one of calculators and economists has succeeded.

Id.

From this outline a philosopher may catch a glimpse of the general economy of nature; and like the mariner cast upon an unknown shore, who rejoiced when he saw the print of a human foot upon the sand, he may cry out with rapture, 'A God dwells here.'

Darwin.

ECOUEN, a well-built town of France, on the side of a hill, containing a number of villas belonging to the citizens of Paris, from which it is about twelve miles distant. On an eminence towards the west extremity stands a noble castle, built in the reign of Francis I., and now belonging to the prince of Conde. Inhabitants about 1200.

ECPHRACTICKS, *n. s.* *Gr. εκ and φραττω.* Such medicines as render rough humors more thin, so as to promote their discharge.

Procure the blood a free course, ventilation, and transpiration, by suitable purges and ephractick medicines.

Harvey.

ECSTASY, n. s. } Fr. *extase*; Ital. Span.
ECSTASIED, adj. } and Port. *ectasi*; Lat. *ec-*
ECSTA'TIC, } *stasis*; Greek, *εκστασις*, ab
ECSTATICAL. } *εκτείνω, extendo*. Any pas-
 sion by which the thoughts are absorbed, and in
 which the mind is for a time lost. The adjectives
 all mean rapt or absorbed in passion or enthu-
 siasm.

Follow them swiftly,
 And hinder them from what this *ecstasy*
 May now provoke them to.

Shakespeare. Tempest.

Now see that noble and most sovereign reason,
 Like sweet bells jangled out of tune, and harsh,
 That unmatched form, and feature of blown youth,
 Blasted with *ecstasy*. *Id. Hamlet.*

Return, my soul! from this *ecstasie*
 And meditation of what thou shalt be
 To earthly thoughts, till it to thee appear
 With whom thy conversation must be there. *Donne.*

Donne.

Would she but shade her tender brows with bay,
 That now lye bare in careless willful rage;
 And trance herself in that sweet *extasy*,
 That rouzeth drouping thoughts of bashful age.

Bp. Hall.

He loved me well, and oft would beg me sing;
 Which when I did, he on the tender grass
 Would sit, and hearken even to *ecstasy*. *Milton.*

There doth my soul in holy vision sit,
 In peasive trance, and anguish, and *ecstatic* fit.
Id.

When one of them, after an *extatical* manner, fell
 down before an angel, he was severely rebuked, and
 bidden to worship God. *Stillingfleet.*

These are as common to the inanimate things as to
 the most *ecstasied* soul upon earth. *Norris.*

'T may be

No longer joy there, but an *ecstasy*. *Suckling.*

Whether what we call *ecstasy* be not dreaming with
 our eyes open, I leave to be examined. *Locke.*

The religious pleasure of a well-disposed mind
 moves gently, and therefore constantly: it does not
 affect by rapture and *ecstasy*; but is like the pleasure
 of health, still and sober. *South.*

Each delighted, and delighting, gives
 The pleasing *ecstasy* which each receives.

Prior.

A pleasure, which no language can express;

An *ecstasy* that mothers each feel,
 Plays round my heart. *Philips's Distressed Mother.*

In trance *ecstatic* may thy pangs be drowned;
 Bright clouds descend, and angels watch thee round.

Pope.

The very kine that gambol at high noon,
 The total herd receiving first from one,
 That leads the dance, a summons to be gay,
 Though wild their strange vagaries, and uncouth
 Their efforts, yet resolved with one consent,
 To give such act and utterance as they may
 To *ecstasy* too big to be suppressed. *Conner.*
 Wakes from his trance, alarmed with young Desire,
 Finds his new sex, and feels *ecstatic* fire;
 From flower to flower with honeyed lip he springs,
 And seeks his velvet loves on silver wings.

Darwin.

And let not this seem strange; the devotee
 Lives not in earth, but in his *ecstasy*;
 Around him days and worlds are heedless driven;
 His soul is gone before his dust to heaven. *Byron.*

ECSTATICI, *Εκστατικοί*, from *ἐκστημι*, I am
 entranced; in antiquity, a kind of diviners who
 were cast into trances or ecstasies, in which they

lay like men dead or asleep, deprived of all
 sense and motion; but, after some time, returning
 to themselves, gave strange relations of what
 they had seen and heard.

ECTHESIS, in church history, a confession
 of faith, in the form of an edict, published A. D.
 639, by the emperor Heraclius, to pacify the
 troubles occasioned by the Eutychian heresy in
 the eastern church. He however revoked it, on
 being informed that pope Severinus had con-
 demned it, as favoring the Monothelites; declar-
 ing at the same time, that Sergius, patriarch of
 Constantinople, was the author of it.

ECTHILIPSIS, among Latin grammarians, a
 figure of prosody whereby the *m*, at the end of a
 word, where the following word begins with a
 vowel, is elided, or cut off, together with the
 vowel preceding it, for the sake of the measure
 of the verse: thus they read mult' ille, for mul-
 tum ille.

ECTROPIUM, in surgery, is when the eye-
 lids are inverted, or retracted, so that they show
 their internal or red surface, and cannot suffi-
 ciently cover the eye.

ECTYPE, n. s. Gr. *εκτυπος*. A copy.

The complex ideas of substances are *ectypes*, copies,
 but not perfect ones; not adequate. *Locke.*

EDA, or **EDAY**, one of the Orkney Isles, about
 five miles and a half long, and nearly one and a
 half broad, situated eight miles N. N. E. from
 Pomora. It consists chiefly of hills of a mode-
 rate height, affording excellent pasture; and con-
 tains several villages, and has two good harbours
 or roadsteads, each sheltered by a small islet,
 where vessels of any burden may ride in safety.
 There is an old chapel in ruins, and the remains
 of several religious houses. Near this island
 are several pasture isles or holms, on which are
 the ruins of several religious edifices.

EDACITY, n. s. } Lat. *edacitas*. Voracity;
EDACIOUS, adj. } ravenousness; greediness;
 rapacity.

The wolf is a beast of great *edacity*, and digestion;
 it may be the parts of him comfort the bowels.

Bacon.

EDAM, a town of North Holland, near the
 Zuyder-zee, with a good harbour, formed by the
 river Ey. The inhabitants derive their subsis-
 tence partly from ship-building, and partly from
 salt and oil works. It is an old market for
 cheese, although much fallen off. Twelve miles
 north of Amsterdam.

• **EDAM**, an island on the coast of Java, about
 two miles in circuit and very woody. Here the
 Dutch have several salt warehouses, and a con-
 vict establishment for making cordage.

EDDA, the system of the ancient Icelandic or
 Runic mythology, containing many curious par-
 ticulars of the theology, philosophy, and manners
 of the northern nations of Europe; or of the Scan-
 dinavians who had migrated from Asia, and from
 whom our Saxon ancestors were descended. Mr.
 Mallet apprehends that it was originally compiled,
 soon after the Pagan religion was abolished, as a
 course of poetical lectures, for the use of such
 young Icelanders as devoted themselves to the
 profession of a scald or poet. It consists of two
 principal parts: the first containing a brief system

of mythology, properly called the Edda: and the second being a kind of art of poetry, and called *scalda*. The most ancient Edda was compiled by Soemund Sigfusson, surnamed the learned, who was born in Iceland about A. D. 1057. This was abridged, and rendered more intelligible, about 120 years afterwards, in the form of a dialogue, by Snorrio Sturleson, who was supreme judge of Iceland in 1215 and 1222. He added also the second part in the form of a dialogue, being a detail of different events transacted among the divinities. The only three pieces that are known to remain of the more ancient Edda of Soemund, are the *Voluspa*, the *Havamaal*, and the *Runic chapter*. The *Voluspa*, or prophecy of *Vola* or *Fola*, appears to be the text, on which the Edda is the comment. It contains, in 200 or 300 lines, the whole system of mythology, disclosed in the Edda, and may be compared to the Sibylline verses, on account of its laconic yet bold style, and its imagery and obscurity. It is professedly a revelation of the decrees of the Father of Nature, and the actions and operations of the gods. It describes the chaos, the formation of the world, with its various inhabitants, the functions of the gods, their most signal adventures, their quarrels with *Loke*, or *Lak*, their great adversary, and the vengeance that ensued; and concludes with a long description of the final state of the universe, its dissolution and conflagration, the battle of the inferior deities, and the evil beings, the renovation of the world, the happy lot of the good, and the punishment of the wicked. The *Havamaal*, or *Sublime Discourse*, is attributed to the god *Odin*, who is supposed to have given these precepts of wisdom to mankind. It is comprised in about 120 stanzas, and resembles the book of Proverbs. The *Runic chapter* contains a short system of ancient magic, and especially of the enchantments wrought by the operation of *Runic characters*. A manuscript copy of the Edda of Snorrio is preserved in the library of the university of Upsal; the first part of which has been published with a Swedish and Latin version by M. Goranson. The Latin version is printed as a supplement to M. Mallet's *Northern Antiquities*. The first edition of the Edda was published by Resenius, professor at Copenhagen, in a large 4to. volume, in 1665, containing the text of the Edda, a Latin translation, by an Icelandic priest, a Danish version, and various readings from different MSS. M. Mallet has also given an English translation of the first part, accompanied with remarks, from which we learn that the Edda teaches the doctrine of the Supreme, called the Universal Father, and *Odin*, who lives for ever, governs all his kingdom, and directs the great things, as well as the small, who formed the heaven, earth, and air; made man, and gave him a spirit or soul, which shall live after the body shall have mouldered away; and then all the just shall dwell with him in *Gimle* or *Vingolf*, the palace of friendship; but wicked men shall go to *Hela*, or death, and from thence to *Nislheim*, or the abode of the wicked, which is below in the ninth world. It inculcates also the belief of several inferior gods and goddesses, the chief of whom is *Frigga*, or *Frea*, i. e. lady, meaning

hereby the earth, who was the spouse of *Odin* or the Supreme God; whence we may infer that, according to the opinion of these ancient philosophers, this *Odin* was the active principle or soul of the world, which, uniting itself with matter, had thereby put it into a condition to produce the intelligences or inferior gods, and men and all other creatures. The Edda likewise teaches the existence of an evil being called *Loke*, the calumniator of the gods, the artificer of fraud, who surpasses all other beings in cunning and perfidy. It teaches the creation of all things out of an abyss or chaos; the final destruction of the world by fire; the absorption of the inferior divinities, both good and bad, into the bosom of the grand divinity, from whom all things proceeded, as emanations of his essence, and who will survive all things; and the renovation of the earth in an improved state.

EDDER, *v. a. & n. s.* Probably from *edge*. To bind or interweave a fence. Not in common use.

To add strength to the edge, *edder* it; which is, bind the top of the stakes with some small long poles, on each side.

Mortimer's Husbandry.

In lopping and felling, save *edder* and stake,

Thine hedges, as needeth, to mend or to make.

Tusser.

EDDY, *n. s., adj. & v. a.* Icel. *ida*; but it is better derived from Goth. *idga*, to agitate: Sax. *ed*, backward, again, and *ea*, water. Water that runs contrary to the main stream: whirl. It is used also as a verb active.

My praises are as a bulrush upon a stream; if they sink not, 'tis because they are borne up by the strength of the current, which supports their lightness; but they are carried round again, and return on the eddy where they first began.

Dryden.

And chaff with eddy winds is whirled around,
And dancing leaves are lifted from the ground.

Id. Virgil.

The wild waves mastered him, and sucked him in,
And smiling eddies dimpled on the main.

Dryden.

So, where our wide Numidian wastes extend,
Sudden the impetuous hurricanes descend,
Wheel through the air, in circling eddies play,
Tear up the sands, and sweep whole plains away.

Addison's Cato.

Tis thine to cherish and to feed
The pungent nose-refreshing weed:
Which, whether pulverized it gain
A speedy passage to the brain,
Or whether, touched with fire, it rise
In circling eddies to the skies,
Does thought more quicken and refine
Than all the breath of all the Nine.

Cowper.

Through her fine limbs the mimic lightnings dart,
And flames innocuous eddy round her heart;
O'er her fair brow the kindling lustres glare,
Blue rays diverging from her bristling hair.

Darwin.

The sea-tide's opposing motion,
In azure column proudly gleaming,
Beats back the current many a rood
In curling foam and mingling flood,
While eddying whirl, and breaking wave,
Roused by the blast of winter, rave.

Byron.

EDDYSTONE Rocks, the name of some rocks in the English Channel, so called from the great variety of contrary currents in their vicinity. They are situated nearly S.S.W. from the middle of Plymouth Sound, their distance from the port

about fourteen miles; and from Ram-Head, the nearest point of land, twelve and a half. They are almost in the line which joins the Start and the Lizard Points; and, as they lie in the direction of vessels coasting up and down the Channel, they were very dangerous, and frequently ships were wrecked on them, before the lighthouse was established. They are so exposed to the swells of the ocean, from all the south and west points of the compass, that the heavy seas come uncontrolled, and break on them with the utmost fury. After a storm, when the sea in general is, to all appearance, quite smooth, and its surface unruffled by the slightest breeze, the growing swell or under current, meeting the slope of the rocks, the sea often rises above the lighthouse in a magnificent manner, overtopping it as with a canopy of froth. Notwithstanding this tremendous swell, Mr. Henry Winstanley, in 1766, undertook to build a lighthouse on the principal rock, for the rest are under water; and he completed it in 1700. This ingenious mechanic was so confident of the stability of his structure, that he declared his wish to be in it during the most tremendous storm that could blow. Unfortunately he obtained his wish, for he perished in it during the dreadful storm which destroyed it, on the 27th November, 1703. In 1709 another lighthouse was erected of wood on this rock, but on a different construction, by Mr. John Rudyard. It stood till 1755, when it was burnt. A third one, of stone, begun by the late celebrated Mr. John Smeaton, on the 2d of April, 1757, was finished 24th August, 1759; and has withstood the rage of all weathers ever since. The rock which slopes towards the south-west is cut into horizontal steps; into which are dove-tailed, and united by a strong cement, Portland stone and granite, for Mr. Smeaton discovered that it was impossible to make use of the former entirely, as there is a marine animal that can destroy it; and that he could not use the latter solely, as the labor of working it would have been too expensive. He therefore used the one for the internal, and the other for the external, part of the structure. Upon the principle of a broad base and accumulation of matter, the whole, to the height of thirty-five feet from the foundation, is a solid mass of stones engrafted into each other, and united by every kind of additional strength. The lighthouse has four rooms, one over another, and at the top a gallery and lantern. The stone floors are flat above, but concave below, and are kept from pressing against the sides of the building by a chain let into the walls. The lighthouse is nearly eighty feet high, and withstands the most violent storms, without sustaining the smallest injury. In all probability, as Mr. Smeaton said, nothing but an earthquake can destroy it. The wooden part of it, however, was burnt in 1770, but renewed in 1774.

EDLINCK (Gerard), a famous engraver, born at Antwerp, where he was instructed in drawing and engraving. He settled at Paris in the reign of Louis XIV. who made him his engraver in ordinary. He was also counsellor in the Royal Academy of Painting. His works are particularly esteemed for the neatness of the

engraving, their brilliant cast, and the ease apparent in the execution; and to this facility is owing the great number of plates we have of his, among which are excellent portraits of many illustrious men of his time. Among the most admired of his prints are the following: 1. A battle between four horsemen, with three figures lying slain upon the ground, from Leonardo da Vinci. 2. A holy family, with Elizabeth, Saint John, and two angels, from the famous picture of Raphael in the late king of France's collection. 3. Mary Magdalen, from Le Brun. 4. Alexander entering into the tent of Darius, a large print, on two plates, from Le Brun. 5. Alexander entering into the tent of Darius, finished by P. Drevet, from Peter Mignard. Edelinck died in 1707, in an advanced age, at the Hotel Royal, in the Gobelins, where he had an apartment. His brother John was also a skilful engraver, but died young.

EDMATOSE, *adj.* Οδημα. Swelling; full of humors: commonly written oedematous.

A serosity obstructing the glands may be watery, edematose, and schirrous, according to the viscosity of the humour. *Arbuthnot.*

EDEN; from Heb. עֵדֶן, i. e. pleasure; a country with a garden, in which the progenitors of mankind were settled by God himself. It would be endless to recount the various conjectures as to its situation, some of which are very wild and extravagant. Moses says that 'a river went out of Eden to water the garden, and from thence it was parted and became into four heads.' This river is supposed to be the common channel of the Euphrates and Tigris, after their confluence: which parted again below the garden into two different channels, so that the two channels before, and the other two after their confluence, constitute the heads mentioned by Moses. This will determine the situation of the garden to have been in the south of Mesopotamia, or in Babylonia. The garden was also called Paradise; a term of Persic original, denoting a garden.

EDEN, a river of England, which rises in Westmoreland, on the borders of Yorkshire, crosses the county of Cumberland, and runs into the Solway Frith, about seven miles below Carlisle. Salmon appear in the Eden in numbers, so early as December and January, and the London and Newcastle markets are supplied with early fish from this river; but it is remarkable that they do not visit the Esk in any quantity till April, notwithstanding the mouths of the two rivers are very near each other.

EDEN, a river of Scotland, in Berwickshire, which rises in Lammermuir, joins the Tiviot at Kelso, runs along the south and south-east borders of the parish of Edenham, and falls into the Tweed near Coldstream. It produces trouts and some salmon.

EDENTON, a district on the sea-coast of North Carolina, bounded on the north by the state of Virginia, on the east by the ocean, on the west by Halifax district, and on the south by Newbern. It is subdivided into nine counties, viz. Chowan, Currituck, Camden, Pasquotank, Perquimans, Gates, Hertford, Bertie, and Tyrrel. Its chief town is Edenton. The wood is chiefly

pine, oak, cypress, and juniper, all of which abound.

EDENTON, the capital of the above district, is a post town and port of entry, at the head of a bay on the north side of Albemarle Sound, and at the north-east side of the opening of Chowan River. It is ninety-seven miles north of Newbern, 139 south-east of Petersburg, and 440 S.S.W. of Philadelphia.

EDER, a river of Germany, having its source on the borders of Nassau, and, after watering the county of Hesse, having its embouchure in the Fulda.

EDESSA, or **VODINA**, a large town of European Turkey, in Romania, near the Vistricza, called by the Turks Moglena. In ancient times it was the residence of the Macedonian kings. It has about 12,000 inhabitants, part of whom are employed in woollen manufactures; and is forty-four miles W.N.W. of Saloniki, and 316 west of Constantinople.

EDFU, a village of Upper Egypt, celebrated as the site of the ancient Apollinopolis Parva, and containing two temples, which present most magnificent monuments of ancient Egyptian architecture. Those of Tentyra, in Denon's opinion, alone could equal them. Each of the sides of the pyramidal propylon, which forms the principal entrance to the greater temple, is 100 feet in length, thirty wide, and 100 high. Many of the figures sculptured on it are thirty feet high, and executed in a very masterly and spirited style. The colors are preserved occasionally. There is a staircase in each division of 150, or 160 steps, which lead into apartments alternately thirty-one feet by ten, and seventeen by ten. Mr. Hamilton never saw more colossal sculptures than on the outer walls of this temple. They are chiefly emblematic of the beneficial influence of the sun in drawing forth and maturing the fruits of the earth. Isis is represented suckling a young child; priests and priestesses are sometimes seen offering young children to the goddess and to Osiris. The rubbish has collected to a greater height here than on the site of any of the other towns in the Thebaid. Long. 32° 53' 44" E., lat. 24° 48' 53" N.

EDGAR, the son of Edmund I., one of the most fortunate of the Anglo-Saxon monarchs. He succeeded his brother Edwy, A. D. 959; and is said to have been rowed down the Dee, by eight kings, his vassals. He died in 975. See **ENGLAND**.

EDGAR ATHELING, the son of prince Edward, by Agatha, daughter of the emperor Henry II. and grandson of Edmund II. king of England. Though he was the lawful heir of the crown, and was even declared king upon the death of Harold II. he submitted to William the Conqueror, after the battle of Hastings; but afterwards retired to Scotland with his two sisters, Margaret and Christina: where they were kindly received by king Malcolm II. who married the princess Margaret. See **ENGLAND**.

EDGAR, a sea-port town of Massachusetts, in the United States, situated on the east side of the island of Martha's Vineyard, and reckoned the best sea-port of the island. Long. 70° 25' W., lat. 41° 22' N.

EDGCOMB, a county of Halifax district North Carolina, bounded on the south by Pitt county; on the south-west by Wayne county and Tar River, which affords it communication with several counties in the state, on the west by Nash county, and on the east by Martin and Halifax counties.

EDGE, *n. s.*, *v. a.* & *v. n.*

EDGE'ING, *n. s.*

EDGE'LESS, *adj.*

EDGE'TOOL, *n. s.*

EDGE'WISE, *adv.*

Sax. *ecge*;
Goth. *egg*, or
ag; Teut. *eche*;
Swed. *egg*; Lat.
acies, of Gr. *ακίς*.

The sharp part of a blade or cutting instrument; termination of two sloping sides; brink; margin; applied, also, to acuteness of intellect. The verbs are derived from the noun, and the active verb is used to signify putting forward edgewise: and, metaphorically, to exasperate; inflame. *Edging*, as a substantive, means that which forns, or covers, the edge: bordering.

'Tis slander,

Whose *edge* is sharper than the sword.

Shakespeare. Cymbeline.

Abate the *edge* of traitors, gracious Lord!
That would reduce these bloody days again.

Id. Richard III.

To-morrow in the battle shink on me,
And fall thy *edgeless* sword; despair and die. *Id.*
A harsh grating tune setteth the teeth on *edge*.

Bacon.

We find that subtle or *edged* quantities do prevail
over blunt ones. *Digby on Bodies.*

He that will a good *edge* win,
Must forge thick, and grind thin. *Proverb.*

There sat she rolling her alluring eyes,
To *edge* her champion's sword, and urge my ruin. *Dryden.*

I must *edge* upon a point of wind,

And make slow way. *Id. Cleomenes.*
Silence and solitude set an *edge* upon the genius,
and cause a greater application. *Id. Dufremoy.*

The garland which I wove for you to wear,
And bordered with a rosy *edging* round. *Dryden.*
There must be no playing with things sacred, nor
jesting with *edgedtools*. *L'Estrange.*
Nurses from their children keep *edgetools*. *Dorset.*
Edging by degrees their chairs forwards, they
were in a little time got up close to one another.

Locke.

Should the flat side be objected to the stream,
it would be soon turned *edgewise* by the force of it.

Ray.

A woman branches out into a long dissertation
upon the *edging* of a petticoat. *Addison's Spectator.*
They are *edgeless* weapons it hath to encounter.

Decay of Piety.

But when long time the wretches' thoughts refined,
When want had set an *edge* upon their mind,
Then various cares their working thoughts employed
And that which each invented all enjoyed.

Creesh's Manil.

The rays which pass very near to the *edges* of any
body, are bent a little by the action of the body.

Newton's Opticks.

We have, for many years, walked upon the *edge* of
a precipice, while nothing but the slender thread of
human life has held us from sinking into endless
misery.

Rogers.

Yes, the last pen for freedom let me draw,
When truth stands trembling on the *edge* of law.

Pope.

Some harrow their ground over, and then plow it
upon an *edge*. *Mortimer's Husbandry.*

I shall exercise upon steel, and its several sorts;
and what sort is fittest for *edgetools*, which for springs.

Moxon.

It is with wits as with razors, which are never so apt to cut those they are employed on, as when they have lost their edge.

Swift.

However, if in general it be not easy to determine concerning the lawfulness of such devious proceedings, which must be ever on the *edge* of crimes, it is far from difficult to foresee the perilous consequences of the resuscitation of such a power in the people.

Burke.

Edge over edge expands the hardening scale,
And sheaths his slimy skin in silver mail. *Darwin.*

But see him on the *edge* of life,

With cares and sorrows worn;

Then age and want, Oh! ill-matched pair!

Show man was made to mourn.

Burns.

LADY TEA. Nay, I allow even that's better than the pains Mrs. Prim takes to conceal her losses in front. She draws her mouth till it positively resembles the aperture of a poor's box, and all her words appear to slide out *edgewise*, as it were.

Sheridan.

And you, ye crags, upon whose extreme *edge*,

I stand, and on the torrent's brink beneath

Behold the tall pines dwindled as to shrubs

In dizziness of distance; when a leap,

A stir, a motion, even a breath, would bring

My breast upon its rocky bosom's bed

To rest for ever—wherefore do I pause?

Byron.

EDGEFIELD, a county of South Carolina, the southernmost in the district of Ninety-Six, bounded on the north by Saluda River, which divides it from Newbury county, on the south-west by Savannah River, which separates it from the state of Georgia, on the east by Orangeburg district, and on the west by Abbeville county. The ridge of elevated land, which divides the waters of Saluda from those of Savannah River, passes nearly through the middle of the county. Edgefield county is about thirty-four miles long, and twenty-four broad.

EDGEFIELD, a town in the above county, with a court house and post office: forty miles from Abbeville; twenty-five from Augusta, and sixty from Colombia.

EDGEHILL, a village in Warwickshire, near Kenton; memorable for the first battle fought between the forces of king Charles I., and those of the parliament in 1642. It is fourteen miles south of Warwick. See ENGLAND, HISTORY.

EDGEWARE, a town of England, in the county of Middlesex, on the borders of Hertfordshire. It is eight miles north-west of London.

EDGEWORTH (Abbé), was born at Edgeworth's town in Ireland in 1745; but his father, who was a clergyman, having become a catholic, he settled with his family at Toulouse. After studying at Paris, the abbé Edgeworth entered the fraternity of Les Missions Étrangères. He was confessor to the princess Elizabeth, and thus becoming known to the unfortunate Louis XVI, he attended him to the scaffold. He made his escape in disguise afterwards, and came to England, whence he went to Mittau to attend upon Louis XVIII, and died there of an hospital fever in 1807. His letters and life were published in 1818.

EDGEWORTH (Richard Lovell), a literary gentleman of considerable talents, was born in 1744 at Bath, and of the same family as the foregoing.

After an education at Trinity College, Dublin, and Corpus Christi, Oxford, he entered the Temple, but, mechanics and general literature engaging his attention, he formed an acquaintance with Dr. Darwin, Mr. Day, and men of similar pursuits; in 1767 he is said to have contrived a telegraph, which however he did not bring into use. After residing some years in England he went to Lyons, where he was engaged in the direction of some works on the Rhone. In 1780 he became a fellow of the Royal Society. In the latter part of his life he resided chiefly on his own estate at Edgeworth's-town, in the south of Ireland, constructing rail-roads, draining bogs, &c. and in conjunction with his celebrated daughter, Miss Edgeworth, wrote a treatise on practical, and another on professional education, as well as some subsidiary works. He was also the author of An Essay on the Construction of Roads and Carriages; A Letter to Lord Charlemont on the Telegraph; and various papers in the Transactions of the Royal Society and Irish Academy. He died at Edgeworth's-town, in June 1817. Mr. Edgeworth married four wives, of whom two were sisters.

EDGINGS, in gardening, the series of small but durable plants, set round the edges or borders of flower-beds, &c. The best and most durable of all plants for this use, is box; which, if well planted and rightly managed, will continue in strength and beauty for many years. The seasons for planting this are, the autumn, and very early in the spring; and the best species for this purpose is the dwarf Dutch box. Formerly, it was also a very common practice to plant borders, or edgings, of aromatic herbs; as thyme, savory, hyssop, lavender, and the like; but these are all apt to grow woody, and to be in part, or wholly destroyed in hard winters. Daisies, thrift, or sea july-flower, and camomile, are also used by some for this purpose: but they require yearly transplanting, and a great deal of trouble, otherwise they grow out of form; and they are also subject to perish in very hard seasons.

EDHILING, EDHILINGUS, an ancient appellation of the nobility among the Anglo-Saxons. 'The Saxon nation,' says Nithard, Hist. lib. iv., 'is divided into three orders or classes of people; the edhilingi, the frilingi, and the lazzi; which signify the nobility, the freemen, and the vassals or slaves.' Instead of edhiling, we sometimes meet with ætheling, or ætheling; which appellation was likewise given to the king's son, and the presumptive heir of the crown. See ÆTHELING.

ED'DISH, *n. s.* Sax. *edisc*, a second crop of grass; the aftermath: a ground on which a crop has grown the preceding year.

Eddish, or *eadish*, is the latter pasture, or grass, which comes after mowing or reaping; otherwise called *ear-grass*, *earsh*, and *etch*. *Dr. A. Rees.*

EDIBLE, *adj.* From Lat. *edo*. Fit to be eaten; fit for food.

Some flesh is not *edible*, as horses and dogs.

Bacon.

Wheat and barley, and the like, are made either *edible* or *potable* by man's art and industry.

More against Atheism.

The *edible* creation decks the board. *Prior.*
Some of the fungus kind, gathered for *edible* mushrooms, have produced a difficulty of breathing.

Arbutnot.

EDICT, *n. s.* Lat. *edictum*. A proclamation or command of prohibition; a law promulgated.

When an absolute monarch commandeth his subjects that which seemeth good in his own discretion, hath not his *edict* the force of a law? *Hooker.*

The great King of kings,
Hath in the table of his law commanded
That thou shalt do no murder; will you then
Spurn at his *edict*, and fulfil a man's?

Shakespeare. Richard III.

Severe decrees may keep our tongues in awe,
But to our thoughts what *edict* can give law? *Dryden.*

The ministers are always preaching, and the governors putting out *edicts* against gaming and fine cloaths. *Addison.*

It is the business of a sensible government to impress all ranks with a sense of subordination, whether this be effected by a diamond buckle, or a virtuous *edict*, a sumptuary law, or a glass necklace.

Goldsmith.

If we may judge by the acts, arrets, and *edicts*, all the world over, for regulating commerce, an assembly of great men is the greatest fool upon earth.

Franklin.

An **EDICT** is an order or instrument, signed and sealed by a prince, to serve as a law to his subjects. We find frequent mention of the *edicts* of the prætor, in the Roman law. In the cidevant French law, the *edicts* were of several kinds: some importing new laws or regulations; others, the erection of new offices; establishments of duties, rents, &c.; and sometimes articles of pacification. In despotic governments, an *edict* is much the same as a proclamation is with us: but with this difference, that the former has the authority of a law from the power which issues it; whereas the latter is only a declaration of a law, to which it refers, and has no power in itself. *Edicts* cannot exist in Britain, because the enacting of laws is lodged in the parliament and not in the king. *Edicts* are all sealed with green wax, as a sign of their being perpetual and irrevocable.

EDIFY, *v. a.*

EDIFICATION, *n. s.*

EDIFICATORY, *adj.*

EDIFICE, *n. s.*

EDIFIER,

EDIFYING, *n. s.*

Fr. *edifier*; Span. and Portug. *edificar*; Italian and Lat. *edificare*. To build, applied both literally and morally; but edification is principally used in the latter sense: edificatory is tending to edification; edifice the building or structure raised: edifier he who builds or raises it.

Seek that ye may excel to the *edifying* of the church. *Bible. 1 Cor. 14. 12.*

He who speaketh no more than *edifieth*, is undeservingly reprehended for much speaking. *Hooker.*

Men are *edified* when either their understanding is taught somewhat whereof, in such actions, it becometh all men to consider, or when their hearts are moved with any affection suitable thereunto. *Id.*

There was a holy chapel *edified*,
Wherein the hermit wont to say
His holy things each morn and eventide.

Spenser.

My love was like a fair house built on another man's ground; so that I have lost my *edifice* by mistaking the place where I erected it.

Shakespeare. Merry Wives of Windsor.

You shall hardly *edify* me, that those nations might not, by the law of nature, have been subdued by any nation that had only policy and moral virtue.

Bacon's Holy War.

God built

So spacious, and his line stretched out so far,
That man may know he dwells not in his own;
An *edifice* too large for him to fill.

Milton.

An exercise so beneficially *edificatory* to the church? *Bp. Hall.*

Our blessed Saviour told us, that we must account for every idle word, not meaning that every word not designed for *edification*, or less prudent, shall be reckoned for a sin.

Taylor.

Life is no life, without the blessing of a friendly and an *edifying* conversation.

L'Estrange.

He gave, he taught; and *edified* the more,
Because he shewed, by proof, 'twas easy to be poor.

Dryden.

Men have *edified*

A lofty temple, and perfumed an altar to thy name.

Chapman.

Out of those magazines I shall supply the town with what may tend to their *edification*.

Addison's Guardian.

As Tuscan pillars owe their original to this country, the architects always give them a place in *edifices* raised in Tuscany.

Id. On Italy.

He must be an idiot that cannot discern more strokes of workmanship in the structure of an animal than in the most elegant *edifice*.

Beaumont.

As in order to the *edification* of the church, the spirit of God at first conferred upon the ministers of it a great variety of spiritual gifts,

Mason.

It is with infinite caution that any man ought to venture upon pulling down an *edifice* which has answered in any tolerable degree for ages the common purposes of society, or on building it up again, without having models and patterns of approved utility before his eyes.

Burke.

Some decent in demeanour while they preach,
That task performed, relapse into themselves
And, having spoken wisely, at the close
Grow wanton, and give proof to every eye,
Whoe'er was *edified*, themselves were not.

Cowper.

Sofares he in that dreadful hour,
When injured Truth exerts her power,
Some new phenomenon to raise,
Which, bursting on his frightened gaze,
From its proud summit to the ground,
Proves the whole *edifice* unsound.

Beattie.

EDILE, *n. s.* Lat. *edilis*. The title of a magistrate in old Rome, whose office seems in some particulars to have resembled that of our justices of peace.

The *edile*, ho! let him be apprehended.

Shakespeare.

E D I N B U R G H.

EDINBURGH, the metropolis of Scotland, is situated in long. $3^{\circ} 14' W.$ from London, and lat. $55^{\circ} 57' N.$ It is surrounded on all sides, except to the northward, where the ground declines gently towards the Frith of Forth, by lofty hills. Arthur's Seat, Salisbury Crags, and the Calton-hill, bound it on the east; the hills of Braid, and the extensive ridge of the Pentland hills rise on the south; and the beautiful eminence of Corstorphine rears its summit on the west. These hills form a magnificent amphitheatre, in which, on elevated, though less lofty, ground, stands this flourishing city. It is said, with considerable propriety, to stand on three hills, which run in a direction from east to west; and hence its natural division into the southern, middle, and northern districts.

The origin of its name, like that of most other cities, is very uncertain. Some imagine it to be derived from Eth, a king of the Picts; others from Edwin, a Saxon prince of Northumberland, who over-ran the whole or greatest part of the territories of the Picts about A. D. 617; while others derive it from the Gaelic words Dun Edin, signifying the face of a hill. The name Edinburgh, however, seems to have been unknown in the time of the Romans. The most ancient title by which we find this city distinguished is that of *Castell Mynyd Agned*; which, in the British language, signifies 'the fortress of the hill of St. Agnes.' Afterwards it was named *Castrum Puellarum*, because the Pictish princesses were educated in the castle (a necessary protection in those barbarous ages) till they were married. The most plausible derivation of the present name of the city seems to be that of the Northumbrian prince above mentioned. Simeon of Durham calls it *Edwinesburgh*, and notices it as existing in the middle of the eighth century.

The most ancient part of the city, or Old Town, as it is called, stands on the middle or central ridge of the three eminences above mentioned, which is terminated on the west by a lofty and almost inaccessible rock, on which is placed the castle; the New Town occupies an elevated plain on the north; and the southern district is situated on a rising ground in the opposite direction. The hill on which the Old Town is built is separated from the other two districts by a valley, on each side, that upon the northern side having been formerly a lake. In the progress of improvement, however, this lake having been drained, and streets and bridges having also been formed, these valleys are no impediment to a complete and ready communication from one district to another.

The peculiar situation of the Old Town has often attracted attention. The principal street, which occupies the flat surface of the central hill, extends nearly in a straight line from the castle, on the western extremity, to the palace of Holyrood-house on the east. This street, which is not improperly named the High Street, measures in length from the castle gate to the palace gate, about 5570 feet, and is about ninety feet in breadth. The upper part of it is elevated about 140 feet above the level of the drained

morass of the North Loch; and, on account of the ground which it occupies gently declining to the east, is about 180 feet above the palace of Holyrood-house. The height of the houses in this quarter, has always rendered it an interesting object to a stranger visiting Edinburgh; and perhaps the High Street of this city is not equalled in grandeur by any street in Europe. Parallel to the High Street, in the valley on the south, runs a street called the Cowgate, from ten to twenty feet in breadth. The buildings in this street, though lofty, are less elevated than those of the High Street. From the High Street down to the loch on the north, and to the Cowgate on the south, run narrow cross streets or lanes, called wynds and closes, many of which, from the abrupt descent of the ground, are extremely steep and difficult of passage; an inconvenience not at all remedied by their width, which is rarely more than six feet.

The origin of this city is, likewise, involved in obscurity. The most absurd and fabulous accounts have been given of its first possessors; and, without sharing in the credulity of the monkish writers, no credit can be given to its remote annals. Situated in that part of the country which formed the Roman province of Valentia, and which, more than any other, was the subject of wars and devastations, it is almost impossible to trace its foundation. If we are to believe our earliest historians, however, the castle was built by Camelon king of the Picts, about A. A. C. 330. It was in the hands of the Anglo-Saxons, from the invasion of Octa and Ebuza in 452, till the defeat of Egfrid king of Northumberland in 685 by the Picts, who then repossessed themselves of it. The Saxon kings of Northumberland reconquered it in the ninth century; and it was retained by their successors till the year 956, when it was given up to Indulfus king of Scotland. In 1093 it was unsuccessfully besieged by the usurper Donald Bane. In 1128 King David I. founded the abbey of Holyrood-house, for certain canons regular; and granted them a charter, in which he styled the town '*Burgo meo de Edwinesbergh, my borough of Edinburgh*'. In 1174 the castle was surrendered to Henry II. of England, to purchase the liberty of king William I. who had been taken prisoner by the English. But William afterwards entered into an alliance with Henry, and married his cousin Ermengarde; upon which the castle was restored as part of the queen's dowry.

James II. in 1450 first bestowed on the community the privilege of fortifying the city with a wall, and empowered them to levy a tax upon the inhabitants for defraying the expense. This original wall of Edinburgh began at the foot of the north-east rock of the castle, where it was strengthened by a small fortress called the Well House Tower, and was carried quite across the hill, having a gate on the top as a communication between the town and castle. It at first proceeded eastward in such a manner, as would have cut off not only all the Cowgate, but some part of the parliament house; and turning to the

north-east was connected with the buildings on the north side of the High Street, at the original Netherbow Port; but after the battle of Floddon the wall of the city was extended. It now began on the south-east side of the rock on which the castle is built. From thence it descended obliquely, to the West Port; it then ascended part of a hill on the other side, called the High Riggs; after which it ran east with but little alteration in its course, to the Bristo and Potter Row ports, and from thence to the Pleasance. Here it took a northerly direction, which it kept from thence to the Cowgate port, after which the enclosure was completed to the Netherbow by the houses of St. Mary's wynd. For 250 years the city of Edinburgh occupied the same space of ground. In the middle of the sixteenth century, it is described as extending in length about an Italian mile, and about half as much in breadth. This space of ground, however, was not at that time occupied in the manner it has been since. The houses of the Old Town were neither so high nor so crowded upon each other as they are now. These were consequences of the number of inhabitants increasing, which occasioned the raising of the houses to such a height, as perhaps is not to be paralleled.

The castle of Edinburgh stands on a high rock, accessible only on the east side. On all others it is very steep, and in some places perpendicular. It is about 300 feet high from its base, and 383 above the level of the sea. The entrance to this fortress is defended by an outer barrier of palisades; within this is a dry-ditch, draw-bridge, and gate, defended by two batteries which flank it; and the whole is commanded by a half moon mounted with cannon. Beyond these are two gate-ways, the first of which is very strong, and has two portcullises. Immediately beyond the second gate-way, on the right hand, is a battery mounted with cannon, carrying balls of 12 and 18 lbs. weight. On the north side are a mortar and some gun batteries. The upper part of the castle contains a half-moon battery, a chapel, a parade for exercise, and a number of houses in the form of a square, which are laid out in barracks for the officers. There are also other barracks sufficient to contain 1200 men; a powder magazine, bomb-proof; a grand arsenal, capable of containing 8000 stand of arms; and other apartments which can contain full 22,000 more. On the east side of the square were formerly royal apartments, in one of which king James VI. was born. In this quarter, immediately under the square tower, is the apartment called the crown room, wherein are deposited the Scottish regalia; consisting of the crown, sceptre, and sword of state, which were placed here on the 26th of March, 1707. It was long doubted whether these ensigns of royalty had not been removed; but in 1818, when commissioners were appointed by his present majesty, then prince regent, to search for them, a large oaken chest in the crown room was forced open, and the relics of the Scottish monarchy were discovered. They were found in a state of the most perfect preservation, and have since been open to the inspection of the public. The crown room was neatly fitted up for the exhibition of

them; and two persons, in the dress of the wardens of the tower, attended to show them to visitors. The governor of the castle is generally a Scottish nobleman; and there is a deputy governor, who resides in the garrison; also a fort-major, a store-keeper, master gunner, and chaplain. In its present improved state this castle can accommodate 2000 men; but its natural strength of situation was not sufficient to render it impregnable, even before the invention of artillery, much less would it be capable of securing it against the attacks of a modern army provided with cannon.

St. Giles's church is a beautiful Gothic building, measuring in length 206 feet. At the west end, its breadth is 110 feet, in the middle, 129; and at the east end, seventy-six. It is adorned with a lofty square tower, from the sides and corners of which rise arches of figured stone work; these, meeting with each other in the middle, complete the figure of an imperial crown, the top of which terminates in a pointed spire. The whole height of this tower is 161 feet. This is the most ancient church in Edinburgh, and its tutelary saint was St. Giles, a native of Greece. It was at first simply a parish church, of which the bishop of Lindisfarne or Holy Island, in the county of Northumberland, was patron. In 1466, it was erected into a collegiate church by James III. At the Reformation it was divided into several parts. The four principal divisions form as many churches appropriated to divine worship; the smaller ones to other purposes. At the same time the religious utensils belonging to it were seized and sold by the magistrates; part of the money being applied to its repair, and the rest added to the funds of the corporation. In the steeple are three ancient bells: there is also a set of music bells, upon which tunes are played by the hand. The principal division is called the High Church, in which the general assembly sits. The church is fitted up with seats for all the great officers of the assembly; and there is a throne for his majesty's commissioner. In this church is a monument to the celebrated Napier, inventor of logarithms; another to the regent Murray; and a third to the great marquis of Montrose. The names of the four churches, into which St. Giles's is divided, are, the New, or High Church, above described; the Old Church; the New North Church, or Haddow's Hole, so named from the Laird of Haddow having been for some time imprisoned in it; and the Tolbooth Church. The Tron Church is an elegant structure, erected in 1641, with a spire, and stands on the south side of the High Street, between the north and south bridges. The spire was burnt down in 1824, having accidentally caught fire from the burning embers blown by the wind from the great tenements on the west. Lady Yester's Church is situated nearly opposite to the Royal Infirmary. The Old and New Gray Friars churches are situated on the top of the south ridge, east of Heriot's Hospital, nearly in the middle of the ancient gardens belonging to the Gray Friars. These churches are both under one roof, and have one common portico; but are separated by a partition wall. The Old Gray Friars was

founded about 1612, and had once a steeple. Trinity College Church was founded by queen Mary, wife of king James II. in 1461, at the same time with the Trinity Hospital. It is situated at the east end of the north loch.

Canongate Church stands near the middle of the north side of the street called the Canongate, and was founded in 1688. It is a Gothic building, in the form of a cross, and was erected at the cost of about £2400, being the accumulated principal and interest of 20,000 merks, bequeathed by a Mr. Thomas Moodie, for the pious purpose of building a church. In the cemetery lie the remains of the celebrated author of the *Wealth of Nations*, Dr. Adam Smith; and a simple stone, erected at the expense of Burns, marks the burial place of his fellow-bard Ferguson. St. Cuthbert's Church, or the West Kirk, stands at the western extremity of the valley which divides the New from the Old Town, near the base of the castle rock. Its architecture is by no means elegant, but a handsome spire atones for the homely appearance of the church itself. It is deemed the largest place of worship in Edinburgh. St. Andrew's Church stands on the north side of George's Street, in the New Town, surmounted with a fine spire 168 feet in height. A portico, supported by four columns of the Corinthian order, projects a few feet into the street. In the spire there is a chime of eight bells. The whole is elegantly finished, and has fine appearance. St. George's Church stands on the west side of Charlotte Square, and forms the terminating object of George's Street, from which it is seen along its whole extent. The front to the square consists of a portico, or vestibule, with four columns and two pilasters of the Ionic order, elevated on a flight of steps sixty-eight feet in width. Behind the portico rises a dome, intended as a miniature representation of that of St. Paul's, London. The whole building, with the exception of the dome, which is seen to advantage in almost every direction round the city, has a heavy appearance, and it has often been regretted that the original design of the celebrated architect, Adam, was abandoned merely with a view to economy. The building, as it stands, cost £33,000; but it has since been ascertained that, according to Mr. Adam's plan, the expense would have been considerably under that sum. This church was opened for public worship in 1814, and is calculated to contain 1600 people. The other churches of Edinburgh, remarkable for the elegance of their architecture, are St. Mary's Church, situated in Bellevue Crescent, opened for worship, in 1825; St. Paul's Chapel, on the north side of York Street, finished in 1818, at an expense of £12,000; St. John's Chapel, situated a little to the south of the western extremity of Prince's Street, also finished in 1818, at an expense of £15,000. St. George's Chapel, in York-place, built from a design by Robert Adam, in 1794; the Roman Catholic Chapel, at the head of Leith-walk, built from a design by Gillespie in 1813, possessing a very fine organ, and a beautiful altar-piece, painted by Vandyke; the Methodist Chapel, in Nicholson's-square, built in 1814, at an expense of £5000;

Dr. Jameson's Chapel, at the south end of Nicholson-street, founded in 1819, and finished in 1820; Dr. Hall's Chapel, terminating the east end of Broughton Street. Mr. Paxton's Chapel, in Infirmary Street; and the Relief Chapel, Cowgate. The architecture of the other places of worship in Edinburgh, is not such as to require them to be particularly noticed on that account. Till of late years, the plainest and most homely accommodation was all that was aimed at in the erection of places of worship. Besides the churches and chapels already particularised, however, there are various others in this city of great importance, either for the extent of the congregations which they contain, or the celebrity and talents of their pastors. The Scottish Episcopal Church alone has several places of worship. There are also Lady Glenore's Chapel, and the Gaelic Chapel, in which latter the service is performed in the Erse language, for the benefit of the Highlanders: it was erected in 1769, and stood on the south side of the castle; but the congregation removed in 1815 to a more commodious place of worship, at the head of the Horse-Wynd. At present, the number of places for divine worship in Edinburgh and Leith, distinguishing the different persuasions, is as follow: Established Church, 16; Chapels of Ease, 9; Scottish Episcopal, 7; Cameronians, 1; United Associate Synod of the Secession, 9; Associate Synod, 1; Original Burgher, 1; Original Antiburgher, 1; Relief, 6; Independents, 3; Baptists, 4; Methodists, 2; Roman Catholics, 2; Glassites, 1; Society of Friends, 1; Bereans, 1; New Jerusalem Temple, 1; Unitarians, 1; Jews, 1; in all sixty-eight. The regular established clergy connected with Edinburgh are twenty-five. The number of parishes is sixteen, nine of which are called collegiate charges, or have two ministers each joined in the discharge of the pastoral office. Besides these there are, under the control of the established church, seven of the chapels of ease, as they are called; two of which are in the Canongate, one in the old part of the town, two in the southern district, one at Stockbridge, and one in Leith.

In 1215 this city was first distinguished by having a parliament and provincial synod held in it; but it does not appear to have been looked upon as the capital of Scotland till about the middle of the fifteenth century, when parliaments began to be held in it regularly, and when civil institutions succeeded to the rude military anarchy, which had previously prevailed. For the improvements which were introduced into the kingdom at that period, Scotland was chiefly indebted to her amiable and enlightened monarch, James I., who unfortunately fell a victim to the jealousy entertained by the nobility, of the measures he projected in favor of the people. In 1329 the town of Leith, with its harbour and mills, had been bestowed upon Edinburgh, by Robert I.; and his grandson, Robert III. conferred upon all the burghesses the singular privilege of building houses in the castle, upon the sole condition that they should be persons of good fame. From the middle of the fifteenth century, its privileges continued to be increased

from various causes. In 1482 the citizens had an opportunity of liberating king James III. from the oppression of his nobles, by whom he had been imprisoned in the castle. On this account the provost was by that monarch made hereditary high sheriff within the city, an office which he continues still to enjoy. The council, at the same time, were invested with the power of making laws and statutes for the government of the city; and the trades, as a testimony of the royal gratitude for their loyalty, received the celebrated banner known by the name of the Blue Blanket, which still exists, and is kept by the convener of the trades for the time. By the overthrow of James IV., at the battle of Floddon, Edinburgh was overwhelmed with grief, that monarch having been attended in his unfortunate expedition by the earl of Angus, then provost, with the rest of the magistrates, and a number of the principal inhabitants, most of whom perished in the battle. The inhabitants, alarmed for the safety of their city, enacted that every fourth man should keep watch at night; the fortifications of the town were renewed, and the wall extended, as we have before mentioned. After this, the inhabitants were gradually relieved from the trouble of watching at night, by a certain number of militia being appointed to prevent disturbances. About this period, the city was almost depopulated by a dreadful plague; so that, to stop if possible, the progress of the infection, all houses and shops were shut up for fourteen days; and some, where infected persons had died, were pulled down altogether. In 1540 the tract of ground, called the Burrough-Muir, was totally overgrown with wood, and it was sagely enacted by the town-council, that whoever would purchase as much as was sufficient to make a new front for his house, might extend it seven feet into the street. Thus, while the city was, in a short time, filled with wooden houses, the streets were, in many instances, narrowed fourteen feet.

In 1542 an English fleet of 200 sail entered the Forth; and, having landed their forces, quickly made themselves masters of the towns of Leith and Edinburgh. They next attacked the castle, but were repulsed from it with loss; and by this were so enraged, that they not only destroyed both towns, but laid waste the country for a great way round. In 1547 Leith was again burned by the English after the battle of Pinky, but Edinburgh was spared. Several disturbances happened in the capital at the time of the Reformation, of which an account will be given under the article SCOTLAND; but none of these greatly affected the city till 1570, when the civil war took place on account of queen Mary's forced resignation. The city was then sometimes in the hands of one party, and sometimes of another; during which the inhabitants, as may easily be imagined, suffered extremely. The earl of Morton, when regent, in 1573, built two bulwarks across the High Street, nearly opposite to the Tolbooth, to defend the city from the fire of the castle. A treaty was at last concluded between the leaders of the opposite factions; but Kirkaldy refused to be comprehended in it. The regent therefore solicited the assistance of queen

Elizabeth, and Sir W. Drury was sent in Scotland with 1500 foot, and a train of artillery. The castle was now besieged in form, and batteries raised against it in different places. The governor defended himself with great bravery for thirty-three days; but finding most of the fortifications demolished, the well choked up with rubbish, and all supplies of water cut off, he was obliged to surrender. The English general, in the name of his mistress, promised him honorable treatment; but the queen of England shamefully gave him up to the regent, by whom he was hanged. Soon after, the most violent religious commotions of Scotland took place, in which the king was insulted and railed at by the clergy, seconded by the magistrates of Edinburgh, as well as the citizens. This led to various severe measures against the city and its ministers, which will be detailed under the article SCOTLAND. A reconciliation, however, at length took place, which appears to have been satisfactory to all parties, as the king not only allowed the clergy, some of whom had been degraded, to be replaced, but in 1610 conferred various marks of his favor on the town. Another invasion from England being apprehended in 1558, the city raised 1450 men for its defence, among whom there are said to have been 200 tailors.

In the beginning of the reign of Charles I., a perfect harmony seems to have subsisted between the court and the city: for in 1627 that monarch presented the city with a new sword and gown, to be worn by the provost. Next year he paid a visit to this capital, and was received by the magistrates in a most loyal manner. When this prince attempted to introduce Episcopacy into Scotland, his first step was the erection of the three Lothians, and part of Berwick into a diocese, Edinburgh being the episcopal seat, and the church of St. Giles the cathedral. Much disturbance was occasioned in 1637, by the first attempt to read the prayer-book there, and next winter the neighbouring people resorted to town in such multitudes, that the privy council thought proper to publish two acts; by one of which they were commanded, under severe penalties, to leave the town in twenty-four hours; and by the other, the court of session was removed to Linlithgow. The bishops on some of these occasions narrowly escaped with their lives. Notwithstanding these disturbances, however, the king again visited Edinburgh in 1641, and was entertained by the magistrates at an expense of £12,000 Scots. It does not appear that after this the city was in any way particularly concerned with the commotions which followed, either throughout the remainder of the reign of Charles I., the Commonwealth, or the reign of Charles II. In 1680 the duke of York, with his duchess, the princess Anne, and the whole court of Scotland, were entertained by the city in the Parliament House, at the expense of £15,000 Scots. At this time, it is said, that the scheme of building the bridge over the North Lough was first projected by the duke. An act passed in 1621, that the houses, instead of being covered with straw or boards, should have their roofs constructed of slate, tiles, or lead. This

act was renewed in 1667; and in 1698 an act was passed, regulating their height also. By this they were restrained to five stories, and the thickness of the wall determined to be three feet at bottom. In 1684, a lantern with a candle was ordered to be hung out in the first floor of every house, to light the streets at night. During the civil war, in 1649, the city was visited by the plague, when the infection was so violent, that it was almost depopulated, and the prisoners were discharged from the Tolbooth. In 1677 the first coffee-houses were licensed. The union, in 1707, had almost produced a war between the two kingdoms, which it was designed to unite, and on that occasion Edinburgh became a scene of the most violent disturbances, of which an account will be found under ENGLAND. During the time the act was passing, it was found necessary for the guards and four regiments of foot to do duty in the city. The disturbances were augmented by the disagreement of the two parties in parliament; and, notwithstanding the victory gained by the court, Sir Patrick Johnson, the provost, who voted for the union, was obliged afterwards to leave the country. In 1715 the city remained faithful to the royal cause; the city guard was increased, and 400 men raised at the public expense. The rebels, however, made themselves masters of the citadel of Leith; but, fearing an attack from the duke of Argyle, abandoned it in the night. A scheme was laid for their becoming masters of the castle of Edinburgh; but, being discovered, it failed, and a serjeant was hanged over the place where he had attempted to introduce the rebels. The loyalty of the city was equally remarkable in 1725, when disturbances were excited in Glasgow, and all parts of the kingdom, concerning the excise bill; for all remained quiet in Edinburgh, and government returned thanks to the magistrates for their vigilance. In 1736, however, the city fell under the royal displeasure, in the following singular manner:—Two smugglers having been condemned to be hanged, were conducted, as usual, each Sunday to the Tolbooth church, guarded by three soldiers. Having arrived there on one of these occasions before the congregation, one of the prisoners suddenly seized the guards, one in each hand, and the other in his teeth, calling out to his companion to fly, which he immediately did, and was never heard of afterwards. The smuggler who had thus saved the life of his companion without regard to his own, now became an object of general compassion; and the guard, who led him to execution, were severely pelted by the mob. Some of the soldiers were certainly wounded in the affair, and captain Porteous, who commanded the guard, was so much provoked, that he gave orders to fire, when six people were killed and eleven wounded. The evidence, however, of the fact, that the orders to fire were given, appears not to have been unexceptionable; nevertheless, on this ground, he was tried and condemned to be executed. The king was at this time in Hanover; and the case of the unfortunate Porteous having been represented to queen Caroline then regent, she granted him a reprieve; but such was the inveteracy of the people against him, that they determined not to allow him the benefit of the

royal clemency. On the day that had been appointed for his execution, therefore, the crowd gradually increased, shut the gates of the city, and burnt the door of the prison. They then took out Porteous, whom the magistrates found it impossible to rescue from their hands, dragged him to the grass market, the usual place of execution, and hanged him on a dyer's sign-post. It was afterwards proved that a member of parliament went to the commander in chief, and requested that he would send a party of soldiers to quell the disturbance, but was denied this request, because he could not produce a written order from the provost. The mob throughout this popular affair were most determined, and in every other point most orderly in their conduct. As they had not brought a rope with them, they broke open a shop where they knew one was to be had; and having taken it, and left the money upon the table, retired peaceably. They even allowed the unhappy Porteous fifteen minutes to pray and sing psalms before hanging him. The English government felt this insult, however, deeply. A reward of £200 was offered by royal proclamation to any person who would discover those concerned; but all efforts were insufficient to produce any discovery: the magistrates and the city therefore were now called to account. The provost was imprisoned three weeks before he was admitted to bail; after which, he and the four bailiffs, with the lords of justiciary, were ordered to London to attend the house of peers. On their arrival, after some debate, it was agreed that they should attend in their robes at the bar; but their examination was, after all, dropped. A bill, however, passed both houses, by which it was enacted, that the city of Edinburgh should be fined in £2000, for the benefit of Porteous's widow; and the provost was declared incapable of ever afterwards serving the government.

In 1745 the city was invested by the Pretender's army; and, on the 17th September, was surprised and taken by a party of Highlanders. The inhabitants were commanded to deposit their arms at Holyrood House; certain stores were required from the city, under pain of military execution; and an assessment of 2s. 6d. in the pound was imposed upon the real rents. The Pretender's army guarded all the avenues to the castle, which however held out against him, and a communication was even preserved with the city for supplies. After the battle of Culloden, the provost of Edinburgh was tried both at London and at Edinburgh, for not defending the city against the rebels; but the jury, after having been allowed to adjourn, under heavy penalties, one day, and having been enclosed another, acquitted him. The duke of Cumberland caused, at this period, fourteen of the rebel standards to be burned at the cross. The city not having, during these commotions, elected the magistrates at the usual time, it became necessary to apply to the king for the restoration of its government. This was readily granted, the burghes being allowed a poll; after which an entirely new set of magistrates was returned. With these transactions all interferences between the government and the metropolis of Scotland ended: the remainder of its history consists altogether of internal occurrences.

In 1716 the city bestowed a settled salary on the provost, in order to enable him to support the dignity of chief magistrate. This was at first £300, but has since been augmented to £500 which his lordship still enjoys. In 1718 it was recommended to the magistrates to distinguish themselves by wearing coats of black velvet, for which they were allowed £10; but this act being abrogated, in 1754, gold chains were assigned as badges of their office, which they continue to wear.

Tumults have been frequent in Edinburgh, and too often attended with the loss of lives. Those in 1740, 1763, and 1765, were occasioned by the dearth of provisions. One in 1742 was provoked by the custom of robbing the sepulchres of the dead for anatomical purposes: one in 1756 by the impressment of seamen for the war then commencing with France: one in 1760 began in consequence of the footmen of gentlemen interrupting the performances at the theatre: one in 1778 in a mutiny of lord Seaforth's Highland regiment: one in 1779 on account of the attempt to repeal the penal laws against the papists: one in 1780 on occasion of fifty Highland recruits having refused to embark at Leith for their appointed destination: one in 1784 from a belief that the distillers enhanced the price of meal by using unmalted grain: one in 1791 from political excitement on the king's birth-day. Another on the night of 31st December, 1811, was singular for its wantonness and atrocity. A band of young men, most of them under majority, but in numbers sufficient to set the regular police of the city at defiance, having armed themselves with bludgeons, assembled in the streets about eleven o'clock, then crowded with people on visits to their friends, as is usual on that night of the year, and proceeded to knock down and rob every person of decent appearance that came in their way. Their numbers prevented all resistance, and they kept possession of the streets till two o'clock of the morning of the new year. One watchman was killed; and, besides being robbed, many of the citizens were dangerously hurt. The activity of the police, however, soon traced out the leaders of this outrage: several of the rioters were seized on the spot. Four were tried and convicted, and three of these were executed on a temporary gibbet, erected on the middle of the High Street, on the 22d of April, 1812. None of them exceeded eighteen years of age.

In the autumn of 1822 Edinburgh was honored by a visit from his present majesty, George IV., which drew from all quarters of the country the grandest assemblage of people that had ever congregated in this ancient metropolis. Previously to his majesty's arrival, the palace of Holyrood House was repaired and fitted up with becoming elegance: triumphal arches were erected at Leith, where it was supposed he would land. A new carriage-way was formed from the great road over the Calton Hill to the front of the palace; the road through the park was opened; the Weigh House, which, but for this circumstance, might have encumbered the street for years, was removed, as if by magic. A road was formed from the chain-pier at Trinity, on the supposition that the king might land there;

and, for a month previous to the actual event, all was bustle and activity, to a degree never before witnessed in the oldest remembrance. At length, when it was known that the royal fleet had actually anchored in Leith Roads, an indescribable multitude of all ranks, from the peer to the peasant, assembled on the shore to witness his majesty's landing, and the procession from Leith to Edinburgh, the order of which had been previously arranged by the authorities. This was on the morning of Thursday the 15th of August. At twelve o'clock a gun from the royal yacht announced that the king had embarked in his barge, which then moved on; and, as it passed up the harbour, the multitude rent the air with acclamations. His majesty was received on a platform, covered with scarlet cloth, by the duke of Dorset, and other peers; the judges of the supreme courts, and the magistrates of Leith; all of whom he shook cordially by the hand. He then proceeded to an open carriage, drawn by eight beautiful bays, amid the continued cheers of the people; and, after being seated, with the duke of Dorset and the marquis of Winchester, it drove off at a slow pace, guarded by the Royal Company of Archers, and a detachment of the Scotch Grays. The procession now moved up Leith Walk, and, when the cavalcade had approached the barrier near Picardy Place, the lord provost, accompanied by the magistrates, presented his majesty with the silver keys of the city; after which they returned to their carriages, and took their places immediately after the lord lieutenant of the county, preceded by their officers. The procession then passed slowly by York Place, turned up St. Andrew's Square, and moved along Prince's Street to the Regent Bridge, Waterloo Place. On entering this splendid street, his majesty expressed his surprise and delight at the beautiful coup d'œil presented by the objects before him. Arthur's Seat in the distance—the Calton Hill at hand—buildings on every side of the most elegant structures—all terraced with human beings. At two o'clock the royal carriage reached Holyrood House; his majesty's arrival at which was announced by salutes of artillery from the Castle, Salisbury Crags, and the Calton Hill. After receiving the congratulations of the magistracy, and other authorities, his majesty drove off to Dalkeith House, which had been previously prepared for his residence. Fire-works were exhibited at Charlotte Square in the evening; and the following night there was a general illumination. It would require much more space than the limits of this work permit, to detail all that passed during his majesty's visit, or describe the general enthusiasm with which he was received. The crowds of well-dressed people in the streets—the numerous clans in their various costumes—the number of equipages—the variety of amusements—and the universal expression of good humor and delight, which every where prevailed, will not soon be forgotten by the citizens of Edinburgh.

Almost the only events of importance which we need now notice, are the great fires which occurred in this city in the year 1824. In June that year a fire took place, beginning at the

Royal Bank Close, which totally destroyed the houses in the upper part of the south side of the High Street, and the eastern angle of Parliament Square. This was followed by one of a still more calamitous nature in November of the same year. It began on the evening of Monday the 15th, at the head of the Old Assembly Close, and continued to increase and spread its ravages on every side with irresistible fury, till it became one grand and terrible conflagration, which threatened destruction to the whole of the old city. It was not subdued till it had laid the fairest part of the principal street in ruins, annihilated the whole houses of several lanes leading from the High Street to the Cowgate, and destroyed all the buildings of Parliament Square, except those connected with the parliament house. Fortunately the loss of life was not great. Four individuals only were killed, and twelve carried to the infirmary severely hurt. The calamity to the unfortunate persons who were rendered houseless, was also greatly lessened by a prompt and liberal public subscription on their behalf. Another fire took place in the High Street in February, 1825, which at its commencement threatened similar devastations, but the flames were happily subdued after the destruction of one large old tenement, and a few smaller houses adjoining it. Edinburgh, like London, partook of the general mania which prevailed in 1825 for speculating in Joint Stock Companies. Stock-jobbing, for the first time, became a business or profession in the Scottish metropolis; and schemes, as wild as the celebrated South Sea Bubble in England, or Mississippi scheme in France, promised to triumph over the characteristic prudence and proverbial caution of the people. The number and the variety of the public companies, which were either set a-going or projected within the short space of six months, excited astonishment for a time, but latterly they became the subject of ridicule; and, when some of the London bubbles fortunately burst, the delusion became so apparent, that all further undertakings in the joint-stock line immediately ceased. That some of the companies which were established at that time may turn out productive to the parties who embarked in them it would be unfair to doubt; but many of them will eventually prove sad lessons to individuals of the folly of rash and ill-timed speculation.

The charitable institutions and general improvements of Edinburgh will now engage our more distinct attention. I. Of the former, the most important is Heriot's Hospital, finely situated on a rising ground to the south of the Castle Hill. It owes its foundation to George Heriot, goldsmith to James VI., who at his death, after having provided for his relations, left to the magistrates and ministers of Edinburgh the residue of his fortune, amounting to £29,325 10s. 1½d., 'for the maintenance, relief, and bringing up of so many poor and fatherless boys, free-men's sons of the town of Edinburgh,' as that sum should be sufficient for. It was founded in July 1633, according to a plan of Inigo Jones; but, the work being interrupted by the civil wars, it was not finished till 1650. The expense of the building is said to have been upwards of

£27,000, and the hospital is now possessed of an income of about £5000 per annum, and is rapidly increasing. In this hospital the boys are taught English, Latin, Greek, and French, writing, arithmetic, book-keeping, mathematics, and geography; and for any other branch of education that may be required they attend masters out of the hospital, who are paid from the funds. The age of admission is from seven to ten, and the boys generally leave the hospital at fourteen; but, if necessary to prepare them for the university, they are retained for a longer period. Those wishing to follow any of the learned professions, are sent to college for four years after leaving the hospital, with an allowance of £30 per annum. Boys going out as apprentices to trades, are allowed £10 annually for five years, and £5 at the leaving of their apprenticeship. At present the number of boys is 180. The whole management is vested in a treasurer, appointed by the magistrates of Edinburgh, under whom are a house-governor, house-keeper, and the masters in the different branches of learning. II. Watson's Hospital; so named from its founder, George Watson, who, dying a bachelor in 1723, left £12,000 for the maintenance and education of the children and grand-children of decayed members of the Merchants' Company of Edinburgh. The scheme, however, was not put in execution till 1738, when the sum originally left had accumulated to £20,000. The present building was then erected, in which about eighty boys are maintained and educated. It stands on the south side of the city, a little to the south of Heriot's Hospital; and was erected at the expense of £5000. It is under the management of the master, assistants, and treasurer of the Merchants' Company, four old bailies, the old dean of guild, and the two ministers of the old church. The boys are genteelly clothed and liberally educated. III. The Merchants' Maiden Hospital was established by voluntary contribution in 1695, for the education and maintenance of daughters of merchant burgesses of Edinburgh. The governors were erected into a body corporate, by act of parliament, in 1707. The annual revenue is £3000. About eighty girls are maintained and educated; the majority of whom, on leaving the house, receive £3 6s. 8d. But, for the encouragement of merit, those who are found superior to the generality in the acquisition of their education, are allowed £3 6s. 8d. IV. The Trades' Maiden Hospital was founded in 1704 by the incorporation of Edinburgh, for the maintenance of the daughters of decayed members, on a plan similar to that of the former. Mrs. Mary Erskine, a widow gentlewoman of the family of Marr, contributed so liberally, that she was by the governors styled joint-governess of the hospital. About fifty girls are maintained in it, and, when they leave it, receive a bounty of £5 11s. 1½d. V. The Orphan Hospital was planned in 1732, by Andrew Gairdner, merchant, and other inhabitants. The revenue is inconsiderable, but the institution is supported by the contributions of charitable persons. Into this hospital orphans are received from all parts of the kingdom. About 150 are maintained in it. It is situated to the eastward of the north bridge; and is a

handsome building, consisting of a body and two wings, with a neat spire, furnished with a clock and two bells. The philanthropic Mr. Howard reckoned this institution one of the most useful charities in Europe, and a pattern for all others of the kind. VI. The Trinity Hospital was founded in 1461, by the queen of James II. At the Reformation it was stripped of its revenues; but the regent afterwards bestowed them on the provost of Edinburgh. The hospital was after this repaired, and appointed for the reception of poor old burgesses, their wives, and unmarried children, not under fifty years of age. It is situated at the foot of Leith Wynd, and comfortably maintains about forty of both sexes, who have each a room for themselves. There is a small library for their amusement, and they have a chaplain. About 100 out-pensioners have £6 a year each. The funds are under the management of the town council. VII. The Charity Workhouse was erected in 1743, by voluntary contributions. It is a large plain building, situated in the south district of the city. The only permanent fund for defraying the expense of this establishment is a tax of two per cent. on the valued rents of the city. The rest is derived from collections at the church doors and voluntary contributions; but, as these always fall short of what is requisite, recourse is frequently had to extraordinary collections. In 1813 it was found necessary to raise the assessment on the valued rents from two per cent. to five. The levy at the present time is at the rate of three and a half per cent. The number of inmates, men, women, and children, including about seventy lunatics, average from 800 to 900, and the average expense of maintaining each person is £8 2s. 3½d. per annum. There are two other charity workhouses in the suburbs, much on the same plan with that now described; one in the Canongate, and the other in St. Cuthbert's or West Kirk par. VIII. Gillespie's Hospital, founded about 1796 by James Gillespie of Spylaw, famous as a manufacturer of snuff in Edinburgh. Besides supporting a considerable number of aged persons of both sexes, this institution educates 160 boys gratis in a school erected for that purpose.

The Edinburgh Royal Infirmary was first projected in 1721, but the proposals which were published not receiving encouragement from the public, the design was dropped till it was again taken up by the College of Physicians in 1725. After considerable difficulty and delay, £2000 was procured, and a small house was opened for the reception of the sick poor in 1729. At length, the stock having increased to £3000, a royal charter was obtained to erect the subscribers into a body corporate, and in 1738 the foundation of the present structure was laid, and the building speedily executed. From that time forward donations were constantly received in aid of its funds; some of them of princely munificence. This establishment is attended by two physicians, chosen by the managers, who visit their patients daily, in presence of the students. The members of the College of Surgeons also used to attend in rotation according to seniority, but that plan has been altered, and the patients are com-

mitted to the care of particular surgeons, chosen annually by the managers. The building consists of a body and two wings, each three stories high, with an attic story, and very elegant front. The body is 210 feet long, and thirty-six broad in the middle. The wings are seventy feet long and twenty-four broad. In the different wards, 228 patients may be accommodated, in distinct beds. There are cold and hot baths for the patients, and also for the citizens; but, for these last the patients are never admitted. The theatre will hold upwards of 200 spectators. There is also a military ward, in consequence of which a small guard is always kept at the infirmary. From 3000 to 4000 patients are now admitted annually; and the yearly revenue of the establishment is £5000.

The first public Dispensary of Edinburgh was founded by Dr. Duncan in 1776, for the poor whose diseases are of such a nature as to render their admission into the infirmary either unnecessary or improper. Here the patients receive advice gratis four days in the week: a register is kept of the diseases of each, and of the effects produced by the medicines employed. All patients, not improper for dispensary treatment, are admitted on the recommendation of the elder or church-warden of the parish where they reside. A similar establishment was founded in 1815, called the New Town Dispensary, for the accommodation of the poor in the northern parts of the city. It has also a midwifery department, under the superintendence of an able physician. Both Institutions afford gratuitous vaccine inoculation. The expense of the medicines and the support of the general establishment at each are defrayed by voluntary subscription. A donation of one guinea, annually, entitles the contributor to recommend patients, and to be a governor for two years; and five guineas confers the same privilege for life. Dispensaries for diseases of the eyes and ears were also established in 1822, and institutions of the same kind for other maladies exist in different quarters of the city.

The charitable institutions thus particularised are, in point of antiquity and importance, the most remarkable in the Scottish metropolis; but there are others, also, of a very valuable nature, the mere enumeration of which will demonstrate that this city is as distinguished for humanity and benevolence, as it has long been for science and literature, and all the arts that tend to improve and adorn life. The following flourish vigorously at the present time:—1. The Lying in Hospital. 2. The Asylum for the Blind. 3. The Lunatic Asylum. 4. The Magdalen Asylum. 5. The Institution for educating Deaf and Dumb Children. 6. The Repositories. 7. The Ministers' Widows Fund. 8. The Society for the Sons of the Clergy. 9. The Society for Relief of the Destitute Sick. 10. Horn's Charity. 11. Walson's Bequest. 12. Thomson's Bequest. 13. Dr. Robert Johnson's Bequest and Strachan's Legacy of Craighook. 14. The Society for the Suppression of Begging. 15. Savings Banks. 16. The Institution for the Relief of Incapables. 17. The Association for the Relief of Imprisoned Debtors. 18. The House of Industry. 19. The Society for Clothing

the Industrious Poor. 20. The Society for promoting Religious Knowledge among the Poor. 21. The Society for the Relief of Indigent Old Men. 22. Two Female Societies for Relief of Indigent Old Women. The funds for all or most of these societies, are chiefly derived from contributions among the charitable, and the collections at occasional sermons.

The modern improvements of Edinburgh were commenced in 1753, at which time the city occupied the same space of ground that it had done for centuries before. When the foundation stone of the Royal Exchange was laid that year, there was a grand procession, and the greatest concourse of people ever remembered in Edinburgh. In 1756 the High Street was cleared by the removal of the cross; which many regretted, as it was a very ancient and elegant building. In 1763 the first stone of the north bridge was laid; and in 1767 an act of parliament was obtained, for extending the royalty of the city over the fields to the northward, where the New Town is now situated. In 1774 the foundation of the Register Office was laid; and so rapidly did improvements proceed for several years, that we find in 1778 St. Andrew's Square, and the streets immediately connected with it, on the original plan of the New Town, were nearly completed. In 1784 the project for rendering the access to the town equally easy on both sides was begun to be put in execution, by laying the foundation of the South Bridge. At the same time a great improvement was made, by reducing the height of the street several feet, all the way from the place where the cross stood to the Netherbow. The street was farther cleared by the removal of the town guard-house, which had long been complained of as an incumbrance. The great earthen mound across the north loch, connecting the new and old town to the west of the North Bridge, was commenced about the same period. In 1789 the new buildings of the University were begun, but, being on a scale far beyond the means possessed for completing them, they stood for many years unfinished; and it was not till 1815, when the exertions of Mr. John Marjoribanks, then lord provost and M. P., procured £10,000 in aid of the undertaking from parliament, and a recommendation to grant the same sum annually for seven years, that plans for its completion were adopted. The next improvement undertaken was the alteration in the old Parliament House, which was begun by the erection of a court-room and apartments for the Barons of Exchequer, and an open arcade in the front of the old building. The original plan included, also, an additional room for the second division of the court, a library room for the advocates and writers to the signet, and a county hall; all of which are now erected. A new prison was intended to be built about the same time with the earliest of these improvements on the Parliament House; but, from some objections raised to the site fixed on for its erection, the design was postponed for a time; and it was not till after an act of parliament for further improving the city had passed, in 1814, that the building of a new gaol was carried into effect. In 1815 Regent Bridge, over the low ground

which divided Prince's Street from the Calton Hill, was begun, together with the adjacent buildings, and it now forms an entrance of unequalled grandeur to the city. The new prison, begun in the same year, stands at its eastern termination, and on the opposite side a public hall has been erected by the incorporated trades of Calton. On the south side are the Stamp-office and Post-office, surmounted with the royal arms, and opposite to the last is a handsome building called the Waterloo Hotel. In 1817 the old Town was much improved by the removal of the remains of the range of old houses which incumbered the middle of the High Street. The old Tolbooth and Creech's land, the two extremities of the range, were taken down that year, and the Weigh-house followed them in 1822. In 1818 a canal was begun at the west end of the city, to be carried westward till it joined the Forth and Clyde canal about a mile beyond Falkirk. This undertaking was finished and open for trade and passage boats in 1822. Its estimated expense was £240,500, which was raised in shares of £50 each. The depth of this canal is five feet, and its width at the surface forty feet, contracting to twenty-two feet at the bottom. Few of the recent improvements promise to be so beneficial to the city and surrounding country as this. It has already had the effect of diminishing the price of coals to the citizens one-third. Besides these important undertakings, many other improvements have been going on at the same time, which a volume would hardly suffice to describe with accuracy. We may, however, mention the following, as having been finished since 1813. Two elegant episcopal chapels, St. George's Church in Charlotte Square, a catholic chapel, a new merchants' maiden hospital, a lunatic asylum, a new observatory, lord Melville's monument in St. Andrew's Square, St. Mary's Church, a house for the education of the deaf and dumb, and the Edinburgh Academy. Also numerous streets and ranges of the most elegant buildings, to the north of Queen Street, extending the city in that direction to the water of Leith, and eastward towards the town and port of Leith.

The Northern District, or New Town, consists of two divisions: the one includes the property laid off for building in 1767; and the other consists of all the additional ground occupied by the buildings erected or erecting to the east, west, and north of the former. The principal streets of the first division are George's Street, Prince's Street, and Queen's Street, running longitudinally in straight lines, and forming a parallelogram, which is intersected at right angles by seven streets, running north and south. This district also comprehends various elegant squares, and some of the finest public buildings. But, generally speaking, the houses are inferior to those of more recent erection in other parts of the city. The second division of the New Town comprehends the streets which descend from Queen's Street, to the north, and those which intersect them from east to west, together with all the recent improvements on the earl of Moray's grounds, the Warristar grounds, and the fields in the neighbourhood of Stockbridge. For the elegance of its buildings and the general advantages of situa-

tion and plan, this division has not, perhaps, its equal in the world. When the whole of the grounds now comprehended in what is called the New Town, are added to the southern and middle districts, the circumference of Edinburgh, is nearly eight miles.

The tribunals of Edinburgh have, in general, splendid accommodations. The judges of the session judiciary and exchequer courts hold their sittings within the buildings called the parliament house, in the great hall of which the Scottish parliament used to meet previous to the union. This hall is the only part of the ancient building which remains in its original state, the other apartments having undergone many alterations within these few years. It is 122 feet long by forty-nine broad, and has a fine arched roof of oak, painted and gilded. A fine statue of the late Viscount Melville, by Chantry, stands on a pedestal near the north end of it. The court of session, before its division into chambers, sat in a room adjoining to the great hall, formerly appropriated for the meeting of the privy council. This apartment, after the division took place, was enlarged and fitted up for the judges of the first division, and a marble statue of the late President Blair, by Chantry, was, in 1818, placed behind the chair of the presiding judge. A new room was likewise erected for the second division, entering from the west side of the great hall; and a statue of president Forbes, which formerly stood in a niche in the outer hall, was removed to this room and placed behind the chair of the lord justice Clerk. This statue was executed by the celebrated sculptor Roubiliac, at the expense of the Faculty of Advocates. An addition was likewise built to the Parliament House in 1819, containing two court rooms for two of the lords ordinary, and a new room for the faculty library. This library, which is one of the most valuable in Britain, now occupies apartments worthy of the rich and rare literary treasures which it contains. The library of the writers to the signet is kept under the same roof. In the centre of the square fronting the Parliament House, there is an elegant equestrian statue of Charles II., which has been much admired. It was cast in Holland, and cost £215. The original Parliament House buildings, as they stood prior to the recent additions and improvements, were begun in 1632, finished in 1640, and cost, what was then deemed, the enormous sum of £11,600 sterling. At the western extremity of the new library rooms of the advocates and writers to the signet, stands a magnificent county hall, the plan of which was taken from one of the finest models of antiquity, the temple of Erectheus, in the Acropolis of Athens. The principal entrance is taken from the Choragic monument of Thrasylus. The interior of this building is laid out in a large hall, a court room, a committee room, and, in the principal floor, for the use of the freeholders of the county. The other floors are occupied as offices for the sheriff, sheriff-clerks, &c. The expense of its erection was £15,000. It was finished in 1819. The accommodations afforded for the inferior law establishment of Edinburgh, if not nearly so

splendid, are generally as commodious as those we have thus described.

The North Bridge, which forms the main passage of communication between the Old and New Towns, was founded in 1763, but the contract for building it was not signed till August 21st, 1765. The architect was Mr. William Mylne, who agreed with the town council of Edinburgh to finish the work for £10,140, and to uphold it for ten years. It was also to be finished before Martinmas 1769; but on the 8th of August that year, when the work was nearly completed, the vaults and side walls on the south fell down, and nine people were buried in the ruins. The bridge was repaired, by pulling down some parts of the side walls; afterwards rebuilding them, and strengthening them with chain bars. The whole was supported at the south end by very strong buttresses and counterforts on each side; but on the north it has only a single support. The length of the bridge, from the High Street in the Old Town to Prince's Street in the New, is 1125 feet; the total length of the piers and arches is 310 feet. The width of the three great arches is seventy-two feet each; of the piers thirteen feet and a half; and of the small arches, each twenty feet. The height of the great arches from the top of the parapet to the base, is sixty-eight feet; the breadth of the bridge within the wall over the arches is forty feet, and the breadth at each end fifty feet. The communication betwixt the two towns by this bridge, though very complete and convenient for such as lived in certain parts of either, was yet found insufficient for those who inhabited the western districts. Another bridge being therefore necessary, it was proposed to raise an earthen mound, by filling up the valley with the rubbish dug out in making the foundations of houses in the New Town; and so great was the quantity, that this was accomplished so as to be fit for the passage of carriages in less than five years. Whilst the mound was forming it sunk at different periods above eighty feet on the west side, and was again filled up: 1800 cart-loads of earth were, upon an average, laid upon this mound every day. It has been said, with justice, to be a work unrivalled by any but Alexander the Great's at Tyre.

The South Bridge is directly opposite to the North, so as to make but one street, crossing the High Street almost at right angles. It consists of twenty-two arches of different sizes; but only one of them is visible, viz. the large one over the Cowgate; and even this is small, in comparison with those of the North Bridge, being no more than thirty feet wide and thirty-one feet high. This bridge was erected with a design to give an easy access to the great number of streets and squares on the south side, as well as to the country on that quarter from which the city is supplied with coals. So great was the rage for purchasing ground on each side of it for building, that the areas sold by auction at £50 per foot in front. They sold higher than ever was known in any city.

Regent Bridge terminates Prince's Street, the southern boundary of the New Town, at the east. This bridge, in connexion with the adjoining buildings, is one of the most splendid of the

recent improvements. It was begun in 1815, and finished in 1819. It now forms the principal entrance into Edinburgh from the new London road, by the south side of the Calton hill. The arch over the low Calton is 'semi-circular, and fifty feet wide. At the north front it is forty-five feet in height, and at the south front sixty-four feet two inches, the difference being occasioned by the ground declining to the south. The roadway is formed by a number of reverse arches on each side. The great arch is ornamented on the south and north by two open arches, supported by elegant columns of the Corinthian order. The whole property purchased to open up the communication to the city by this bridge cost £52,000, and the building areas sold for the immense sum of £35,000. The street along the bridge is called Waterloo Place, as it was founded in the year on which that memorable battle was fought, and was intended to commemorate the event.

The observatory is seated on the top of the Calton hill, and is furnished with all the instruments necessary for astronomical observations. The scheme for the erection of it was first adopted in 1736; and the earl of Morton and Mr. McLaurin, professor of mathematics, each contributed to its erection. The foundation stone was laid by provost Stodart, on the 25th of August 1776. But Mr. Adam the architect, conceiving the idea of giving the whole the appearance of a fortification, accordingly a line was marked out for enclosing the limits of the observatory, and of having Gothic towers at the angles. Thus the money designed for the work was totally exhausted, and the observatory long remained unfinished. In 1792, however, the building was completed by the magistrates. But it was not till 1812, when the astronomical institution was founded, that it was furnished with a set of philosophical instruments. In 1818 a new observatory was built a little to the east of the old one. It is now under the most superior scientific management, and while we write we observe a public announcement of his majesty's having bestowed £2000 upon it to purchase instruments.

The palace of Holyrood House, is the only royal habitation in Scotland, that is not in ruins. It is a handsome square of 230 feet in the inside, surrounded with piazzas. The front, facing the west, consists of two double towers joined by a beautiful low building, adorned with a double balustrade above. The gateway in the middle is decorated with double stone columns, supporting a cupola in the middle, representing an imperial crown, with a clock underneath. On the right hand is the great staircase, which leads to the council chamber and the royal apartments. These are large and spacious, and in one of them the Scottish peers meet, to elect sixteen of their number to represent them in the British parliament. The gallery is on the left hand, and measures 150 feet by 27½. It is adorned with the supposed portraits of all the kings of Scotland, from Fergus I. to James VII. In the apartments of the duke of Hamilton, which he possesses as hereditary keeper of the

palace, queen Mary's bed of crimson damask, bordered with green fringes and tassels, is still to be seen, but almost reduced to rags. Here also strangers are shown a piece of wainscot hung upon hinges, which opens in a trap-stair communicating with the apartments below. Through this passage lord Darnley and the other conspirators rushed in to murder the unhappy Rizzio. Towards the outward door of these apartments are large dusky spots on the floor, said to have been occasioned by Rizzio's blood, which could never be washed out. But a very slight degree of skill in chemistry is sufficient to perpetuate a miracle of this kind. The front of this palace is two stories high; the roof flat; but at each end the front projects, and is ornamented with circular towers at the angles. Here the building is much higher. Great part of it was burnt by Cromwell's soldiers; but it was repaired and altered into its present form after the Restoration. The fabric was planned by Sir William Bruce, a celebrated architect, and executed by Robert Mylne, mason. The environs of the palace afford an asylum for insolvent debtors; and adjoining to it is a field called St. Anne's Yards; beyond which there is an extensive park, called the King's Park, which, with the Duke's Walk, and the hills of Arthur's Seat, Salisbury Crags, and St. Leonard's Hill, are all within the privilege of the sanctuary. The abbey church, built by David I. in 1128, has been long in ruins. See HOLYROOD HOUSE. About the year 1795 some of the chief rooms of the palace were fitted up for the reception of part of the royal family of France, when proscribed and exiled from their native kingdom.

Edinburgh is divided into ten parishes, of which there are nine in the old city, named after the nine oldest churches, and one in the new town: besides the Canongate, and St. Cuthbert's, or West Kirk parishes; and those of South and North Leith; in all sixteen, included in the public enumerations of the inhabitants. It has a weekly general market on Wednesday, and an annual fair called Hallow Fair, in November, which lasts a week. The markets of Edinburgh are plentifully supplied with all sorts of provisions. Fresh butchers' meat, as well as fowl and fish, may be had every day; and no city can be better supplied with garden stuffs. A remarkable instance of the plenty of provisions with which Edinburgh is supplied was observed in 1781, when several large fleets, all of them in want of necessaries, arrived in the Forth, to the amount of above 600 sail, and having on board at least 20,000 men; yet the increased consumption of provisions, which certainly ensued upon the arrival of so many strangers, made not the least increase in the rate of the markets, inasmuch that several victualling ships, sent down by London merchants, returned without opening their hatches. The city mills are let to the corporation of bakers in Edinburgh; and the bread made in the city is remarkable for its good quality. The revenue of the city, arising partly from duties of different kinds, and partly from landed property, is upwards of £45,000 sterling per annum; but the

places of profit and emolument at the disposal of the town council, may be estimated at not less than £30,000.

The Theatre stands nearly opposite to the Register Office, in Shakspeare Square. The building is exceedingly plain externally, its only decorations being a statue of Shakspeare, and emblematical figures of tragedy and comedy on the top of the front. But it is elegantly fitted up within. This building was first opened as a place for theatrical performances in 1769; after much opposition from the clergy, who, for many years, had displayed the greatest hostility to every amusement of the kind. It was originally built by patent from the crown; and the prices of admission were then, three shillings for the boxes and pit, two shillings for the first gallery, and one shilling for the second or upper gallery. At these rates the house could hold with ease about £140. But the box seats were afterwards raised to four shillings, and subsequently in 1815 to five shillings. The seats in the pit and galleries still remain at the old rate. In 1809 the patent was acquired by Mr. Henry Siddons, who was at that time manager, and who continued to conduct it till he died in 1815. It has since been under the management of Mr. Murray, his brother-in-law, who, in addition to a regular company of excellent performers, presents the public at intervals with all the actors and actresses of eminence that appear on the boards of Drury Lane and Covent Garden.

Musical Entertainments, on a scale of great extent and in the highest perfection, have been frequent in Edinburgh, and the records of them go as far back as 1695. In 1672 a music hall was purposely erected at the foot of Niddry Street, after the model of the great Opera Theatre in Parma. This institution flourished for about seventy years, and was a favorite resort of the fashionable society of Edinburgh during the greater part of that time. Admission was obtained by special tickets, not transferable, and which were always gratis, except when benefits were given for the emolument of professional performers. The society, however, at length broke up, and the entertainments began to be gradually neglected. The hall was then disposed of for other purposes, and, after being some time occupied as a Baptist meeting-house, it was purchased in 1812 by the Grand Lodge, and has since been known by the name of Freemasons' Hall. After the weekly concerts of this society were discontinued, subscription concerts were performed in the Assembly Rooms, George's Street, and at Corri's Rooms, formerly the Circus, now the Caledonian Theatre. Musical festivals on a plan similar to that of the Oratorios in London, have also thrice taken place in Edinburgh, for the benefit of the public charities.

New Assembly Rooms were erected in George's Street, not unsuitable to the general elegance of the other buildings in the New Town, in 1787. The principal hall is ninety-two feet long, forty-two feet wide, and forty feet in height. There are also a Tea Room, two Card Rooms, and a grand Saloon. Two Assemblies are held weekly through the winter, the one a dancing, the other a card assembly. The card parties are rather se-

lect than numerous; but the dancing assemblies are well frequented. The Caledonian, a minor theatre, is the only other place of public amusement which our limits will permit us to particularise. This building was originally erected for equestrian exhibitions, and called the Royal Circus. It was subsequently converted into a place of worship, but after various changes, was fitted up as a minor theatre, in 1822.

No city in the world affords greater security to the inhabitants in their persons and properties than Edinburgh. Robberies are rare, and street murder hardly known; so that a person may walk out at any hour of the night in perfect security. This, in former times, was, in a great measure, owing to the vigilance of a town-guard. In 1700 it consisted of 126 men. From that time it continued embodied till the year 1805, when a new system of police was adopted. It was then reduced to an officer and thirty men, as a guard to the lord provost; and this last remnant was finally disbanded in 1817, when the old Tolbooth was taken down, the lower part of which had been occupied as their guard-room. The arms of this ancient body of men were the same as those used by the king's forces in general, but, in their capacity of night watchmen, they used a weapon called a lochaber axe, the use of which had long been discontinued in every other place. In addition to the town-guard, there was also a body of Militia, called the Trained Bands, consisting of 1600 men; but they have also been long dissolved. The officers, however, are still elected annually, and the provost, *ex officio*, bears the title of colonel as their commander.

In 1805, the town-guard being found inadequate to preserve the peace of the city and protect the inhabitants in its extended state, an act of parliament was applied for, and under its sanction a new system of police was established. By this statute the city was divided into wards, and commissioners were appointed for each ward, for the purpose of assessing the inhabitants in the expense of the establishment, and for other duties. A court was also established, with a judge of police and clerk, for the trial of offences; and the judge was empowered to punish by fine and compensation for damages, by imprisonment in jail, or by commitment to Bridewell. The examination of the offender and witnesses was taken *instanter* and *viva voce*, and the sentence pronounced was immediately executed. After an experiment of nearly seven years, this system was found not to answer in consequence of the extravagant powers which had been given to the court. A new bill was accordingly brought into parliament, and an improved system was established in 1812, the office of judge of police being abolished. The city was divided into twenty-six wards, with three resident commissioners for each; the sheriff of the county and the magistrates of the city were appointed judges; a superintendent was also appointed, and various enactments provided for the cleansing, watching, and paving of the streets, and for other matters of general police. This statute was further amended in 1822. In addition to the superintendent there are now three lieutenants and a clerk. The expense of the establishment for the year 1824 was £20,292 6s. 5d.

levied at the rate of one shilling in the pound on a rental of £373,736.

The town council of Edinburgh has the direction of all public affairs. The ordinary council consists of twenty-five persons; the extraordinary, of eight, making in all thirty-three. The whole is composed of merchants and tradesmen, whose respective powers and interests are so interwoven, that a sort of balance is preserved between the two bodies. The members of the town-council are partly elected by members of the fourteen incorporations, partly by their predecessors in office. These incorporations are, the companies of the surgeons (also erected into a royal college), goldsmiths, skimmers, furriers, hammermen, wrights, masons, tailors, bakers, fleshers, cordiners (or shoemakers), weavers, waukers, bonnet-makers, dyers, and merchants'. The lord-provost of Edinburgh, who is styled right honorable, is high sheriff, coroner, and admiral, within the city and its liberties, and the town, harbour, and road of Leith. He has also a jurisdiction in matters of death, now in desuetude. He is preses of the convention of royal boroughs, colonel of the trained bands, commander of the city guard and of the Edinburgh jail; has the precedency of all the great officers of state and of the nobility, walking on the right hand of the king, or of his majesty's commissioner, and has a sword and mace carried before him. Under him are four magistrates called bailies, whose office is much the same with that of the aldermen in London, excepting that they continue in office only one year. There is also a dean of guild, who has the charge of the public buildings, and without whose warrant no house or building can be erected within the city. He has a council to consult with a nominal treasurer, who formerly had the keeping of the town's money, which is now given to the chamberlain. These seven magistrates are elected annually; and with the seven of the former year, three merchants' and two trades' counsellors, and fourteen deacons, making in all thirty-three, form the council of the city, and have the sole management and disposal of the city revenues. Formerly the provost was also an officer in the Scottish parliament. The magistrates are sheriffs depute and justices of the peace; and the town council are patrons of all the churches of Edinburgh, patrons of the University, and electors of the city's representative in parliament. They have besides a very ample jurisdiction both civil and criminal, are superiors of the Canongate, Portsburgh, and Leith, and appoint over these certain of their own number, who are called baron bailies; but the person who presides over Leith has the title of admiral, because he has there a jurisdiction over maritime affairs. The baron bailies appoint one or two of the inhabitants of their respective districts to be their substitutes. These are called resident bailies, and hold courts in absence of the baron bailies, for petty offences, and discussing civil causes of small moment.

In a paper communicated by the Rev. Dr. Blair to Sir John Sinclair containing an enumeration of families and examinable persons in the parishes of the city, in 1722, the total number of

families was taken at 5979, and of persons 20,336. Adding the usual proportion of one-fourth of the examinable persons for children, the number of inhabitants would amount to 25,420; and allowing 15,000 for the suburbs, the total would be 40,420 souls. Maitland, in his History of Edinburgh, computing from the register of burials, makes the total number within the nine parishes 48,000 in 1753. And that this was very near the truth, appears from the enumeration actually made at the request of the Rev. Dr. Webster, in 1755, when the total number was found to be 57,195. But, as in this number, the inhabitants of south and north Leith were included, amounting to 9405, the total number of souls in the city and its environs turns out exactly 47,790, which is within 210 of Maitland's computation, and shows it to have been founded on just principles. The population of Edinburgh had increased very much within twenty years following, for the computation made by the late Mr. Hugo Arnot, in 1775, was considerably greater. The number of families in Edinburgh, Leith, &c., is stated by him at 13,806: which multiplied by five, (supposed more just than by six), and adding 1400 for the castle, &c., the number of souls in the city and suburbs, including Leith, amounted, in 1775, to 70,630. An enumeration was made in 1791 for the statistical report of the city, which stated the total of inhabitants, including those of the suburbs and town of Leith, at 84,886. But the accuracy of this enumeration is much doubted; because the parliamentary enumeration of 1801 makes the number of inhabitants in Edinburgh and its suburbs, including Leith, only amount to 82,560. A similar enumeration took place in 1811, when the return was 102,987. The last was in 1821, when the return was as follows: number of families, 29,193; males 62,099, females 76,136; total 138,235.

The chief prison, or gaol, stands on the Calton Hill, and was erected about ten years ago. It is in the Saxon style of architecture, and is in length 194 feet by forty feet deep. It is divided into six classes of cells, four for men and two for women, besides a division containing cells for condemned criminals. Each of the classes has on the ground floor a day room with a fire-place, an open arcade for exercise in bad weather, and an airing ground supplied with water. The number of cells is fifty-eight, each being eight feet by six. In the centre of the building there is a chapel, and at the top there are four infirmary rooms for the sick. The house of the governor or captain of the gaol, as he is called, is placed upon an eminence which overlooks the prison. It is a picturesque building in the Gothic style, and contains, besides the governor's apartments, a committee room for the gaol-commissioners, a school for the instruction of juvenile delinquents, &c. The whole is surrounded by a wall about twenty feet high. There is also a prison called the Canongate Tolbooth, built in the reign of James VI., chiefly occupied as a debtors' prison. Besides this there are court-houses and prisons in the other suburbs of the city, but none of them worthy of particular notice. The old Tolbooth, which stood at the north-west corner of St. Giles's

prominent feature in its history and character to deserve our distinct notice. In 1581 a grant was obtained from James VI. for founding a college within the city of Edinburgh; and the citizens, aided by various donations, purchased part of the areas, chambers, and church of the collegiate provostry and prebends of the Kirk-a-field, otherwise called *Templum et Præfectura Sanctæ Mariæ* in campis, as a suitable site for it. In 1583 the provost, magistrates, and council, the patrons of this new institution, prepared the place for the reception of teachers and students; and in October, 1583, Robert Rollock, whom they had invited from a professorship in the University of St. Andrew's, began to teach in it. Other professors were soon after elected; and Rollock was made principal of the College, and professor of divinity. The offices of principal and professor of divinity remained united till 1620. In 1617 James VI. having visited Scotland, commanded the principal and regents to attend him in Stirling Castle, where they held a solemn philosophical disputation, and the king desired that their college should for the future be called The College of King James, which name it still bears in all its diplomas and public deeds. For some time the college consisted only of the principal and four regents or professors of philosophy, who each instructed one class of students for four years, in Latin, Greek, logic, mathematics, ethics, and physics. It was not till about the year 1710 that the regents began to be confined each to a particular profession; since which time they have been commonly styled Professors of Greek, Logic, Moral Philosophy, and Natural Philosophy.—The first medical professors instituted at Edinburgh, were Sir Robert Sibbald and Dr. Archibald Pitcairn, in 1685. For thirty years afterwards, however, a summer lecture, on the officinal plants, and the dissection of a human body, once in two or three years, completed the whole course of medical education at Edinburgh. In 1720 an attempt was made to teach the different branches of physic regularly; which succeeded so well, that, ever since, the reputation of the University as a school for medicine has been undisputed. The College has a fine library, founded in 1580, by Mr. Clement Little, advocate. It is enriched by a copy of every book entered in Stationers' Hall, according to statute, and it now contains 70,000 volumes. The students of divinity, who pay nothing to this library, have one belonging to their own particular department. The museum contains a capital collection of natural curiosities, the number of which is daily increasing; and, under the admirable management of professor Jamieson, it promises to become the most interesting and important in Britain. The anatomical and obstetrical preparations are peculiarly valuable. This university having been instituted after the Reformation, among a frugal people that had no love for ecclesiastical dignities, it differs greatly from the wealthy foundations which receive the name of Universities and colleges in England, or in the Catholic countries of the continent of Europe. It still consists of a

single college, which enjoys the privilege of conferring degrees.

The branches of education at present taught in it are the following: 1. *Literature and Philosophy*, comprehending humanity, or Latin, Greek, mathematics, logic, moral philosophy, natural philosophy, rhetoric, belles lettres, universal history, and natural history. 2. *Theology*, comprehending divinity, church history, and oriental languages. 3. *Law*, comprehending civil law, institutes and pandects, Scots' law, public law, conveyancing. 4. *Medicine*, comprehending dietetics, materia medica, and pharmacy; practice of physic, chemistry, and chemical pharmacy; theory of physic, anatomy, and surgery; theory and practice of midwifery; medical jurisprudence, clinical medicine, clinical surgery, and military surgery. During the Summer session lectures are given on the following branches, viz. botany, natural history, midwifery, clinical lectures on medicine, and clinical lectures on surgery. The principal professors and lecturers are at present thirty-one in all; and the number of students is about 2400. The professorships of church history, natural history, astronomy, law of nature and nations, and rhetoric, are in the gift of the crown. The professor of agriculture was nominated by Sir William Pulteney, the founder of the institution. The remaining chairs are in the gift of the town council. Besides the classes here enumerated, the medical professors alternately give clinical lectures upon the cases of the patients in the Royal Infirmary. The integrity and discernment uniformly displayed in the appointment to professorships in this university, have contributed greatly to extend its reputation both at home and abroad. From confidence in the talents and industry of the professors, it has become a seat of education, not only to the youth of the united kingdom, but, to the honor of our country, students have been attracted to it from every nation in Europe, and from almost every civilised country on the globe. About thirty years ago, the old buildings of the college being thought quite unsuitable to the dignity of such a flourishing seat of learning, the magistrates and council set on foot a subscription for erecting a new structure, according to a design of Robert Adam, Esq., architect. Most of the old fabric was in consequence pulled down, and the new building is now in considerable forwardness. It is upon a superb scale, and the whole, when finished, if not the most splendid structure of the sort in Europe, will be the completest and most commodious. The estimate for completing the whole was about £63,000. The six columns in the front are not to be equalled in Britain. The shaft of each is twenty-three feet high, and three feet diameter, of one entire stone. The botanical garden belonging to the university is situated to the northward of the village of Canon-mills, and consists of about twelve acres. But the funds for the support of this garden are very inadequate to the purpose, not exceeding £170 per annum.

See MID-LOTHIAN.

EDIT, *v. a.* } Old Fr. *editer*; Lat. *edo*,
 EDITION, *n. s.* } *edere*, to set forth. To
 EDITOR, *n. s.* } publish; and hence to pre-
 EDITORIAL, *adj.* } pare a work for publication.
 It is now particularly applied in our language,
 to the duty of superintendence and correction,
 in distinction from the original composition of a
 book.

These are of the second *edition*. *Shakspeare.*

The business of our redemption is to rub over the
 defaced copy of the creation, to reprint God's image
 upon the soul, and to set forth nature in a second and
 a fairer *edition*. *South.*

I cannot go so far as he who published the last
edition of him. *Dryden's Fables, Preface.*

The Code, composed hastily was forced to undergo
 an emendation, and to come forth in a second *edition*.
Baker.

This English *edition* is not so properly a translation,
 as a new composition upon the same ground.

Burnet.

When a different reading gives us a different
 sense, or a new elegance in an author, the *editor*
 does very well in taking notice of it.

Addison's Spectator.

This nonsense got into all the *editions* by a mistake
 of the stage *editors*. *Pope's Notes on Shakspeare.*

Here you see the two strongest inducements are
 held forth;—first, that nobody ought to read it; and,
 secondly, that every body buys it: on the strength of
 which the publisher boldly prints the tenth *edition*,
 before he has sold ten of the first. *Sheridan.*

I sent it in a letter to the *editor*,
 Who thanked me duly by return of post—
 I'm for a handsome article his creditor.

Byron.

EDMONDSON (Joseph), a genealogist and
 herald painter, was appointed in 1764, Mowbray
 herald extraordinary. He was also a member of
 the Society of Antiquaries. He died in 1786.
 His works are, *Historical Account of the Gre-
 ville family*, 8vo.; *A Companion to the Peerage*,
 8vo.; *A Body of Heraldry*, 2 vols. folio; *Baro-
 nageum Genealogicum, or the Pedigrees of Eng-
 lish Peers*, 6 vols. folio.

EDMUND I, king of England, the son of
 Edward the Elder, succeeded his brother Athel-
 stan A. D. 941, and exhibited proofs of great

courage and abilities during a short reign of about
 eight years. He was murdered by Leolf, a
 robber, A. D. 948. See ENGLAND.

EDMUND II, surnamed Ironside, from his
 strength and valor, succeeded his father Ethel-
 red II. A. D. 1016, in that part of England
 which was not then possessed by the Danes.
 He was endowed with great abilities, but was
 murdered by the traitor, Edric, duke of Mercia,
 before he had reigned a year. See ENGLAND.

EDOM, Heb. עֲדוֹם, i. e. red; or Esau, the
 son of Isaac and brother of Jacob. The name
 Edom was given him, either because he sold his
 birth-right to Jacob for a mess of red pottage, or
 by reason of the color of his hair and complexion.
 Idumæa is derived from Edom, and is often
 called in Scripture the land of Edom. See the
 next article.

EDOM, or Idumæa, in ancient geography, a
 district of Arabia Petraea. A great part of the
 south of Judæa was also called Idumæa, because
 occupied by the Idumæans, upon the Jewish
 captivity. But Edom Proper appears not to
 have been very extensive, from the march of the
 Israelites, in which they compassed it on the
 south eastwards, till they came to the country of
 the Moabites. Within this compass lies mount
 Hor, where Aaron died; marching from which
 the Israelites fought with king Arad the Canaan-
 ite, who came down the wilderness against them.
 And this is the extent of the Idumæa Propria,
 lying south of the Dead Sea; but in Solomon's
 time extending to the Red Sea.—1 Kings ix. 26.

EDRISSI (Mohamed ben Mohamed, Scherif
 al) an Arabian prince and geographer of the
 twelfth century, who, being expelled from his
 dominions in the south of Egypt, took refuge in
 Sicily, at the court of Roger II. Here he com-
 posed *Geographical Recreations*; and construct-
 ed a silver globe, said to have weighed 400
 Greek pounds, on which were inscribed the di-
 visions of the earth, so far as they were then
 known. His book, which has been termed *Geo-
 graphia Nubiensis*, from its containing much
 information relative to the eastern parts of Africa,
 was translated into Latin by Gabriel Sionita
 and John Hesronita, and published at Paris, 4to,
 1619.

E D U C A T I O N .

EDUCATE, *v. a.* } Lat. *educare*, from *duco*,
 EDUCATION, *n. s.* } to lead. To bring up
 from youth; instruct youth. See Hooker's fine
 definition of the substantive.

Education and instruction are the means, the one
 by use, the other by precept, to make our natural fa-
 culty of reason both the better and the sooner to judge
 rightly between truth and error, good and evil.

Hooker.

The best time for marriage will be towards thirty,
 or as the younger times are unfit, either to choose or
 to govern a wife and family, so, if thou stay long, thou
 shalt hardly see the *education* of thy children, who,
 being left to strangers, are in effect lost; and better
 were it to be unborn than ill-bred.

Raleigh to his Son.

' Diversity of *education*, and discrepancy of those
 principles wherewith men are at first imbued, and
 wherein all our after reasonings are founded.

Lord Digby to K. Digby.

If the children of religious parents, after all
 Christian nurture, shall shame their *education*, God
 takes it more heinously, and revenges it more sharply.

Bp. Hall. Contemplation.

Their young succession all their cares employ;
 They breed, they brood, instruct and educate,
 And make provision for the future state.

Dryden. Virgil.

Some independent ideas, of no alliance to one an-
 other, are, by *education*, custom, and the constant din
 of their party, so coupled in their minds, that they al-
 ways appear there together. *Locke.*

What education did at first conceive,
Our ripened age confirms us to believe.

Pomfret.

Education is worse, in proportion to the grandeur of the parents: if the whole world were under one monarch, the heir of that monarch would be the worst tutored mortal since the creation.

Swift. On Modern Education.

Education at our public schools and universities is travelling in a waggon for expedition, where there is a bridle road that will take you by a short cut to *Parassus*, and the polisher has got the key of it.

Cumberland.

Lively and sensible, and having received an education somewhat above her rank, her conversation was very agreeable. Ralph read plays to her every evening.

Franklin.

True, and then as to her manner; upon my word I think it is particularly graceful, considering she never had the least education: for you know her mother was a Welsh milliner, and her father a sugar baker at Bristol.

Sheridan.

EDUCATION. We have explained this term verbally. A more ample and satisfactory definition has been given thus: 'Education is that series of means, by which the human understanding is gradually enlightened, and the dispositions of the human heart are formed and called forth, between early infancy and the period when a young person is considered as qualified to take a part in active life.'

The word education, among the ancients, seems to have had a signification different from that which is affixed to it by the moderns. *Educit obstetrix*, says *Varro*, *educat nutrix*, *institut paragogus*, *docet magister*. According to this distinction, education, institution, and instruction, are as different as the midwife, the nurse, the preceptor, and the master. But other writers, both ancient and modern, have considered education in the comprehensive sense expressed in the above definition; and as no subject is of more importance than this, it being the practical foundation of all mental acquirements, as well as of all virtue, many distinguished authors have devoted their minds to the consideration of it. *Lycurgus*, and others of the most eminent legislators of antiquity, considered a proper education as so necessary to form good citizens, that they incorporated their systems of education with the codes of laws they gave to their countrymen. But among all the legislators and authors of antiquity, of whose works any relics have come down to us, none appears to have written with more propriety on this subject, than the celebrated *Quintilian*, who taught rhetoric in Rome under *Domitian*, *Nerva*, and *Trajan*.

Among the moderns, the sublime *Milton*, and the judicious *Locke*, have left treatises on this important topic. The late lord *Kames* too was the author of an excellent tract, entitled *Loose Hints on Education*; and the fanciful *Rousseau*, whose genius and eccentricities are well known to the public, devoted his *Emilius* to the consideration of this subject. To these a host of respectable modern names might be added. But we do not consider a *Dictionary of Science* as the proper depository for extensive speculations of this kind. Our whole work, indeed, is a course of elementary, and therefore

• VOL. VII.

educational treatises; what is more must be either purely speculative; or it must involve details which are varied with the designs of every parent, and the talents, station in life, and destiny of every young person. It will suffice, therefore, here briefly to review the principal ancient and modern systems of education, adding a more particular account of one or two modern and material improvements.

The system of *Lycurgus*, however well adapted to a state just emerging from barbarism, was but a species of detached military training; designed to form the heroic at the expense of all the other virtues, and extinguishing all regard to the interest of other states as well as family and personal interests, in an exclusive spirit of supposed patriotism. For, in reality, his system was too confined to be truly patriotic. It had no tendency to elevate the human intellect, or to stimulate into activity many of the noblest and best affections of our nature. Had his institutions been preserved in their pristine vigor, the Spartans might have continued precisely the same; but they would have been incapable of receiving the knowledge of those arts which adorn and improve mankind. The system, indeed, of a state education has always been too cumbrous for management; it has the appearance at the best of endeavouring to mould all minds into one form, and, by having a strong tendency to produce habitual submission to the will of one, of being highly unfavorable to public liberty. No doubt can exist which is to be preferred, the total neglect of education, or this artificial and forced method of attempting it; but all that the state has legitimately to do is, to take care that none shall be without the means of instruction, and to leave private persons to follow the bent of their own inclinations in the employment of them. In those nations which were first civilised, the power of the parent was considered as absolute; and as implicit submission was, from the first, inculcated upon the young, the labor of education was greatly diminished, and the limited knowledge and sentiments of the parent were very easily communicated to youth. The round of duty was less extensive, and its parts less complicated than at present. Among the Israelites, where moral education appears to have made the greatest advances, the system of duty was completely laid down in the written law; so that all the knowledge which the age and country possessed was certainly to be gained, and the moral principles certainly to be regulated aright, where the parent employed wisely that authority which the law enforced, and which the customs of the times would otherwise have allowed.

The necessity of a tolerably correct direction of the early propensities, in order to promote domestic comfort, must in a great number of cases have led to such direction of them, without any view to the future advantage of the individual. But with respect to those who were to come forwards in the employments of the state, or in any other way to be exposed to the notice of their countrymen, the advantages of early instruction in knowledge, and of the early cultivation of those qualities which the wants of the age and

2 Y

country made of great estimation, were so obvious, that they appear to have led, in a variety of cases, to great attention to the work of education; and though we have not, in many instances, any account of the procedures of the ancients, yet, in the few circumstances which have been recorded, we perceive that, long before any thing like a systematic plan of education was adopted, individuals made education an object of primary concern.

One grand object of moral education, so far as it respects rectitude of dispositions and affections, is to cultivate the habit of self-control. Religious people, of all periods, who have possessed the light of revelation, have, in a particular manner, been sensible that this habit lies at the foundation of moral worth; and where the authority of the parent is generally preserved, the cultivation of this habit follows as a matter of course. It requires a wise choice of means to prevent filial submission from being the submission of a slave, rather than of a child: but where it is acquired, and rightly directed, the foundation is laid for submission and obedience to the will of God; and, where *this principle* takes a firm hold on the mind, almost every thing is done that could be wished, to further the progress of the individual towards moral worth. A maxim of the highest authority, now indeed, is felt in all its truth, 'The fear of the Lord is the beginning of wisdom.' In reading almost the only systematic work of antiquity on the subject of education, that of Quintilian, we become convinced of the writer's great good sense, excellence of disposition, and extensive information; and from his work, though it had a particular object in view, much may be learned by the modern instructor. Most excellent principles are scattered up and down in those general parts, which amply repay our perusal, though we are seldom invited to proceed by elegance of diction, or brilliance of thought: and the different facts he mentions, give us reason to suppose that, in his time, education was in a most degraded state at Rome.

Among the moderns few names are more justly venerated than that of John Milton. His life was devoted to study; and part of it was employed in instructing youth. Among his other works we find a Treatise on Education. He had himself been educated according to the plan long established in the English universities. The object of his directions is to exhibit a plan of 'a better education, in extent and comprehension far more large, and yet of time far shorter, and of attainment far more certain, than any that had yet been in practice.' The following is the substance of his treatise:—'The end of learning is to cultivate our understandings, and to rectify our dispositions, by enriching our minds with the treasures of wisdom. But, in the present modes of education, this design does not appear to be kept in view. The learner of Latin is burdened with rules, themes, verses, and orations; but no care is taken to make him master of the valuable knowledge which the classics contain. And, when he advances farther, he is driven into the thorny paths of logic and metaphysics. So, when his studies are completed, he

is almost as destitute of real knowledge as when he first entered a school.' To render learning truly beneficial, instead of the school and university education which youth at present receive, Milton proposes that the place of both school and university be supplied by an academy, in which they may acquire all that is taught at either, except law and physic.

'Let the academy,' he says, 'afford accommodation for 150 persons; twenty of whom may be servants and attendants. As many academies as are necessary may be afterwards erected on the model of this one. Let the youth who are introduced into this academy begin with learning the principal rules of grammar. In their pronunciation of Latin, let them follow that of the Italians, as that of the English is indistinct, and unsuitable to the genius of the language. Next read to them some entertaining book on education, such as the three first books of Quintilian, in Latin; and Cebes, Plutarch, or some other of the Socratic discourses, in Greek; and inspire them, by seasonable lectures, with love for learning, admiration of great and virtuous characters, and a disposition to cheerful obedience. At a different hour let them be instructed in arithmetic and geometry. Between supper and bed time instruct them in the principles of religion and the sacred history. From the writers on education, let the pupils pass to the authors on agriculture, to Cato, Varro, and Columella. Before half these authors be read, they cannot but be pretty well qualified to read most of the Latin prose authors. They may now learn the use of the globes, and make themselves acquainted with the ancient and modern maps. Let them about this time, begin the study of the Greek tongue, and proceed in it as in the Latin: they will not fail to overcome, in a short time, all the difficulties of grammar; after which they will have access to all the treasures of natural knowledge to be found in Aristotle and Theophrastus. In the same manner they may make themselves acquainted with Vitruvius, Seneca, Meia, Celsus, Pliny, and Solinus. Let them next turn their attention to mathematics, beginning with trigonometry, as an introduction to fortification, architecture, and navigation. To teach them the knowledge of nature, and the arts of life, let them have the instructions of artists and mechanics, whose skill has been obtained by actual practice. They will now read the poets with ease and pleasure. From these let them proceed to the moralists; after which they may be allowed the best Greek, Latin, and Italian dramatic compositions. From these let them proceed to politics: let them here study the law of Moses, the admirable remains of the ancient lawgivers of Greece, the Roman tables, edicts, and pandects, concluding with the institutions of their mother country. Let them next be more particularly instructed in the principles of theology; having by this time acquired the Hebrew language, together with the Chaldee and the Syriac dialect, whereby they may read the Scriptures in their original tongue. Thus furnished, they will be able to enter into the spirit of the noblest historians and poets. To get by heart, and repeat in a proper manner, passages from the writ-

ings of some of these, will have the happiest effects in elevating their genius. Let this stately edifice be crowned with logic and rhetoric. This would unite the advantages of an Athenian and a Spartan education: for the pupils should be taught the exercises of wrestling and fencing, and the whole military discipline.' Such are the sentiments of our admired poet on education—a plan to be expected from one who was an enthusiastic admirer of the sciences, arts, and institutions of Greece and Rome; and who, at the same time, from his religious and political principles, was no friend to the universities.

The name of Locke is almost equally calculated to excite the attention of every reader. He was capable of thinking for himself; but, unlike Rousseau, more desirous of rendering himself useful, than of being admired for singularity: he had examined without prejudice the effects of those modes of education of which he disapproves. To render himself useful to mankind, he could descend from the heights of science to the humble task of translating *Æsop's Fables*.

Mr. Locke, in his *Treatise on Education*, proposes the two great objects, of preserving and strengthening the bodily constitution; and informing the understanding with useful knowledge, while we cherish good dispositions in the heart. In his directions on the first of these heads, he recommends plain fare, simple and light clothing, with abstinence from strong liquors, and as much as possible from medicine, together with temperance and early rising. In one thing, however, few parents will be willing to comply with Mr. Locke's advice. He not only directs that children's feet be frequently bathed in cold water; but even wishes that their shoes were always kept in such a condition as to admit water freely. This he thinks likely to fortify the constitution in such a manner, as to render them less liable, in the course of life, to such diseases as arise from any unusual exposure to wet or cold. Whatever may be thought of this advice, his method of cultivating the understanding, and forming the dispositions, deservedly claims the attention of parents and preceptors. With a virtuous indignation he reprobates that folly by which we generally corrupt the heart and spoil the temper of children, in idleness; so as to render them incorrigible as they advance in life. On the other hand he reckons it neither necessary nor prudent to treat them with harshness or severity. Let them be formed to obedience from their earliest years: let them be accustomed to submit implicitly to the direction of those on whom they depend. But beware of souring their tempers, and depressing their spirits by harshness; as well as of accustoming them to neglect their duty, except when allured to it by the hopes of reward. Inspire them with a sense of shame, and with a generous thirst for praise. Caress and honor them when they do well; treat them with neglect when they act amiss. This will produce much better effects than if you were at one time to chide and beat them; at another, to reward them with a profusion of foolish indulgences.

Mr. Locke does not approve of forming children at too early an age, to that politeness and

propriety of manners which should distinguish them when they become men. This great man was of opinion that a private education is more favorable than a public one to virtue, and scarcely less favorable to learning. He advises us more particularly to keep our pupil at a distance from evil example; to choose the most favourable seasons for instruction; to enforce obedience strictly, but rarely by blows. If his engagements in life prevent the parent from superintending and directing his son's education personally, let him commit him to the care of a virtuous and judicious tutor, who is rather a man of experience in the world than of profound learning; for it is more necessary that the pupil be formed for conducting himself with prudence in the world, and be fortified against those temptations to which he will be exposed in active life, than that his head be stuffed with Latin and logic. Mr. Locke, although his own mind was stored with Grecian and Roman literature, is against that application to ancient learning, which was then indispensably required in the education of youth. He considers languages and philosophy as rather having a tendency to render the youth unfit for acting a prudent and becoming part in life, than forming him for it; and he therefore insists that these should be but in a subordinate degree the objects of his attention.

Curiosity, he thinks, ought to be industriously roused in the breast of the child, and cherished by meeting the readiest gratification. He should be indulged in play, while he continues to play with keenness and activity; but not suffered to loiter about in indolence. To restrain him from fool-hardy courage, point out to him the dangers to which it exposes him: to raise him above timorous cowardice, and inspire him with manly fortitude, accustom him from the earliest period of life to an acquaintance with such things as he is most likely to be afraid of: subject him now and then to pain, and expose him to danger; but let such trials be judiciously conducted. When, from idleness or curiosity, children treat dogs, cats, birds, butterflies, &c., with cruelty, Mr. Locke advises that they be carefully watched, and every means used to excite them to generous sensibility. Allow them to keep tame birds, dogs, &c., only on condition of their using them with tenderness. He supposes that this unhappy disposition to cruelty is occasioned, or fostered by people's laughing when they behold the impotent efforts of children to do mischief; and encouraging them in maltreating those creatures which are within their reach. He censures the practice too of entertaining them with stories of fighting and battles; and representing characters distinguished for atrocious acts of inhumanity as great and illustrious. Let such practices be refrained from, if you wish to inspire your child with generous and humane sentiments. Teach him gentleness and tenderness, not only to brutes but also to servants and companions. The enquiries of a child ought to be answered readily, that great man insists, though his questions be put in awkward language. Curiosity is natural, and, if not repressed, he will often be excited by it to the pursuit of knowledge. Let him find

his eagerness in this pursuit a source of applause and esteem. Avoid the folly of those who sport with the credulity of children, by answering their questions in a ludicrous or deceitful manner. When he attempts to reason on such subjects as are offered to his observation, be careful to encourage him : praise him if he reasons with any degree of plausibility ; even if he blunders, beware of laughing at him. With regard to amusements ; while you indulge him freely in innocent diversions, encourage him to exercise his own ingenuity in constructing them for himself. In virtue, wisdom, breeding, and learning, he comprehends all that is necessary to enable his pupil to act a respectable part in life. In forming a boy to virtue, he advises first to inform him of the relation subsisting between human creatures and a supreme independent Being, and to teach him, that obedience and worship are due to that Being, but beware of impressing his mind with any notions concerning spirits or goblins, which may render him incapable of bearing darkness or solitude. Next labor to impress his mind with a veneration for truth ; habituate him to a strict adherence to it ; and endeavour to render him gentle and good-natured.

Good breeding forms no inconsiderable part of a good education. In teaching this, Mr. Locke advises, 1st, To inspire a youth with a disposition to oblige all with whom he is conversant ; next, to teach him how to express that disposition in a becoming manner. Let boisterous roughness, contempt of others, censoriousness, impertinent raillery, and a spirit of contradiction, be banished from his temper and behaviour. But beware of leading him to regard the mere forms of intercourse as matters of the highest importance. Teach him that genuine good breeding is only an easy and graceful way of expressing good sense and benevolence in his conversation and deportment.

Mr. Locke advises to initiate the child in reading, as an amusement, without letting him know that he is engaged about a matter of any importance : or teach him to consider it as a high honor to be permitted to learn his alphabet ; otherwise he will turn from it with disgust. Such books only as are plain, entertaining, and instructive, should at this time be put into his hands. Mr. Locke disapproves of an indiscriminate perusal of the Bible at this period of life ; but reckons it highly proper, to cause him to peruse some of its beautiful historical passages, with its elegant and simple moral precepts. He advises next to proceed with writing, and drawing, if the boy be not naturally incapable of acquiring the latter.

The scholar must now begin an acquaintance with other languages. Yet, says Mr. Locke, let none waste their time in attempting to acquire a knowledge of Latin, but such as are designed for some of the learned professions, or for the life of a gentleman without a profession. To these last it may be useful ; to others this writer thinks it is wholly unserviceable. But in learning the Latin tongue, he proposes, as a much happier method than burdening and perplexing a boy with rules of grammar, to make him speak it

with a tutor sufficiently master of it for that purpose. He proposes, that if we cannot conveniently have the boy taught Latin by conversation, the introductory books should be accompanied with an English version, to which he may have recourse, for the explanation of the Latin. And he again prohibits perplexing him with grammatical difficulties, as at his age, it is impossible to enter into the spirit of these things.

Skill in grammar, says Mr. Locke, may be useful to those whose lives are to be dedicated to the study of the dead languages : and that knowledge, which the gentleman and the man of the world may have occasion to derive from the ancient languages, may be acquired without a painful study of prosody or syntax. As the learning of any language is merely learning words ; if possible, let it be accompanied with the acquisition of some real knowledge of things ; such as the nature of plants, animals, &c. He insists that the boy be not burdened and tormented with the composition of Latin themes and verses. Neither let his memory be oppressed with whole pages and chapters from the classics. Such ridiculous exercises have no tendency, whatever prejudice may urge to the contrary, to improve him either in the knowledge of languages or of nature.

Mr. Locke, however, wishes that the French language were learned along with the Latin ; and these to be accompanied with the study of arithmetic, geography, history, and chronology. Let these branches of knowledge be communicated to the learner in one of the two languages ; and he will thus, he thinks, acquire the language with greater facility. We fear, however, the difficulty of acquiring these sciences, particularly the two first, would thus be proportionably increased. One method which Mr. Locke recommends for facilitating the study of language is, to put into the youth's hand, as soon as he has acquired a tolerable knowledge of chronology, some of the most entertaining Latin historians : the interesting nature of the events which they relate will not fail to command his attention, in spite of the difficulty which he must find in making out their meaning. The Bible and Cicero de Officiis will be his best guides in the study of ethics. The law of nature and nations, as well as the civil and political institutions of his country, he also recommends as important objects, which he ought to study with the most careful attention. Rhetoric and logic, with all their rules and terms, will contribute little to render him an acute reasoner or an eloquent speaker. Cicero and Chillingworth will be more beneficial in teaching him to reason and to persuade, than all the treatises on those arts which he can peruse, or all the lectures which he can hear.

In every art and science, Mr. Locke prefers practice and experience to rules. Natural philosophy, as contributing to inspire the breast with warmer sentiments of devotion, and serving many useful purposes in life, ought to make a part in the young gentleman's studies. But he prefers the humble experimental writers on that subject to the lofty builders of systems. Mr. Locke does not think Greek necessary for a gentleman or man of the world !

He recommends dancing, as contributing to ease and gracefulness of carriage; with riding and fencing, as necessary branches of a young gentleman's education. He also advises that he should learn some mechanical trade, with the exercise of which he may agreeably fill up some of his leisure hours: and insists that he should by no means be unskilled in the management of accounts. Travelling, he thinks, will do more hurt than good to the understanding and morals of the traveller, unless deferred to a later period, than that at which young gentlemen are usually sent out.

Dr. Watts subjoins a Discourse on the Education of Children and Youth, to his excellent *Treatise on the Improvement of the Mind*. It treats of, 1. Instructing children in religion, which he thinks should be attempted 'as soon as they begin to know almost any thing:' 2. The improvement of their natural powers: 3. Self-government, which he proposes children to be early instructed in: 4. Reading and writing: 5. An employment: 6. Rules of prudence: 7. Accomplishments in life; among which are enumerated the Greek, Latin, and French languages, logic, mathematics, arithmetic, algebra, geography, astronomy, natural philosophy, history, poesy, music, drawing, fencing, riding, and dancing; in which last accomplishment the Dr. 'confesses he sees no evil,' though he thinks 'mixed dancing has most sensible dangers,' over which 'a wise parent will keep a watchful eye upon the child.' 8. Of evil influences, from terrifying stories, bloody histories, &c. 9. Of sports and diversions. 10 and 11, His two last sections, treat of the proper degrees of liberty and restraint in sons and daughters. Dr. Johnson has said, 'Whoever has the care of instructing others may be charged with deficiency in his duty if this book is not recommended.'

In 1762 the celebrated John James Rousseau surprised the public with his *Emilius*; a moral romance in 4 vols. 12mo. We quote, with very little alteration, the character given of it, by Mr. Heron, in the *Encyclopædia Britannica*.

'For originality of thought, affecting sentiment, enchanting description, and bold vehement eloquence, this book,' observes 'his writer, 'is one of the noblest pieces of composition, not only in the French language, but even in the whole compass of ancient and modern literature. The irregularity of his method, however, renders it a very difficult task to give an abridged view of his work. He conducts his pupil, indeed, from infancy to manhood. But instead of being barely a system of education, his work is besides a treasure of moral and philosophical knowledge. He has chosen a path, and follows it from the bottom to the summit of the hill: yet whenever a flower appears, on the right or left hand, he eagerly steps aside to pluck it; and sometimes, when he has once stepped aside, a new object catches his eye and seduces him still farther. Still, however, he returns. His observations are in many places loosely thrown together, and many things are introduced, the want of which would by no means have injured either the unity or the regularity of his work. If we attempt to review the principles on which he proceeds, in

reprobating the prevalent modes of education, and pointing out a new course, his primary and leading one seems to be, that we ought to watch and second the designs of nature, without anticipating her. As the tree blossoms, the flowers blow, and the fruit ripens each at a certain period; so there is a time fixed in the order of nature for the sensitive, another for the intellectual, and another for the moral powers of man to display themselves. We in vain attempt to teach children to reason concerning truth and falsehood, concerning right and wrong, before the proper period arrive: we only confound their notions of things, and load their memories with words without meaning; and thus prevent both their reasoning and moral powers from attaining that strength and acuteness of which they are naturally capable. He attempts to trace the progress of nature, and to mark in what manner she gradually raises the human mind to the full use of all its faculties. Upon the observations which he has made, in tracing the gradual progress of the powers of the human mind towards maturity, his system is founded.

'As it is impossible to communicate to the blind any just ideas of colors, or to the deaf of sounds; so it must be acknowledged, that we cannot possibly communicate to children ideas which they have not faculties to comprehend. If they are, for a certain period of life, merely sensitive animals, it must be folly to treat them during that period as rational and moral beings. But is it a truth that they are, during any part of life, guided solely by instinct, and capable only of sensation? Or, how long is the duration of that period? Has nature unkindly left them to be, till the age of twelve, the prey of appetite and passion? So far are the facts of which we have had occasion to take notice, concerning the history of infancy and childhood, from leading to such a conclusion, that to us it appears undeniable that children begin to reason very soon after their entrance into life. When the material world first opens on their senses, they are ignorant of the qualities and relations of surrounding objects: they know not, for instance, whether the candle which they look at be near or at a distance; whether the fire with which they are agreeably warmed may also affect them with a painful sensation. But they remain not long in this state of absolute ignorance. They soon appear to have acquired some ideas of the qualities and relative situation of bodies. They cannot, however, acquire such ideas, without exerting their reasoning powers in a certain degree. Appearances must be compared, and inferences drawn, before knowledge can be gained. It is not sensation alone which informs us of the relative distances of bodies; nor can sensation alone teach us, that the same effects which we have formerly observed will be again produced by the same cause.

'But, if children appear capable of reasoning at a very early period, they appear also to be at a very early period subject to the influence of the passions: they are angry or pleased, merry or sad, friends or enemies, even while they hang at the breast; instead of being selfish, they are naturally liberal and social. And, if we observe

them with attention, we shall find that the passions do not display themselves sooner than the moral sense. As it is wisely ordered, that we should not see, and hear, and feel, without being able to compare and draw inferences from our perceptions; so it is a no less certain and evident law of nature, that the passions no sooner begin to agitate the human breast, than we become able, in a certain degree, to distinguish the beauty and the deformity of virtue and vice. The child is not only capable of gratitude and attachment to the person who treats him with kindness; he is also capable of distinguishing between gratitude and ingratitude, and of viewing each with proper sentiments. He cries when you refuse to gratify his desires; but he boldly insists that he is injured when you use him cruelly or unjustly. It is indeed impossible to attend to the conduct of children during infancy, without being convinced that they are, even then, capable of moral distinctions. So little are they acquainted with artificial language, that we and they do not then well understand each other. But view their actions; consider those signs by which nature has taught them to express themselves. Our limbs, our features, and our senses, are not gradually and by piecemeal bestowed as we advance towards maturity; the infant body comes not into the world mutilated or defective: why then, in point of mental abilities, should we be for a while brutes, without becoming rational and moral beings till the fulness of time be accomplished? all the differences between the phenomena of manhood and those of infancy and childhood may be accounted for, if we only reflect, that, when children come into the world, they are totally unacquainted with all the objects around them; with the appearances of nature, and the institutions of society; that they are sent into the world in a feeble state, in order that the helplessness occasioned by their ignorance may attract the notice and gain the assistance of those who are able to help them; and that they attain not full strength in the powers either of mind or body, nor a sufficient acquaintance with nature, with artificial language, and with the arts and institutions of society, till they arrive at manhood.

Even Rousseau, notwithstanding the art with which he lays down his system, cannot avoid acknowledging indirectly, on several occasions, that our social dispositions, our rational and our moral powers, display themselves at an earlier period, than that at which he wishes us to begin the cultivation of them.

But though the great outlines of his system be merely theory, unsupported by facts, may plainly contradictory to facts, yet his observations on the impropriety or absurdity of the prevalent modes of education are very often just, and many of the particular directions which he gives for the conducting of education are judicious. He is often fanciful, and often deviates from the common road, only to show that he is able to walk in a separate path: yet his views are liberal and extensive: his heart seems to have glowed with benevolence: his book contains much observation of human actions; displays an intimate acquaintance with the motives

which sway the human heart; and, though by no means a perfect system for education, is yet superior to what many other writers had before done upon the subject.

With those who estimate with an impartial eye the value of the blessings which life affords, the business of education is a most important task. It is the formation of the heart to virtue, of the mind to cheerfulness, of the understanding to wisdom. It is the teaching a child to open his eyes to the circumstances by which he is surrounded; to distinguish virtue from vice; truth from falsehood; beauty from deformity; and happiness from misery: to qualify him to attribute neither more nor less than its proper importance to every acquisition and every pursuit; and, instead of being borne along by the follies and the prejudices of mankind, to raise himself above them to that degree of mental eminence and moral excellence, which will enable him to judge distinctly of the value of all earthly enjoyments, and, by the strength of his own faculties, to select those, and those only, which will contribute to his temporal and eternal good. Education, says Dr. Cogan, when developing its influence upon the passions, introduces to an intimate acquaintance with numberless objects which are totally unknown to the ignorant; and every object possesses some quality of a pleasant or unpleasant nature, proportionably multiplying or diversifying our agreeable or disagreeable sensations. With the ignorant, objects are comparatively few. Scenes before them are of no great extent; and even these are overlooked by the majority, whose years pass away in a kind of sensitive indolence, without apathy or affection. Sometimes, however, a natural acuteness of understanding is observable among the most illiterate, accompanied with lively sensations and very strong affections; and when they are once aroused, by objects that appear interesting, their passions are most violent. What they know can alone appear important to them—and the very little they possess is their all. Their whole souls are concentrated in that which gives pleasure, and the powers of body and mind are exerted to repel whatever gives pain. This will indicate the cause of that remarkable strength of passions and affections, both of the benevolent and malevolent kind, so observable in savage nations; and the impetuosity of character so often to be met with among the active and uninformed in every nation. The cultivated mind, by increasing its acquaintance with innumerable subjects, will inevitably discover some pleasing quality in every object of its pursuit: of consequence, both attention and affections are divided and subdivided into innumerable ramifications; and thus, although enjoyment may upon the whole be augmented by aggregate numbers, yet each individual quality possesses but a moderate share of influence. The young and inexperienced are generally affected by simple objects. The causes of their joy or anger, sorrow or fear, are seldom complex. As the powers of the mind are more enlarged, the affections are both more diversified, and rendered more complicated. Thus, upon the perception of favors and obligations, the joy

from good becomes united with gratitude to the author of that good ; with love, veneration, and respect for his character ; with admiration at the extent of the good, or at some peculiarity in the delicacy and liberality with which it was conferred. Experience introduces the passions of hope and fear, by teaching us the knowledge of good worth possessing, on the one hand, and the accidents to which it is liable on the other. It is observable, farther, that the young and inexperienced, whose habits are not yet formed, and to whom every thing is new, are most apt to be influenced by the introductory emotions of surprise and wonder. This inexperience renders things and events, which are familiar to others, new and strange to them. They are prone to be in ecstasies for acquisitions and advantages comparatively trifling, and to be agitated by small or imaginary evils, because their imaginations have not been corrected by experience. But if these passions, from more simple causes, are frequently stronger in them than in others, it is equally true that their affections are less permanent. A rapid succession of novelties, and the immense variety which increased knowledge introduces, quickly efface the preceding impression. But the extent of this subject enjoins brevity. A whole encyclopædia could scarcely do it justice. The infinite diversity of pursuits, which in this age engage the attentions of an awakened world, are accompanied by an equal diversity of predilections ; they present an infinite variety of qualities to the inquisitive mind, which excite their correspondent emotions and affections.

The business of education comprehends much indeed. It includes the circumstances of the child in regard to local situation, and the manner in which the necessities and conveniences of life are supplied to him ; the degree of care and tenderness with which he is nursed in infancy ; the examples set before him by parents, preceptors, and companions ; the degree of restraint or licentiousness to which he is accustomed ; the various bodily exercises, languages, arts, and sciences which are taught him, and the method and order in which they are communicated ; the arts of overcoming prejudices, of guarding against evil influences, of conquering temptations, and of governing himself ; and it constantly regards, as of the greatest importance, the imbuing the mind with the principles of morality and religion. In different periods of society, in different climates, and under different forms of government, various institutions have naturally prevailed in the education of youth ; and even in every different family, the children must be educated in a different manner, according to the varieties in the situation, dispositions, and abilities of the parents.

The modern *improvements in education* have been great ; they are connected with the education of all ranks, but have more particularly concerned our public schools, and the extension of this invaluable blessing, by economical methods, to the poor.

I. First, in order of time, stand *Sunday Schools*. The excellent founder of them, Mr. Robert Raikes, a gentleman of Gloucestershire

(in which county he was born 1735), seems at first to have had his attention engaged to the general condition of the poor, by observing the miserable moral state of the prisoners confined for less crimes in the county jail. In a letter to a gentleman who had applied to him for the particulars of the nature and origin of his plan, he thus expresses himself :—

“Some business leading me one morning into the suburbs of the city, where the lowest of the people (who are principally employed in the pin manufactory) reside, I was struck with concern at seeing a group of children, wretchedly ragged, at play in the street. I asked an inhabitant whether those children belonged to that part of the town, and lamented their misery and idleness. Ah ! sir, said the woman to whom I was speaking, could you take a view of this part of the town on Sunday, you would be shocked indeed ; for then the street is filled with multitudes of these wretches, who, released on that day from their employment, spend their time in noise and riot, playing at chuck, and cursing and swearing in a manner so horrid, as to convey to any serious mind an idea of hell rather than any other place. We have a worthy clergyman, said she, minister of our parish, who has put some of them to school ; but upon the sabbath they are all given up to follow their inclinations without restraint, as their parents, totally abandoned themselves, have no idea of instilling into the minds of their children, principles to which they themselves are strangers.

“This conversation suggested to me, that it would at least be a harmless attempt, if it were productive of no good, should some little plan be formed to check this deplorable profanation of the sabbath. I then enquired of the woman if there were any decent, well-disposed women in the neighbourhood, who kept schools for teaching to read. I was presently directed to four. To these I applied, and made an agreement with them, to receive as many children as I should send on the Sunday, whom they were to instruct in reading and the church catechism. For this I engaged to pay them a shilling for their day's employment. The women seemed pleased with the proposal. I then waited on the clergyman before-mentioned, and imparted to him my plan. He was so much satisfied with the idea that he engaged to lend his assistance by going round to the schools on a Sunday afternoon, to examine the progress that was made, and to enforce order and decorum among such a set of little heathens.

“This, sir, is the commencement of the plan. It is now about three years since we began, and I could wish you were here to make enquiry into the effect. A woman who lives in a lane where I had fixed a school, told me some time ago, that the place was quite a heaven upon Sundays, compared to what it used to be. The numbers who have learned to read and say their catechism are so great that I am astonished at it. Upon the Sunday afternoon the mistresses take their scholars to church, a place into which neither they nor their ancestors ever entered with a view to the glory of God. But what is yet more extraordinary, within this month, these little ragamuffins have in great numbers taken it into their heads to frequent the early morning prayers,

which are held every morning at the cathedral at seven o'clock. I believe there were near fifty this morning. They assemble at the house of one of the mistresses, and walk before her to church, two and two, in as much order as a company of soldiers. I am generally at church, and after service they all come round me to make their bow; and, if any animosities have arisen, to make their complaint. The great principle I inculcate is to be kind and good-natured to each other; not to provoke one another; to be dutiful to their parents; not to offend God by cursing and swearing; and such little plain precepts as all may comprehend. As my profession is that of a printer, I have printed a little book, which I give amongst them; and some friends of mine, subscribers to the Society for promoting Christian Knowledge, sometimes make me a present of a parcel of Bibles, Testaments, &c., which I distribute as rewards to the deserving. The success that has attended this scheme, has induced one or two of my friends to adopt the plan, and set up Sunday schools in other parts of the city, and now a whole parish has taken up the object; so that I flatter myself in time the good effects will appear so conspicuous as to become generally adopted. The number of children at present thus engaged on the sabbath are between 200 and 300; and they are increasing every week, as the benefit is universally seen. I have endeavoured to engage the clergy of my acquaintance that reside in their parishes. One has entered into the scheme with great fervor; and it was in order to excite others to follow the example, that I inserted in my paper the paragraph which I suppose you saw copied into the London papers. I cannot express to you the pleasure I often receive in discovering genius and innate good dispositions among this little multitude. It is botanising in human nature. I have often too, the satisfaction of receiving thanks from parents, for the reformation they perceive in their children. Often I have given them kind admonitions, which I always do in the mildest and gentlest manner. The going among them, doing them little kindnesses, distributing trifling rewards, and ingratiating myself with them, I hear, have given me an ascendancy, greater than I ever could have imagined; for, I am told by their mistresses, that they are very much afraid of my displeasure. If you ever pass through Gloucester, I shall be happy to pay my respects to you, and to show you the effects of this effort at civilisation. If the glory of God be promoted in any, even the smallest degree, society must reap some benefit. If good seed be sown in the mind, at an early period of human life, though it shows itself not again for many years, it may please God, at some future period, to cause it to spring up, and to bring forth a plenteous harvest.

Mr. Raikes's first effort bears date about the close of the year 1781, or the beginning of 1782; and the system began to extend itself in the city of Gloucester. Having tried the experiment for more than a year, he determined to invite the public attention to a scheme which he perceived to be fraught with such benefits. For this purpose he inserted a paragraph in a weekly newspaper, of which he was the editor and printer.

The following is a copy of this important notice:—

' Gloucester Journal, Nov. 3, 1783.'

'Some of the clergy in different parts of this county, bent upon attempting a reform among the children of the lower class, are establishing Sunday schools for rendering the Lord's day subservient to the ends of instruction, which has hitherto been prostituted to bad purposes. Farmers, and other inhabitants of the towns and villages, complain that they receive more injury in their property on the sabbath than all the week besides; this in a great measure proceeds from the lawless state of the younger class, who are allowed to run wild on that day, free from every restraint. To remedy this evil, persons duly qualified are employed to instruct those that cannot read; and those that may have learnt to read, are taught the catechism, and conducted to church. By thus keeping their minds engaged, the day passes profitably, and not disagreeably. In those parishes where this plan has been adopted, we are assured that the behaviour of the children is greatly civilised. The barbarous ignorance in which they had before lived, being in some degree dispelled, they begin to give proofs that those persons are mistaken, who consider the lower orders of mankind as incapable of improvement, and therefore think an attempt to reclaim them impracticable, or, at least, not worth the trouble.'

His statement of the good effects of his schools, caught the attention of a gentleman in Lancashire, before alluded to, who wrote immediately to Mr. Raikes, and received the letter already given. By permission of its author, this epistle was printed in one of the numbers of the Gentleman's Magazine for 1784 (vol. liv. p. 410). Through the medium of this publication, the plan was laid before thousands of the most intelligent members of society in the kingdom. Mr. Raikes soon had to answer the enquiries of other correspondents anxious to gain information on this new and important subject.

The scheme began now to be very generally known and adopted. Christians of all denominations, wondering that it should never have been devised before, seemed determined to repair, as much as possible, the mischief of past neglect, by applying with the utmost diligence the benefits of this new discovery in the world of morals and religion. Several public-spirited gentlemen in the metropolis, perceiving that the system would be greatly aided by the establishment of a society, which should combine the patronage and energies of all denominations of Christians, held a preparatory meeting August 30th, 1785, to take into consideration the propriety of forming a society for establishing and supporting Sunday schools for the instruction of poor children, in different parts of the kingdom. In consequence of a resolution then passed, a public meeting was holden on the 7th of September, and an institution formed, bearing the title of 'A Society for the Support and Encouragement of Sunday Schools in the different Counties of England.' This establishment was exceedingly beneficial to the growing cause. By the respectability of its mem-

bers, it increased the public confidence; by their talents it enlightened the public mind; by their activity it stimulated the public zeal; and, by their property, it assisted the public expenditure.

It was an object of importance with the committee of the Sunday School Society, to engage the co-operation of episcopal authority within the pale of the established religion of the country; and it must be spoken to the honor of the bishops, that they promptly came forward, and cast the weight of their mitres into the scale of this good cause. Among the dignitaries of the church, who patronised the plan, the bishops of Salisbury and Landaff, and the deans of Canterbury and Lincoln, obtained a conspicuous place by their zeal and talents. So rapidly had the flame spread through the country, that, by the close of 1786, it is conjectured that not less than 250,000 children were every Sunday receiving instruction.

The schools were at first universally conducted by hired teachers. This entailed a load of pecuniary difficulty upon the plan, which, had it not been removed, must have considerably retarded its progress, and consequently diminished its usefulness. The Sunday School Society alone expended, during the first sixteen years of its existence, no less than £4000 in the salaries of teachers. And this was not the least evil attending upon purchased labor. Hiring teachers can scarcely be expected to possess either the zeal or ability of those who now engage in the work from motives of pure benevolence. Gratuitous instruction was an astonishing improvement of the system; and which does not appear to have entered into the views of its benevolent author. 'If we were asked,' says a writer in the Sunday School Repository, 'whose name stood next to that of Robert Raikes in the annals of Sunday Schools, we should say, the person who first came forward, and voluntarily proffered his exertions, his time, and his talents, to the instruction of the young and the poor; since an imitation of his example has been the great cause of the present flourishing state of these institutions, and of all that future additional increase which may be reasonably anticipated. At what precise period this was first introduced, does not appear, or where it commenced, so that the award of this second honor is reserved for the decision of the last day. About the year 1800 this plan became very general through the kingdom.'

The improvement in the mode of popular education, introduced by Dr. Bell and Mr. Lancaster, to which we shall immediately advert in a more particular manner, must be considered as forming another era in the history of Sunday schools. The advantage derived from these useful systems, does not merely consist in a servile imitation of all their arrangements, but in demonstrating to the world, more clearly than was ever shown before, that education is an art susceptible of indefinite improvement, and in exciting an ardor, before unknown, to carry it on to perfection.

The institution of Sunday schools was now become universal in this kingdom. Every city, and every town had warmly espoused the cause. Still there was one thing wanting to raise the

system to the highest degree of efficiency, and that was union. Reasoning upon the general principle, many were led to conclude, that great benefits would result to this particular case, from an association of counsel and energy. After much private intercourse on this subject, between many persons in London, a public meeting was holden, July 13th, 1803, in the school-rooms belonging to Surrey chapel, and the Sunday School Union was then formed.

This new society commenced its operations with no less prudence than vigour. Carefully abstaining from even the appearance of a desire to interfere with the private management of any of the associated schools, it aimed to diffuse new life and energy through them all. One of its first objects was the compilation of a new spelling book, more adapted to moral and religious instruction than any they could find already in existence. This production reflects no small degree of credit on its industrious compilers. The next object of the committee was to ascertain, by an extensive correspondence, what parts of the country were most destitute of schools. Finding, in many places, that the advantages of the system were greatly diminished by the want of method and order which prevailed in the schools, they published in 1806, 'A plan for the Formation and Regulation of Sunday Schools.'

The example of the metropolis was soon imitated by many of the large towns, and several counties. Unions were formed in different parts of the kingdom, from which the happiest effects have resulted; among which may be reckoned the establishment of new schools in neglected parts of large towns, and amidst the darkness of benighted villages;—a fresh excitement given to those employed in the work of tuition;—the diffusion of Christian affection;—and in some instances a great improvement in the mode of instruction. The formation of the Sunday School Union must, therefore, be regarded as an event of vast importance to the success of this valuable scheme. Surprising it is to state, but it was not until the year 1816, that the first Sunday school in America was opened at New York. The Wesleyan Methodist Missionaries had opened one the year previous in the heart of the island of Ceylon.

In an account like the present, the establishment of the Scotch Sabbath Evening Schools, ought not to be omitted, as they may be fairly stated to have arisen out of the English Sunday School Institution. The children of the poor, so far as common education is concerned, are all taught to read in the parochial schools, which are established in the southern parts of that enlightened country. Still, however, as it respects the observance of the sabbath, and the more direct business of religious instruction, like the children in this kingdom, they are left of course to the care of their parents, multitudes of whom, indifferent to the welfare of their own souls, feel no solicitude for the salvation of their offspring. Observing and commiserating the condition of these neglected youth, who in great numbers spent the sabbath, and especially the sabbath evenings, in profanity and vice,

the friends of religion in Edinburgh formed the pious resolution of collecting them together on the Lord's day evenings, for the purpose of imparting religious knowledge. They assemble at six o'clock, and are dismissed about eight; during which time every effort is made to instruct them in the way of eternal salvation, and to urge them forward in the path of life. This admirable system commenced in Edinburgh, in the year 1787, and soon spread through all the principal towns of Scotland. How desirable that it should pass the Tweed, and be adopted in England! There is one class of youth, to whom it might become an incalculable blessing; i. e. the elder boys and girls, who have just left other schools, and who are generally considered as gone beyond their care. Thus abandoned, it is too commonly the case, that they lose all the little impression they have received while under instruction. Could they be collected together on a sabbath evening, to be taught by those who would interest themselves in their welfare, what a blessing might be expected to accrue!

Adult Schools were originally a ramification of the Sunday school system. The first school for the instruction of adult persons exclusively, was opened in the summer of 1811, in North Wales, through the efforts of the Rev. T. Charles, episcopal minister of Bala, Merionethshire. The success of the undertaking was considerable; multitudes in every district repaired to the chapels, or other places appropriated to the purpose, for instruction, and the most beneficial results became every where observable. Mr. Charles's own account is as follows:—

'My maxim has been for many years past to aim at great things; but if I cannot accomplish great things, to do what I can, and be thankful for the least success; and still to follow on without being discouraged at the day of small things, or by unexpected reverses. For many years I have laid it down as a maxim to guide me, never to give up a place in despair of success. If one way does not succeed, new means must be tried; and if I see no increase this year, perhaps I may the next. I almost wish to blot out the word impossible from my vocabulary, and obliterate it from the minds of my brethren. We had no particular school for the instruction of adults exclusively, till the summer of 1811; but many attended the Sunday schools with the children, in different parts of the country, previous to that time. What induced me first to think of establishing such an institution, was the aversion I found in the adults to associate with the children in their schools. The first attempt succeeded wonderfully, and far beyond my most sanguine expectations. The report of the success of this school soon spread over the country, and in many places the illiterate adults began to call for instruction. In one county, after a public address had been delivered to them on the subject, the adult poor, even the aged, flocked to the Sunday school in crowds; and the shop-keepers could not immediately supply them with an adequate number of spectacles. Our schools, in general, are kept in our chapels; in some districts, where there are no chapels, farmers, in the summer time, lend their barns. The adults and children are

sometimes in the same room, but placed in different parts of it. When their attention is gained and fixed, they soon learn; their age makes no difference, if they are able, by the help of glasses, to see the letters. As the adults have no time to lose, we endeavour, before they can read, to instruct them without delay, in the first principles of Christianity. We select a short portion of Scripture, comprising the leading doctrines, and repeat them to the learners, till they can retain them in their memories; and which they are to repeat the next time we meet.'

Soon after this, at the second anniversary of the Bristol Auxiliary Bible Society, among other intelligence communicated to the meeting, a letter from Keynsham was read, which contained the following sentence:—'We have been necessarily obliged to omit a great number of poor inhabitants who could not read, and therefore are not likely to be benefited by the possession of a bible.' This statement struck the attention of an individual present, by the name of William Smith. To be deprived of the inspired volume by an inability to peruse it, appeared to him worse than for a man to be dying of the plague, through ignorance of the way of applying a remedy, which in itself was within his reach. His benevolent mind meditated upon their situation. He longed to relieve them, but scarcely dared to hope that the case admitted of relief. In this dilemma he consulted Stephen Prust, Esq. a respectable merchant in the city, whose name stands high in the long list of Bristol philanthropists; and, in the advice and support of this gentleman, the scheme of Smith met the sunshine which it wanted. He slept not a second night upon his plan, after he had received the promise of his generous friend to assist him in the undertaking, before he commenced his exertions. As he was employed the next day in collecting subscriptions for the Bible Association, whenever he met with persons who could not read, he asked them if they would like to learn, provided a school should be opened. Many embraced the offer with expressions of pleasure, and their names were taken down. Two rooms were immediately obtained, and the work of instruction commenced. So little could the ardor of Smith endure delay, that in nineteen days after he had disclosed his mind to Mr. Prust, the school was opened with eleven men and ten women. The number rapidly increased, till, a few weeks after, some active friends to the cause of religion and humanity, met the founder of the new institution, and formed themselves into a society, bearing the title of 'An Institution for Instructing adult Persons to read the Holy Scriptures.' The society continued to attract the attention, and engage the support of Christians of all denominations; and at length received a most valuable accession in the active co-operation of Thomas Pole, M. D., a physician in connexion with the society of Friends. Within the period of two years, this society admitted 1508 scholars, exclusive of 276 who were taught by schools belonging to several dissenting congregations.

Public adult tuition has been since somewhat modified, both at Bristol and in other places, in conformity with the aversion of the grown-up

poor to an exposure of their ignorance. The plan of private schools has accordingly been adopted, by which a few neighbours are associated together, and taught at their own habitations, or in a private manner at some convenient place. Since this period, adult schools have been established in various parts of the kingdom; at Plymouth, Salisbury, Uxbridge, Sheffield, Norwich, Ipswich, and other places; and these examples of benevolence have not been disregarded or unimitated by the metropolis.

But the most brilliant of all our modern discoveries and improvements in this important science of sciences, is the *New System of Education*, which, however warmly opposed for a time, may now be regarded as established. With Dr. Bell, originally a superintendent of the Military Male Orphan Asylum at Madras, the first idea of this system clearly originated. This was a public charity resembling the Royal Military Asylum at Chelsea. A salary of 1200 pagodas, £480, was attached to Dr. Bell's office when he entered upon it, but this he declined; accepting the office solely for the sake of being more useful; it is said, in his station than he could hope to be by any other means. 'Here,' he reasoned with himself, 'is a field for a clergyman to animate his exertion, and encourage his diligence. Here his success is certain, and will be in proportion to the ability he shall discover, the labor he shall bestow, and the means he shall employ. It is by instilling principles of religion and morality into the minds of the young, that he can best accomplish the ends of his ministry: it is by forming them to habits of diligence, industry, veracity, and honesty, and by instructing them in useful knowledge, that he can best promote their individual interest, and serve the state to which they belong,—two purposes which cannot, in sound policy, or even in reality, exist apart.' With these feelings, and with this sense of duty, Dr. Bell began his task. He had to work upon the most unpromising materials. It was an established opinion, that the half-caste children were an inferior race, both in moral and intellectual faculties, as if a certain milish obliquity of nature had been produced by crossing colors in the human species. This opinion was like one of those prophecies which bring about their own accomplishment. Dr. Bell knew how deeply it was rooted, and saw but too plainly that it rested upon apparent experience; he knew also, that these children learnt from their unhappy mothers that cunning, and selfishness, and deceit, which become the defensive instincts of a despised and degraded generation; the baleful prejudice which prevailed against them inevitably producing the vices which it pre-supposed. The boys placed under his care were in general stubborn and perverse, addicted to trick, lying, and duplicity; and those among them who were farther advanced in age were, for the most part, trained in habits and customs incompatible with that method without which no system of education could proceed.

'I soon found,' says he, 'that if ever the school was to be brought into good order, it must be done, either by instructing ushers in the economy of such a seminary, or by youths from

among the pupils trained for the purpose. For a long time I kept both these objects in view; but was in the end compelled, after the most painful efforts of perseverance, to abandon entirely the former, and adhere solely to the latter. I found it difficult beyond measure to new-model the minds of men of full years, and that whenever an usher was instructed so far as to qualify him for discharging the office of a teacher of this school, I had formed a man who could earn a much higher salary than was allowed at this charity, and on far easier terms. My success, on the other hand, in training my young pupils in habits of strict discipline, and prompt obedience, exceeded my expectation: and every step of my progress has confirmed and riveted in my mind the superiority of this new mode of conducting a school through the medium of the scholars themselves.'—*Experiment*, first edition, p. 10.

'It is in this mode of conducting a school that the discovery consists; this mode, which is briefly termed self-tuition, is the principle of the new school, and the new system rests wholly upon it. This is the key-stone of the arch,—the main-spring of the watch,—the moving power of the whole machine. Dr. Bell did not come to the superintendence of the Madras Asylum prepared with his theory, and ready to put it in execution. He found the school with an establishment of one master and two ushers, and as the school increased one of the boys was added as head-teacher, so that there were four nominal masters continued to the 22d of January, 1796. But when the report was drawn up five months afterwards (June 28), and the school had increased farther to the number of 200, the masters were reduced to three. 'None of these masters had made a progress in letters equal to the boys in the first class.' Their duty, it is expressly stated, was not to teach, but to look after the various departments of the institution. As teachers they had been gradually superseded, and from the 1st of June, 1795, the school was 'entirely taught by the boys.' This was one of the cases in which practice led to theory.'

Dr. Bell perceived the expense of time, labor, and punishment, which the common system of tuition requires, and, having found a remedy, perceived also wherein the principle of that remedy lay, and as a principle acted upon it and announced it to the world. Every class had its teacher and assistant. Give me four and twenty children to-day, was a saying of Dr. Bell, and I will give you as many teachers to-morrow as you want. There was no hesitation in degrading a teacher who failed in any of the tasks required of him, and making trial of another, till one was found fit for the office; these teachers had no other occupation, no other pursuit, nothing to employ their minds but this single object; they could do that only which they were assigned to do, and they did it the better, because they themselves knew nothing more than what was perfectly level to the capacities of their pupils.

The first attempt which Dr. Bell made to introduce a new practice in the school, proved to him the necessity of proceeding upon this principle. At first sight of a Malabar school, his attention had been caught by the manner in

which the letters were taught in sand; yet he could not fully establish even so simple a practice as this, till he had trained boys whose minds he could command, and who, as he says, 'only knew to do as they were bidden, and were not disposed to dispute or evade the orders given them.' Many advantages arise from this easy improvement, besides the great and obvious saving of expense. A distinct notion of the different form of the letters is immediately obtained, and the difficulty of distinguishing those letters whose very difference of form is founded upon their similarity (b and d, p and q, for instance), by which children are so long perplexed, is removed at once. The scholar, at the same time, learns so much of the art of writing, as materially to facilitate his progress when he arrives at that class wherein it is taught.

The next improvement of the Madras school, was the practice of syllabic reading: the child, after he had learnt to read and spell monosyllables, was not allowed to pronounce two syllables till he had acquired, by long practice, a perfect precision; upon the common plan, children make continual blunders, in the beginning and middle, and more especially in the termination of words: to prevent this confusion, they were taught to read syl-la-ble by syl-la-ble, and, when so far advanced as to read sentences, to pause awhile at the end of every word. 'So much,' says Dr. Bell, 'for the first minutiae: were I to pursue this subject through all its stages I should fill a volume.' From the commencement of his experiment, he made the scholars, as far as possible, do every thing for themselves. If a bad subject came to school, a good boy was chosen to take care of him, teach him right principles, treat him kindly, reconcile him to the school, and render him happy like the rest in his situation. The consequence of such a system was, that the boys, feeling themselves happy, felt also that their advantage was the only object which the master had in view; they were sure of his favor if they continued to do right, they were certain of his disapprobation and displeasure if they offended; but knowing that he was just, and feeling that he was good, they regarded him as their friend, and benefactor, and common parent. An annual saving of not less than 2400 pagodas, or £960, upon the education and support of 200 boys, was produced in the institution at Madras, by Dr. Bell's regulations and improvements!

After superintending the school for seven years, he found it necessary for his health to return to Europe. The directors of the charity passed a resolution for providing him a passage in any ship in which he might wish to sail; declaring at the same time, that, under the wise and judicious regulations which he had established, the institution had been brought to a degree of perfection and promising utility 'far exceeding their most sanguine expectations when it was established.'

These testimonies Dr. Bell published in 1797, on his arrival in Europe, in a little duodecimo pamphlet, under the title of *An Experiment in Education*, made at the Male Asylum of Madras; suggesting a system by which a school or

family may teach itself under the superintendence of the master or parent.

When the manuscript of this little work was put into the hands of the publisher, says a friend of his, whose account of the system we follow, Dr. Bell said to him, 'You will think me an enthusiast; but in a thousand years this system of tuition will spread over the world!' What he meant by 'the system' is apparent both from the title and the whole tenor of the pamphlet;—not writing in sand, not syllabic reading, nor any of the improvements in detail, but the main principle and main-spring of the whole, 'by which a school or family may teach itself, under the superintendence of the master or parent,' the 'new mode of conducting a school through the medium of the scholars themselves.' Had Dr. Bell done no more than conceive the idea of this new system, and publish it to the world, he would have done enough. Whoever might have been the first person to carry the system into effect, the discovery would have been his, and to have imputed it to any other person would have been as unreasonable as it would be to ascribe the great discovery of Franklin, respecting the sameness of electricity and lightning, not to him but to the French Curé, who, while Franklin waited for the erection of a tower then building at Philadelphia, to which he might affix his metallic rod, set up a conductor according to the American philosopher's instructions, and verified Franklin's theory by thus bringing down the lightning, before it was known in Europe that Franklin had verified it himself by means of a paper-kite.

The Charity school of St. Botolph, Aldgate, was the first place in England where Dr. Bell's discovery was adopted. 'That the principle of the new system,' says another able writer on this topic, 'essentially consists in the tuition of the scholars by the scholars, in classes of equal proficiency, by short, easy, and perfect lessons, and not in any of the practices either introduced into the male asylum by Dr. Bell, or subsequently by Mr. Lancaster is most clearly and satisfactorily proved by this simple criterion. Discard all the peculiar practices or contrivances of the school, and, if the tuition by the scholars be duly carried on, the difference of progress will not be greatly material. On the other hand, discard the system of tuition by the scholars, and retain all the practices, the charm ceases, subordination and diligence cannot be so readily maintained, punishments must be resumed, and, after all, the school is comparatively inoperative. The system, therefore, is evidently one and the same in both cases, and in all its applications. If a Mahomedan were to start up and apply it to the Koran, or a Brahmin to the Shaster, it would be equally reasonable for them to call it the Mahomedan or the Hindoo system, as for Mr. Lancaster to call it Lancasterian, unless he can prove that it originated with him.'

Having thus fairly traced the new system to its inventor, we may be allowed to claim for Mr. Lancaster the great merit of having by indefatigable zeal, first made the system generally known in England, and of having procured for it the patronage of many exalted and distinguished

individuals, with the Sovereign at their head. He opened his free school in the Borough in the year 1800. In the year 1803, in the first edition of his *Improvements in Education*, (part 3rd. page 44) he wrote thus;—‘I ought not to close my account, without acknowledging the obligations I lie under to Dr. Bell, of the male asylum at Madras, who so nobly gave up his time, and liberal salary, that he might perfect that institution, which flourished greatly under his fostering care. He published a tract in 1798, entitled an *Experiment on Education*, made at the male asylum of Madras, suggesting a system whereby a school or family may teach itself, under the superintendence of the master or parent. From this publication I have adopted several useful hints; I beg leave to recommend it to the attentive perusal of the friends of education, and of youth. I am persuaded nothing is more conducive to the promotion of a system than actual experiment. Dr. Bell had 200 boys, who instructed themselves, made their own pens, ruled their books, and did all that labor in school, which among a number is light, but resting on the shoulders of the well-meaning, and honest, though unwise teacher, often proves too much for his health, and embitters or perhaps costs him his life. I much regret that I was not acquainted with the beauty of his system, till somewhat advanced in my plan; if I had known it, it would have saved me much trouble, and some retrograde movements. As a confirmation of the goodness of Dr. Bell’s plan, I have succeeded with one nearly similar in a school attended by almost 300 children.

Mr. Lancaster was afterwards vain enough to state, in the public papers, that having ‘invented under the blessing of Divine Providence, a new and mechanical system of education, for the use of schools, he feels anxious to disseminate the knowledge of its advantages through the united kingdom;’ and vanity was his complete overthrow. He had the merit we have willingly ascribed to him, and, in addition to this, he invented a few economical practices in the use of slates and spelling cards, which are equally applicable to all schools conducted on the new system, and which have been adopted in Dr. Bell’s school, without any denial of their origin, just as the sand-writing and syllabic spelling were confessedly borrowed from Dr. Bell. He invented also a variety of new punishments, in the application of which his scholars were made the correctors, no less than the instructors of each other; and many of which were of a nature very questionable in their bearing on the moral character; that is, calculated to make the pupils insolent, turbulent, and overbearing.

Sorry we are to add, that not only was the question of originality agitated at first with many bitter personal feelings between the friends of these parties, but it insensibly mingled itself with religious controversy. An advocate on the side of Dr. Bell, and the Madras system, says with great candor: ‘We are sorry to admit that there was no great appearance of acceleration in the proceedings of the Church, till Mr. Lancaster started up with all the eagerness and activity of a sectary—with all the zeal of a missionary—

with all the adventitious motives and practices of a person whose subsistence and reputation depended upon the success of his plan; and fortified with all the countenance and support of the host of sectaries, whose eagle-eyes perceived at a glance what an opportunity was offered, at once to place the cause of humanity in opposition to that of the Church,—what a glorious occasion was presented to associate in the minds of the people the ideas of charity and dissent *British Review*, No. 6.

Mr. Lancaster, and what was now called the British system, admitted and taught the reading of the Bible, in fact, into the schools founded upon his plan, but excluded all catechisms. ‘Impelled by all these aids and motives, continues the above writer, Mr. Lancaster soon became the prominent character on the canvass, and by the great mass, both of the clergy and laity, who had never heard of Dr. Bell, was considered as the necessary, indeed the only instrument through whom the new system could be carried into practice. And we shall ever consider it as reflecting immortal honor on many zealous ministers of the church, that the practicability of the plan was no sooner shown by Mr. Lancaster, than they immediately lent him their countenance; and finding to their regret that no propositions, having in view the general instruction of the poor, were then circulated and enforced by the authority of the church as a body, they trusted to their own individual exertions to make Mr. Lancaster’s plan square as well as they could with the interests of the church. We should certainly have been glad to see her interfere sooner, as soon indeed as it was evident and publicly notified by experience that the new system imported by Dr. Bell was a practicable one for the instruction of the poor. We should then have been furnished with a stronger argument than we now possess for repelling the sneering insinuations of those, who lose no opportunity of observing, that, but for the exertions of Mr. Lancaster and his partisans, and the fear and emulation which they have excited, the prospects of general instruction for the poor would have been very different from what they now are. By whatever means, however, the effect was produced, the Church is at length roused, and those who wish to secure to the rising generation of the people a knowledge of the excellence of her doctrines, may now do so without any alloy of danger, which even the most trembling solicitude for her safety can entertain.’

The question of the comparative economy of the two schools has been thus stated:—Dr. Bell introduced the knowledge of sand-writing and syllabic spelling, which Mr. Lancaster confessedly borrowed from him. Mr. Lancaster, having first opened a large school, introduced the economical use of slates in many cases where paper-books were necessarily used at Madras. But these slates are now used in Dr. Bell’s schools. Mr. Lancaster also invented a large card, with the letters and short words printed thereon, one of which stuck against the wall serves the whole class to read from: whereas Dr. Bell prefers that each child should have a small card of its own, which it may look at and

con over at its pleasure. The difference in the first cost of these instruments amounts to about seven shillings per 100 children yearly; and the use of either is a matter of mere opinion as to the advantage of giving each child's lesson into its own hand. Many of Dr. Bell's schools use the large cards, many of Mr. Lancaster's the small ones; a few Bibles and Testaments are admitted to be as necessary in Mr. Lancaster's schools as in Dr. Bell's. So that in fact the two schools are now on a perfect equality as to expense. The use of slates, or of paper books, for writing and ciphering, depends on the respective tastes of the master or patrons. If they think the pride and pleasure which a child and his parents take in looking back upon the records of the progress he has made will more than repay the expense of paper books, they will adopt them. If they think otherwise, or if their funds are very confined, they will reject them. The system will be neither the better nor the worse for their determination either way, or for the adoption or omission of the small or the large card, or for a multitude of other things, about which much noise has been made.

The Madras system has become the basis of the National Schools connected with the established church throughout the kingdom; and large and well earned are its triumphs over the wretchedness and ignorance of the poor. The British and Foreign School Society, into which the British system is now merged, is, on the other hand, principally in the hands of dissenters; nor can it be denied the merit of praise for great and noble exertions in the cause of universal education. Mr. Lancaster, as we have intimated, has worn out his warmest friends in this country by his personal vanity and extravagant conduct; but the system is under very respectable and disinterested management. It is said, by competent judges, that the pupils of the National Schools excel in reading; while those of the British and Foreign School system are superior in their acquaintance with arithmetic.

But the plans of Dr. Bell were yet more extended. He himself gave the public, in 1816, an interesting, though somewhat verbose, publication, entitled '*Ludus Literarius: the Classical and Grammar School; or an Exposition of an Experiment in Education, made at Madras in the years 1789—1796; with a view to its Introduction into Schools for the Higher Orders of Children*,' 8vo.: and at the Charter-house, and some respectable private seminaries, the advantages of mutual instruction among pupils have been most successfully applied.

'In proposing,' says Dr. Bell, 'to transfer the Madras system of education into schools of a higher order, and especially into grammar schools, I make no pretension to superior attainments in literature, nor do I presume to vie with the learned preceptors of our classical schools in skill in languages, or in sciences.

To teach a teacher ill becometh me.

'The task I have in hand is of a less elevated description, and does not require deep erudition. It is not the science of letters, but the art of tuition, or the mode of communicating that science,

of which I am to treat. I do not purpose to add to the master's stock of knowledge, but to put into his hands machinery, by which he may bring down his learning to the level of the capacity of children, disseminate his knowledge among his pupils, and by the simplest instruments, and gentlest means, establish order, check vice, and uphold virtue. For such schools I have no new discovery to develop, no new system to suggest, no improvement on the Madras invention to offer. All I propose is, to show, more particularly than I have heretofore done, the applicability of that invention to schools of other descriptions, than those in which it has long been employed with uniform success. Beyond this the reader need expect nothing entirely original; at the same time, it is true, that in the rudiments of the Latin grammar, independently of this machinery, which will embrace every branch of the scholars' studies, other methods of proceeding will be recommended with regard to elementary lessons, and the introduction to syntax, parsing, and prosody, than those which are usually followed. In the principles, however, on which these processes depend, nay, perhaps in the processes themselves, the master will find nothing but what has been suggested before. He may see nothing but what he knew before, or at least will think, as soon as he has read it, that he knew before—so simple, so plain, and so true shall it be. But my solicitude is, that it may be known in the way which may avail both for the master and his pupil.'

He afterwards proceeds to propose the 'scheme of a school on the model of the Madras system,' which, as it is a key to this great improvement, in all its forms, we subjoin complete:—

'1. The asylum, like every well regulated school, is arranged into forms or classes, each composed of as many scholars as, having made a similar progress, unite together.

'The scholar ever finds his own level, not only in his class, but also in the ranks of the school, being promoted or degraded from place to place according to his relative proficiency.

'So much for the general formation of a school. Now more particularly of the Madras Asylum.

'2. Each class is, when preparing their lessons by themselves, paired off into tutors and pupils.

'Thus in a class of thirty-six scholars, the eighteen best and most trusty are tutors respectively to the eighteen-worst.

'This arrangement, by no means an important link in the chain of self-tuition, is frequently dispensed with, and when continued lessons take place, as in the schools of the National Society, it is of course superseded.

'3. To each class is attached an assistant teacher, whose business is, as the name implies, to act under, with, or for the teacher.

'4. The teacher who, with his assistant, has charge of the class, as well when learning, as saying their lessons, and is responsible for their order, behaviour, diligence, and improvement.

'Both the teacher, and his assistant, say their lessons with their class.

'5. A sub-usuer, and usher (or rather a competent number of ushers), are appointed, when necessary, to inspect the school, watch over the

whole, and give their instruction and assistance wherever wanted, as the agents and ministers of the master.

6. The schoolmaster, whose province it is to direct and conduct the system in all its ramifications, and to see all the subordinate offices carried into effect.

7. Last of all comes the superintendent (who may be the chaplain of the establishment, parochial minister, secretary, treasurer, trustee, or visitor), whose scrutinising eye must pervade the whole machine, whose active mind must give it energy, and whose unbiassed judgment must inspire confidence, and maintain the general order and harmony.

What goes before comprises the system of tuition by teachers and ushers, or, as they are often called, monitors.

What follows is for the purposes of precisor and inspection, and as checks and instruments of discipline in the execution and superintendence of the above plan.

8. On the front of the teachers' and assistants' books, when taken in hand, is written with ink the year and day of the month; and throughout their books, the end of each lesson, when given out, is noted by a score with a pencil. Also the sum of the daily lessons (so noted in the marked book), and the other tasks of the day, likewise the individual proficiency of each scholar are entered in a register book for the master's use, and the visitors' reference and inspection.

9. Black book, as the boys call it, or register of such offences as require serious animadversion, and a weekly scrutiny by

10. A jury of twelve boys—the peers of the culprits.

Under perfect instruction, and the able and impartial administration of the laws of the school, the 9th and 10th regulations become a dead letter; the general laws of inspection and emulation being found sufficient for the purpose of discipline.

This, in brief, is the scheme of the Madras system of education, framed on an extensive scale, and in a multiplied form, fitted for a numerous school.

We can only admit his further observations 'On the effects of equalised classification.'

1. Equalised classification extends perfect instruction to every member of a school.

From the law of classification, by which every scholar claims and assumes his place, not according to his standing or length of time in school, but to his actual proficiency and acquirements, determined by a fair and constant competition with his school-fellows, and is ranked, by this impartial and unerring law, with those with whom he is on a footing of equality; it necessarily follows that no scholar either retards others in their daily course, or is retarded himself: his station in the school, and progress in learning, always bear a just proportion to his talents and industry. No idleness, on the one hand, is occasioned by the want of sufficient employment, from his having his lessons prepared long before those with whom he is associated; and, on the other hand, no scholar is oppressed by the burden of tasks, to which he is unequal,

nor his progress stayed by the length and difficulty of lessons, which he cannot overtake.

Hence it is, that, in a Madras school, a complete acquaintance with every lesson is not, as too frequently happens, confined to scholars of superior parts or industry, but is extended and insured to every scholar in every class; hence too it is, that while there is no let or hindrance to the career of memory, judgment, or genius, there is also an end to dunces in our schools. One boy outstrips another in his gymnasium—his scholastic career; but he who is left behind is master of the inferior ground which he occupies, as well as the other is of the superior station which he has attained. *Falsa enim est querela, paucissimis hominibus vim percipiendi quæ tradantur, esse concessam; plerosque vero laborem ac tempora tarditate ingenii perdere, &c*

It is an unfounded complaint, that very few learners are naturally endowed with the faculty of understanding the lessons which are prescribed to them, and that most do in reality lose their labor and time from defect of genius. Quite otherwise is the fact: for you will find the generality of men quick in conception, and prompt to learn. This is the characteristic of man. As birds are destined by nature to fly, horses to run, and wild beasts to be ferocious: so to us is peculiar the (agitation) working and sagacity of the mind. Hence it is believed, that the human soul is of celestial origin. The dull and the indocile are no more conformable to the nature of man, than bodies which are accounted prodigies and monsters. But these are very rare. Of this fact the good promise, which the generality of children display, is a sufficient proof. And, when it dies away and disappears with age, it is manifest that the fault does not originate in any real deficiency of nature, but arises from want of due culture. It cannot indeed be denied that one excels another in genius, and that some make greater, some less, proficiency. But none can be found who have derived no benefit from study.

How happily has the Madras system of education illustrated this position, to a degree beyond the conception of the greatest minds of former times! And what an acquisition is it, to the science of instruction, that every scholar who enters a school shall derive continual and progressive improvement during the period of his stay, having his understanding cultivated, and his memory exercised and improved in exact proportion to the strength of the faculties which he possesses! No longer will even a single learner quit a school thus conducted, without having all along been duly occupied in the improvement of his talents, and in the increase of his attainments. None will now by reason of the difficult and disproportioned course of their studies, and the ill assortment of the classes, and by imperfect instruction in the beginning, pass through the forms of their school, as those who wander through a dark and dreary wilderness, toiling and fatiguing themselves to find an exit, without a ray of light, or of comfort, or of profit, to their benighted minds—a state in which many were wont to remain till they left school. To others, and those I fear few in number, the time

comes when, after a tedious, irksome, and unprofitable process, age ripens their faculties, and they begin to understand and to relish their daily exercises, and to derive from them profit and pleasure—that profit and pleasure, which, by a sad perversion of instruction, are commonly denied them at the early periods of their studies.

‘2. But the new classification not only extends the benefit of perfect instruction to every member of a school alike; but also, by the love of imitation which it indulges, and feeds, and by the emulation which it creates, calls forth the exertion, and accelerates the progress, of each and every scholar.

‘As those children, whose talents or rather acquirements are nearly equal, rank in the same class, a spirit of imitation and competition is kept in perpetual action. A lively degree of interest is given to all their occupations, their attention is kept constantly awake, and the several powers of their minds are called forth into constant exercise, by the incessant application of two of the most powerful principles of our nature—the desire of eminence and distinction, and the dread of shame and degradation.’

Dr. Bell's proposals for adapting Lilye's

grammar to his new system, and his general plan of instruction with respect to the rudiments of the Latin language, occupy the latter part of his work, and we can only refer our readers to its pages for further information on this point. In conclusion, he says, ‘What I seek, as the grand consummation of my labors, and completion of my design, is to put into the hands of our learned and able masters, that new organ of the human mind which is fitted, in a wonderful degree, to minister to their ease, comfort, and utility, as well as to the satisfaction, delight, and improvement of their scholars: and by which alone they can render their institutions in future, what they have been for the past—faithful and true nurseries of youth to the good of the nation, to the character of our nobles, and to the glory of God. If so much has been done towards these ends with the former method of cultivating their rich soils, what fruitful crops may not comparatively be expected from the vast improvements in the art of cultivating the human mind, to which the new machinery has given rise?’

We may add that a Latin, as well as Greek Grammar, has been published on the plan here commends, by the Charter House.

EDUCE, *v. a.* Lat. *educō*. To bring out; extract.

That the world was *educated* out of the power of space, give that as a reason of its original: in this language, to grow rich, were to *educē* money out of the power of the pocket.

Glanville.

This matter must have lain eternally confined to its beds of earth, were there not this agent to *educē* it thence.

Woodward.

The 'eternal art *educēs* good from ill,
Grafts on this passion our best principle. *Pope.*

Just so the ' Omnipotent, who turns

The system of a world's concerns,

From mere minutiae can *educē*

Events of most important use;

And bid a dawning sky display

The blaze of a meridian day. *Comper.*

The *education* of electricity from the earth is shown by an insulated cushion soon ceasing to supply either the vitreous or resinous ether to the whirling globe of glass or of sulphur.

Darwin.

EDULCORATE, *v. a.* Fr. *edulcor*; Lat.

EDULCORATION, *n. s.* *dulcoro*, *a dulcis*, sweet. To sweeten; the act of sweetening, or purifying.

(Swine's dung) though not so proper for a garden, is said yet to *edulcorate* and sweeten fruit so sensibly, as to convert the bitterest almond into sweet.

Erclyn.

EDULCORATION, in chemistry, properly signifies the rendering substances more mild. It consists almost always in taking away acids and other saline substances; and this is effected by washing the bodies to which they adhere in a large quantity of water. The washing of diaphoretic antimony, powder of algaroth, &c., till the water comes off quite pure and insipid, are instances of chemical *edulcoration*.

EDULCORATION, in pharmacy, is merely the sweetening of juleps, potions, and other medicines, by adding sugar or syrup.

EDWARD FORT, a fort in Nova Scotia, in the town of Windsor in Hants county, said to be large enough to contain 100 men. It is situated on Avon River, which is navigable thus far for vessels of 400 tons: those of sixty tons can go two miles higher.

EDWARDS (George), F.R.A.S.S., was born at Stratford, in Essex, April 3d, 1694. Upon leaving school he was put apprentice to a tradesman in Fenchurch-street; but Dr. Nicolas, a relation of his master's, having left him his books, which were removed to an apartment occupied by Edwards, he eagerly employed his leisure hours in perusing them, which entirely deprived him of all inclinations for business, and he resolved to travel. In 1716 he visited the principal towns in Holland, and in about a month returned to England. Two years after he took a voyage to Norway, at the invitation of a gentleman, who was nephew to the master of the ship in which he embarked. At this time Charles XII. was besieging Fredericksburg; in consequence of which our young naturalist was confined by the Danish guard, who supposed him to be a spy employed by the Swedes. However, upon obtaining testimonials of his innocence, a release was granted. In 1718 he returned to England, and next year visited Paris, by the way of Dieppe. During his stay in France he made two journeys of 100 miles each; the first to Chalons, in Champagne, in May, 1720; the second on foot, to Orleans and Blois: but an edict happening at that time to be issued for securing vagrants, to transport them to America, as the banks of the Mississippi wanted population, our author narrowly escaped a western voyage. On his arrival in England, Mr. Edwards closely pursued his favorite study of natural history, applying himself to drawing and coloring such animals as fell under his notice.

A strict attention to natural, more than picturesque beauty, claimed his earliest care: birds first engaged his attention; and, having purchased some of the best pictures of these subjects, he was induced to make a few drawings of his own; which were admired by the curious, who encouraged our young naturalist to proceed, by paying a good price for his labors. Among his first patrons and benefactors may be mentioned James Theobalds, Esq., of Lambeth. Our artist, thus unexpectedly encouraged, increased in skill and assiduity; and procured, by his application to his favorite pursuit, both a decent subsistence and a large acquaintance. In 1731 he made an excursion to Holland and Brabant, where he collected several scarce books and prints, and saw the original pictures of several great masters. In December 1733, by the recommendation of the great Sir Hans Sloane, Bart., president of the College of Physicians, he was chosen librarian, and had apartments in the college. By degrees he became one of the most eminent ornithologists in this or any other country. His merit is so well known in this respect, as to render any eulogium on his performances unnecessary. He never trusted to others what he could perform himself; and often found it so difficult to give satisfaction to his own mind, that he frequently made three or four drawings to delineate the object in its most lively character and attitude. In 1743 the first volume of his *History of Birds* was published in 4to. His subscribers exceeding even his most sanguine expectations, a second volume appeared in 1747. The third was published in 1750; and the fourth in 1751. This volume being the last he intended to publish, he seems to have considered it as the most perfect of his productions in natural history, and wrote a curious dedication of it to the great God of nature. Our author, in 1758, continued his labors under a new title, viz. *Gleanings of Natural History*. A second volume of the *Gleanings* was published in 1760. The third part, which made the seventh and last volume of his works, appeared in 1764. The whole of his works contain engravings and descriptions of more than 600 subjects in natural history, not before described or delineated. He likewise added a general index in French and English; which was afterwards perfected, with the Linnæan names, by Linnæus himself, who honored him with his friendship and correspondence. On St. Andrew's day, 1750, Mr. Edwards was presented, by the president and council of the Royal Society, with the gold Copley medal. He was a few years afterwards elected F.R.S. and F.A.S., London; and a member of various academies of sciences and learning in different parts of Europe. His collection of drawings, which amounted to upwards of 900, was purchased by the earl of Bute. After the publication of his last work, being arrived at his seventieth year, he retired from public employment to a house which he had purchased at Plaistow; where he was afflicted with cancer in the eye, and the stone, a complaint to which, at different periods of his life, he had been subject. Yet, in the severest paroxysms of misery, he was scarcely known to

utter a complaint. Having completed his eightieth year, emaciated with age and sickness, he died July 23d, 1773, lamented by a numerous acquaintance.

EDWARDS (Richard), a minor English poet and dramatist of considerable powers, was born in Somersetshire in 1523, and educated at Corpus Christi College, Oxford. He afterwards became a student, and graduated at Christ Church. At the beginning of the reign of queen Elizabeth, he was one of the gentlemen of the royal chapel, and teacher of the children. Much esteemed as a poet and musician by his contemporaries, his death, in 1566, was greatly lamented. He wrote *Damon and Pythias*, a comedy, acted at court and printed in 1570; *Palemon and Arcite*, a comedy acted before queen Elizabeth at Christ Church; *Sonnets to the beauties of the courts of Mary and Elizabeth* in MS., in the British Museum, and several poems, included in his *Paradise of Dainty Devices*.

EDWARDS (John), an English divine, and controversial writer, born at Hertford in 1637. His father, Thomas Edwards, was a furious presbyterian, and wrote with equal zeal against the episcopalians and independents; but, when the latter party prevailed, he withdrew to Holland, where he died in 1646. A work of his, entitled *Gangrana*, exhibits a curious picture of the religious divisions of that period. John received his education first at Merchant Taylor's school, London, and afterwards St. John's College, Cambridge, where he was chosen fellow. He married in 1676, and was soon after presented to the living of St. Peter's, Colchester. Here he continued only about three years, when he removed to Cambridge, took his degree of D.D., and from this time employed himself chiefly in writing. He published a vast number of books, not a few of them practical, but the greater part on controversial subjects. His opinions were Calvinistic. He died in 1716. The most esteemed of his works is his *Preacher*, in 3 vols.

EDWARDS (Jonathan), an American divine, was born at Windsor, in Connecticut, in 1703, and educated at Yale College, where he took his degrees in arts. In 1722 he became preacher to a presbyterian congregation at New York; and, in 1724, was chosen tutor of Yale College; which station he resigned in 1726, and removed to Northampton to assist his grandfather, who was minister there. He remained at Northampton till 1750, when he was dismissed from his situation for refusing to administer the sacrament to those who could not give proofs of their conversion. In 1751 he went as a missionary among the Indians, and, in 1757, was elected president of the college of New Jersey, which station he did not long enjoy; for next year, 1758, he was attacked by the small pox, which proved fatal. Mr. Edwards's works demonstrate him to have been an acute metaphysician, and strict Calvinist. He wrote, 1. *A Treatise concerning Religious Affections*; 2. *The Life of David Brainerd, a Missionary*; 3. *Narrative of the Work of God in the Conversion of many Hundred Souls in Northampton*; 4. *An Enquiry into the Modern prevailing Notion of that Freedom of Will*, which

is supposed to be essential to Moral Agency;
5. The great Doctrine of Original Sin defended;
6. Sermons, &c. &c.

EDWARDS (Edward), a London artist, of great ingenuity, was born in 1738, and brought up to his father's business of a chair-maker and carver. This he soon quitted for drawing, in which he acquired skill enough to become a teacher, and by that means supported his mother when a widow, and a brother and sister. The society of arts encouraged his efforts by two premiums, for historical pictures, and in 1773 he became an associate of the Royal Academy. He now visited Italy, and on his return was employed by Mr. Horace Walpole, Mr. Hamilton of Bath, and several other gentlemen. In 1788 he became teacher of perspective in the Royal Academy, and in the course of his duties composed his *Treatise on Perspective*, 4to. He died in 1806: after his death were printed his *Anecdotes of Painters*, 4to., with his life prefixed.

EDWARDS (Bryan), a literary gentleman principally known for his *History of the West Indies*, was born in 1743, at Westbury in Wiltshire. Educated at a private dissenting seminary at Bristol, he acquired on the death of his father the protection of an uncle, of considerable property in Jamaica, and was placed by him under the tuition of a clergyman resident there. Together with the large fortune of his uncle, he inherited that of a Mr. Hume of Jamaica, and, becoming a considerable merchant, returned to England, and took his seat in 1796 for the borough of Grampound, which he represented until his death in July 1800. He published *Thoughts on the Trade of the West India Islands with the United States*, 8vo. 2. *A Speech on the Slave Trade*. 3. *History of the British Colonies in the West Indies*, 2 vols. 4to. and 3 vols. 8vo. 4. *The Proceedings of the governor and assembly of Jamaica in regard to the Maroon negroes*, 8vo.

EDWARDS (George), a physician and political writer of respectable literary attainments, left the following productions. *The Aggrandisement and National Perfection of Great Britain*, 2 vols. 4to., 1787; *Royal and Constitutional Regeneration of Great Britain*, 2 vols. 4to.; *Practical Means of exonerating the public Burthens, and of raising the Supplies of War without new Taxes*, 4to., both in 1790; *Great and important Discovery of the Eighteenth Century*, &c., 8vo.; *First Volume of the Franklinian Improvement of Medicine*, 4to., both in 1791; *Effectual Means of providing against the Distress apprehended from Scarcity*, &c., 8vo. 1800; *Practical Means of counteracting the present Scarcity*, &c., 8vo.; *Political Interests of Great Britain*, 8vo., both 1801; *Peace on Earth, Good will towards Men*, &c., 1805, 8vo.; *Measures as well as Men*, &c. 8vo., 1806; *A plain Speech to the Imperial Parliament of Great Britain*, 8vo.; *Means adequate to the present Crisis*, 8vo.; *Discovery of the natural Æra of Mankind*, all in 1807; and *The National Improvement of the British Empire*, &c., 1808. Dr. Edwards died at his house in Suffolk Street, February 17th, 1823, in the seventy-second year of his age.

EDWARDS (Thomas), an English divine, born

at Coventry in 1729, and educated at Clare-Hall, Cambridge, of which he became fellow. He printed a translation of the *Psalms* in 1755, and the year following was chosen master of the grammar-school at Coventry, besides being presented to the rectory of St. John Baptist in that city. In 1759 he published a book, entitled *The Doctrine of Irresistible Grace proved to have no Foundation in the New Testament*. In 1762 he became the defendant of bishop Hare's *System of the Hebrew Metre against Dr. Lowth*. He took the degree of D.D. in 1766, and in four years after obtained the living of Nuneaton in Warwickshire, where he died in 1785. Besides the works above noticed, he published *Selections from Theocritus*, with notes.

EDWARDS (Thomas), an ingenious writer, born in London in 1709. He was bred to the bar, and became a member of the society at Lincoln's Inn, yet he scarcely ever practised. He attacked Warburton's edition of *Shakspeare* in 1744, after which he published a very sharp and humorous work, entitled *Canons of Criticism*, with a Glossary, which went through several editions. He added to this work some sonnets, and an account of the trial of the letter Y. He died in 1757. A tract of his, upon *Predestination*, was published some time after.

EDWARDS (William), a self-taught architect, of Glamorganshire, South Wales, whose name deserves to be recorded on account of the uncommon displays of genius which he has left in that corner of the country. He held only the rank of an ordinary mason, yet, by the superior mental powers with which he was endowed, he acquired remarkable skill in the designing and building of bridges. That over the Taaf, particularly, which is the segment of a circle, the chord of which is 147 feet at the surface of the water, is a monument of his abilities. William Edwards likewise exercised the calling of a methodist preacher. He died in 1789, aged seventy-one.

EDWIN'S HALL, an ancient ruinous building, on Cockburn Law in Berwickshire, so named from Edwin, king of Northumberland, but said to have been originally built by the Picts. It consists of three concentric circles; the diameter of the innermost is forty feet, the wall seven feet thick; the space between the innermost and second wall, seven feet, and that between the second and third, ten feet. The stones are very large, and grooved into each other, having never been cemented with mortar.

EDWY, the son of Edmund I., king of England, succeeded his uncle, Edred, A.D. 955. The tragical history of this unfortunate monarch and his virtuous queen Elgiva, reflects an indelible stain on the character of St. Dunstan, and shows what sort of monsters were canonised as saints in the ages of superstition. See BRITAIN.

EDYSTONE LIGHT-HOUSE. See EDDYSTONE.

EECKHOOT (Gerbrant Vander), an historical portrait painter, was born at Amsterdam in 1621, and was a disciple of Rembrandt; whose manner of designing, coloring, and penciling, he imitated so nearly, that it is difficult to distinguish between several of his paintings and those of his

master; his touch and his coloring are the same as Rembrandt's; but he rather excelled him in the extremities of his figures. His principal employment was in portraits; but his chief delight was in painting historical subjects, which he executed with equal success. His composition is rich and full of judgment; the distribution of his masses of light and shadow, is truly excellent; and, in the opinion of many connoisseurs, he had more transparence in his coloring, and better expression, than his master. He died in 1674.

EEK, *v. a.* Better written EFF, which see.

EEL, *n. s.* Sax. and Swed. æl; Dan. Belg. and Teut. æl; Germ. aal; Gr. *εγκελος*, *abulus*, *limus*, mud. A slimy, serpentine kind of fish, bred in muddy waters.

Is the adder better than the eel,
Because his painted skin contents the eye.

Shakspeare.

EEL, in ichthyology. See MURÆNA.

EEL-FISHING. See ANGLING.

EELS, MICROSCOPIC. See ANIMALCULE. The microscopic eels in vinegar are similar to those in sour paste. The taste of vinegar was formerly thought to be occasioned by the biting of these little animals, but that opinion has been long ago exploded. Mentzelius says, he has observed the actual transformation of these little creatures into flies; but as this has never been observed by any other person, nor is there an instance of such a transformation in any other animalcule, it seems probable that Mentzelius has been mistaken in his observations.

EEL SHEAR, a forked instrument, with three or four jagged teeth, used for catching of eels; that with the four teeth is best, which they strike into the mud at the bottom of the river, and if it strike against any eels it never fails to bring them up.

EVEN, *adv.* Contracted from even. See EVEN.

Says the satyr, if you have a trick of blowing hot and cold out of the same mouth, I have *e'en* done with you.

L'Estrange.

EFBE, an island near the south coast of Mysol, in the Eastern Seas, having a bay on its north side, which forms a harbour. It is five or six miles in length, and birds of paradise migrate, where they are caught with bird-lime, and dried as they appear in Europe. Captain Forrest found two small villages here. Long. 127° E., lat. 2° 12' S.

EFF, *n. s.* Commonly written est. A small lizard. See EFT.

EFFABLE, *adj.* Lat. *effabilis*. Expressible; utterable.

He accommodated thereunto his universal language to make his character *effable*.

Wallis.

EFFACE, *v. a.* Fr. *effacer*, Lat. *ex* and *facio*. To destroy, or mar the appearance; blot out; hence, to destroy, generally; to wear away.

Nor our admission shall your realm disgrace,
Nor length of time our gratitude *efface*.

Dryden's *Æneid*.

Characters on dust, the first breath of wind *effaces*.

Locke.

It was ordered, that his name should be *effaced* out of all public registers.

Addison on Italy.

Time, I said, may happily *efface*
That cruel image of the king's disgrace. *Prior*.
Otway failed to polish or refine,
And fluent Shakspeare scarce *effaced* a line.

Pope.

So coin grows smooth, in traffic current passed,
Till Cæsar's image is *effaced* at last.

Cowper.

Who hath bent him o'er the dead
Ere the first day of death is fled,
The first dark day of nothingness,
The last of danger and distress,
(Before decay's *effacing* fingers
Have swept the lines where beauty lingers).

Byron.

EFFECT, *n. s.* & *v. a.* Fr. *effect*; Ital. *effetto*; Span. *efetto*, *effecto*; Port. *efeito*, *effectus*, *e* ex-
plicative, and *facio*, to make. That which is produced by a real or supposed cause; completion; reality:

hence, in the plural, palpable and moveable property; hence also consequence or event accomplished or proposed; success; advantage: as a verb to bring to pass; produce; cause; particularly as an agent. Effectible means, that may be accomplished; practicable: effective is, having the power to accomplish objects or effects: efficient is, serviceable: effectless, useless; impotent: effector, he who produces an effect, applied to the First Cause: effectual is, actually productive of effects; practically operative of them: to effectuate, derived to us from the Fr. *effectuer*, is synonymous with to effect.

They spake to her to that *effect*. 2 Chron.

Christ is become of no *effect* unto you.

Gal. v. 4.

The communication of thy faith may become *effectual*, by the acknowledging of every good thing.

Philom. 6.

I have the taught division betwene

Frende of *effete*, and frende of countenance,

Chaucer.

In shew, a marvellous indifferently composed *se-
late* ecclesiastical was to govern, but in *effect* one
only man should, as the spirit and soul of the residue,
do all in all.

Hooker.

The reading of scripture is *effectual*, as well to lay even the first foundation, as to add degrees of farther perfection, in the fear of God.

Id.

What form of prayer

Can *arise* my turn? Forgive me my foul murder!

That cannot be, since I am still possesser

Of those *effects* for which I did the murder,

My crown, mine own ambition, and my queen.

Shakspeare

I'll chop off my hands;

In bootless prayer have they been held up,

And they have served me to *effectless* use.

Id.

Reprove my allegation, if you can;

Or else conclude my words *effectual*.

Id.

No man, in *effect*, doth accompany with others, but he learneth, ere he is aware, some gesture, or voice, or fashion.

Bacon's *Natural History*.

They are not *effective* of any thing, nor leave no work behind them.

Bacon.

Being consul, I doubt not t' *effect*

All that you wish.

Ben Jonson.

2 L 2

Though the means cannot *effect* that which we desire ; yet God will have us use the likeliest means on our part to *effect* it. *Bp. Hall. Contemplations.*

If either the curses of men, or the endeavours of the powers of darkness, should be *effectual*, all would be hell. *Id.*

Anger is the most impotent passion that accompanies the mind of man ; it *effects* nothing it goes about. *Clarendon.*

He should depart only with a title, the *effect* whereof he should not be possessed of, before he deserved it. *Id.*

That a pot full of ashes will still contain as much water as it would without them, is not *effectible* upon the strictest experiment. *Browne's Vulgar Errors.*

Nor do they speak properly who say that time consumeth all things ; for time is not *effective*, nor are bodies destroyed by it. *Id.*

If a mischief become public and great, acted by princes, and *effected* by armies, and robberies become by whole fleets, it is virtue, and it is glory. *Bp. Taylor.*

Whosoever is an *effective* real cause of doing his neighbour wrong is criminal, by what instrument soever he does it. *Taylor.*

If any mystery, rite, or sacrament, be *effective* of any spiritual blessings, then this much more, as having the prerogative and principality above every thing else. *Id.*

This *effectively* resists the devil, and suffers us to receive no hurt from him.

Taylor's Rule of Holy Living.

Recovering shankers, crystallines,
And nodes and blotches in their rinds,
Have no *effect* to operate
Upon that duller block your pate ? *Hudibras.*

State and wealth, the business and the crowd,
Seem at this distance but a darker cloud ;
And is to him, who rightly things esteems,
No other in *effect* than what it seems. *Denham.*

The change made of that syrup into a purple color, was *effected* by the vinegar. *Boyle on Colours.*

We commemorate the creation, and pay worship to that infinite Being who was the *effector* of it. *Derham.*

The students of nature, conscious of her more cryptick ways of working, resolve many strange *effects* into the near efficiency of second causes. *Glanville. Apology.*

The institution has hitherto proved without *effect*, and has neither extinguished crimes, nor lessened the number of criminals. *Temple.*

You may see by her example, in herself wise, and of others beloved, that neither folly is the cause of vehement love, nor reproach the *effect*. *Sidney.*

He found means to acquaint himself with a nobleman, to whom discovering what he was, he found him a fit instrument to *effectuate* his desire. *Id.*

Effect is the substance produced, or simple idea introduced into any subject, by the exerting of power. *Locke.*

These men's opinions are not the product of judgment, or the consequence of reason ; but the *effects* of chance and hazard, of a mind floating at all adventures, without choice, and without direction. *Id.*

Sometimes the sight of the altar, and decent preparations for devotion, may compose and recover the wandering mind more *effectually* than a sermon. *South.*

I took pleasure to trace out the cause of *effects*, and the dependence of one thing upon another in the visible creation. *Burnet's Theory.*

Semblant art shall carve the fair *effect*,
And full achievement of thy great designs.

To say of a celebrated piece that there are faults in it, is, in *effect*, to say that the author of it is a man. *Prior.*

We see the pernicious *effects* of luxury in the ancient Romans, who immediately found themselves poor as soon as this vice got footing among them. *Addison.*

The emperor knew that they could not convey away many of their *effects*. *Addison on Italy.*

A subject of that vast latitude, that the strength of one man will scarcely be sufficient *effectually* to carry it on. *Id. Spectator.*

A fatal instance of this in our first parents we have upon sacred record ; the unhappy *effects* of which are but too visible in all. *Woodward.*

The morality of an action depends upon the motive from which we act. If I sling half a crown to a beggar with intention to break his head, and he picks it up and buys victuals with it, the physical *effect* is good ; but, with respect to me, the action is very wrong. *Mason.*

This idea he immediately carried into *effect*, by fixing a bar of iron of the depth he wanted along each side of the keel, moving upon hinges that admitted of being moved in one direction, but which could not be bent back in the opposite direction. *Johnson.*

A true artist should put a generous deceit on the spectators, and *effect* the noblest designs by easy methods. *Franklin.*

EFFEMINATE, *adj., v. a., v. n.* Fr. *efféminé* ; Ital. *effeminate* ; Span. and Port. *effeminado* ; Lat. *effeminatus*, *effemino* ; *e*, expletive, and *famina*, a woman. Womanish ; unmanly ; tender ; nice ; voluptuous. The verb seems to have been derived, in our language, from the adjective.

Know ye not that the unrighteous shall not inherit the kingdom of God ? Be not deceived : neither fornicators, nor *effeminate*. *Bible. 1 Cor. vi. 9.*

The king, by his voluptuous life and mean marriage, became *effeminate*, and less sensible of honour. *Bacon.*

After the slaughter of so many peers,
Shall we at last conclude *effeminate* peace ? *Shakespeare.*

As well we know your tenderness of heart,
And gentle, kind, *effeminate* remorse. *Id.*

Vices the hare figured ; not only feneration, or usury, from its fecundity and superfetation, but degenerate *effemination*. *Browne's Vulgar Errors.*

From man's *effeminate* slackness it begins,
Who should better hold his place. *Milton.*

But foul *effeminacy* held me yoked
Her bond slave : O indignity, O blot
To honour and religion ! *Id. Agonistes.*

What boots it at one gate to make defence,
And at another to let in the foe
Effeminately vanquished ? *Milton.*

So long as idleness is quite shut out from our lives, all the sins of wantonness, softness, and *effeminacy* are prevented. *Taylor.*

The more *effeminate* and soft his life,
The more his fame to struggle to the field. *Dryden.*

Poetry—not being an art of lies—not of *effeminateness*, but of notable stirring courage. *Sidney.*

It weakens and *effeminates* their minds to suffer them to complain; and if they endure sometimes crossing or pain from others, without being permitted to think it strange or intolerable, it will do them no harm to learn sufferance, and harden them early.

Locke.

In a slothful peace both courage will *effeminate* and manners corrupt.

Pope.

And I can feel

Thy follies too; and with a just disdain
Frown at *effeminates*, whose very looks
Reflect dishonour on the land I love. Cowper.

But that *effeminacy*, folly, lust,
Enervate and enfeeble, and needs must;
And that a nation shamefully debased
Will be despised and trampled on at last,
Unless sweet Penitence her powers renew,
Is truth, if history itself be true. Id.

'I offer you a handsome suit of clothes:

'A woman's, true: but then there is a cause

Why you should wear the'—'What though my soul
loathes

'The *effeminate*?'—Thus, after a short pause,
Sighed Juan, muttering also some slight oaths,

'What the devil shall I do with all this gause?'
Byron.

EFFENDI, in the Turkish language, signifies master; and accordingly it is a title very extensively applied; as to the mufti and emirs, to the priests of mosques, to men of learning, and of the law. The grand chancellor of the empire is called reis effendi.

EFFERVESCE, *v. n.* } Lat. *effervesco*;

EFFERVES'ENCE, *n. s.* } *efferveo*, *e* and *fer-*

EFFERVES'CENT, *adj.* } *veo*, to burn. To
rise in chemical ebullition: to generate heat by
intestinal motion.

Take chalk, ignite it in a crucible, and then
powder it: put it into strong spirit of nitre, 'till it
becomes sweetish, and makes no *effervescence* upon
the injection of the chalk. Grew.

The compound spirit of nitre, put to oil of cloves,
will *effervesce* even to a flame. Mead on Poisons.

Hot springs do not owe their heat to any colluctation
or *effervescence* of the minerals in them, but to
subterranean heat or fire.

Woodward's Natural History.

In the chemical sense, *effervescence* signifies an in-
testine motion, produced by mixing two bodies together
that lay at rest before; attended sometimes with a
hissing noise, frothing and ebullition.

Arbuthnot on Aliments.

We have an agreeable imitation of acidulous
waters, under the term of what is called the *effr-*
escing draught. This consists of two solutions,
one of an alkaline carbonate, and the other of the
citric or some other vegetable acid, which are directed
to be mixed together, and swallowed during the act
of *effervescence*. Dr. A. Rees.

EFFERVESCENCES are commonly attended with
bubbles, vapors, small jets of the liquid, &c.,
occasioned by the air which then disengages
itself. Sometimes, also, they are accompanied
with a great degree of heat, the cause of which
is not so well known. Formerly the word fer-
mentation was also applied to effervescences;
but now that word is confined to the motion natu-
rally excited in animal and vegetable matters,
and from which new combinations among their
principles take place.

EFFETE, *adj.* Lat. *effatus*, (*e* privative, young).
Barren; and *seto*, to bear young; disabled from
producing young; worn out.

All that can be allowed him now, is to refresh his
decrepit, *effete* sensuality, with the history of his for-
mer life. South.

In most countries the earth would be so parched and
effete by the drought, that it would afford but one
harvest. Bentley.

EFFICA'CIOUS, *adj.* } Old Fr. *efficaise*,
EFFICA'CIOUSLY, *adv.* } power; Lat. *efficax*,
EFFICACY, *n. s.* } *efficacis*, from *efficio*,
to **EFFECT**, which see. Powerful; productive of
intended objects or consequences.

Whatsoever is spoken concerning the *efficacy* or
necessity of God's word, they tie and restrain only
into sermons. Hooker.

Whether if they had tasted the tree of life before
that of good and evil, they had suffered the curse of
mortality; or whether the *efficacy* of the one had not
overpowered the penalty of the other, we leave it unto
God. Brune.

Efficacy is a power of speech which represents a
thing, by presenting to our minds the lively ideas or
forins. Peacham.

If we find that any other body strikes *efficaciously*
enough upon it, we cannot doubt but it will move that
way in which the striking body impels it.

Digby on Bodies.

The apostle tells us of the success and *efficacy* of
the gospel upon the minds of men; and, for this
reason, he calls it the power of God unto salvation.

Tillotson.

A glowing drop with hollowed steel

He takes, and, by one *efficacious* breath,

Dilates to cube or square. Philips.

The arguments drawn from the goodness of God,
have a prevailing *efficacy* to induce men to repent.

Rugers.

Bad as the world is, there is reason to think it
would be a thousand times worse, if it were not for
this institution; the wisdom and humanity of which
can never be sufficiently admired; and which, if it
were as strictly observed as it is positively commanded,
would operate with singular *efficacy* in advancing
public prosperity, as well as private virtue.

Beattie.

EFFICI'ENCE, *n. s.* } Lat. *efficio*. See
EFFICIENCY, } **EFFICACIOUS**. Act or
EFFICIENT, *adj.* & *n. s.* } power of producing
EFFICIENTLY, *adv.* } effects or consequen-
ces; agency: as a substantive, efficient is sy-
nonymous with causer, or with effector.

The manner of this divine *efficiency* being far above
us, we are no more able to conceive by our reason,
than creatures unreasonable by their sense are able
to apprehend after what manner we dispose and order
the course of our affairs. Hooker.

God, which moveth meer natural agents as an
efficient only, doth otherwise move intellectual crea-
tures, and especially his holy angels. Id.

Observations of the order of nature carry the mind
up to the admiration of the great *efficient* of the world.
Hale.

That they are carried by the manuduction of a rule,
is evident; but what that regulating *efficiency* should
be, is not easily determined. Glanville.

A pious will is the means to enlighten the under-
standing in the truth of Christianity, upon the ac-
count of a natural *efficiency*: a will so disposed, will
engage the mind in a severe search. South.

Logical or consequential necessity is when a thing does not *efficiently* cause an event but yet by certain infallible consequences does infer it. *South.*

Gravity does not proceed from the *efficiency* of any contingent and unstable agents; being entirely owing to the direct concurrence of the power of the Author of nature. *Woodward.*

Your answering in the final cause, makes me believe you are at a loss for the *efficient*.

Collier on Thought.

I look upon indolence as a sort of suicide; for the man is *efficiently* destroyed, though the appetite of the brute may survive. *Chesterfield.*

EFFIG'ATE, *v. a.* } Lat. *effligio*, (e, and *fin-*
EFFIG'ATION, *n. s.* } *go*, to fashion). To form
EFF'IGIES, *n. s.* } into resemblance; to
EFF'IGY. } image: effigies or effigy
is resemblance, generally of a rough, uncouth, or of the French caricature kind: but our ~~other~~ writers use these words more seriously, and for 'actual image,' or idea.

We behold the species of eloquence in our minds, the *effigies* or actual image of which we seek in the organs of our hearing.

Dryden's Dufresnoy, Preface.

Observe those numerous wrongs in *effigy*,
The gods have saved from the devouring sea.

Garth.

EFFIGY is also used for the print or impression of a coin, representing the prince's head who struck it.

EFFIGY, TO EXECUTE OR DEGRADE IN, denotes the execution or degradation of a condemned criminal, who cannot be apprehended. In France, before the revolution, they used to hang a picture on a gibbet, wherein was represented the criminal, with the manner of punishment; at the bottom was written the sentence of condemnation. Those who were sentenced to death were executed in effigy.

EFFINGHAM, a county of the United States, in the lower district of Georgia, bounded by the Savannah River on the north-east, which separates it from South Carolina, and by the Ogeechee River on the south-west, which divides it from Liberty county. Chief towns, Ebenezer and Elberton.

EFFINGHAM, a township of New Hampshire, in Stafford county, seated on the Ossipee, south-east of Ossipee Pond.

EFFLORESCENCE, *n. s.* } Lat. *effloresco*,
EFFLORES'ENCY, } *e* expletive, and
EFFLORES'CENT, *adj.* } *floro*, to flower;
from *flos*, *floris*, a flower. The production of flowers; hence any excrescence of the shape or appearance of flowers.

Where there is less heat, there the spirit of the plant is digested, and severed from the grosser juice in *efflorescence*. *Bacon.*

Excrescencies in the form of flowers.

Two white sparry incrustations, with *efflorescencies* in form of shrubs, formed by the trickling of water.

Woodward.

Yellow *efflorescent* sparry incrustations on stone. *Id.*

It has lately been found in large quantities in a natural basin of calcareous earth at Molfetta in Italy, both in thin strata between the calcareous beds, and in *efflorescences* of various beautiful leafy and hairy forms. *Darwin.*

A wart beginneth in the cutis, and seemeth to be an *efflorescence* of the serum of the blood.

Wiseman's Surgery.

EFFLORESCENCE, in chemistry, denotes the formation of a kind of mealy powder on the surface of certain bodies. Efflorescence is occasioned either by decomposition or drying. The efflorescence which happens to cobalt and pyrites is of the first; and that observed on the crystals of marine alkali, Glauber's salt, &c., of the latter kind. An efflorescence is sometimes also a species of crystallisation, the nature of which is not well understood; as the beautiful vegetations which shoot up from vitriolated tartar, acidulated either with the vitriolic or nitrous acids, the saline spicule, which are observed to shoot from salt butter, &c. Besides the common crystallisation of salts, all of them have the property of appearing in the form of an efflorescence, or small saline spicule, when mixed with any thick substance, particularly lime. Whatever salt happens to be made use of, there is little or no difference in the efflorescence. Thus, in butter very much salted, the sea-salt shoots in the form of long spicule, though the sea-salt itself never shoots but in the form of cubical crystals. In like manner, Glauber's salt will appear in the form of an efflorescence, as well as the fossile alkali, &c., nor will the form of the crystals of the efflorescence be perceptibly different from those of sea-salt. The efflorescences which we see very commonly upon walls, are in general Glauber's salt. In some cases, they are composed of fossile alkali. The reason of these differences is not known. In almost all cases of this kind there seems to be a real growth of salt. On one spot of a plaster wall, about two feet square, which we observed particularly, this growth was very evident. The produce was a true Glauber's salt; and, by frequently taking off the efflorescence, eight ounces were procured; nor did the prolific virtue of the wall seem to be in the least impaired by the waste.

EFFLORESCENTIA, or rather EFFLORESCENTIE TEMPTIS, in botany, from *effloresco*, to bloom, the precise time of the year and month in which every plant shows its first flowers.

EFFLUENCE, *n. s.* } Fr. *flux*; Lat. *effluo*,
EFF'LUX, *n. s.* & *v. n.* } *efflucis*; from *c*, out of,
EFFLUX'ION, *n. s.* } and *fluo*, *flurus*, to flow.
A flowing forth: that which flows; emanation. Or, as Dr. Johnson observes, the act of flowing is more properly effluence, that which flows more properly efflux.

There are some light *effluxions* from spirit to spirit, when men are one with another; as from body to body. *Bacon.*

The first *efflux* of men's piety, after receiving of the faith, was the selling and consecrating their possessions. *Hammond.*

By *effluxion* and attraction bodies tend towards the earth. *Brown.*

These scintillations are not the ascension of the air upon the collision of two hard bodies, but rather the inflammable *effluences* discharged from the baches collided. *Id.*

Bright *effluence* of bright essence increate.

Milton.

Five thousand and some odd centuries of years
are *effluxed* since the creation.

Boyle's Seraphick Love.

Through the copious *efflux* of matter, through the
orifice of a deep ulcer, he was reduced to a skeleton.
Harvey.

From the bright *effluence* of his deed
They borrow that reflected light,
With which the lasting lamp they feed,
Whose beams dispel the damps of envious night.
Prior.

Prime clearer, light !

Of all material beings, first and best !

Efflux divine ! *Thomson's Summer.*

EFFLU'VIUM, *n. s. sing.* } Lat. *effluo*. See
EFFLU'VIA, *n. s. plur.* } EFFLUENCE.

Small particles that exude, i. e. flow as it were,
from bodies, commonly applied in modern times
to the smell or scent they yield.

If the earth were an electric body, and the air but
the *effluvium* thereof, we might believe that, from at-
traction, and by effluxion, bodies tended to the earth.
Browne.

Neither the earth's diurnal revolution upon its axis,
nor any magnetick *effluvia* of the earth, nor the air,
or atmosphere which environs the earth, can produce
gravity. *Woodward.*

If these *effluvia*, which do upward tend,
Because less heavy than the air, ascend ;
Why do they ever from their height retreat,
And why return to seek their central seat ?
Blackmore.

EFFORCE, *v. a.* Fr. *efforcer*. To force ;
to break through by violence ; strain ; violate.

In all that room was nothing to be seen,
But huge great iron chests and coffers strong ;
All barred with double bonds, that ne'er could ween,
Them to *efforce* by violence or wrong.
Faerie Queene.

Then 'gan her beauty shine as brightest sky,
And burnt his beastly heart 't' *efforce* her chastitie.
Spenser.

The palmer lent his ear into the noise,
To wheet who called so importunately ;
Again he heard a more *efforced* voice,
That bade him come in haste. *Id.*

EFFORM, *v. a.* } Latin, *efformo*. To
EFFORM'ATION, *n. s.* } make in any certain
manner ; to shape ; to fashion.

Nature begins to set upon her work of *efformation*.
More.

Merciful and gracious, thou gavest us being, raising
us from nothing, and *efforming* us after thy own image.
Taylor.

They pretend to solve phenomena, and to give an
account of the production and *efformation* of the uni-
verse. *Ray.*

EFFORT. Fr. *effort* ; most probably from
the Latin *fortis*, strong, hold. Struggle ; earnest
endeavour ; vehement action. It is accented by
good writers on either syllable.

If, after having gained victories, we had made the
same *efforts* as if we had lost them, France could not
have withstood us.

Addison. On the State of the War.

Though the same sun, with all diffusive rays,
Blush in the rose, and in the diamond blaze,
We prize the stronger *effort* of his power,
And always set the gem above the flower. *Pope.*
Blackmore himself for any grand *effort*. *Id.*

There is not so poor a book in the world, that would
not be a prodigious *effort* were it wrought out entirely
by a single mind, without the aid of prior investigators.
Johnson.

And bathing his chill temples tried to sooth

Each pulse to animation, till beneath
Its gentle touch and trembling care, a sigh
To these kind *efforts* made a low reply. *Byron.*

Good without *effort*, great without a foe. *Id.*

EFFUSION, *n. s.* Lat. *effodio*. The act of
digging up from the ground ; deterration.

He set apart annual sums for the recovery of ma-
nuscripts, the *effusion* of coins, and the procuring of
innumics. *Arbutnot.*

EFFRAIABLE, *adj.* Fr. *effroyable*. Dread-
ful ; frightful ; terrible. A word not used.

Pestilential symptoms declare nothing a proportion-
ate efficient of their *effraiable* nature but arsenical
fumes. *Harvey.*

EFFRONTERY. Fr. *effronterie* ; Lat. *effrons*,
shameless ; from *frons*, *frontis*, the forehead, often
put for impudence or assurance (from modest fe-
males wearing it veiled). Shamelessness ; im-
modesty ; contempt of reproach.

They could hardly contain themselves within one
unworthy act, who had *effrontery* enough to commit or
countenance it. *King Charles.*

A bold man's *effrontery*, in company with women,
must be owing to his low opinion of them, and his
high one of himself. *Clarissa.*

Others with ignorance and insufficiency have self-
admiration and *effrontery* to set up themselves.

Watts.

His pride, that scorns to obey or to submit,
With them is courage, his *effrontery* wit.

Cowper.

EFFULGE, *v. n.* } Lat. *effulgeo*, to shine
EFFULGENCE, *n. s.* } out, from *e*, out of, and
EFFULGENT, *adj.* } fulgeo to shine. To emit
light, lustre. Effulgence is the lustre, light, or
brightness, emitted.

On thee

Impressed, the *effulgence* of his glory abides.

Milton.

Thy lustre, blest *effulgence*, can dispel
The clouds of error, and the gloom of hell.

Blackmore.

How soon the *effulgent* emanations fly
Through the blue gulf of interposing sky ! *Id.*

The downward sun
Looks out *effulgent*, from amid the flash
Of broken clouds. *Thomson's Spring*

The topaz charms the sight,
Like these *effulging* yellow streams of light.

Savage.

The west is indeed on fire with his descending glo-
ries. In what broad and *effulgent* day do they reveal
the infatuation of the duke of Bedford ; sharpening
the axe for his own neck, and for the necks of all men
of rank and property in the kingdom ! *Seward.*

Effulgent maids ! you round deciduous day,
Tressed with soft beams, your glittering bands array.
Darwin.

EFFUMABILITY, *n. s.* Lat. *fumus*. The
quality of flying away, or vaporizing in fumes.
A useful word, but not adopted.

They seem to define mercury by volatility, or, if I
may coin such a word, *effumability*. *Boyle.*

EFFUSE', *v. a. & n. s.* } *Fr. effusion*, Ital
EFFUS'ION, *n. s.* } *Span. and Portug.*
EFFU'SIVE, *adj.* } *effusione*; *Lat. effu-*
sio, from *effundo*, to pour out, i. e. *e*, out, and
sundo, to pour. To pour out; shed; spill.
 Shakspeare uses *effuse* for *effusion*. The act of
 pouring out words or things; the thing poured
 out.

When there was but as yet one only family in the
 world, no means of instruction, human or divine,
 could prevent *effusion* of blood. *Hooker.*

My heart hath melted at a lady's tears,
 Being an ordinary inundation;
 But this *effusion* of unmanly drops,
 This shower, blown up by tempest of the soul,
 Startles mine eyes, and makes me more amazed.

Shakspeare.

The air hath got into my deadly wounds,
 And much *effuse* of blood doth make me faint. *Gl.*
 Stop *effusion* of our Christian blood,
 And 'establish quietness. *Id. Henry VI.*

Purge me with the blood of my Redeemer, and I
 shall be clean; wash me with that precious *effusion*,
 and I shall be whiter than snow. *King Charles.*

Such great force the gospel of Christ had upon men's
 souls, melting them into that liberal *effusion* of all that
 they had. *Hamm. on Fundam.*

He fell, and, deadly pale,
 Groaned out his soul, with gushing blood *effused*.

Milton.

Our blessed Lord commanded the representation of
 his death, and sacrifice on the cross, should be made
 by breaking bread and *effusion* of wine.

Taylor's Worthy Communicant.

Yet shall she be restored, since public good
 For private interest ought not be withstood,
 To save the *effusion* of my people's blood.

Dryden's Homer.

If the flood-gates of heaven were any thing distinct
 from the forty days rain, their *effusion*, 'tis likely,
 was at this same time when the abyss was broken
 open. *Burnet's Theory.*

At last emerging from his nostrils wide,
 And gushing mouth, *effused* the briny tide.

Pope's Odyssey.

The North-east spends its rage; the *effusive* South
 Warns the wide air. *Thomson's Spring.*

The several irruptions of Arabs, Tartars, and Per-
 sians, into India were, for the greater part, ferocious,
 bloody, and wasteful in the extreme: our entrance
 into the dominion of that country was as generally,
 with small comparative *effusion* of blood; being intro-
 duced by various frauds and delusions, and by taking
 advantage of the incurable, blind, and senseless ani-
 mosity, which the several country powers bear towards
 each other, rather than by open force. *Burke.*

Your myriad trains o'er stagnant oceans tow,
 Harnessed with gossamer, the loitering prow;
 Or with fine films, suspended o'er the deep,
 Or oil *effusive* lull the waves asleep. *Darwin.*

EFFUSION, or **FUSION**, in astronomy, denotes
 that part of the sign Aquarius, represented on
 celestial globes and planispheres, by the water
 issuing out of the urn of the water-bearer.

EFT, *n. s.* Sax. *efeta*, from Goth. *vate*, water.
 A water-lizard.

Peacocks are beneficial to the places where they
 are kept, by clearing of them from snakes, adders,
 and *efts*, upon which they will live.

Mortimer's Husbandry.

The crocodile of Egypt is the lizard of Italy, and
 the *eft* in our country. *Nicholas.*

EFT, in zoology. See **LACERTA**.

EFT, *adv.* } Sax. *eft*, and *eftþona*, from
EFTSOONS' } Sax. *eftan*, to hasten. Soon;
 quickly; following soon. The Goth. *eft* signi-
 fies behind; and our naval word *ast*, as well as
 after, afterwards, &c., are of the same family.
 See **APT**.

But sithen thynges passed cannot be gaine called,
 muche oughte wee the more beware, by what occasion
 we haue taken soo greates hurt afore, that we *eftsoones*
 fall not in that occasion agayne. *Sir T. More.*

Eft through the thick they heard one rudely rush,
 With noise whereof he from his lofty steed

Down fell to ground, and crept into a bush,
 To hide his coward head from dying dread.

Faerie Queene.

Eftsoones he gan apply relief

Of salves and medicines. *Id.*

He in their stead *eftsoones* placed Englishmen, who
 possessed all their lands. *Spenser's State of Ireland.*

The Germans deadly hated the Turks, whereof it
 was to be thought that new wars should *eftsoones*
 ensue. *Knolles's History.*

Quite consumed with flame,

The idol is of that eternal maid;

For so at least I have preserved the same,

With hands profane, from being *eft* betrayed.

Fairfax.

Eftsoons, O sweetheart kind, my love repay,
 And all the year shall then be holiday.

Guy's Pastorals.

EGALITE', *Fr. i. e.* equality; the surname
 assumed by Philip Bourbon Capet, the last duke
 of Orleans, to ingratiate himself with the republic-
 ans, upon the abolition of monarchy in France,
 in August, 1792. Neither this piece of policy,
 however, nor his voting for the death of his un-
 fortunate relation, Louis XVI., could save him
 from being denounced as a conspirator against
 the liberty of the republic, on the 12th April,
 1793, and condemned to be guillotined on the
 6th November following. He was executed
 accordingly at five P. M., three hours after his
 condemnation.

EGBERT, the first king of all England, and
 the last of the Saxon heptarchy. He was a de-
 scendant of the royal family of Wessex, and a
 prince of great accomplishments; but, while
 young, he was obliged to withdraw to France,
 where he lived at the court of Charlemagne, till
 Brithric, the then king of Wessex, from whose
 jealousy he had fled, became obnoxious to the
 nobility, through the conduct of his queen. Eg-
 bert, who, during his exile, had acquired both
 the arts of war and government, was recalled to
 take possession of the kingdom, to which he was
 legal heir; was proclaimed king of Wessex in
 800, and in 802 he united all the other kingdom
 under him, giving the whole the name of Eng-
 land. In about five years after, his dominions
 were twice invaded by the Danes, with great
 force, but he defeated them in both their at-
 tempts. He died in 838, and was succeeded by
 Ethelwolf. See **ENGLAND**.

EGEDE (Hans), a Danish missionary, who
 went to Greenland in 1721. He became the
 founder of an establishment there, over which he
 presided for fifteen years, and was the author of
 a work on the topography and natural history of
 Greenland, published in Danish in 1729, and
 afterwards translated into French and Dutch.

He died in 1758, aged seventy-one, in the isle of Falster.

EGEDE (Paul), son of the preceding, was his assistant in the above mission; and published a journal of his own residence in Greenland, from 1721 to 1788. He died at the age of eighty-one, June 3d, 1789.

EGENOTISO, an island in the Eastern Indian Sea, about twenty miles in circumference, fifty miles from the north-east coast of Sumatra. Long. 104° 45' E., lat. 0° 27' S.

E'GER, *n. s.* See EAGRE. An impetuous or irregular flood or tide.

From the peculiar disposition of the earth at the bottom, wherein quick excitations are made, may arise those *eggers* and flows in some estuaries and rivers; as is observable about Trent and Humber in England.

Browne's Vulgar Errors.

EGER, a river rising in Suabia, which passes by Nordlingen, and runs into the Wernitz, six miles north of Donauwert.

EGER, a large river of Franconia, which flows eastward to Bohemia, and falls into the Elbe.

EGER, an old fortified town of Bohemia, on the above river. It contains some manufactures; has three annual fairs; and in the neighbourhood is a well-known chalybeate spring. It was occupied by the French in 1742, but retaken the following year. It suffered greatly by fire in 1809. Population about 8000. Seventy-six miles from Prague.

EGERIA, or ÆGERIA, a nymph held in great veneration by the Romans. She was courted by Numa Pompilius; and, according to Ovid, became his wife. This prince, to give his laws the greater authority, solemnly declared, before the Roman people, that they were previously sanctified and approved by the nymph Egeria. Ovid says, that Egeria was so disconsolate at the death of Numa, that she melted into tears, and was changed into a fountain by Diana. She was ranked as a goddess who presided over the pregnancy of women, whence some reckoned her the same with Lucina.

EGERTON (John), an eminent prelate, born in London in 1721, was the son of Henry Egerton, bishop of Hereford. He received the first part of his education at Eton, after which he was sent to Oriel College, Oxford. In 1745 he obtained the living of Ross in Herefordshire, and the next year a prebend in the cathedral of Hereford. He was preferred to the deanery of Hereford in 1750, and afterwards successively to the bishoprics of Bangor, Litchfield, and Durham. He was a liberal contributor to several important public works in his diocese, and his charities were extensive. He published several sermons on public occasions; and died in 1787.

EGERTON (Thomas), lord chancellor of England, under James I., was the natural son of Sir Richard Egerton, in Cheshire, and was born about 1540. He was educated at Oxford, whence he removed to Lincoln's Inn. He received the honor of knighthood, and was made attorney-general in 1592; and not long after, master of the rolls, which was followed by the office of lord-keeper. In 1603 he was appointed lord chancellor, with the title of baron Ellesmere; and in 1616 he was created viscount

Brackley, but died the year following. His Privileges and Prerogatives of the High Court of Chancery, and his Observations concerning the Office of Lord Chancellor, were published after his death.

EGERTON (Francis), duke of Bridgewater, descended from the above nobleman, was born in 1736, being the fifth son of the first duke, and the third who held that title. He succeeded his elder brother in 1748. This nobleman exhibited a most enlightened and persevering spirit in his various schemes for making navigable canals for the advantage of his estates in Lancashire and Cheshire, and in his patronage of the celebrated Brindley, by whom his plans were executed. The duke had the satisfaction of witnessing the entire success of his undertakings, prior to his death, which took place in 1802.

EGEST', *v. a.* } Lat. *egero*, *egestum*, from
EGEST'ION, *n. s.* } *e*, out, and *gero*, to bear:
to carry forth. To evacuate food naturally.

Divers creatures sleep all the Winter; as the bear, the hedge-hog, the bat, and the bee; these all wax fat when they sleep, and *egest* not.

Bacon's Natural History.

The animal soul or spirits manage as well their spontaneous actions, as the natural or involuntary exertions of digestion, *egestion*, and circulation.

Hale's Origin of Mankind.

EGG. *Isl.* *eggia*, to incite; *Sax.* *eggian*; *Dan.* *egge*: according to Minshew all derived from Lat. *ago*, to compel, do, &c.

Study becomes pleasant to him who is pursuing his genius, and whose ardour of inclination *eggs* him forward, and carrieth him through every obstacle.

Durham's Physico-Theology.

EGG, *n. s.* *Goth.* and *Swed.* *egg*; *Sax.* *æg*; *Erse.* *ough*; perhaps from the foregoing verb, *i. e.* that which is excited to life by hatching.

About her commeth all the world to begge.

He asketh lande, and he to pas would bryng,

This toye and that, and all not worth an *egg*:

He would in loue prosper aboue all thyng.

Sir T. More.

Therefore think him as the serpent's *egg*,

Which hatched, would, as his kind, grow mischievous.
Shakspeare.

An *egg* was found having lain many years at the bottom of a moat, where the earth had somewhat overgrown it; and this *egg* was come to the hardness of a stone, and the colors of the white and yolk perfect.

Bacon.

Hear this then, ye careless ostriches, that leave your *eggs* in the open sand for the sun to hatch, without the fear of any hoof that may crush them in pieces.

Bp. Hall.

There was taken a great glass-bubble with a long neck, such as chemists are wont to call a philosophical *egg*.

Boyle.

Every insect of each different kind,

In its own *egg*, cheered by the solar rays,

Organs involved and latent life displays. *Blackmore.*

As true wit generally consists in the resemblance and congruity of ideas, false wit chiefly consists in the resemblance and congruity sometimes of single letters, as in anagrams, chronograms, lipograms, and acrostics: sometimes of words, as in puns and quibbles: and sometimes of whole sentences or poems, cast into the figures of *eggs*, axes, or altars. *Addison.*

The Aphid is in a similar manner hatched from an egg in the vernal months, and produces a viviparous offspring without sexual intercourse for nine or ten successive generations; and then the progeny is both male and female, which cohabit, and from these new females are produced eggs, which endure the winter; the same process probably occurs in many other insects. *Darwin.*

And now the day of woe drew on apace,
A day of woe to all the pigmy race,
When dwarfs were doomed, but penitence was vain,
To rue each broken egg, and chicken slain. *Beattie.*

She and her maid, had promised by day-break
To pay him a fresh visit, with a dish
For breakfast, of eggs, coffee, bread, and fish. *Byron.*

Egg, in physiology, a body formed in certain females, in which is contained an embryo, or fœtus of the same species, under a cortical surface or shell. The exterior part of an egg is the shell; which in a hen, for instance, is a white, thin, and friable cortex, including all the other parts. It is lined every where with a very thin, but a pretty tough membrane, which dividing at, or very near, the obtuse end of the egg, forms a small bag, where nothing but air is contained. In new-laid eggs this follicle appears very little, but becomes larger when the egg is kept. Within this are contained the albumen, or white, and the vitellus, or yolk; each of which have their different virtues. The albumen is a cold, viscous, white liquor in the egg, different in consistence in its different parts. It is observed, that there are two distinct albumens, each of which is enclosed in its proper membrane. Of these one is very thin and liquid; the other is more dense and viscous, and of a somewhat whiter color; but in old and stale eggs, after some days incubation, inclining to a yellow. As this second albumen covers the yolk on all sides, so it is itself surrounded by the other external liquid. The albumen of a fecundated egg, is as sweet and free from corruption, during all the time of incubation, as it is in new laid eggs; as is also the vitellus. As the eggs of hens consist of two liquors separated one from another, and distinguished by two branches of umbilical veins, one of which goes to the vitellus, and the other to the albumen; so it is very probable, that they are of different natures, and consequently appointed for different purposes. When the vitellus grows warm with incubation, it becomes more humid, and like melting wax or fat, whence it takes up more space. For as the fœtus increases, the albumen insensibly wastes away and condenses; the vitellus, on the contrary, seems to lose little or nothing of its bulk when the fœtus is perfected, and only appears more liquid and humid when the abdomen of the fœtus begins to be formed. The chick in the egg is first nourished by the albumen, and when this is consumed, by the vitellus, as with milk. If we compare the chalazæ to the extremities of an axis passing through the vitellus, which is of a spherical form, this sphere will be composed of two unequal portions, its axis not passing through its centre; consequently, since it is heavier than the white, its smaller portion must always be uppermost in all positions of the egg. The yellowish white round spot, called cicatri-

cula, is placed on the middle of the smaller portion, and therefore always appears on the superior part of the vitellus. Not long before the exclusion of the chick, the whole yolk is taken into its abdomen; and the shell, at the obtuse end of the egg, frequently appears cracked some time before the exclusion of the chick. The chick is sometimes observed to perforate the shell with its beak. After exclusion, the yolk is gradually wasted, being conveyed into the small guts by a small duct. Eggs differ very much according to the birds that lay them, as to their color, form, bigness, age, and the different way of dressing them; those most used in food are hens' eggs; of which, such as are new-laid are best. As to the preservation of eggs, it is observed, that the egg is always quite full when it is first laid by the hen; but from that time it gradually becomes less and less so, to its decay; and, however compact and close its shell may appear, it is nevertheless perforated with a multitude of small holes, though too minute for the discernment of our eyes, the effect of which is a daily decrease of matter within the egg, from the time of its being laid; and the perspiration is much quicker in hot weather than in cold. To preserve eggs fresh, there needs no more than to preserve them full, and stop the transpiration: the method of doing which is, by stopping up those pores with matter which is not soluble in watery fluids; and on this principle it is, that all kinds of varnish, prepared with spirit of wine, will preserve eggs fresh for a long time, if they are carefully rubbed all over the shell; tallow, mutton fat, and even fresh butter, are also good for this purpose; for such as are rubbed over with any of these will keep as long as those coated over with varnish. M. Reaumur observes, that hens' eggs are properly a sort of chrysalis of the animal; their germ, after they are impregnated by the cock, containing the young animal alive, and waiting only a due degree of warmth to be hatched, and appear in its proper form. When eggs have been long kept, there is a road found near one of their ends, between the shell and the internal membrane; this is a mark of their being stale, and is the effect of an evaporation of part of their humidity: the varnish which M. Reaumur used to the chrysalis, being tried on eggs, was found to preserve them for two years, as fresh as if laid but the same day, and such as the nicest palate could not distinguish from those that were so.

The art of hatching chickens by means of ovens has long been practised in Egypt, chiefly in a village named Berme, and its environs. About the beginning of autumn, the natives scatter themselves all over the country; where each undertakes the management of an oven. These ovens are of different sizes, but, in general, they contain from 40,000 to 80,000 eggs, and they usually keep them working for about six months: as, therefore, each brood takes up in an oven, as under a hen, only twenty-one days, it is easy in every one of them to hatch eight different broods of chickens. Every Bermean is under the obligation of delivering to the person who trusts him with an oven, only two-thirds of as many chickens as there have been

eggs put under his care; and he is a gainer by this bargain, as more than two-thirds of the eggs usually produce chickens. This useful and advantageous method of hatching eggs was discovered in France by the ingenious M. Reaumur; who, by a number of experiments, reduced the art to fixed principles. He found that the heat necessary for this purpose is nearly the same with that marked 32° on his thermometer, or 96° on Fahrenheit's. The degree of heat which brings about the development of the cygnet, the gosling, and the Turkey pout, is the same as that which fits for hatching the Canary songster, and, in all probability, the smallest humming-bird: the difference is only in the time during which this heat ought to be communicated to the eggs of different birds. After many experiments, M. Reaumur found, that stoves heated by means of a baker's oven, succeeded better than those made hot by layers of dung: and the furnaces of glass-houses, and those of the melters of metals, by means of pipes to convey heat into a room, might, no doubt, be made to answer the same purpose. As to the form of the stoves, no great nicety is required. Nothing more is necessary but to ascertain the degree of heat, by melting a lump of butter of the size of a walnut, with half as much tallow, and putting it into a phial. This serves to indicate the heat with sufficient exactness: for when it is too great, this mixture will become as liquid as oil; and when the heat is too small, it will remain fixed in a lump: but it will flow like a thick syrup, upon inclining the bottle, if the stove be of a right temper. Great attention therefore should be given to keep the heat always at this degree, and that all the eggs in the stove may equally share the irregularities of the heat, M. Reaumur has invented a sort of low boxes, without bottoms, and lined with furs. These, which he calls artificial parents, not only shelter the chickens from the injuries of the air, but afford a kindly warmth, so that they take the benefit of their shelter as readily as they would have done under the wings of a hen. After hatching, it will be necessary to keep the chickens for some time in a room artfully heated, and furnished with these boxes: but afterwards they may be safely exposed to the air in the courtyard, in which it may not be amiss to place one of these artificial parents to shelter them, if there should be occasion for it. They are generally a whole day after being hatched, before they take any food at all. A few crumbs of bread may then be given them for a day or two, after which they will pick up insects and grass for themselves. But, to save the trouble of attending them, capons may be taught to watch them in the same manner as hens do.

EGG HARBOUR, LITTLE, a township of New Jersey, in Burlington county, consisting of 23,000 acres. The compact part of the township is called Clam Town. It has a small trade to the West Indies.

EGG HARBOUR RIVER, GREAT, a river of New Jersey, which rises between Gloucester and Cumberland counties. After running E. S. E. a few miles, it becomes the divisional line between

Cape May and Gloucester counties, and falls into the bay of its own name. The inlet from the Atlantic Ocean lies in $39^{\circ} 22'$. The river abounds with sheephead, rock-fish, perch, oysters, clams, &c., which find a ready market at Philadelphia. This river is navigable twenty miles for vessels of 200 tons.

EGG HARBOUR RIVER, LITTLE, or Little Inlet, lies about seventeen miles north-east of Great Egg Harbour Inlet. It receives Mulicus River which rises in Gloucester and Burlington counties, and forms part of the divisional line a few miles from the bay. It is navigable twenty miles for vessels of sixty tons.

EGG ISLAND, a small island on the west coast of Virginia, at the mouth of York River. 2. A small island in the Straits of Magellan, seven miles north-east of York Minster. 3. A small island on the north-east side of Delaware Bay, Cumberland. Long. $75^{\circ} 12'$ W., lat. $39^{\circ} 16'$ N.

EGG-PLANT (*solanum melongena*); a herbaceous annual, from a foot to eighteen inches high, a little branched, and more or less covered with a substance resembling cotton: the leaves are oval, sinuate, and petiolate; the flowers large, white, or purplish, lateral, and frequently solitary; but sometimes two or three are situated upon a common divided peduncle; the calyx and peduncles are furnished with a few short prickles; the fruit is very large, smooth, and shining, and generally of a violet color, but sometimes yellow or white. It is cultivated in the warm parts of both continents, and the fruit is much used as an article of food, when cooked, which is done in various ways: in India, it is generally served up with sugar and wine, or simply sugared water; in the south of France, with olive-oil. There are several varieties, one of which bears a white fruit, exactly resembling a pullet's egg, and has been sometimes confounded with another species, which is acrid and poisonous.

EGINHART, or **EGINHARD**, secretary to Charles the Great, and the most ancient of the German historians. It is said, that he insinuated himself into the favor of Imma, daughter of Charles the Great, and that Charles, having discovered the intrigue, married the two lovers, and gave them an estate in land.

EGGLANTINE, *n. s.* Fr. *cglantier*. A species of rose; sweet-briar.

EGGLANTINE, in botany. See *Rosa*.

EGILON, a king of the Moabites, who oppressed the Israelites for eighteen years. See Judges iii. 12—14. Calmet confounds this servitude of the Hebrews with that under Chushan-rishathaim, making it to subsist only eight years from A. M. 2591 to 2599; whereas this servitude under Eglon lasted eighteen years, and commenced A. M. 2661, and sixty-two years after they had been delivered by Othniel, from their subjection to Chushan-rishathaim.

EGMONT, NEW GUERNSEY, or **SANTA CRUZ ISLAND**, one of Queen Charlotte's islands, in the South Pacific Ocean, discovered in 1595, by the Spanish navigator Mandana. He bestowed upon it the name of Santa Cruz, which was changed to Egmont by captain Carteret in 1767. It is high and mountainous throughout, being about

twenty-two miles in length, and eleven in breadth. The soil, from the abundance of small streams, produces several roots and fruits, but not in great profusion. Some of the natives are of a deep olive color, others black, and all of moderate size, with slender extremities. Their physiognomy is disagreeable, and tends to inspire that mistrust and dislike which their treacherous and dishonest conduct but too well justifies. They are tattooed, particularly on the back: wear white powder in their hair, and many ornaments. The men go naked, wrapping a cord several times round the belly: the women have a petticoat which descends to the knees, and cover the head, and part of the body, with a sort of shift. Their huts are large, having windows, and are generally placed under the shade of cocoa-trees along the shore. Their arms are bows, arrows, and darts. They chew betel; and have canoes with outrigging, formed of the trunk of a single tree, about fifteen feet long. Long. 165° 59' E., lat. 10° 46' S.

EGMONT ISLAND, an island in the Gulf of Mexico, on the west coast of East Florida, at the entrance of Spiritu Santo Bay. Long. 82° 55' W., lat. 27° 54' N. Also an island in the South Pacific Ocean, six miles in length, four in breadth, low, and covered with trees. Long. 138° 30' W., lat. 19° 20' N.

EGOOCHSHAC, a harbour on the North coast of the island of Unalashka, entered by captain Cook in the year 1778, who found some Russians settled here for the purpose of purchasing skins of the natives: they had store-houses, and a sloop of about thirty tons burden.

EGOTISM. Fr. *egoisme*, from Lat. pers. pron. *ego*; Gr. *εγω*.

Egotism is the coquetry of a modern author; whose epistles, dedicatory prefaces, and addresses to the reader, are so many affected graces, designed to draw the attention from the subject, towards himself; and make it be generally observed not so much what he says, as what he appears, or is, and what figure he already makes, or hopes to make in the fashionable world. *Shaftesbury.*

The most violent *egotism* which I have met with, in the course of my reading, is that of Cardinal Wolsey's; *ego et rex meus*, I and my king.

Spectator.

A tribe of *egotists*, for whom I have always had a mortal aversion, are the authors of memoirs, who are never mentioned in any works but their own.

Id.

EGRA, a town of Bohemia, seated on a river of the same name, formerly imperial, and possessing towns and villages. It contains a great number of able artificers, and is famous for its mineral waters. General Wallenstein was assassinated here in 1634. The French became masters of this town in 1741; but afterwards, being blocked up, they were forced to capitulate Sept. 7th, 1743. It is considered as a town of the greatest consequence in Bohemia, except Prague. It lies seventeen miles south-west of Elnbogen, and seventy-six west of Prague. Long. 12° 40' E., lat. 50° 9' N.

EGREGIOUS, *adj.* } Old Fr. *egrege*; Ital. EGREGIOUSLY, *adv.* } Spanish, and Portug. *egregio*; Lat. *egregius* i. e. *e grege*, separated from the flock. Remarkable; extraordinary; now generally used in a bad sense; but Milton (see below) and other good writers formerly applied it to eminence and merit.

He might be able to adorn this present age, and furnish history with the records of *egregious* exploits both of art and valour. *Moore against Atheism.*

We may be bold to conclude, that these last times, for insolence, pride, and *egregious* contempt of all good order, are the worst. *Hooker's Preface.*

suffered the pangs of an *egregious* death, to be stopt in, like a strong distillation, with cloaths. *Shakspere.*

Ah me, most credulous fool!

Egregious murderer!

Id. Cymbeline.

Make the Moor thank me, love me, and reward me,

For making him *egregiously* an ass,
And practising upon his peace and quiet,
Even to madness. *Id. Othello*

The folly of fools', that is, the most *egregious* piece of folly that any man can be guilty of, is to play the knave. *Tillotson.*

One to empire born;

Egregious prince; whose manly childhood shewed
His mingled parents, and portended joy
Unspeakable.

Philips

And hence the *egregious* wizard shall foredoom
The fate of Louis and the fall of Rome. *Pope.*

An *egregious* and pregnant instance how far virtue
surpasses ingenuity. *Woodward.*

He discovered that, besides the extravagance of
every article, he had been *egregiously* cheated.

Arbuthnot's John Bull.

EGREMONT, a market town, and formerly a borough in Cumberland, on a small river which falls into the Irish Sea, near the promontory of St. Bees, five miles S. S. E. from Whitehaven, and 293 north from London. The buildings in general are ancient, and many of the houses have piazzas in front. On a remarkable eminence are the ruins of a castle, in which the earl of Egremont holds a court. The town gives the title of earl to the Wyndham family. Market on Saturday, well supplied with barley and oats.

EGRESS, } Ital. *egresso*; Lat. *egressus*,
EGRESSION. } from *e*, out, and *gradior*, *gressus*.
to walk; the act of going out; departure.

Gates of burning adamant,
Barred over us, prohibit all *egress*. *Milton.*

This water would have been locked up within the earthen, and its *egress* utterly debarred, had the strata of stone and marble remained continuous.

Woodward's Natural History.

The vast number of troops is expressed in the swarms; their tumultuous manner of issuing out of their ships, and the perpetual *egression*, which seemed without end, are imaged in the bees pouring out.

Pope.

EGRIOT, *n. s.* Fr. *aigret*, perhaps from *aigre*, sour. A species of cherry.

The cœur-cherry, which inclineth more to white, is sweeter than the red; but the *egriot* is more sour.

Bacon.

E G Y P T.

EGYPT, an extensive country of Africa, lying between 30° and 36° of E. long., and between 22° and 31° of N. lat. It is bounded by the Mediterranean on the north, by the Red Sea and Isthmus of Suez, which divide it from Arabia, on the east, by Abyssinia or Ethiopia on the south, and by the deserts of Barca and Nubia on the west; being 600 miles in length from north to south, and from 100 to 250 in breadth from east to west. Ancient Egypt is by some divided into two parts, the Upper and Lower Egypt: by others into three, the Upper Egypt, properly so called, or Thebais; the Middle Egypt, or Heptanomis; and the Lower Egypt, the best part of which was the Delta, or that space encompassed by the branches of the Nile. The whole area of cultivable soil has been recently estimated at 11,000 square miles.

Egypt may with justice lay claim to as high antiquity as any nation in the world. It was most probably peopled by Mizraim the son of Ham and grandson of Noah. By its ancient inhabitants it was called Chemia, and is still called Chemi in the language of the Copts or native Egyptians. In Scripture it is generally named Mizraim; though in the Psalms it is styled the land of Ham. To us it is best known by the name of Egypt, the etymology of which is more uncertain. Some derive it from *Ægyptus*, a supposed king of the country: others say it signifies no more than 'the land of the Copts;' *Aia* in Greek signifying the country, and *Αἰκοπος*, *Aicoptos*, being easily hardened into *Ægyptus*. The most probable opinion, however, seems to be, that it received this name from the blackness of its soil and the dark color both of its river and inhabitants; for such a blackish color is by the Greeks called *ægyptios*, from *γῆψ*, and *αἰγυπιος*, a vulture; and by the Latins, *subvulturius*. For the same reason other names of a similar import have been given to this country by the Greeks; such as *Aeria*, and *Melambolus*: the river itself was called *Melo*, or *Melas*; by the Hebrews *Shihor*, and by the Ethiopians *Siris*; all signifying black.

The air and climate of Egypt are extremely warm, not only from the height of the sun, which in summer approaches to the zenith, but from the want of rain, and from the vicinity of those burning and sandy deserts which lie to the south. In July and August, according to M. Volney, Reaumur's thermometer stands, even in the most temperate apartments, at 24° or 25° above the freezing point; and in the southern parts it is said to rise still higher. Hence, he says, only two seasons should be distinguished in Egypt, the cool and the hot, or spring and summer. The latter continues for the greatest part of the year, viz. from March to November, or even longer; for by the end of February the sun is intolerable to an European at nine o'clock in the morning. During the whole of this season the air seems to be inflamed, the sky sparkles, and every one sweats profusely, even without the least exercise, and when covered with the lightest

dress. This heat is tempered by the inundation of the Nile, the fall of the night dews, and the subsequent evaporation; so that some of the European merchants, as well as the natives, complain of the cold in winter. The dew does not fall regularly throughout the summer, as with us; the parched state of the country not affording a sufficient quantity of vapor for this purpose. It is first observed about St. John's day (June 24th), when the river has begun to swell, and consequently a great quantity of water is raised from it by the heat of the sun, which, being soon condensed by the cold of the night air, falls down in copious dews. It might be imagined that as, for three months of the year, Egypt is in a wet and marshy situation, the excessive evaporation and putrefaction of the stagnating waters would render it very unhealthy. But this is by no means the case. The great dryness of the air makes it absorb vapors of all kinds with the utmost avidity; and these, rising to a great height, are carried off by the winds either to the south or north without communicating any of their pernicious effects. This dryness is so remarkable in the internal parts of the country, that flesh meat exposed to the open air does not putrefy even in summer, but soon becomes hard and dry like wood. In the deserts there are frequently dead carcasses thus dried in such a manner, and become so light, that one may easily lift that of a camel with one hand. In the maritime parts, however, this dryness of the air is not to be expected. They discover the same degree of moisture which usually attends such situations. At Rosetta and Alexandria iron cannot be exposed to the air twenty-four hours without rusting. According to the above writer, the air of Egypt is also strongly impregnated with salts. No experiments have ever shown, that any salt was or could be diffused in the air, except volatile alkali, and this is now known to be formed by the union of two permanently elastic fluids: and it is certain that a saline air would quickly prove fatal to the animals who breathed it. The abundance of this kind of salt in Egypt therefore only shows that, by some unknown operation, the heat of the sun forms it from the two ingredients of earth and water, though we do not yet understand the manner, nor are able to imitate this natural operation. To this saline property of the earth M. Volney ascribes the excessive quickness of vegetation in Egypt, which is so great that a species of gourd, called *kara*, will in twenty-four hours send forth shoots of four inches in length; but, in all probability for the same reason, no exotic plant will thrive in Egypt. The merchants are obliged to send annually to Malta for their garden seeds; for, though the plants thrive very well at first, yet, if the seed of them be preserved and sown, they always come up too tall and slender. In consequence of the great dryness of the air, Egypt is exempted from the phenomena of rain, hail, snow, thunder, and lightning. Earthquakes are also seldom heard of in this country; though they have sometimes been very fatal and

destructive, particularly one in 1112. In the Delta it never rains in summer, and very seldom at any other time. In 1761, however, such a quantity of rain unexpectedly fell, that a great number of houses, built with mud-walls, tumbled entirely down by being soaked with the water, to which they were unaccustomed. In the Higher Egypt the rain is still less frequent; but the people, sensible of the advantages which accrue from it, always rejoice when any falls, however insufficient to answer the purpose. This deficiency of rain is supplied by the inundation and dews. The latter proceed partly from the waters of the inundation, and partly from the sea. At Alexandria, after sun-set, in April, the clothes exposed to the air on the terraces are soaked with them as if it had rained. These dews are more or less copious according to the direction of the wind. They are produced in the greatest quantity by the west and north-west, which blow from the sea; but the south and south-east winds, blowing over the deserts of Africa and Arabia, produce none.

Though the climate of Egypt is far from being unhealthy, yet there are not a few diseases which seem to be peculiar to it, and to have their origin either from the constitution of the atmosphere, or the manner of living. One of these has been supposed to be the plague; which opinion was supported by Dr. Mead, who endeavoured to assign a natural reason why it should take its origin in this country. But it is now universally agreed that the plague never originates in the interior parts of Egypt, but always begins at Alexandria, passing successively thence to Rosetta, Cairo, Damietta, and the rest of the Delta. It is likewise observed, that its appearance is always preceded by the arrival of some vessel from Smyrna or Constantinople; and that, if the plague has been very violent in either of these cities, the danger to Egypt is the greater. On proper enquiry, it is found to be much more a native of Constantinople; whence it is exported by the absurd negligence of the Turks, who refuse to take any care to prevent the spreading of the infection. As they sell even the clothes of the dead without the least ceremony, and ships laden with this pernicious commodity are sent to Alexandria, it is no wonder that it should soon make its appearance there. As soon as it has reached Cairo, the European merchants shut themselves up with their families in their khans or lodgings, taking care to have no further communication with the city. Their provisions are now deposited at the gate of the khan, and are taken up by the porter with iron tongs; who plunges them into a barrel of water provided for the purpose. If they have occasion to speak to any person, they take care to keep at such a distance as to avoid touching or even breathing upon each other. By these precautions they certainly escape the general calamity, except by accident. There is a remarkable difference betwixt the plague at Constantinople and the plague in Egypt. In the former it is most violent in summer, and in the latter in winter, ending there always in June. It is also remarkable that the water carriers of Egypt, whose backs, from the nature of their occupation, are constantly wet.

never have the plague. It appears in Egypt every fourth or fifth year, when it makes such ravages as would depopulate the country, were it not for the vast concourse of strangers who arrive here every year from all parts of the Turkish empire. A malady which seems in reality to be peculiar to Egypt is blindness. This is so common at Cairo, that M. Volney informs us, out of 100 people, whom he met in the street, he might reckon twenty quite blind; ten without the sight of one eye; and twenty others with their eyes red, purulent, or blemished. Almost every one, says he, wears a fillet, a token of an approaching or convalescent ophthalmia. In considering the causes of this disorder, he reckons the sleeping upon terraces to be a principal one. The south wind, he says, cannot be the cause; otherwise the Bedouins would be equally subject to it with the Egyptians themselves; but what is with the greatest probability to be assigned as the cause, is the very poor and little nutritive food which the natives are obliged to use. 'The cheese, sour milk, honey, confection of grapes, green fruits, and raw vegetables,' says he, 'which are the ordinary food of the people, produce in the stomach a disorder which physicians have observed to affect the sight: the raw onions, especially, which they devour in great quantities, have a peculiar heating quality, as the monks of Syria made me remark on myself. Bodies thus nourished abound in corrupted humors, which are constantly endeavouring a discharge. Diverted from the ordinary channels, by habitual perspiration, these humors fly to the exterior parts, and fix themselves where they find the least resistance. They therefore naturally attack the head, because the Egyptians, by shaving it once a week and covering it with a prodigiously hot head dress, principally attract to it the perspiration; and, if the head receive ever so slight an impression of cold on being uncovered, this perspiration is suppressed, and falls into the teeth, or still more readily on the eyes as being the tenderest parts. It will appear the more probable that the excessive perspiration of the head is a principal cause, when we reflect that the ancient Egyptians, who went bare-headed, are not mentioned by physicians as being so much afflicted with ophthalmies; though we are informed by historians that some of the Pharaohs died blind. The Arabs of the desert, who cover the head but little, especially when young, are also very little subject to them. In this country blindness is often the consequence of the small-pox, a disorder very frequent and very fatal among the Egyptians. They are not unacquainted with inoculation, but very seldom practise it. To the same cause, viz. unwholesome food, M. Volney ascribes the general deformity of the beggars, and miserable appearance of their children; which he says are nowhere so wretched. Their hollow eyes, pale, and puffed faces, swollen bellies, meagre extremities, and yellow skins, make them always seem as if they had not long to live. Their ignorant mothers pretend that this is the effect of the evil eye of some envious person, who has bewitched them; and this ancient prejudice is still general in Turkey; but the real cause is the badness of their food. In

spite of the talismans, therefore, an incredible number of them perish; nor is any city more fatal to the population of the neighbouring country than Grand Cairo. The venereal disease, which, for reasons best known to themselves, the inhabitants call the blessed evil, is so general at Cairo, that one half of the inhabitants are infected. It is extremely difficult to cure, though the symptoms are comparatively very mild, inasmuch, that people who are infected with it will frequently live to the age of eighty; but it is fatal to children born with the infection, and exceedingly dangerous to such as emigrate to a colder climate. Besides these, there are two uncommon diseases met with in Egypt, viz. a cutaneous eruption which returns annually; and a swelling of the testicles, which often degenerates into an enormous hydrocele. The former comes on towards the end of June, or beginning of July, making its appearance in red spots and pimples all over the body, occasioning a very troublesome itching. The cause of this distemper, M. Volney says, is the corruption of the water of the Nile, which, towards the end of April, becomes very putrid. After this has been drunk for some time, the waters of the inundation, which are fresh and wholesome, tend to introduce some change in the blood and humors; whence a cutaneous eruption is the consequence. The hydrocele is most commonly attached to the Greeks and Copts; and is attributed to the quantity of oil they use, as well as to their frequent hot bathing. Our author remarks, that in Syria, as well as in Egypt, constant experience has shown, that brandy distilled from common figs, or from the fruit of the sycamore tree, as well as from the dates and the fruit of the nopal, has a most immediate effect on the testicles, which it renders hard and painful the third, or fourth, day after it has been drunk; and, if the use of it be not discontinued, the disorder degenerates into a confirmed hydrocele. Brandy distilled from dried raisins has not the same effect: this is always mixed with aniseeds, and is very strong, being distilled three times. The Christians of Syria, and the Copts of Egypt, make great use of it; the latter especially drink whole bottles of it at their suppers. I imagined this an exaggeration; but I have myself had ocular proofs of its truth, though nothing could equal my astonishment that such excesses do not produce instant death, or at least every symptom of the most insensible drunkenness. In Spring malignant fevers prevail in this country; concerning which M. Volney mentions no remarkable particular, but that eggs are a kind of poison, and that bleeding is very prejudicial. He recommends a vegetable diet, and the bark in very large quantity.

M. Larrey, who was the chief surgeon of Buonaparte's medical staff, divides the climate into what he calls quatre saisons constitutionnelles; the first of which commences about the 20th August, when the Nile begins to overflow its banks. From this moment until the autumnal equinox, the inundation increases; lower Egypt is then like a sea, in which the towns and villages appear as so many islands: towards the end of September the waters retire, and the general

seed-time commences. To this season he gives the name of *saison humide*; the west winds and fogs then prevail, and produce ophthalmia, fever, diarrhœa, and catarrh.

His second season begins with December, and continues to the 1st March. The winds blow mostly from the east; the nights are cold, but during the day the temperature is that of June in France. The various productions of the earth are vigorously on the increase; the surface is spread over with the most lively tints of verdure; the birds and other animals '*se livrent à leurs amours*,' and all nature, reanimated by the moderate heat of the sun and the fecundity of the river, seems to grow young again. This period is healthy, if the night airs are avoided, and may justly be called, *la saison fécondante*.

The *saison morbide* of this writer extends from the beginning of March to the end of May. The east winds, which tempered the air during the spring, now pass to the south, which they seldom quit before the end of May or beginning of June. These are the '*winds of fifty days*,' blowing over the deserts, and called by the Arabs, '*simoom*,' by the Turks '*samul*.'

The fourth, which M. Larrey designates under the name of *saison étésienne*, commences about the middle of June, or just before the solstice, and continues to the overflowing of the Nile.

The winds are then variable, but, towards the end of it, fix themselves to the north, when they become regular, rising and falling with the sun. These winds, in passing over the Mediterranean, are generally supposed to carry with them aqueous vapors to the mountains of Ethiopia or Abyssinia; where, being condensed, they are precipitated in torrents of rain, at and after the summer solstice, producing that gradual and constant periodical increase of the Nile, on which the sustenance of the whole population depends. The air is now clear and dry, and, though the heat is excessive, it is the most healthy part of the year.

According to M. Volney, who gives a very particular description of the face of the country, the entrance into Egypt at Rosetta presents a most delightful prospect, by the perpetual verdure of the palm trees on each side, the orchards watered by the river, with orange, lemon, and other fruit trees, which grow there in vast abundance; and the same beautiful appearance is continued all the way to Cairo. As we proceed farther up the river, he says, nothing can more resemble the appearance of the country than the marshes of the lower Loire, or the plains of Flanders: instead, however, of the numerous trees and country houses of the latter, we must imagine some thin woods of palms and sycamores, with a few villages of mud-walled cottages, built on artificial mounds. All this part of Egypt is very low and flat, the declivity of the river being so gentle, that its waters do not flow at a greater rate than one league in an hour. Throughout the country nothing is to be seen but palm trees, single or in clumps, which become more rare as you advance; with wretched villages composed of huts with mud walls, and a boundless plain, which at different seasons is an ocean of fresh water, a miry morass, a verdant

field, or a dusty desert; and on every side an extensive and foggy horizon, where the eye is wearied and disgusted. At length, towards the junction of the two branches of the river, the mountains of Cairo are discovered on the east; and to the south-west three detached masses appear, which, from their triangular form, are known to be the Pyramids. We now enter a valley which turns to the south, between two chains of parallel eminences. That to the east, which extends to the Red Sea, merits the name of a mountain from its steepness and height, as well as that of a desert from its naked and savage appearance. Its name in the Arabic language is Mokattam, or the hewn mountain. The western is nothing but a ridge of rocks covered with sand, which has been very properly termed a natural mound or causeway. In short, that the reader may at once form an idea of this country, let him imagine on one side a narrow sea and rocks; on the other, immense plains of sand; and, in the middle, a river, flowing through a valley of 150 leagues in length, and from three to seven wide, which, at the distance of thirty leagues from the sea, separates into two arms; the branches of which wander over a soil almost free from obstacles, and void of declivity.

This country is still divided into two principal parts, called the Higher, or Upper, and Lower Egypt. It is subdivided into eighteen provinces.

Egypt, Higher, or Upper, says M. Savary, is only a long narrow valley beginning at Sienna and terminating at Cairo. It is bounded by two chains of mountains running from north to south and taking their rise from the last cataract of the Nile. On reaching the latitude of Cairo they separate to the right and left; the one taking the direction of mount Colzoun, the other terminating in some sand banks near Alexandria; the former being composed of high and steep rocks, the latter of sandy hillocks over a bed of calcareous stone. Beyond these mountains are deserts bounded by the Red Sea on the east, and on the west by other parts of Africa; having in the middle that long plain, which, even where widest, is not more than nine leagues over. Here the Nile is confined in its course between these insuperable barriers, and, during the time of its inundation, overflows the country all the way to the foot of the mountains; and Mr. Bruce observes, that there is a gradual slope from the bed of the river to those mountains on both sides. The baron de Tott says, that the mountains four leagues from the Nile, and facing Cairo, are only a ridge of rocks above forty or fifty feet high, which divide Egypt from the plains of Libya; which ridge accompanies the course of the river, at a greater or less distance, and seems as if only intended to serve as a bank to the general inundation.

Egypt, Lower, according to M. Savary, comprehends all the country between Cairo, the Mediterranean, the Isthmus of Suez, and Libya. 'This immense plain,' says he, 'presents on the borders of its parching sands a stripe of lands, cultivated along the canals of the river, and in the middle a triangular island to which the Greeks gave the name of Delta; at the top of the angle of which, the baron de Tott informs us, the

rocks of Libya and the coasts of Arabia open and recede from each other, towards the east and west parallel to the Mediterranean. This great extent of country from Barca to Gaza, is either overflowed by the river, or capable of being so; which thus fertilizes in a high degree a tract of country, seemingly devoted to perpetual barrenness, on account of the want of rain and the heat of the climate. According to the testimonies of both Mr. Bruce and M. Volney, the coast of Egypt is so extremely low, that it cannot be discovered at sea till the mariners come within a few leagues of it. In ancient times the sailors pretended to know when they approached this country, by a kind of black mud brought up by their sounding lines from the bottom of the sea; but this notion, though as old as the days of Herodotus, has been discovered to be a mistake by Mr. Bruce; who found the mud to arise while the vessel was opposite to the deserts of Barca. All along the coast of Egypt a strong current sets to the eastward.

The Egyptians, like the Chinese, pretend to an excessive antiquity, and have been said to possess records for 10,000, 20,000, or even 50,000 years. Thus their history is so much involved in obscurity and fable, that for many ages it must be passed over in silence. The first mortal king whom the Egyptians own to have reigned in that country, was Menes or Menas, whom some chronologers reckon the same with Mizraim, the grandson of Noah. He had been preceded, however, by a set of immortals (a fable probably founded upon the long lives of the Antediluvians), but who, notwithstanding their immortality, had left him the kingdom in a very bad situation: for the whole country except Thebais was a morass; the people also were quite destitute of religion and every kind of knowledge which could render life comfortable. Menes diverted the course of the Nile, which, before that time had washed the foot of a sandy mountain near the borders of Libya, built the city of Memphis, instructed his subjects, and accomplished a variety of wonders usually attributed to the founders of kingdoms. From the time of Menes, the Egyptian chronology is filled with a list of 330 kings, who reigned 1400 years, but did nothing worthy of notice. The first distinct fact of history we find concerning Egypt, is the irruption of the shepherds, by whom the country was subdued; but at what period this revolution happened cannot be known. The affair is thus related by Manetho. In the reign of Timaus, king of Egypt, a multitude of men, ignoble in their race, pouring from the east into Egypt, made war with the inhabitants; who submitted to them without resistance. The shepherds, however, behaved with the greatest cruelty; burnt the cities, threw down the temples, and put to death the male inhabitants, carrying the women and children into captivity. This people came from Arabia, and were called Hyccos, or king shepherds. They held Egypt in subjection for 259 years; at the end of which period they were obliged, by a king of Upper Egypt, named Amosis or Thethmosis, to leave the country. This prince's father had gained great advantages over them, and shut them up in a place called

Abaris or Avaris, containing 10,000 acres of land. Here they were closely besieged by Amosis, with an army of 400,000 men, till at last an agreement was made, in consequence of which the shepherds withdrew from Egypt with their families, to the number of 240,000; and, taking the way of the desert, entered Syria; but fearing the Assyrians, who were then very powerful, and masters of Asia, they entered the land of Canaan, and built there the city of Jerusalem. According to Mr. Bruce, the shepherds who invaded Egypt were no other than the inhabitants of Barabra. They were, he says, carriers to the Cushites who lived farther to the south. The latter had built the many stately temples in Thebes and other cities of Egypt; though, according to him, they had no dwelling places, but holes or caves in the rocks. Being a commercial people, they remained at home collecting and preparing their articles, which were dispersed by the Barabers, or shepherds above mentioned. These, from the nature of their employment, lived in moveable habitations, as the Tartars do at this day. By the Hebrews, he tells us, they were called phut but shepherds by every other people; and from the name baraber the word Barabra is derived. By their employment, which was the dispersing the Arabian and African goods all over the continent, they had become a great and powerful people; and, from their opposite dispositions and manners, were often enemies to the Egyptians. To one Salatis our author ascribes the destruction of Thebes in Upper Egypt, so much celebrated by Homer for its magnificence. But this certainly cannot be the case; for Homer wrote long after the time of Joseph: and we find that even then the Egyptians held the shepherds in abhorrence, in all probability because they had been grievously oppressed by them. Mr. Bruce reckons three invasions of these people, viz.: 1st, that of Salatis already mentioned, who overthrew the first dynasty of Egyptian kings from Menes, and destroyed Thebes; 2d, that of Sabacco or So; for, according to him, this was not the name of a single prince, but of a people, and signifies shepherds; and 3d, after the building of Memphis, where 240,000 of them were besieged, as above mentioned. But these accounts are inconsistent; for how is it possible that the third invasion, antecedent to the building of Jerusalem, could be posterior to the second, if the latter happened only in the days of Hezekiah? In these early ages, however, it appears that the kingdom of Egypt had been very powerful, and its dominion very widely extended; as it is said, that the Bactrians revolted from Osymandyas, another Egyptian king of very high antiquity, and of whose wealth the most marvellous accounts are given. After an unknown interval of time from this monarch, reigned Sesostris. He was the first great warrior whose conquests are recorded with any degree of distinctness. In what age of the world he lived, is uncertain. Some chronologers, among whom is Sir Isaac Newton, are of opinion, that he is the Sesac, or Shishak, who took Jerusalem in the reign of Rehoboam. Others place him much earlier; and Mr. Whiston supposes him to have been the Pharaoh who refused to part with the Israelites, and was at last drowned in the Red

Sea. Mr. Bryant endeavours to prove that no such person ever existed; but that in his history, as well as that of many ancient heroes, we have an abridgment of that of the Cushites, or Babylonians, who spread themselves over great part of the known world, and every where brought the people in subjection to them. His reign is reckoned the most extraordinary part of the Egyptian history; and the following is the least fabulous account that can be obtained of it. The father of Sesostris was told in a dream, by the god Vulcan, that his son, then newly born, should be lord of the whole earth. Upon the credit of this vision, his father took all the males in Egypt that were born on the same day with Sesostris, under his protection; appointed nurses and proper persons to take care of them, and had them treated like his own child; being persuaded that they who had been the constant companions of his youth would prove his most faithful ministers and soldiers. As they grew up, they were inured to laborious exercises; and, in particular, were never permitted to taste any food till they had performed a course of 180 furlongs, upwards of twenty-two of our miles. When the king imagined they were sufficiently educated in the martial exercises in which he designed them to excel, they were sent for a trial of their abilities against the Arabians. In this expedition Sesostris proved successful, and in the end subdued that people, who had never before been conquered. He was then sent to the westward, and conquered the greatest part of Africa; nor could he be stopped in his career till he arrived at the Atlantic Ocean. Whilst he was on this expedition, his father died; and Sesostris then resolved to fulfil the prediction of Vulcan, by actually attempting the conquest of the world. As he suspected this must take up a long time, he prepared for his journey in the best manner possible. The kingdom he divided into thirty-six provinces, and endeavoured to secure the affections of his people by gifts both of money and land. He forgave all who had been guilty of offences, and discharged the debts of all his soldiers. He then constituted his brother Armais the supreme regent; but forbade him to use the diadem, and commanded him to offer no injury to the queen or her children, or the royal concubines. His army is said to have consisted of 600,000 foot, 24,000 horse, and 27,000 chariots. Besides these land forces, he had at sea two mighty fleets; one, according to Diodorus, of 400 sail. Of these fleets, one was designed to make conquests in the west, and the other in the east, and therefore the one was built on the Mediterranean, and the other on the Red Sea. The first of these conquered Cyprus, the coast of Phœnicia, and several of the Cyclades; the other all the coasts of the Red Sea; but its progress was stopped by shoals and difficult places which the navigators could not pass; so that he seems not to have made many conquests by sea. With the land forces Sesostris marched against the Ethiopians and Troglodites, whom he overcame, and obliged them to pay him a tribute of gold, ebony, and ivory. From thence he proceeded as far as the promontory of Dira, near the straits of Babelmandel, where he set up a pillar with an inscription in sacred characters.

He then marched on to the country where cinnamon grows, probably some place in India; and here he in like manner set up pillars, which were to be seen for many ages. As to his farther conquests, it is agreed by almost all authors of antiquity, that he over-ran and pillaged the whole continent of Asia, and some part of Europe. He crossed the Ganges, and erected pillars on its banks; and thence is said to have marched eastward to the very extremity of the Asiatic continent. Returning thence, he invaded the Scythians and Thracians; but authors do not agree that he conquered them. Some even affirm, that he was overthrown by them with great slaughter, and obliged to abandon a considerable part of his booty and military stores. But whether he had good or bad success in these parts, it is believed that he settled a colony in Colchis. Herodotus, however, who gives the most particular account of the conquests of this monarch, does not say whether the colony was designedly planted by Sesostris; or whether part of his army loitered behind, and took up their residence in that region. From his own knowledge, he asserts, that the inhabitants of that country were undoubtedly of Egyptian descent. This was evident from the personal resemblance they bore to the Egyptians, who were swarthy and frizzle-haired; but more especially from the conformity of their customs, particularly circumcision. The utmost boundary of this monarch's conquests, however, was in the country of Thrace; for, beyond that country his pillars were no where to be seen. These pillars he erected in every region which he conquered, with the following inscription, 'Sesostris, king of kings, and lord of lords, subdued this country by the power of his arms.' Besides these, he left also statues of himself; two of which, according to Herodotus, were to be seen in his time; one on the road between Ephesus and Phœcæ, and the other between Smyrna and Sardis; they were armed after the Ethiopian and Egyptian manner, holding a javelin in one hand and a bow in the other. The reasons given by Sesostris for returning into Egypt from Thrace, and thus leaving the conquest of the world unfinished, were the want of provisions for his army, and the difficulty of the passes. Most probably, however, his return was hastened by the intelligence he received from the high priest of Egypt, concerning the rebellious proceedings of his brother; who, encouraged by his long absence, had assumed the diadem, and violated the queen, and the royal concubines. On receiving an account of this, Sesostris hastened from Thrace; and at the end of nine years came to Pelusium in Egypt, attended by an innumerable multitude of captives of different nations, and loaded with the spoils of Asia. His treacherous brother, we are told, met him at the gates of the city; and Sesostris is said to have accepted of an invitation to an entertainment from him. At this he drank freely, together with the queen, and the rest of the royal family. During the continuance of the entertainment, Armais caused a great quantity of dried reeds to be laid round the apartment where they were to sleep; and as soon as they were retired to rest set fire to them. Sesostris perceiving the danger he was in, and that his guards, over-

charged with liquor, were incapable of assisting him, rushed through the flames, and was followed by his wife and children. In thanksgiving for his deliverance, he made several donations to the gods, particularly to Vulcan the god of fire. He then took vengeance on his brother Armais, said to be the Danaus of the Greeks, who, being driven out of Egypt, withdrew into Greece. Sesostris now laid aside all thoughts of war, and applied himself wholly to such works as might tend to the public good, and his own future reputation. To prevent the incursions of the Syrians and Arabians, he fortified the east side of Egypt with a wall, which ran from Pelusium through the desert to Heliopolis, for 187½ miles. He raised also an incredible number of lofty mounds of earth, on which he constructed various new towns to secure them from the inundations of the Nile. From Memphis to the sea he dug canals which branched out from the Nile; and not only made an easier communication between different places, but rendered the country in a great measure impassable to any enemy. He erected a temple in every city in Egypt, and dedicated it to the supreme deity of the place; but, in the course of this great undertaking, he took care to employ none of his Egyptian subjects. Thus he secured their affection, and employed the vast multitude of captives he had brought along with him: to perpetuate the memory of a transaction so remarkable, he caused it to be inscribed on all these temples, 'No one native labored hereon.' In the city of Memphis, before the temple of Vulcan, he raised six gigantic statues, each of one stone. Two of them were thirty cubits high, representing himself and his wife; the other four were twenty cubits each, and represented his four sons. He raised also two obelisks of marble 120 cubits high, with inscriptions, denoting the greatness of his power, his revenues, &c. The captives taken by Sesostris are said to have been treated with the greatest barbarity; so that at last they resolved to deliver themselves from a servitude so intolerable. The Babylonians particularly were concerned in this revolt, and laid waste the country to some extent; but, being offered a pardon and a place to dwell in, they were pacified, and built a city, which they called Babylon. Towards the conquered princes, who waited on him with their tribute, the Egyptian monarch behaved with unparalleled insolence. On certain occasions, he is said to have unharnessed his horses, and, yoking kings together, made them draw his chariot. One day, however, observing one of the kings who drew him to look back upon the wheels with great earnestness, he asked, what made him look so attentively at them? The unhappy prince replied, 'O king, the going round of the wheel puts me in mind of the vicissitudes of fortune; for as every part of the wheel is uppermost and lowermost by turns, so it is with men; who one day sit on a throne, and on the next are reduced to the vilest degree of slavery.' This answer brought the insulting conqueror to his senses; so that he gave over the practice, and thenceforth treated his captives with great humanity. At length this mighty monarch lost his sight, and laid violent hands on himself.

After the death of Sesostris, we find another

chasm of an indeterminate length in the Egyptian history. It concludes with the reign of Amasis, or Amosis; who being a tyrant, his subjects joined Actisanes the king of Ethiopia to drive him out. Thus Actisanes became master of the kingdom; and after his death follows another chasm in the history, during which the empire is said to have been in a state of anarchy for five generations. This period brings us down to the times of the Trojan war. The reigning prince in Egypt was at that time called Cetes; by the Greeks, Proteus. The priests reported that he was a magician; and that he could assume any shape he pleased, even that of fire. This fable, as told by the Greeks, derived its origin from a custom among the Egyptians, perhaps introduced by Proteus, that of adorning and distinguishing the heads of their kings with the representations of animals or vegetables, or even with burning incense, in order to strike the beholders with the greater awe. Whilst Proteus reigned, Paris or Alexander, the son of Priam king of Troy, was driven by a storm on the coast of Egypt with Helen, whom he was carrying off from her husband. But when the Egyptian monarch heard of the breach of hospitality committed by Paris, he seized him, his mistress, and companions, with all the riches he had brought from Greece. He detained Helen, with all the effects belonging to Menelaus her husband, promising to restore them to the injured party whenever they were demanded; but commanded Paris and his companions to depart out of his dominions in three days. In what manner Paris afterwards prevailed upon Proteus to restore his mistress, we are not told; neither do we know any thing further of the transactions of this prince's reign nor of his successors, except what has entirely the air of fable, till the days of Sabacon the Ethiopian, who again conquered this kingdom. He began his reign with an act of great cruelty, causing the conquered prince to be burnt alive: nevertheless, he no sooner saw himself firmly established on the throne of Egypt, than he became a new man; so that he is highly extolled for his mercy, clemency, and wisdom. He is thought to have been the So mentioned in Scripture, who entered into a league with Hoshea king of Israel against Shalmaneser king of Assyria. He is said to have been excited to the invasion of Egypt by a dream, in which he was assured, that he should hold that kingdom for fifty years. Accordingly, he conquered Egypt, as had been foretold; and at the expiration of the time above-mentioned, he had another dream, in which the tutelar god of Thebes acquainted him, that he could no longer hold the kingdom of Egypt with safety and happiness, unless he massacred the priests as he passed through them with his guards. Being haunted with this vision, and at the same time abhorring to hold the kingdom on such terms, he sent for the priests, and acquainted them with what seemed to be the will of the gods. Upon this it was concluded, that it was their pleasure, that Sabacon should remain no longer in Egypt; and therefore he immediately returned to Ethiopia. Of Anysias, who was Sabacon's immediate successor, we have no particulars worth notice. After him reigned

Sethon, who was both king and priest of Vulcan. He gave himself up to religious contemplation; and not only neglected the military class, but deprived them of their lands. At this they were so much incensed, that they entered into an agreement not to bear arms under him; and in this state of affairs Sennacherib king of Assyria arrived before Pelusium with a mighty army. Sethon now applied to his soldiers, but in vain; they unanimously persisted in refusing to march under his banner. Being therefore destitute of all human aid, he applied to the god Vulcan, and requested him to deliver him from his enemies. Whilst he was yet in the temple of the god, it is said, he fell into a deep sleep; during which, he saw Vulcan standing at his side, and exhorting him to take courage. He promised, that if Sethon would but go out against the Assyrians, he should obtain a complete victory over them. Encouraged by this assurance, the king assembled a body of artificers and laborers, and marched towards Pelusium. He had no occasion, however, to fight; for the very night after his arrival at Pelusium, an innumerable multitude of field rats, entering the enemy's camp, gnawed to pieces the quivers, bowstrings, and shield-straps. Next morning, when Sethon found the enemy disarmed, and beginning to fly, he pursued them to a great distance, making a terrible slaughter. In memory of this extraordinary event, a statue of Sethon was erected in the temple of Vulcan, holding in his hand a rat, with these words: 'Whosoever beholdeth me, let him be pious.'

Not long after the death of Sethon, the form of government in Egypt was totally changed. The kingdom was divided into twelve parts, over which as many of the chief nobility presided. This division, however, subsisted but for a short time. Psammiticus, one of the twelve, dethroned all the rest, fifteen years after the division had been made. The history now begins to be divested of fable; and from this time may be accounted equally certain with that of any other nation. The vast conquests of Sesostris were now no longer known; for Psammiticus possessed no more than the country of Egypt itself. It appears, indeed, that none of the successors of Sesostris, or even that monarch himself, had made use of any means to keep in subjection the countries he had once conquered. Perhaps, indeed, his design originally was rather to pillage than to conquer; and therefore on his return, his vast empire vanished. Psammiticus, however, endeavoured to extend his dominions by making war on his neighbours; but, putting more confidence in foreign auxiliaries than in his own subjects, the latter were so much offended, that upwards of 200,000 fighting men emigrated in a body, and took up their residence in Ethiopia. To repair this loss, Psammiticus encouraged commerce, and opened his ports to all strangers, whom he greatly caressed, contrary to the impolitic maxims of his predecessors, who refused to admit them into the country. He also laid siege to Azotus in Syria which held out for twenty-nine years against the whole strength of the kingdom; from which it appears that Psammiticus was no great warrior. He is reported to

have sent to discover the springs of the Nile: and is said to have made an attempt to discover the most ancient language and religion in the world. Nechus, the son and successor of Psammiticus, is the Pharaoh-Necho of Scripture, and was a prince of an enterprising and warlike genius. In the beginning of his reign he attempted to cut through the isthmus of Suez, between the Red Sea and the Mediterranean; but was obliged to abandon the enterprise, after having lost 120,000 men in the attempt. After this he sent a ship, manned with some expert Phœnician mariners, on a voyage to explore the coasts of Africa. Accordingly, they performed the voyage; sailed round the continent of Africa: and after three years returned to Egypt, where their relation was deemed incredible. The most remarkable wars in which this king was engaged, are recorded in the sacred writings. He went out against the king of Assyria, by the divine command, as he himself told Jorah (II Chron. xxxv. 21); but, being opposed by this king, he defeated and killed him at Megiddo; after which he made his son Jehoikim, king, and imposed on him an annual tribute of 100 talents of silver and one talent of gold. He then proceeded against the king of Assyria; and weakened him so much, that the empire was soon after dissolved. Thus he became master of Syria and Phœnicia; but, in a short time, Nebuchadnezzar king of Babylon came against him with a mighty army. The Egyptian monarch, not daunted by the formidable appearance of his antagonist, boldly ventured a battle; but was overthrown with prodigious slaughter, and Nebuchadnezzar became master of all the country to the very gates of Pelusium. The reign of Apries, the Pharaoh Hophra of Scripture, presents us with a new revolution in the Egyptian affairs. He is said to have been a martial prince, and in the beginning of his reign very successful. He took by storm the rich city of Sidosi; and, having overcome the Cypriots and Phœnicians in a sea-fight, returned to Egypt laden with spoil. This success probably incited Zedekiah king of Judah to enter into an alliance with him against Nebuchadnezzar king of Babylon. The bad success of this alliance was foretold by the prophet Jeremiah; and accordingly it happened. For Nebuchadnezzar having sat down with his army before Jerusalem, Apries marched from Egypt to relieve the city; but no sooner did he perceive the Babylonians approaching him, than he retreated as fast as he could, leaving the Jews exposed to the rage of their merciless enemies: who were thereupon treated as Jeremiah had foretold: and by this step Apries brought upon himself the vengeance denounced by the same prophet. The manner in which these predictions were fulfilled is as follows: the Cyreneans, a colony of the Greeks, being greatly strengthened by a numerous supply of their countrymen under their third king Battus styled the Happy, and encouraged by the Pythian oracle, began to drive out their Libyan neighbours, and share their possessions among themselves. Hereupon Andican king of Libya sent a submissive embassy to Apries, and implored his protection against the Cyreneans. Apries complied with his re-

quest, and sent a powerful army to his relief. The Egyptians were defeated with great slaughter; and those who returned complained that the army had been sent off by Apries in order to be destroyed, that he might tyrannise without control over the rest of his subjects. This thought catching the attention of the people, an almost universal defection ensued. Apries sent Amasis, his chief minister, to bring them back to a sense of their duty. But while Amasis was haranguing and advising them to return to their allegiance, the people brought the ensigns of royalty and proclaimed him king. See AMASIS. Apries then despatched one Patarbemis, with orders to take Amasis, and bring him alive before him. This he found impossible, and therefore returned without his prisoner; at which the king was so enraged, that he commanded Patarbemis's nose and ears to be cut off. This piece of cruelty completed his ruin; for when the rest of the Egyptians, who had continued faithful to Apries, beheld the inhuman mutilation of Patarbemis, they to a man deserted and went over to Amasis. Both parties now prepared for war; Amasis having under his command the whole body of native Egyptians; and Apries only those Ionians, Carians, and other mercenaries whom he could engage in his service. The army of Apries amounted only to 30,000, but, though greatly inferior in number to the troops of his rival, as he well knew that the Greeks were much superior in valor, he did not doubt of victory. Nay, so far was Apries puffed up with this notion, that he did not believe it was in the power even of any God to deprive him of his kingdom. The two armies soon met and drew up in order of battle near Memphis. A bloody engagement ensued; in which, though the army of Apries behaved with the greatest resolution, they were at last overpowered by numbers, and utterly defeated, the king himself being taken prisoner. Amasis now took possession of the throne without opposition. He confined Apries in one of his palaces, but treated him with great care and respect. The people, however, were implacable, and could not be satisfied while he enjoyed his life. Amasis, therefore, at last found himself obliged to deliver him into their hands. Thus the prediction received its final completion: Apries was delivered up to those who sought his life: and who no sooner had him in their power, than they strangled him, and laid his body in the sepulchre of his ancestors. During these intestine broils, which must have greatly weakened the kingdom, but most probably before the death of Apries, Nebuchadnezzar invaded Egypt. He had been for thirteen years before this employed in besieging Tyre, and at last had nothing but an empty city for his pains. To make himself some amends, therefore, he entered Egypt, harassed the country, killed and carried away great numbers of the inhabitants, so that the country did not recover from the effects of this incursion for a long time after. In this expedition, however, he seems not to have aimed at permanent conquest, but to have been induced to it merely by the love of plunder, of which he carried with him an immense quantity to Babylon. Some say he assisted Amasis against

Apries. During the reign of Amasis, Egypt is said to have flourished greatly, and to have contained 20,000 populous cities. That good order might be kept among such vast numbers of people, Amasis enacted a law, by which every Egyptian was bound once a year to inform the governor of his province by what means he gained his livelihood; and if he failed of this, to put him to death. The same punishment he decreed to those who could not give a satisfactory account of themselves. This monarch very much favored the Greeks, and married a queen of Grecian extraction. To many Greek cities, as well as particular persons, he made considerable presents. He also allowed the Greeks in general to come into Egypt, and settle either in the city of Naucratis, or carry on their trade upon the sea-coast; granting them also temples, and places where they might erect temples to their own deities. He received also a visit from Solon the celebrated Athenian lawgiver, and reduced the island of Cyprus under his subjection. The prosperity of Egypt, however, ended with the death of Amasis, or indeed before it. The Egyptian monarch had in some way incensed Cambyses king of Persia. The cause of the quarrel is uncertain; but, whatever it was, the Persian monarch vowed the destruction of Amasis. In the mean time Phanes of Halicarnassus, commander of the Grecian auxiliaries in the pay of Amasis, took some private disgust; and, leaving Egypt, embarked for Persia. He was a wise and able general, perfectly acquainted with every thing that related to Egypt; and had great credit with the Greeks in that country. Amasis was immediately sensible how great the loss of this man would be to him, and therefore sent after him a trusty eunuch with a swift galley. Phanes was accordingly overtaken in Lycia, but not brought back; for, making his guard drunk, he continued his journey to Persia, and presented himself before Cambyses, as he was meditating the overthrow of the Egyptian monarchy.

At this dangerous crisis also, the Egyptian monarch imprudently made Polycrates, tyrant of Samos, his enemy. This prince had hitherto been remarkable for an uninterrupted course of success; and Amasis, being at this time in strict alliance with him, wrote a letter, in which, after congratulating him on his prosperity, he told him that he was afraid lest his successes were too many, and that he might be suddenly overthrown. For this reason he advised him voluntarily to deprive himself of some portion of his happiness; and to cast away that which would grieve him most if he were accidentally to lose it. Polycrates followed his advice, and threw into the sea a signet of inestimable value. This, however, did not answer the intended purpose. The signet happened to be swallowed by a fish, which was taken a few days afterwards, and thus was restored to Polycrates. Of this Amasis was no sooner informed, than, considering Polycrates as really unhappy, and already on the brink of destruction, he resolved to put an end to the friendship which subsisted between them. For this purpose he despatched an herald to Samos, commanding him to acquaint Polycrates, that he renounced

his alliance, and all the obligations between them; that he might not mourn his misfortunes with the sorrow of a friend. Polycrates now at liberty, therefore, to act against him, accordingly offered to assist Cambyses with a fleet of ships in his Egyptian expedition. Amasis had not, however, the misfortune to see the calamities of his country. He died about A.A.C. 525, after a reign of forty-four years; and left the kingdom to his son Psammenitus, just as Cambyses was approaching the frontiers of the kingdom. The new prince was scarce seated on the throne, when the Persians appeared. Psammenitus drew together what forces he could, to prevent them from entering the kingdom. Cambyses, however, immediately laid siege to Pelusium, and made himself master of it by the following stratagem: he placed in the front of his army a great number of cats, dogs, and other animals, that were deemed sacred by the Egyptians. He then attacked the city, and took it without opposition: the garrison, which consisted entirely of Egyptians, not daring to throw a dart or shoot an arrow against their enemies, lest they should kill some of the holy animals.

Cambyses had not long, however, taken possession of the city, when Psammenitus advanced against him with a numerous army. Before the engagement, the Greeks who served under Psammenitus, to shew their indignation against their treacherous countryman, Phanes, brought his children, it is said, into the camp, killed them in the presence of their father and of the two armies, and then drank their blood. The Persians, enraged at so cruel a sight, fell upon the Egyptians with the utmost fury, put them to flight, and cut the greatest part of them in pieces. Those who escaped fled to Memphis, where they were soon after guilty of a horrid outrage. Cambyses sent a herald to them in a ship from Mitylene: but no sooner did they see her come into the port, than they flocked down to the shore, destroyed the ship, and tore to pieces the herald and all the crew; afterwards carrying their mangled limbs into the city, in a kind of barbarous triumph. Not long after, they were obliged to surrender; Psammenitus thus falling into the hands of his inveterate enemy, now enraged beyond measure at the cruelties exercised upon the children of Phanes, the herald, and the Mitylenean sailors. The rapid success of the Persians struck with such terror the Libyans, Cyreneans, Barcæans, and other dependents or allies of the Egyptian monarch, that they immediately submitted. Nothing now remained but to dispose of the captive king, and revenge on him and his subjects the cruelties which they had committed. This the merciless victor executed in the severest manner. On the 10th day after Memphis had been taken, Psammenitus and the chief of the Egyptian nobility were ignominiously sent into one of the suburbs of that city. Here the king being seated in a proper place, saw his daughter coming along in the habit of a slave with a pitcher to fetch water from the river, and followed by the daughters of the greatest families in Egypt, all in the same miserable garb,

with pitchers in their hands, drowned in tears, and loudly bemoaning their miserable situation. When the fathers saw their daughters in this distress, all but Psammenitus burst into tears; he only cast his eyes on the ground, and kept them fixed there. After the young women, came the son of Psammenitus, and 2000 of the young nobility, with bits in their mouths and halters round their necks, proceeding to execution. This was done to expiate the murder of the Persian herald and the Mitylenean sailors; for Cambyses caused ten of the Egyptians of the first rank to be publicly executed for every one of those that had been slain. Psammenitus, however, observed the same conduct as before, keeping his eyes stedfastly fixed on the ground, though all the Egyptians around him made the loudest lamentations. A little after this he saw an intimate friend and companion, now advanced in years, who, having been plundered of all he had, was begging his bread from door to door in the suburbs. Psammenitus now wept bitterly; and, calling out to his friend by name, struck himself on the head as if he had been frantic. Of this the spies who had been set over him to observe his behaviour, gave immediate notice to Cambyses, who sent to enquire into the cause of such immoderate grief. Psammenitus answered, that the calamities of his own family confounded him, and were too great to be lamented by any outward signs; but the extreme distress of a bosom friend gave more room for reflection, and therefore extorted tears from him. With this answer Cambyses was so affected, that he sent orders to prevent the execution of the king's son; but they came too late, for the young prince had been put to death before any of the rest. Psammenitus himself was then sent for into the city, and restored to his liberty: had he not indeed showed a desire of revenge, he might perhaps have been trusted with the government of Egypt; but, being discovered in some schemes against the government, he was seized, and condemned to drink bull's blood. The Egyptians were now reduced to the lowest degree of slavery. Their country became a province of the Persian empire; the body of Anasis their late king was taken out of his grave; and, after being mangled in a shocking manner, was finally burnt. But, what was felt as a still greater grievance, their god Apis was slain, and his priests ignominiously scourged: this inspired the whole nation with such a hatred to the Persians, that they could never afterwards be reconciled to them. As long however as the Persian empire subsisted, the Egyptians could never shake off their yoke. They frequently revolted indeed, but were always overthrown with loss. At last they submitted, without opposition, to Alexander the Great; after whose death, Egypt again became a powerful kingdom; but, from the conquest of it by Cambyses to the present time, it has never been governed but by foreign princes, agreeably to the prophecy of Ezekiel, 'There shall be no more a prince of the land of Egypt.'

On the death of Alexander the Great, Egypt, together with Libya, and that part of Arabia which borders on Egypt, was assigned to Pto-

lemy the son of Lagus, as governor, under Alexander's son by Roxana, who was then an infant. Nothing was farther from the intention of this governor, than to keep the provinces in trust for another. He did not, however, assume the title of king, till his authority was firmly established; and this did not happen till nineteen years after the death of Alexander, when Antigonus and Demetrius had unsuccessfully attempted the conquest of Egypt. From the time of his first establishment on the throne, Ptolemy, who had assumed the title of Soter, reigned twenty years; which added to the former nineteen, make up the thirty-nine years which historians commonly allow him to have reigned alone.—In the thirty-ninth year of his reign, he made his son, Ptolemy Philadelphus, partner in the empire; declaring him his successor, to the prejudice of his eldest son named Ceraunus; being excited thereto by his violent love for Berenice, Philadelphus's mother. Upon this, Ceraunus immediately quitted the court; and fled at last into Syria, where he was kindly received by Seleucus Nicator, whom he afterwards ungratefully murdered. The most remarkable transaction of this reign was the embellishing of Alexandria, which Ptolemy made the capital of his new kingdom. See ALEXANDRIA. Ptolemy Soter died about A.A.C. 284, in the forty-first year of his reign, and eighty-fourth of his age. He was the best prince of his race; and left behind him an example of prudence, justice, and clemency, which few of his successors followed. Besides the provinces originally assigned to him, he added to his empire those of Cæle Syria, Ethiopia, Pamphylia, Lycia, Caria, and some of the Cyclades. His successor, Ptolemy Philadelphus, added nothing to the extent of his empire; nor did he perform any thing remarkable except embellishing further the city of Alexandria, enriching its library, causing the Old Testament to be translated into Greek, (See BIBLE), and entering into an alliance with the Romans. In his time, Magas, the governor of Libya and Cyrene, revolted; and held these provinces as an independent prince, notwithstanding the utmost efforts of Ptolemy to reduce him. At last an accommodation took place; and a marriage was proposed between Berenice, the only daughter of Magas, and Ptolemy's eldest son. The young princess was to receive all her father's dominions by way of dowry, and thus they would again be brought under the dominion of Ptolemy's family. But, before this treaty could be put in execution, Magas died; and then Apamea, the princess's mother, did all she could to prevent the marriage. This, however, she was not able to do: but her efforts for that purpose produced a destructive war for four years with Antiochus Theos, king of Syria, and the acting of a bloody tragedy in the family of the latter. See SYRIA. About A.A.C. 246 Ptolemy Philadelphus died; and was succeeded by his eldest son Ptolemy, who had been married to Berenice, the daughter of Magas. In the beginning of his reign, he found himself engaged in a war with Antiochus Theos king of Syria. From this he returned victorious, and brought with him 2500 statues and pictures,

among which were many of the ancient Egyptian idols, which had been carried away by Cambyses into Persia. These were restored by Ptolemy to their ancient temples; in memory of which favor, the Egyptians gave him the surname of Euergetes, or the Beneficent. In this expedition he greatly enlarged his dominions, making himself master of all the countries that lie between mount Taurus and the confines of India. An account of these conquests was given by himself, inscribed on a monument, to the following effect. 'Ptolemy Euergetes, having received from his father the sovereignty of Egypt, Libya, Syria, Phœnicie, Cyprus, Lycia, Caria, and the other Cyclades, assembled a mighty army of horse and foot, with a great fleet, and elephants, out of Trogloditia and Ethiopia; some of which had been taken by his father, and the rest by himself, and brought thence, and trained up for war: with this great force he sailed into Asia; and having conquered all the provinces which lie on this side the Euphrates, Cilicia, Pamphylia, Ionia, the Hellespont, and Thrace, he crossed that river with all the forces of the conquered countries, and the kings of those nations, and reduced Mesopotamia, Babylonia, Susia, Persia, Media, and all the country as far as Bactria.' On the king's return from this expedition he passed through Jerusalem, where he offered many sacrifices to the God of Israel, and ever afterwards expressed a partiality for the Jewish nation. At this time the Jews were tributary to the Egyptian monarchs, and paid them annually twenty talents of silver. This tribute, however, Onias, who was then high priest, being of a very covetous disposition, had for a long time neglected to pay, so that the arrears amounted to a very large sum. Soon after his return, therefore, Ptolemy sent one of his courtiers, named Athenion to demand the money, and desired him to acquaint the Jews that he would make war upon them in case of a refusal. A young man, however, named Joseph, nephew to Onias, not only found means to avert the king's anger, but even got himself chosen his receiver general, and by his faithful discharge of that important trust, continued in high favor with Ptolemy as long as he lived. Ptolemy Euergetes having at last concluded a peace with Seleucus, the successor of Antiochus Theos, attempted the enlargement of his dominions on the south side. In this he was attended with such success, that he made himself master of all the coasts of the Red Sea, both on the Arabian and Ethiopian sides, quite down to the straits of Babel-mandel. On his return he was met by ambassadors from the Achæans, imploring his assistance against the Etolians and Lacedæmonians. This the king readily promised them: but, they having in the mean time engaged Antigonus king of Macedon to support them, Ptolemy was so much offended that he sent powerful succours to Cleomenes III. king of Sparta; hoping, by that means, to humble both the Achæans and their new ally Antigonus. In this however he was disappointed; for Cleomenes, after having gained very considerable advantages over the enemy, was at last entirely defeated in the battle of Selasia, and obliged to take refuge in Ptolemy's dominions. He was received by the

Egyptian monarch with the greatest kindness; a yearly pension of twenty-four talents was assigned him, with a promise of restoring him to the Spartan throne: but, before this could be accomplished, Ptolemy died, in the twenty-seventh year of his reign, and was succeeded by his son Ptolemy Philopater. Thus we have seen the Egyptian empire restored to a considerable height of power; and had the succeeding monarchs been careful to preserve its strength as transmitted to them by Euergetes, it is probable that Egypt might have been able to hold the balance against Rome, and after the destruction of Carthage to have prevented that haughty city from becoming mistress of the world. But after the death of Ptolemy Euergetes, the Egyptian empire, being governed either by weak monarchs, or wicked monsters, quickly declined, and from that time makes no conspicuous figure in history, except in the depravity of some of its kings, in which indeed, it may, vie with any nation.

Ptolemy Philopater began his reign with the murder of his brother Magas; after which, giving himself up to universal licentiousness, the kingdom fell into anarchy. Cleomenes the Spartan king still resided at court; and, being now unable to bear the dissolute manners which prevailed there, he pressed Philopater to give him the assistance he had promised for restoring him to the throne of Sparta. This he rather insisted upon, because he had received advice that Antigonus king of Macedon was dead, that the Achæans were engaged in a war with the Etolians, and that the Lacedæmonians had joined the latter against the Achæans and Macedonians. Ptolemy, when afraid of his brother Magas, had indeed promised to assist the king of Sparta with a powerful fleet, hoping thus to attach him to his own interest: but now, when Magas was out of the way, it was determined by the king, or rather his ministers, that Cleomenes should not be assisted, nor even allowed to leave the kingdom; and this extravagant resolution produced the desperate attempt of Cleomenes, of which an account will be found in the history of SPARTA. Of the disorders which now ensued, Antiochus king of Syria, surnamed the Great, took the advantage, and attempted to wrest from Ptolemy the provinces of Cælo-Syria and Palestine. But in this he was finally disappointed; and might easily have been totally driven out of Syria, had not Ptolemy been too much taken up with his debaucheries to think of carrying on the war. The discontent occasioned by this piece of negligence soon produced a civil war in his dominions, and the whole kingdom continued in the utmost confusion till his death, which happened in the seventeenth year of his reign and thirty-seventh of his age. During the reign of Philopater happened a very extraordinary event with regard to the Jews, which is recorded in the third Book of Maccabees, chap. ii. iii. iv. v. The king of Egypt, while on his Syrian expedition, had attempted to enter the temple of Jerusalem; but, being hindered by the Jews, he was filled with the utmost rage against the whole nation. On his return to Alexandria, he resolved to make those who dwell in that city feel the first effects of his vengeance. He began with publishing a

decree, which he caused to be engraved on a pillar erected for that purpose at the gate of his palace, excluding all those who did not sacrifice to the gods worshipped by the king. Thus the Jews were debarred from suing to him for justice or protection. By the favor of Alexander the Great, Ptolemy Soter, Philadelphus, and Euergetes, the Jews enjoyed at Alexandria the same privileges with the Macedonians. In that metropolis the inhabitants were divided into three classes. In the first were the Macedonians, or original founders of the city, and along with them were enrolled the Jews; in the second were the mercenaries who had served under Alexander; and in the third the native Egyptians. Ptolemy now, to be revenged of the Jews, ordered that they should be degraded from the first rank, and enrolled among the native Egyptians; and that all of that nation should appear at an appointed time before the proper officers, to be enrolled among the people; that at the time of their enrolment they should have the mark of an ivy leaf, the badge of Bacchus, impressed with a hot iron on their faces; that all who were thus marked should be made slaves; and, lastly, that if any one should stand out against this decree, he should be immediately put to death. That he might not, however, seem an enemy to the whole nation, he declared, that those who sacrificed to his gods should enjoy their former privileges, and remain in the same class. Yet, notwithstanding this tempting offer, 300 only out of many thousand Jews who lived in Alexandria could be prevailed upon to abandon their religion in order to save themselves from slavery. The apostates were immediately excommunicated by their brethren: and this their enemies construed as done in opposition to the king's order; which threw the tyrant into such a rage, that he resolved to extirpate the whole nation, beginning with the Jews who lived in Alexandria and other cities of Egypt, and proceeding from thence to Judæa and Jerusalem itself. In consequence of this cruel resolution, he commanded all the Jews that lived in any part of Egypt to be brought in chains to Alexandria, and there to be shut up in the Hippodrome, which was a very spacious place without the city, where the people used to assemble to see horse-races and other public diversions. He then sent for Herman master of the elephants; and commanded him to have 500 of these animals ready against the next day, to let loose upon the Jews in the Hippodrome. But when the elephants were prepared for the execution, and the people were assembled in great crowds to see it, they were for that and the succeeding day disappointed by the king's absence. At last he came to the Hippodrome attended with a vast multitude of spectators; but, when the elephants were let loose, instead of falling upon the Jews, they turned their rage against the spectators and soldiers, and destroyed great numbers of them. At the same time, some frightful appearances which were seen in the air so terrified the king, that he commanded the Jews to be immediately set at liberty, and restored them to their former privileges. No sooner were they delivered from this danger than they demanded leave to put to death such of their

nation as had abandoned their religion; which being granted, they despatched the 300 apostates. Philopater was succeeded by Ptolemy Epiphanes; and he, after a reign of twenty-four years, by Ptolemy Philometor. In the beginning of his reign, a war commenced with the king of Syria, who had seized on the provinces of Cælo-Syria and Palestine in the preceding reign. In the course of this war, Philometor was either voluntarily delivered up to Antiochus, or taken prisoner. But, however this was, the Alexandrians, despairing of his ever being able to recover his liberty, raised to the throne his brother Ptolemy, who took the name of Euergetes II. but was afterwards called Physcon, or the big-bellied, on account of the extraordinary size of his person, through gluttony and luxury. He was scarcely seated on the throne, however, when Antiochus Epiphanes, returning into Egypt, drove out Physcon, and restored the whole kingdom, except Pelusium, to Philometor. His design was to kindle war betwixt the two brothers, so that he might have an opportunity of seizing the kingdom. For this reason he kept to himself the city of Pelusium; by which, being the key of Egypt, he might at his pleasure re-enter the country. But Philometor, apprised of his design, invited his brother Physcon to an accommodation, which was happily effected by their sister Cleopatra. The brothers agreed to reign jointly, and to oppose to the utmost of their power Antiochus, whom they considered as a common enemy. On this the king of Syria invaded Egypt with a great army, but was prevented by the Romans from conquering it. The two brothers were no sooner freed from the apprehension of a foreign enemy, than they began to quarrel with each other. Their differences soon came to such a height, that the Roman senate interposed. But, before the ambassadors employed to enquire into the merits of the cause could arrive in Egypt, Physcon had driven Philometor from the throne, and obliged him to quit the kingdom. On this the dethroned prince fled to Rome, where he appeared meanly dressed, and without attendants. He was very kindly received by the senate; who were so well satisfied of the injustice done him, that they immediately decreed his restoration. He was reconducted home accordingly; and, on the arrival of the ambassadors in Egypt, an accommodation was negotiated, whereby Physcon was put in possession of Libya and Cyrene, and Philometor of all Egypt and the island of Cyprus; each of them being declared independent of the other. The treaty, as usual, was confirmed with oaths and sacrifices, and was broken almost as soon as made. Physcon was dissatisfied with his share of the dominions; and therefore sent ambassadors to Rome, desiring that the island of Cyprus might be added to his other possessions. This could not be obtained by the ambassadors; Physcon therefore went to Rome in person. His demand was evidently unjust; but the Romans, considering it their interest to weaken the power of Egypt as much as possible, adjudged the island to him. Physcon set out from Rome with two ambassadors; and, arriving in Greece on his way to Cyprus, he raised there a great number of mercenaries, with a design to sail im-

mediately to that island and conquer it. But the Roman ambassadors telling him that they were commanded to put him in possession of it by fair means and not by force, he dismissed his army, and returned to Libya, while one of the ambassadors proceeded to Alexandria. Their design was to bring the two brothers to an interview on the frontiers of their dominions, and there to settle matters amicably. But the ambassador who went to Alexandria, found Philometor very averse from compliance with the decree of the senate. He put off the ambassador so long, that Physcon sent the other also to Alexandria, hoping that the joint persuasions of the two would induce Philometor to comply. But the king, after entertaining them at an immense charge for forty days, at last refused to submit, and told the ambassadors that he was resolved to adhere to the first treaty. With this answer the Roman ambassadors departed, and were followed by others from the two brothers. The senate, however, not only confirmed their decree in favor of Physcon, but renounced their alliance with Philometor, and commanded his ambassador to leave the city in five days. In the mean time the inhabitants of Cyrene having heard unfavorable accounts of Physcon's behaviour, during the short time he reigned in Alexandria, conceived so strong an aversion against him, that they resolved to keep him out of their country by force of arms. On receiving intelligence of this resolution, Physcon dropped all thoughts of Cyprus for the present, and hastened with all his forces to Cyrene, where he soon established himself in the kingdom. His vicious and tyrannical conduct, however, increased the aversion of the Cyrenians so much, that some of them, entering into a conspiracy against him, fell upon him one night as he was returning to his palace, wounded him in several places, and left him for dead on the spot. This he laid to the charge of his brother Philometor; and, as soon as he was recovered, took another voyage to Rome. Here he made his complaints to the senate, and showed them the scars of his wounds, accusing his brother of having employed assassins to murder him. Though Philometor was known to be a man of a most humane and mild disposition, and therefore very unlikely to have been concerned in so black an attempt, yet the senate, being offended at his refusing to submit to their decree concerning Cyprus, hearkened to this false accusation, and not only refused to hear what his ambassadors had to say, but ordered them immediately to depart from the city. At the same time they appointed five commissioners to conduct Physcon into Cyprus, and put him in possession of that island, enjoining all their allies in those parts to supply him with forces. Physcon having thus got together an army, which seemed to be sufficient for the accomplishment of his design, landed in Cyprus; but, being there encountered by Philometor in person, he was entirely defeated, and obliged to shelter himself in the city called Lapitho. Here he was closely besieged, and at last obliged to surrender. Every one now expected that Physcon would have been treated as he deserved; but his brother, instead of punishing, restored him to the government of Libya and Cyrene,

adding some other territories instead of the island of Cyprus, and promising him his daughter in marriage. Thus an end was put to the war between the two brothers, for the Romans were ashamed any longer to oppose a prince who had given such a signal instance of his justice and clemency. On his return to Alexandria, Philometor appointed one Archias governor of Cyprus. But he, soon after the king's departure, agreed with Demetrius, king of Syria, to betray the island to him for 500 talents. The treachery was discovered before it took effect; and the traitor, to avoid the punishment due to his crime, killed himself. Ptolemy, being offended with Demetrius for this attempt on Cyprus, joined Attalus, king of Pergamus, and Ariarathes, king of Cappadocia, in setting up a pretender to the crown of Syria. This was Alexander Balas, to whom he even gave his daughter Cleopatra in marriage, after he had placed him on the throne of Syria. But he, notwithstanding these and many other favors, being suspected of having entered into a plot against his benefactor, Ptolemy became his greatest enemy; and, marching against him, routed his army in the neighbourhood of Antioch. He did not, however, long enjoy his victory; for he died in a few days after the engagement, of the wounds he had received.

On the death of Philometor, Cleopatra, the queen, designed to secure the throne for her son. But some of the principal nobility declaring for Physcon, a civil war was about to ensue, when matters were compromised, on condition that Physcon should marry Cleopatra, that he should reign jointly with her during his life, and declare her son by Philometor, heir to the crown. These terms were no sooner agreed upon than Physcon married Cleopatra, and on the very day of the nuptials, murdered her son in her arms. This was only a prelude to the cruelties which he afterwards committed on his subjects. He first put to death all those who had shown any concern for the murder of the young prince. He then wreaked his fury on the Jews, whom he treated more like slaves than subjects, on account of their having favored the cause of Cleopatra. His own people were treated with little more ceremony. Numbers of them were every day put to death for the smallest faults, and often for no fault at all, but merely to gratify his inhuman temper. His cruelty towards the Alexandrians is related under the article ALEXANDRIA. He divorced his queen, who was also his sister, and married her daughter, who was likewise called Cleopatra, and whom he had previously ravished. In short, his behaviour was so exceedingly wicked, that it soon became quite intolerable to his subjects; and he was obliged to fly to the island of Cyprus with his new queen, and Memphis, a son he had by her mother. On the flight of the king, the divorced queen was placed on the throne by the Alexandrians; but Physcon, fearing lest a son whom he had left behind should be appointed king, sent for him into Cyprus, and caused him to be assassinated as soon as he landed. This provoked the people against him to such a degree, that they pulled down and dashed to pieces all the statues which

had been erected to him in Alexandria. This the tyrant supposed to have been done at the instigation of the queen, and therefore resolved to revenge it on her by killing his own son whom he had by her. He therefore, without the least remorse, caused the young prince's throat to be cut; and, having put his mangled limbs into a box, sent them as a present to his mother Cleopatra. The messenger with whom this box was sent, was one of his guards. He was ordered to wait till the queen's birth day, which approached, and was to be celebrated with extraordinary pomp; and, in the midst of the general rejoicing, he was to deliver the present. The horror and detestation occasioned by this unparalleled piece of barbarity cannot be expressed. An army was soon raised, and the command of it given to one Marsyas, whom the queen had appointed general, and enjoined to take all the necessary steps for the defence of the country. On the other hand, Physcon having hired a numerous body of mercenaries, sent them, under the command of Hengelochus, against the Egyptians. The two armies met on the frontiers of Egypt, and a bloody battle ensued, wherein, however, the Egyptians were entirely defeated, and Marsyas was taken prisoner. Every one expected that the captive general would have been put to death with the severest torments; but Physcon, perceiving that his cruelties only exasperated the people, resolved to try whether he could regain their affections by lenity; and therefore pardoned Marsyas, and set him at liberty. Cleopatra, being greatly distressed by this overthrow, demanded assistance from Demetrius, king of Syria, who had married her eldest daughter by Philometor, promising him the crown of Egypt for his reward. Demetrius accepted the proposal, marched with all his forces into Egypt, and laid siege to Pelusium. But he being no less hated in Syria than Physcon was in Egypt, the people of Antioch, taking advantage of his absence, revolted against him, and were joined by most of the other cities in Syria. Thus Demetrius was obliged to return; and Cleopatra, being now in no condition to oppose Physcon, fled to Ptolemais, where her daughter the queen of Syria resided. Physcon was then restored to the throne of Egypt, which, notwithstanding his crimes, he enjoyed till his death, which happened at Alexandria, in the twenty-ninth year of his reign, and sixty-seventh of his age.

To Physcon succeeded Ptolemy Lathyrus, about A.A.C. 122; but he had not reigned long before his mother, finding that he would not be entirely governed by her, instigated the Alexandrians, to drive him from the throne, and place on it his youngest brother, Alexander. Lathyrus, after this, was obliged to content himself with the government of Cyprus, which he was permitted to enjoy in quiet. Ptolemy Alexander, in the mean time, finding he was to have only the shadow of sovereignty, and that his mother Cleopatra was to have all the power, stole away privately from Alexandria. The queen used every artifice to bring him back, well knowing that the Alexandrians would never suffer her to reign alone. At last her son yielded to her intreaties; but soon after, understanding

that she had hired assassins to despatch him, he caused her to be murdered. The death of the queen was no sooner known to the Alexandrians, than, disdaining to be commanded by a parricide, they drove out Alexander, and recalled Lathyrus. The deposed prince for some time led a rambling life in the island of Cos, but, having got together some ships, he, the next year, attempted to return into Egypt. But being met by Tyrrhus, Lathyrus's admiral, he was defeated, and obliged to fly to Myra in Lycia. From Myra he steered towards Cyprus, hoping that the inhabitants would place him on the throne, instead of his brother. But Charcas, another of Lathyrus's admirals, coming up with him while he was ready to land, an engagement ensued, in which Alexander's fleet was dispersed, and himself killed. During these disturbances, Apion, king of Cyrenaica, the son of Ptolemy Physcon by a concubine, having maintained peace and tranquillity in his dominions during a reign of twenty-one years, died, and by his will left his kingdom to the Romans: and thus the Egyptian empire was again considerably reduced and circumscribed. Lathyrus, being now delivered from all competitors, turned his arms against the city of Thebes, which had revolted from him. He marched in person against the rebels; and, having defeated them in a pitched battle, laid close siege to their city. The inhabitants defended themselves with great resolution for three years, but were at last obliged to submit, and the city was given up to be plundered by the soldiers. They left every where the most melancholy monuments of their avarice and cruelty; so that Thebes, which till that time had been one of the most wealthy cities of Egypt, was now reduced so low that it never afterwards made any figure. About A.A.C. 76, Ptolemy Lathyrus was succeeded by Alexander II. the son of Ptolemy Alexander I. He was first sent by Cleopatra into the island of Cos, with a great sum of money, and all her jewels, as thinking that the safest place where they could be kept. When Mithridates, king of Pontus, made himself master of that island, the inhabitants delivered up to him the young Egyptian prince, together with all the treasures. Mithridates gave him an education suitable to his birth; but he, not thinking himself safe with a prince who had shed the blood of his own children, fled to the camp of Sylla, the Roman dictator, who was then making war in Asia. From that time he lived in the family of the Roman general, till news was brought to Rome of the death of Lathyrus. Sylla then sent him to Egypt to take possession of the throne. But, before his arrival, the Alexandrians had chosen Cleopatra for their sovereign. To compromise matters, however, it was agreed that Alexander should marry her, and take her for his partner on the throne. This was accordingly done; but nineteen days after the marriage he murdered her, and for fifteen years afterwards showed himself such a monster of wickedness, that a general insurrection at last ensued among his subjects, and he was obliged to fly to Pompey the Great, who was then carrying on the war against Mithridates king of Pontus. But Pompey refusing to concern himself in the matter, he retired to Tyre.

where he died a few months after. Alexander, while he was in Tyre, had sent ambassadors to Rome to influence the senate in his favor. But, dying before the negociation was finished, he made over by his last will all his rights to the Roman people, declaring them heirs to his kingdom: not out of any affection to the republic, but with a view to raise disputes between the Romans, and his rival Auletes, whom the Egyptians had placed on the throne. The will was brought to Rome, where it occasioned warm debates. Some were for taking immediate possession of Egypt. Others thought no notice should be taken of such a will, because Alexander had no right to dispose of his dominions in prejudice to his successor, and to exclude from the crown those who were of the royal blood of Egypt. Cicero represented, that such a notorious imposition would debase the majesty of the Roman people, and involve them in endless wars and disputes; that the fruitful fields of Egypt would be a strong temptation to the avarice of the people, who would insist on their being divided among them; and lastly, that by this means the bloody quarrels about the Agrarian laws would be revived. These reasons had some weight with the senate; but what chiefly prevented them from seizing on Egypt at this time was, that they had lately taken possession of the kingdom of Bithynia, in virtue of the will of Nicomedes; and of Cyrene and Lybia, by the will of Apion. They thought, therefore, that if they should, on the like pretence, take possession of the kingdom of Egypt, this might too much expose their design of setting up a kind of universal empire, and occasion a formidable combination against them. Ptolemy Auletes, who was now raised to the throne by the Egyptians, is said to have surpassed all the kings that went before him in the effeminacy of his manners. The surname Auletes, which signifies the flute-player, was given him because he piqued himself on his skill in performing upon that instrument, and was not ashamed even to contend for the prize in the public games. He took great pleasure in imitating the manners of the bacchanals; dancing in a female dress, and in the same measures that they used during the solemnity of their god; and hence he had the surname of the New Dionysius, or Bacchus. As his title to the crown was disputable, he being only the son of a concubine, his first care was to get himself acknowledged by the Romans, and declared their ally. This was obtained by applying to Julius Cæsar, who was at that time consul, and immensely in debt. Cæsar being glad of such an opportunity of raising money, made the king of Egypt pay pretty dear for his alliance: 6000 talents, a sum equal to £1,162,500 sterling were given partly to Cæsar himself, and partly to Pompey, whose interest was necessary for obtaining the consent of the people. Though the revenues of Egypt amounted to twice this sum, yet Auletes found it impossible for him to raise it without severely taxing his subjects. This occasioned a general discontent; and, while the people were almost ready to take up arms, a most unjust decree passed at Rome for seizing the island of Cyprus. When the Alexandrians heard of this, they pressed

Auletes to demand that island as an ancient appendage of Egypt; and, in case of a refusal, to declare war against that haughty and imperious people, who they now saw, though too late, aimed at nothing less than the sovereignty of the world. With this request the king refused to comply; upon which his subjects, already provoked beyond measure at the taxes with which they were loaded, flew to arms, and surrounded the palace. The king had the good fortune to escape their fury, and immediately leaving Alexandria, set sail for Rome. In his way to that city, he landed on the island of Rhodes, where the celebrated Cato at that time was, being on his way to Cyprus, to put the unjust decree of the senate into execution. Auletes, desirous to confer with a man of his prudence, immediately sent to acquaint him with his arrival. He imagined that, upon this notice, Cato would instantly come and wait upon him; but the proud Roman told the messenger, that if the king of Egypt had any thing to say to Cato, he might come to his house. Accordingly the king went to pay him a visit; but was received with very little ceremony, Cato not even vouchsafing to rise out of his seat when he came into his presence. When Auletes had laid his affairs before this haughty republican, he was blamed by him for leaving Egypt, the richest kingdom in the world, in order to expose himself, as he said, to the indignities he would meet with at Rome. There, Cato told him, nothing was in request but wealth and grandeur. All the riches of Egypt, he said, would not be sufficient to satisfy the avarice of the leading men in Rome. He, therefore, advised him to return to Egypt; and strive, by a more equitable conduct, to regain the affections of his people. He even offered to reconduct him thither, and employ his good offices in his behalf. But though Ptolemy was sensible of the propriety of this advice, the friends he had with him dissuaded him from following it, and accordingly he set out for Rome. On his arrival, he found, to his great concern, that Cæsar, in whom he confided, was then in Gaul. He was received, however, by Pompey with great kindness. He assigned him an apartment in his own house, and omitted nothing that lay in his power to serve him. Notwithstanding this protection, however, the Egyptian monarch was obliged to go from house to house like a private person, soliciting the votes of the senators. After he had spent immense treasures in procuring a strong party, he was at last permitted to lay his complaints before the senate; but, at the same time, there arrived an embassy from the Alexandrians, consisting of 100 citizens, to acquaint the senate with the reasons of their revolt. When Auletes first set out for Rome, the Alexandrians, not knowing what was become of him, placed on the throne his daughter Berenice; and sent an embassy into Syria to Antiochus Asiaticus, inviting him into Egypt to marry the queen, and reign in partnership with her. Antiochus was dead before the arrival of the ambassadors; upon which, the same proposal was made to his brother Seleucus, who readily accepted it. This Seleucus is described by Strabo as monstrously deformed in body, and

still more so in mind. The Egyptians nicknamed him Cybiosactes, or the Scullion. He was scarcely on the throne, when he gave a signal instance of his avaricious temper. Ptolemy I. had caused the body of Alexander the Great to be deposited in a coffin of massy gold. This the king seized upon; and thus provoked his wife Berenice to such a degree, that she caused him to be murdered. She then married one Archelaus, the high priest of Comana in Pontus, who pretended to be the son of Mithridates the Great; but was, in fact, only the son of that monarch's general. Auletes was not a little alarmed on hearing of these transactions, especially when the ambassadors arrived, who he feared would overturn all the schemes he had labored so much to bring about. The embassy was headed by one Dion, a celebrated academic philosopher, who had many powerful friends at Rome. But Ptolemy found means to get both him and most of his followers assassinated; and this intimidated the rest to such a degree, that they durst not execute their commission, or, for some time, even demand justice for the murder of their colleagues. The report of so many murders, however, at last spread a general alarm. Auletes, sure of the protection of Pompey, did not scruple to own himself the perpetrator of them. Nay, though an action was commenced against one Ascitius, an assassin, who had stabbed Dion, the chief of the embassy above mentioned, and the crime was fully proved, yet he was acquitted by the venal judges, who had all been bribed by Ptolemy. In a short time, the senate passed a decree, by which it was enacted, that the king of Egypt should be restored by force of arms. All the great men in Rome were ambitious of this commission; which, they well knew, would be attended with immense profit. Their contests, on this occasion, took up a considerable time; but at last a prophecy of the Sybil was found out, which forbade the assisting an Egyptian monarch with an army. Ptolemy, therefore, wearied out with so long a delay, retired from Rome, where he had made himself generally odious, to the temple of Diana, at Ephesus, there to wait the decision of his fate. Here he remained a considerable time; but as he saw that the senate came to no resolution, though he solicited them by letters, he at last, by Pompey's advice, applied to Gabinius, the pro-consul of Syria, a man of most infamous character, and ready to undertake any thing for money. Therefore, though it was contrary to an express law, for any governor to leave his province, without positive orders from the senate and people of Rome, Gabinius ventured to transgress this law, upon condition of being well paid. As a recompense for his trouble, he demanded 10,000 talents; that is, £1,937,500 sterling; and Ptolemy, glad to be restored on any terms, agreed to pay that sum: but Gabinius would not stir till he had received one-half of it. This obliged the king to borrow it from a Roman knight, named Caius Rabirius Posthumus; Pompey interposing his credit and authority for the repayment both of capital and interest. Gabinius now set out for Egypt, attended by the famous

Marc Anthony, who at this time served in the army under him. He was met by Archelaus, who, since the departure of Auletes, had reigned in Egypt jointly with Berenice, at the head of a numerous army. In the first engagement the Egyptians were utterly defeated, and Archelaus taken prisoner. Thus Gabinius might have put an end to the war at once; but his avarice prompted him to dismiss Archelaus, on his paying a considerable ransom; after which, pretending that he had made his escape, fresh sums were demanded from Ptolemy for defraying the expenses of the war. For these Ptolemy was again obliged to apply to Rabirius, who would only supply what he wanted at a very high interest. At last, Archelaus was defeated and killed, and Ptolemy again became master of all Egypt. No sooner was he firmly settled on the throne, than he put to death his daughter Berenice, and cruelly oppressed his people in order to procure the money he had been obliged to borrow while in exile. These oppressions and exactions the cowardly Egyptians bore with great patience, being intimidated by the garrison which Gabinius had left in Alexandria. But neither the fear of the Romans, nor the authority of Ptolemy, could make them put up with an affront offered to their religion. A Roman soldier happened to kill a cat, an animal held sacred, and even worshipped by the Egyptians; and, no sooner was this sacrilege known, than the Alexandrians made a general insurrection, and, gathering together in crowds, made their way through the Roman guards, dragged the soldier out of his house, and, in spite of all opposition, tore him in pieces. Notwithstanding the heavy taxes, which Ptolemy laid on his people, it does not appear that he had any design of paying his debts. Rabirius, who, as we have already observed, had lent him immense sums, finding that the king affected delays, took a voyage to Egypt, to expostulate with him in person. Ptolemy excused himself on account of the bad state of his finances, but offered to make Rabirius collector-general of his revenues, that he might, in that employment, pay himself, an offer which Rabirius gladly accepted. But Ptolemy, soon after, upon some frivolous pretence or other, caused him and all his servants, to be closely confined. This base conduct exasperated Pompey as much as Rabirius; for the former had been in a manner security for the debt, as the money had been lent at his request, and the business transacted at a country-house of his near Alba. However, as Rabirius had reason to fear still worse treatment, he took the first opportunity of making his escape.

To complete his misfortunes, he was prosecuted at Rome as soon as he returned, 1. For having enabled Ptolemy to corrupt the senate with sums lent him for that purpose. 2. For having debased and dishonored the character of a Roman knight, by farming the revenues, and becoming the servant of a foreign prince. 3. For having been an accomplice with Gabinius, and sharing with him the 10,000 talents, which that pro-consul had received for his Egyptian expedition

By the eloquence of Cicero he was acquitted ; and one of the best orations to be found in the writings of that author, was composed on this occasion. Gabinus was also prosecuted ; and, as Cicero spoke against him, he very narrowly escaped death. He was, however, condemned to perpetual banishment, after having been stripped of all he was worth ; and lived in exile till the time of the civil wars, when he was recalled by Cæsar, in whose service he lost his life. Auletes enjoyed the throne of Egypt about four years after his re-establishment ; and, at his death, left his children, a son and two daughters, under the tuition of the Roman people. The name of the son was Ptolemy, those of the daughters were Cleopatra and Arsinoë. This was the Cleopatra who afterwards became so famous, and had so great a share in the civil wars of Rome. As the transactions of that queen's reign, however, are so closely connected with the affairs of Rome, that they cannot be well understood without knowing the situation of the Romans at that time, we refer for an account of them to the history of Rome. With Cleopatra ended the family of Ptolemy Lagus, the founder of the Grecian empire in Egypt, after it had held that country in subjection for the space of 294 years.

Egypt now became a province of the Roman empire, and continued subject to the emperors of Rome or Constantinople. In the year 642 it was conquered by the Arabs under Amr Ebn Al As, one of the generals of the khalif Omar. In 889 an independent government was set up in this kingdom by Ahmed Ebn Tolun, who rebelled against Al Mokhadi, khalif of Bagdad. It continued to be governed by him and his successors for twenty-seven years, when it was again reduced by Al Moctasi khalif of Bagdad. In about thirty years after, we find it again an independent state, being joined with Syria under Mahomet Ebn Taj, who had been appointed governor of these provinces. This government, however, was also but short-lived ; for in 963 it was conquered by Jawhar, one of the generals of Moez Ledinillah, the Fatemite khalif of Cairwan in Barbary. No sooner was Moez informed of the success of his general, than he prepared with all expedition to go and take possession of his new conquest. Accordingly, he ordered all the vast quantities of gold which he and his predecessors had amassed, to be cast into ingots of the size and figure of mill-stones used in hand-mills, and conveyed on camels' backs into Egypt. To show that he was fully determined to abandon his dominions in Barbary, and to make Egypt the royal residence, he caused the remains of the three former princes of his race to be removed from Cairwan in Barbary, and to be deposited in a stately mosque erected on purpose in the city of Cairo : the most effectual perhaps of all methods to induce his successors to reside in Egypt also, as it was become an established custom among those princes, frequently to pay their respectful visits to the tombs of their ancestors. To establish himself the more effectually in his new dominions, Moez suppressed the usual prayers made in the mosques for the khalifs of Bagdad, and substituted his own name in their stead.

This was complied with, not only in Egypt and Syria, but even throughout all Arabia, the city of Mecca alone excepted. The consequence was, a schism in the Mahommedan faith, which continued upwards of 200 years, and was attended with continual anathemas, and sometimes destructive wars between the khalifs of Bagdad and those of Egypt. Having fully established himself in his kingdom, he died in the forty-fifth year of his age, three years after he had left his dominions in Barbary ; and was succeeded by his son Abu Al Mansur Barar, surnamed Aziz Billah.

The new khalif succeeded at the age of twenty-one ; and committed the management of affairs entirely to the care of Jawhar, his father's long experienced general and prime minister. In 978 he sent this famous warrior to drive out Al Aftekin, the emir of Damascus. The Egyptian general accordingly undertook the siege of that place ; but, at the end of two months, was obliged to raise it, on the approach of an army of Karmatians under the command of Al Hakem. As Jawhar was not strong enough to venture an engagement with these Karmatians, it was impossible for him to hinder them from effecting a junction with the forces of Al Aftekin. He therefore retreated, or rather fled towards Egypt with the utmost expedition ; but, being overtaken by the two confederate armies, was soon reduced to the last extremity. He was, however, permitted to resume his march, on condition that he passed under Al Aftekin's sword and Al Hakem's lance ; and to this disgraceful condition Jawhar found himself obliged to submit. On his arrival in Egypt, he immediately advised Al Aziz to undertake an expedition in person into the east, against the combined army of the Turks, Karmatians, and Damascenes, under the command of Al Aftekin and Al Hakem. The khalif followed his advice ; and advancing against his enemies overthrew them with great slaughter ; Al Aftekin himself escaped out of the battle, but was afterwards taken and brought to Al Aziz, who made him his chamberlain, and treated him with great kindness. Jawhar, in the mean time, was disgraced on account of his bad success ; and in this disgrace he continued till his death, which happened A. D. 990, and in the year of the Hegira 381. This year Al Aziz having received advice of the death of Saadoddawla, prince of Aleppo, sent a formidable army under the command of a general named Manjubekin, to reduce that place. Lulu, who had been appointed guardian to Saadoddawla's son, finding himself pressed by the Egyptians, who carried on the siege with great vigor, demanded assistance from the Greek emperor. Accordingly, he ordered a body of troops to advance to Lulu's relief, when Manjubekin, being informed of their approach, immediately raised the siege, and advanced to give them battle. An obstinate engagement ensued, in which the Greeks were at last overthrown with great slaughter. After this victory, Manjubekin pushed on the siege of Aleppo very briskly ; but finding the place capable of defending itself much longer than he at first imagined, and his provisions beginning to fail, he raised the siege. The khalif upon this sent him a very threatening letter and commanded him to return before Aleppo.

He did so; and continued the siege for thirteen months; during all which time it was defended by Lulu with incredible bravery. At last the Egyptians, hearing that a numerous army of Greeks was on their way to relieve the city, raised the siege, and fled with the utmost precipitation. The Greeks then took and plundered several of the cities which Al Aziz possessed in Syria; and Manjubekin made the best of his way to Damascus, where he declared himself independent. Aziz, informed of this revolt, marched in person against him with a considerable army; but, being taken ill by the way, he expired in the twenty-first year of his reign and forty-second of his age. Aziz Billah was succeeded by his son Abu Al Mansur, surnamed Al Hakem; who, being only eleven years of age, was put under the tuition of an eunuch of approved integrity. This reign is remarkable for nothing so much as the madness with which the khalif was seized at the latter part of it. This first manifested itself by his issuing many preposterous edicts; but at length grew to such a height, that he fancied himself a god, and found no fewer than 16,000 persons who owned him as such. These were mostly the Dararians, a new sect sprung up about this time, and so called from their chief Mohammed Ebn Ishmael, surnamed Darari. He is supposed to have inspired the khalif with this impious notion; and, as Darari set up for a second Moses, he did not scruple to assert that Al Hakem was the great Creator of the universe! For this reason, a zealous Turk stabbed him in the khalif's chariot. His death was followed by a three days' uproar in the city of Cairo, during which Darari's house was pulled down, and many of his followers massacred. The sect, however, did not expire with its author. He left behind him a disciple named Hamza, who, being encouraged by the mad khalif, spread it through his dominions. This was quickly followed by an abrogation of all the Mahomedan fasts, festivals, and pilgrimages, the grand one to Mecca in particular; so that the zealous Mahomedans were now greatly alarmed, as justly supposing that Al Hakem designed entirely to suppress the worship of the true God, and introduce his own in its place. From this apprehension, however, they were delivered by the death of the khalif; who was assassinated, by a contrivance of his own sister, A. D. 1020. Al Hakem was succeeded by his son Al Thaher, who reigned fifteen years; and left the throne to a son under seven years of age, named Al Mostanser Billah. In the year 1041, a revolt happened in Syria; but Al Mostanser having sent a powerful army into that country, under the command of one Anushtekin, he not only reduced the rebels, but considerably enlarged the Egyptian dominions in Syria. In 1054 a Turk named Al Bassasiri, having quarrelled with the vizier of Al Kayem, khalif of Bagdad, fled to Egypt and put himself under the protection of Al Mostanser. The latter, imagining this would be a favorable opportunity for enlarging his dominions, and perhaps seizing on the city of Bagdad, supplied Bassasiri with money and troops. By this assistance he was enabled to possess himself of Arabian Irak, and ravaged that province to the very gates of Bagdad. On this,

Al Kayem wrote to Togrol Beg, or Tangrolipix, the Turkish sultan, to come to his assistance. The sultan immediately complied, and soon after arrived at Bagdad with a formidable army and eighteen elephants. Of this Bassasiri gave notice to Al Mostanser, and intreated him to exert himself further for his support against so powerful an enemy. This was accordingly done, but nothing worthy of notice happened till 1058, when Bassasiri having excited Ibrahim the sultan's brother to revolt, Togrol Beg was obliged to employ all his force against him. This gave Bassasiri an opportunity of seizing on the city of Bagdad; and the unfortunate khalif, according to some, was taken prisoner, or, according to others, fled. Bassasiri, on his entry, caused Al Mostanser to be immediately proclaimed khalif in all quarters of the city. Al Kayem's vizier he caused to be led on a camel through the streets of Bagdad, dressed in a woollen gown, with a high red bonnet, and a leathern collar about his neck; a man lashing him behind. Then being sewed up in a bull's hide, with the horns placed over his head, and hung upon hooks, he was beaten without ceasing till he died. The imperial palace was plundered, and the khalif himself detained a close prisoner. This success was but short lived; for, in 1056, Togrol Beg defeated his brother Ibrahim, took him prisoner and strangled him. He then marched to Bagdad, which Bassasiri abandoned at his approach. Here the khalif Al Kayem was delivered up by Mahras, the governor of a city called Haditha, who had the charge of him; and was immediately restored to his dignity: which Bassasiri no sooner understood, than he again advanced towards the city. Against him Togrol Beg sent a part of his army under some of his generals, while he himself followed with the rest. A battle ensued, in which the army of Bassasiri was defeated, and he himself killed. His head was brought to Togrol Beg, who caused it to be carried on a pike through the streets of Bagdad. Thus the hopes of Al Mostanser were entirely frustrated; and from this period we may date the declension of the Egyptian empire under the khalifs. They had made themselves masters of almost all Syria; but no sooner was Bassasiri's bad success known, than the younger part of the citizens of Aleppo revolted, and set up Mahmud Azzoddawla, who immediately laid siege to the citadel. Al Mostanser sent a powerful army against him, which Azzoddawla entirely defeated, and took the general himself prisoner: soon after this he made himself master both of the city and citadel, with all their dependencies. In his new dominions he behaved with the greatest cruelty, destroying every thing with fire and sword, and making frequent incursions into the neighbouring provinces, which he treated in the same manner. This disaster was soon followed by others still more terrible. In 1066 a famine raged over all Egypt and Syria, with such fury, that dogs and cats were sold for four or five Egyptian dinars each, and other provisions in proportion. Multitudes of people died in Cairo for want of food. Nay, so great was the scarcity, that the vizier had but one servant left who was able to attend him to the khalif's palace, and to whom he gave the

care of his horse when he alighted at the gate. But, at his return, he was surprised to find that the horse had been carried off, killed, and eaten by the famished people. Complaining of this to the khalif, he caused three of them who had carried off the horse to be hanged. Next day, however, he was still more surprised to hear, that all the flesh had been picked off the bones of the three unhappy criminals, so that nothing but the skeletons was left. And to such a degree of misery were the inhabitants, not only in Cairo but through all Egypt, reduced, that the carcasses of those who died were sold for food at a great price. The khalif at this time is said to have showed the greatest kindness and benevolence towards his unhappy subjects; inasmuch that of 10,000 horses, mules, and camels, which he had in his stables when the famine began, he had only three left when it was removed. The famine was followed by a plague; and this by an invasion of the Turks under Abu Ali Al Hassan Hascroddawla, the very general who had been sent against the rebel Azzoddawla and defeated by him. He began with besieging the khalif in his own palace; and the unhappy prince being in no condition to make resistance was obliged to buy himself off at the expense of every thing valuable that was left in his exhausted capital. This, however, did not hinder these merciless plunderers from ravaging all the Lower Egypt from Cairo to Alexandria, and committing the most horrid cruelties through that whole tract. This happened in 1067 and 1068; and in 1069 and 1070 there happened two other revolts in Syria: so that this country was now almost entirely ruined. In 1095 died the khalif Al Mostanser, having reigned sixty years; and was succeeded by his son Abul Kasem, surnamed Al Mostali. The most remarkable transaction of this prince's reign was, his taking the city of Jerusalem from the Turks in 1098: but this success was only of short duration; for it was, the same year, taken by the crusaders. From this time to 1164, the Egyptian history affords little else than an account of the intestine broils and contests between the viziers, who were now become so powerful, that they had in a great measure stripped the khalifs of their civil power, and left them nothing but a shadow of spiritual dignity. These contests at last gave occasion to a revolution, by which the race of Fatemite khalifs was totally extinguished: a revolution which was accomplished in the following manner. One Shawar, having overcome all his competitors, became vizir to Al Aded, the eleventh khalif of Egypt. He had not been long in possession of that office, when Al Dargam, an officer of rank, endeavoured to deprive him of it. Both parties quickly had recourse to arms; and a battle ensued, in which Shawar was defeated, and obliged to fly to Nuroddin prince of Syria, by whom he was graciously received, and who promised to reinstate him in his office of vizier. As an inducement to Nuroddin to assist him more powerfully, Shawar told him that the crusaders had landed in Egypt, and made a considerable progress in the conquest of it. He promised also, that, in case he

was reinstated in his office, he would pay Nuroddin annually the third part of the revenues of Egypt; and would, besides, defray the whole expense of the expedition. As Nuroddin bore an implacable hatred to the Christians, he readily undertook an expedition against them, for which he was to be so well paid. He therefore sent an army into Egypt, under the command of Shawar and a general named Asadoddin. Dargam, in the mean time, had cut off so many generals whom he imagined favorable to Shawar's interest, that he thereby weakened the military force of the kingdom, and in a great measure deprived himself of the power of resistance. He was thus easily overthrown by Asadoddin, and Shawar reinstated in the office of vizier. The faithless minister, however, no sooner saw himself firmly established in his office, than he refused to fulfil his engagements to Nuroddin by paying the stipulated sums. Upon this, Asadoddin seized Pelusium and some other cities. Shawar then entered into an alliance with the crusaders, and Asadoddin was besieged by their combined forces in Pelusium. Nuroddin, however, having invaded the Christian dominions in Syria, and taken a strong fortress, called Harem, Shawar and his confederates thought proper to hearken to some terms of accommodation, and Asadoddin was permitted to depart for Syria. In the mean time Nuroddin, having subdued the greatest part of Syria and Mesopotamia, resolved to make Shawar feel the weight of his resentment. He therefore sent back Asadoddin into Egypt with a sufficient force, to compel Shawar to fulfil his engagements: but this the vizier took care to do before the arrival of Asadoddin; and thus, for the present, avoided the danger. It was not long, however, before he gave Nuroddin fresh occasion to send this general against him.

That prince had now driven the crusaders almost entirely out of Syria, but was greatly alarmed at their progress in Egypt; and consequently offended at the alliance which Shawar had concluded with them, and which he persisted in observing. This treaty was also thought to be contrived on purpose to prevent Shawar from being able to fulfil his promise to Nuroddin, of sending him annually a third of the revenues of Egypt. Nuroddin therefore again despatched Asadoddin into Egypt, in 1166, with a sufficient force, and attended by the famous Saladin, his own nephew. They entered the kingdom without opposition, and totally defeated Shawar and the crusaders. They next made themselves masters of Alexandria; and, after that, overran all the Upper Egypt. Saladin was left with a considerable garrison in Alexandria; but Asadoddin was no sooner gone, than the crusaders laid siege to that city. This at last obliged Asadoddin to return to its relief. The great losses he had sustained in this expedition probably occasioned his agreeing to a treaty with Shawar, by which he engaged to retire out of Egypt, upon being paid a sum of money. Asadoddin was no sooner gone, than Shawar entered into a fresh treaty with the Franks. By this new alliance he was to attack Nuroddin in his own dominions, as he was at

that time engaged in quelling some revolters, which would effectually prevent his sending any more forces into Egypt. This treaty so provoked the Syrian prince, that he resolved to suspend his other conquests for some time, and exert his whole strength in the conquest of Egypt. By this time the crusaders had reduced Pelusium, and made a considerable progress in the kingdom, as well as in some other countries, through the divisions which reigned among the Mahomedan princes. In such places as they conquered, they put many to the sword. Christians as well as Mahomedans; selling the rest for slaves, and giving up the towns to be plundered by the soldiers. From Pelusium they marched to Cairo; which was then in no posture of defence, but in the utmost confusion, by reason of the divisions which reigned in it. Shawer, therefore, as soon as he had heard of their approach, caused the ancient quarter called Mesr to be set on fire, and the inhabitants to retire into other parts. He also prevailed upon the khalif to solicit the assistance of Nuroddin; which the latter was indeed much inclined to grant, as it gave him the fairest opportunity both of driving the crusaders out of Egypt, and of seizing the kingdom to himself. For this purpose he had already raised an army of 60,000 horse under his general Asadoddin; and, on the receipt of Al Aded's message, gave them orders to set out immediately. The crusaders were now arrived at Cairo; and had so closely besieged that place, that neither Shawer nor the khalif knew any thing of the approach of the Moslem army, which was hastening to their relief. The vizier, therefore, finding it impossible to hold out long against the enemy, had recourse to his old subterfuge of treaties and high promises. He sent the enemy 100,000 dinars, and promised them 900,000 more, if they would raise the siege; which they, dreading the approach of Asadoddin, very readily accepted. The army of Nuroddin now approached the capital by hasty marches, and were every where received with the greatest demonstrations of joy. Asadoddin, on his arrival at Cairo, was invited by Al Aded to the royal palace, where he, with Saladin and the other principal officers were most magnificently treated. Shawer was no less assiduous in attending punctually upon them. But, having invited the general and some others to an entertainment, he had formed a scheme of having them seized and murdered. The plot, however, being discovered, Shawer's head was cut off, and Asadoddin was made vizier in his stead. He died, however, two months and five days after his instalment, and was succeeded by his nephew Saladin. The new vizier was the youngest of all the grandees who aspired to that office, but had already given some signal proofs of his valor. Some of his rivals were highly displeased with his promotion, and even publicly declared that they would not obey him. To gain these to his interest, therefore, Saladin distributed among them part of the vast treasures left by his uncle; by which means he soon governed Egypt without control. Soon after his being installed into office, he totally defeated the negroes who guarded the royal palace, and had opposed his election; by which means, and

by placing a strong garrison in the castle of Cairo, his power became firmly established. But though he had no intention of continuing in his allegiance to Nuroddin, he did not think it prudent at first to declare himself. He sent for his father, however, and the rest of his family, who were in Nuroddin's dominions, in order, as he said, to make them partakers of his grandeur and happiness. Nuroddin did not think proper to deny this request; though being already jealous of the great power of Saladin, he insisted that his family should consider him only as one of his generals in Egypt. A good understanding subsisted between Nuroddin and Saladin for some time, which contributed to raise the credit of the latter with the Egyptians. In 1169 Nuroddin sent him orders to omit the name of Al Aded, the khalif of Egypt, in the public prayers, and substitute that of the khalif of Bagdad in its place. This was a dangerous attempt; as it might have produced a revolt in favor of Al Aded; and at any rate it gave Saladin an opportunity of engrossing even that small remnant of power which was left to the khalif. Al Aded, however, was not sensible of his disgrace: for he was on his death-bed, and past recovery, when Nuroddin's orders were executed. After his death, Saladin seized on all his wealth and valuable effects: which consisted of jewels of prodigious size, sumptuous furniture, a library containing 100,000 volumes, &c. His family he caused to be closely confined in the most retired place of the palace; and either manumitted his slaves, or kept them for himself.

Saladin was now arrived at the highest pitch of wealth, power, and grandeur. He was, however, obliged to behave with great circumspection with regard to Nuroddin; who still continued to treat him as his vassal, and would not suffer him to dispute the least of his commands. He relied for advice chiefly on his father Ayub, who was a consummate politician, and very ambitious of seeing his son raised to the throne of Egypt. He therefore advised Saladin, whilst he amused Nuroddin with feigned submissions, to take every method to secure himself in the possession of so valuable a kingdom. Nuroddin himself, however, was too great a master in dissimulation to be easily imposed on by others; and, therefore, though he pretended to be well pleased with Saladin's conduct, he was all this time raising a powerful army, with which he was fully determined to invade Egypt the following year. But while he meditated this expedition, he was seized with a quinsy at the castle of Damascus, which put an end to his life in 1173. Saladin, though now freed from the apprehensions of such a formidable enemy, did not venture to assume the title of Sovereign, while he saw the successor of Nuroddin at the head of a very powerful army. His first care therefore was to secure to himself an asylum, in case he should be obliged to leave Egypt altogether. For this purpose he chose the kingdom of Nubia; but having despatched his brother Malek Turanshah thither, at the head of a considerable army, the latter was so much struck with the sterility and desolate appearance of the country, that he returned without attempting any thing. Saladin

then sent his brother into Arabia Felix, to subdue that country, which had been for some time held by Abdalnabi, an Arabian prince. Malek entered the country without opposition; and, having brought Abdalnabi to a general action, entirely defeated him, took him prisoner, and threw him into irons. He then overran and reduced under subjection to Saladin great part of the country, taking no fewer than eighty castles of considerable strength. Saladin, now sure of a convenient place of refuge, assumed the title of Sultan of Egypt; and was acknowledged as such by the greater part of the state. The zeal of the Egyptians for the Fatemite khalifs, however, soon produced a rebellion. One Al Kanz, or Kanzanad-dowla, governor of a city in Upper Egypt, assembled a great army of blacks, or rather swarthy natives; and, marching into the lower country, was there joined by great numbers of other Egyptians. Against them Saladin despatched his brother Malek, who soon entirely dispersed them. This, however, did not prevent another insurrection under an impostor, who pretended to be David the son of Al Aded, and had collected a body of 100,000 men. But, before these had time to effect any great damage, they were surprised by the sultan's forces, and entirely defeated. Above 300 were publicly hanged, and a vast number perished in the field, insomuch that it was thought scarcely a fourth part of the whole body escaped. About this time Saladin gained a considerable advantage over the Crusaders, commanded by William II. king of Sicily. That prince had invaded Egypt with a numerous fleet and army, with which he laid close siege to Alexandria by sea and land. Saladin, however, marched to the relief of the city with such expedition, that the crusaders were seized with a sudden panic, and fled with the utmost precipitation, leaving all their military engines, stores, and baggage behind. In 1175 the inhabitants of Damascus begged of Saladin to accept the sovereignty of that city and its dependencies; being jealous of the minister, who had the tuition of the reigning prince, and who governed with an absolute sway. The sultan set out with the utmost celerity to Damascus, at the head of a chosen detachment of 700 horse. Having settled his affairs in that city, he appointed his brother Saif Al Islam governor of it; and set out for Hems, to which he immediately laid siege. Making himself master of this place, he then proceeded to Hamah, which soon surrendered, but the citadel held out for some time. Saladin pretended that he accepted the sovereignty of Damascus and the other places he had conquered, only as deputy to Al Malek Al Saleh, the successor of Nuroddin, and who was then under age; and that he was desirous of sending Azzodin, who commanded in the citadel, with a letter to Aleppo, where the young prince resided. This so pleased Azzodin, that he took the oath of fidelity to Saladin, and immediately set out with his letter. He had not, however, been long at Aleppo before he was, by the minister's orders, thrown into prison; upon which his brother, who had been appointed governor of the citadel of Hamah in his absence, delivered it up to Saladin. The sultan then marched to Aleppo,

VOL. VII.

but, being vigorously repulsed in several attacks, he was at last obliged to abandon the enterprise. At the same time, Kamschlegin, Al Malek's minister or vizier, hired the chief of the Batanists or Assassins, to murder him; but the attempts made in consequence miscarried. See ASSASSINS. After raising the siege of Aleppo, Saladin returned to Hems, which the crusaders had invested. On his approach, however, they retired; after which, the sultan made himself master of its strong castle. This was soon followed by the reduction of Balbec; and these rapid conquests so alarmed the ministers of Al Malek, that, entering into a combination with some of the neighbouring princes, they raised a formidable army, with which they designed to crush the sultan at once. Saladin, fearing the event, offered to cede Hems and Hamah to Al Malek, and to govern Damascus only as his lieutenant: but these terms being rejected, a battle ensued; in which the allied army was utterly defeated, and the shattered remains of it shut up in Aleppo. This produced a treaty, by which Saladin was left master of all Syria, excepting only the city of Aleppo and its territory. In 1176 Saladin returned from the conquest of Syria, and made his triumphal entry into Cairo. Here, having rested himself and his troops for some time, he began to encompass the city with a wall 29,000 cubits in length, but which he did not live to finish. Next year he led a very numerous army into Palestine against the crusaders. But here his usual good fortune failed him. His army was entirely defeated; 40,000 of his men were left dead on the field; and the rest fled with so much precipitation, that, having no towns in the neighbourhood where they could shelter themselves, they traversed the vast desert between Palestine and Egypt, and scarcely stopped till they reached the capital itself. Thus the greatest part of the army perished; and, as no water was to be had in the desert, almost all the cattle died of thirst before the fugitives arrived on the confines of Egypt. Saladin himself seemed to have been greatly intimidated; for in a letter to his brother Al Malek, he told him, that he was more than once in the most imminent danger; and that God, as he apprehended, had delivered him, to reserve him for the execution of some grand and important design. In 1182 he set out on an expedition to Syria with a formidable army, amidst the acclamations and good wishes of the people. He was, however, repulsed with loss both before Aleppo and Al Mawasel, after having spent much time and labor in besieging these two important places. In the mean time a most powerful fleet of European ships appeared on the Red Sea, which threatened the cities of Mecca and Medina with the utmost danger. The news of this armament no sooner reached Cairo, than Abu Beer, Saladin's brother, who had been left viceroy, caused another to be fitted out with all speed under the command of Lulu, a brave and experienced officer; who quickly came up with them, and a dreadful engagement ensued. The Christians were defeated after an obstinate resistance, and all the prisoners butchered in cold blood. This proved such a terrible blow to the Europeans, that they never more ventured on a like at-

tempt. In 1183 Saladin continued to extend his conquests. The city of Amida in Mesopotamia surrendered to him in eight days; after which, being provoked by some violence committed by Amadoddin, prince of Aleppo, he resolved to make himself master of that place. His army being now numerous, he pushed on the siege with the utmost vigor; upon which Amadoddin capitulated, on condition of being allowed to possess certain cities in Mesopotamia, which had formerly belonged to him, and being ready to attend the sultan on whatever expedition he pleased. After the conquest of Aleppo, Saladin took three other cities, and then marched against the crusaders. Having sent out a party to reconnoitre, they fell in with a considerable detachment of Christians, whom they easily defeated, taking about 100 prisoners, with the loss of only a single man on their side. The sultan, animated by this first instance of success, advanced against the crusaders, who had assembled their whole army at Sepphoris in Galilee. On viewing the sultan's troops, however, and perceiving them to be greatly superior in strength to what they had at first apprehended, they declined an engagement, nor could Saladin with all his skill force them to it. But, though he found it impossible to bring the crusaders to a decisive engagement, he harassed them greatly, and destroyed great numbers of them. He also carried off many prisoners, dismantled three of their strongest cities, laid waste their territories, and concluded the campaign with taking another strong town. For three years Saladin continued to gain ground on the crusaders, yet without any decisive advantage; till 1187, when the cruel ravages committed in their territories obliged the Christians to venture a battle. Both armies, therefore, being resolved to exert their utmost efforts, a most fierce and bloody battle ensued. Night prevented victory from declaring on either side, and the fight was renewed with equal obstinacy next day. The victory was still left undecided; but on the third day Saladin's troops, finding themselves surrounded by the enemy on all sides but one, and there also hemmed in by the river Jordan, so that there was no room to fly, fought like men in despair, and at last gained a most complete victory. Vast numbers of the Christians perished on the field. A large body retired to the top of a neighbouring hill covered with wood; but being surrounded by Saladin's troops, who set fire to the wood, they were all obliged to surrender at discretion. Some of them were butchered by their enemies, as soon as they delivered themselves into their hands, and others thrown into irons. Among the latter were the king of Jerusalem himself, Arnold prince of Al Shawbec and Al Carac, the masters of the Templars and Hospitallers, with almost the whole body of the latter. So great was the consternation of the Christians on this occasion, that one of Saladin's men is said to have taken thirty of them prisoners, and tied them together with the cord of his tent, to prevent them from making their escape. The masters of the Templars and Hospitallers, with the knights acting under them, were no sooner brought into Saladin's presence,

than he ordered them all to be cut in pieces. After the engagement, Saladin seated himself in a magnificent tent, placing the king of Jerusalem on his right hand, and Arnold prince of Al Shawbec and Al Carac on his left. Then he drank to the former, and at the same time offered him a cup of snow water. This was thankfully received; and the king immediately drank to the prince of Al Carac, who sat near him. 'I will not, said Saladin, suffer this cursed rogue to drink; as that, according to the laudable and generous custom of the Arabs, would secure to him his life.' Then turning towards the prince, he reproached him with having undertaken the expedition while in alliance with himself, with having intercepted an Egyptian caravan in the time of profound peace, and massacring the people of which it was composed, &c. Notwithstanding all this, he told him, he would grant him his life, if he would embrace Mahomedanism. This condition, however, was refused; and the sultan, with one stroke of his scymitar, cut off the prince's head. This terrified the king of Jerusalem; but Saladin assured him he had nothing to fear, and that Arnold had brought on himself a violent death by his want of common honesty. The crusaders being thus totally defeated and dispersed, Saladin next laid siege to Tiberias, which soon capitulated, as did also Acca or Ptolemais, where he found 4000 Mahomedan prisoners in chains, whom he immediately released. As the inhabitants of Acca enjoyed a very extensive trade, he found there not only vast sums of money, but likewise a great variety of valuable wares, all of which he seized. About the same time his brother Al Malec attacked and took a very strong fortress in the neighbourhood; after which Saladin divided his army into three bodies, and soon made himself master of Neapolis, Cesarea, Sepphoris, and other cities in the neighbourhood of Ptolemais, where his soldiers found only women and children, the men having been all killed or taken prisoners. His next conquest was Joppa, which was taken by storm after a vigorous resistance. Every thing being then settled, and a distribution made of the spoils and captives, Saladin marched in person against Tebrien, a strong fortress in the neighbourhood of Sidon; which he took by assault, after a siege of six days, and ordered the fortress to be razed, and the garrison put to the sword. From Tebrien he proceeded to Sidon, which, being deserted by its prince, surrendered almost on the first summons. Berytus was next invested, and surrendered in seven days. Among the prisoners Saladin found in this place the prince of a territory called Hobeil, who by way of ransom delivered up his dominions to him, and was of consequence released. About the same time, a Christian ship, in which was a nobleman of tried courage and experience in war, arrived at the harbour of Ptolemais, not knowing that it was in the hands of Saladin. The governor might easily have secured the vessel; but neglecting the opportunity, she escaped to Tyre, where the above-mentioned nobleman, together with the prince of Hobeil, contributed not a little to retrieve the affairs of the Christians, and enable

them to make a stand for four years longer. Saladin in the mean time went on with his conquests. Having made himself master of Ascalon, after a siege of fourteen days, he next invested Jerusalem. The garrison was numerous, and made an obstinate defence; but Saladin having at last made a breach in the walls by sapping, the besieged desired to capitulate. This was at first refused; upon which the Christian ambassador boldly said to him:—‘ If that be the case, O sultan, know that we who are extremely numerous, and have been restrained from fighting like men in despair, only by the hopes of an honorable capitulation, will kill all our wives and children, commit all our wealth and valuable effects to the flames, massacre 5000 prisoners now in our hands, leave not a single beast of burden or animal of any kind belonging to us alive, and level with the ground the rock you esteem sacred, together with the temple Al Aksa. After this we will sally out upon you in a body; and doubt not but we shall either cut to pieces a much greater number of you than we are, or force you to abandon the siege.’ This desperate speech had such an effect upon Saladin, that he immediately called a council of war, at which all the general officers declared, that it would be most proper to allow the Christians to depart unmolested. The sultan therefore allowed them to march out freely with their wives, children, and all their effects; after which he received ten dinars from every man who was capable of paying that sum, five from every woman, and two from every young person under age. For the poor who were not able to pay any thing, the rest of the inhabitants raised the sum of 30,000 dinars. Most of the inhabitants of Jerusalem were escorted by a detachment of Saladin’s troops to Tyre; and, soon after, he advanced with his army against that place. As the port was blocked up by a squadron of five men of war, Saladin imagined that he should easily become master of it. But in this he found himself mistaken. For one morning, by break of day, a Christian fleet fell upon his squadron, and entirely defeated it; nor did a single vessel escape their pursuit. A considerable number of the Mahomedans threw themselves into the sea during the engagement; most of whom were drowned, though some few escaped. About the same time Saladin himself was vigorously repulsed by land; so that, after calling a council of war, it was thought proper to raise the siege. In 1188 Saladin reduced the city of Laodicea and some others, together with many strong castles; but met also with several repulses. At last he took the road to Antioch; and having reduced all the fortresses that lay in his way, many of which had been deemed impregnable, Bohemond, prince of Antioch, was so much intimidated that he desired a truce for seven or eight months. This Saladin found himself obliged to comply with, on account of the prodigious fatigues his men had sustained, and because his auxiliaries now demanded leave to return home. All these heavy losses of the Christians, however, proved in some respects an advantage, as they were thus obliged to lay aside their animosities, which had originally proved the ruin of their affairs. Those

who had defended Jerusalem, and most of the other fortresses taken by Saladin, having retreated to Tyre, formed there a very numerous body. This proved the means of preserving that city and also of re-establishing their affairs for the present. For, having received powerful succours from Europe, they were enabled, in 1189, to take the field with 30,000 foot and 2000 horse. Their first attempt was upon Alexandretta; from whence they dislodged a strong party of Mahomedans, and made themselves masters of the place with very little loss. They next laid siege to Ptolemais; of which Saladin had no sooner received intelligence, than he marched to its relief. After several skirmishes with various success, a general engagement ensued, in which Saladin was defeated with the loss of 10,000 men. This enabled the Christians to carry on the siege of Ptolemais with greater vigor; which place, however, they were not able to reduce for two years. This year the sultan was greatly alarmed, by an account that the emperor of Germany was advancing to Constantinople with an army of 260,000 men, to assist the other crusaders. This prodigious armament, however, came to nothing. The multitude were so reduced with sickness, famine, and fatigue, that scarcely 1000 of them reached the camp before Ptolemais. The siege of that city was continued, though with bad success on the part of the Christians. They were repulsed in all their attacks, their engines were burnt with naphtha, and the besieged always received supplies of provisions in spite of the utmost efforts of the besiegers; while a dreadful famine and pestilence raged in the Christian camp, which sometimes carried off 200 people a-day. In 1191 the Christians received powerful succours from Europe. Philip II. of France, and Richard I. of England, arrived before the camp at Ptolemais. The latter was esteemed the bravest and most enterprising of all the generals the crusaders had; and the spirits of his soldiers were greatly elated by the thoughts of acting under such an experienced commander. Soon after his arrival, the English sunk a Mahomedan ship of vast size, having on board 650 soldiers, and a great quantity of arms and provisions, going from Berytus to Ptolemais. Of the soldiers and sailors who navigated this vessel, only one person escaped; who, being taken prisoner by the English, was despatched to the sultan with the news of the disaster. The besieged still defended themselves with the greatest resolution; and, the king of England happening to fall sick, the operations of the besiegers were delayed. On his recovery, however, the attacks were renewed with such fury, that the inhabitants found themselves under a necessity of surrendering the place. One of the terms of the capitulation was, that the crusaders should receive a very considerable sum of money from Saladin, upon delivering up their Mahomedan prisoners. With this article Saladin refused to comply; in consequence of which, Richard caused 3000 of those unfortunate men to be slaughtered at once. After the reduction of Ptolemais, the king of England, now made generalissimo of the crusaders, took the road to Ascalon in order to besiege that place; after which, he intended to

make an attempt upon Jerusalem itself. Saladin, to intercept his passage, placed himself in the way with an army of 300,000 men. On this occasion was fought one of the greatest battles of that age. Saladin was totally defeated, with the loss of 40,000 men; and Ascalon soon fell into the hands of the crusaders. Other sieges were afterwards carried on with success, and Richard even approached within sight of Jerusalem, in 1192, when, by the weakened state of his army, and the divisions among the officers, he was under the necessity of concluding a truce with the sultan, for three years, three months, three weeks, three days, and three hours; soon after which Richard set out on his return to England. In 1193 Saladin died, to the inexpressible grief of the Mahommedans, who held him in the utmost veneration. His dominions in Syria and Palestine were divided among his children and relations into many petty principalities. His son Othman succeeded to the crown of Egypt; but, as none of his successors possessed the enterprising genius of Saladin, the history from that time to 1250 affords nothing remarkable.

In 1250 the reigning sultan, Malek Al Salek, was dethroned and slain by the Mamelukes or Mamlouks, as they are called, a kind of mercenary soldiers who served under him. In consequence of this revolution, the Mamelukes became masters of Egypt, and chose a sultan from among themselves. These Mamelukes were originally young Turks or Tartars, sold to private persons by the merchants, from whom they were bought by the sultan, educated at his expense, and employed to defend the maritime places of the kingdom. The reason of this institution originally was, that the native Egyptians were become so cowardly, treacherous, and effeminate, from a long course of slavery, that they were unfit for arms. The Mamelukes, on the contrary, made most excellent soldiers; for, having no friends but among their own corps, they turned all their thoughts to their own profession. According to M. Volney, they came originally from Mount Caucasus, and were distinguished by the flaxen color of their hair. The expedition of the Tartars, in 1227, proved indirectly the means of introducing them into Egypt. These horrible conquerors, having slaughtered and massacred till they were weary, brought along with them an immense number of slaves of both sexes, with whom they filled all the markets in Asia. The Turks purchased about 12,000 young men, whom they bred up in the profession of arms, in which they soon attained to great perfection; but at last, becoming mutinous, they turned their arms against their masters, and in 1250 deposed and murdered the sultan, Malek. The Mamelukes having thus got possession of the government, and neither understanding nor valuing any thing but the art of war, every species of learning decayed in Egypt, and a great degree of barbarism was introduced. Neither was their empire of long duration, notwithstanding their martial abilities. The reason was, that they were originally only a small part of the sultan of Egypt's standing forces. As a numerous standing army was necessary in a country where the fundamental maxim of government

was, that every native must be a slave, they were at a loss how to act; being justly suspicious of all the rest of the army. At last they resolved to buy Christian slaves, and educate them in the same way that they themselves had formerly been. These were commonly brought from Circassia, where the people, though they professed Christianity, made no scruple of selling their children. When they were completed in their military education, these soldiers were disposed of through all the fortresses erected in the country, to bridle the inhabitants; and, because in their language such a fort was called Borge, the new militia obtained the name of Borgites. By this expedient the Mamelukes imagined they would be able to secure themselves in the sovereignty, but they were mistaken. In process of time, the old Mamelukes grew proud, indolent, and lazy: and the Borgites, taking advantage of this, rose upon their masters, deprived them of the government, and transferred it to themselves about A. D. 1382. The Borgites, however, assumed the name of Mamelukes; and became famous for ferocious valor. They were almost perpetually engaged in wars either foreign or domestic; and their dominion lasted till 1517, when they were invaded by Selim I., the Turkish sultan. The Mamelukes defended themselves with incredible valor; notwithstanding which, being overpowered by numbers, they were defeated in every engagement. The same year, their capital, the city of Cairo, was taken, and a terrible slaughter made of those who defended it. The sultan, Tuman Bey, was forced to fly; and, having collected all his forces, he ventured a decisive battle. The most romantic efforts of valor, however, were insufficient to cope with the innumerable multitude which composed the Turkish army. Most of his men were cut in pieces, and the unhappy prince himself was at last obliged to take shelter in a marsh. He was dragged from his hiding place, where he had stood up to the shoulders in water, and soon after put to death. With him ended the glory, and almost the existence, of the Mamelukes, who were now every where searched for and cut in pieces.

Selim gave a specimen of his government the very day after his being put in full possession of it by the death of Tuman Bey. Having ordered a theatre to be erected, with a throne upon it, on the banks of the Nile, he caused all the prisoners, upwards of 30,000, to be beheaded in his presence, and their bodies thrown in the river. But notwithstanding this horrid barbarity, he did not attempt the total extermination of the Mamelukes, but seems to have recollected that, if he established a pacha in Egypt with the same powers with which he invested those of other parts, he would be under strong temptations to revolt, by reason of the distance from the capital. He therefore proposed a new form of government, by which the power, being distributed among the different members of the state, should preserve an equilibrium; so that the dependence of the whole should be upon himself. With this view he chose, from among those Mamelukes who had escaped the general massacre, a divan, or council of regency, consisting of the pacha and chiefs of the seven military corps. The former

was to notify to this council the orders of the Porte, to send the tribute to Constantinople, and provide for the safety of government both external and internal; while, on the other hand, the members of the council had a right to reject the orders of the pacha, or even of deposing him, provided they could assign sufficient reasons. All civil and political ordinances must also be ratified by them. Besides this, he formed the whole body into a kind of republic; for which purpose he issued an edict, stating: 'Though, by the help of the Almighty, we have conquered the whole kingdom of Egypt with our invincible armies, nevertheless our benevolence is willing to grant to the twenty-four sangiacs of Egypt (see SANGIAC) a republican government with the following conditions. 1. That our sovereignty shall be acknowledged by the republic; and, in token of their obedience, our lieutenant shall be received as our representative, but to do nothing against our will or the republic; but, on the contrary, shall co-operate with it for its welfare on all occasions: Or, if he shall attempt to infringe any of its privileges, the republic is at full liberty to suspend him from his authority, and to send to our Sublime Porte a complaint against him, &c. 2. In time of war the republic shall provide 12,000 troops at its own expense, to be commanded by a sangiac or sangiacs. 3. The republic shall raise annually and send to our Sublime Porte the sum of 560,000 aslans (see ASLAN), accompanied by a sangiac, who shall have a satisfactory receipt, &c. 4. The same sum to be raised for the use of Medina, and Kiabe, or Mecca. 5. No more troops or janizaries shall be kept by the republic in time of peace than 14,000; but in time of war they may be increased to oppose our and the republic's enemies. 6. The republic shall send annually to our granary, out of the produce of the country 1,000,000 of casiz (twenty-five oca, see OCA), or measures of corn, viz. 600,000 of wheat, and 400,000 of barley. 7. The republic, fulfilling these articles, shall have a free government over all the inhabitants of Egypt, independent of our lieutenant; and shall execute the laws of the country with the advice of the mollah, or high priest, under our authority, and that of our successors. 8. The republic shall be in possession of the mint as heretofore; but with the condition that it shall be under the inspection of our lieutenant, that the coin may not be adulterated. 9. That the republic shall elect a sheik bellet out of the number of beys, to be confirmed by our lieutenant; and that the said sheik bellet shall be our representative, and shall be esteemed by all our lieutenants, and all our officers, both of high and low rank, as the head of the republic; and if our lieutenant is guilty of oppression, or exceeds the bounds of his authority, the said sheik bellet shall represent the grievances of the republic to our Sublime Porte. But in case any foreign enemy or enemies disturb the peace of the republic, we and our successors engage to protect it with our utmost power, until peace is re-established, without any cost or expense to the republic. Given and signed by our clemency to the repub-

lic of Egypt.' Thus the power of the Mamelukes still continued in a very considerable degree, and gradually increased so much as to threaten a total loss of dominion to the Turks. During the last sixty years, the Porte having relaxed from its vigilance, such a revolution took place, that the Turkish power is now almost reduced to nothing. But to understand this we must consider the way in which the race of Mamelukes was continued or multiplied in Egypt. This is not in the ordinary way, by marriage; on the contrary, M. Volney assures us, that 'during 550 years in which there have been Mamelukes in Egypt, not one of them has left subsisting issue; all their children perish in the first or second descent. Almost the same thing holds good with regard to the Turks; and it is observed, that they can only secure the continuance of their families by marrying women who are natives, which the Mamelukes have always disdained. The means by which they are perpetuated and multiplied are the same by which they were first established, viz. by slaves brought from their original country. From the time of the Moguls this commerce has been continued on the banks of the Cuban and Phasis, in the same manner as it is carried on in Africa by the wars among the hostile tribes, and the misery or avarice of the inhabitants, who sell their children to strangers. The slaves thus procured are first brought to Constantinople, and afterwards dispersed through the empire, where they are purchased by the wealthy. When the Turks subdued Egypt (says M. Volney), they should undoubtedly have prohibited this dangerous traffic; their omitting which seems about to dispossess them of their conquest, and which several political errors have long been preparing. For a considerable time the Porte had neglected the affairs of this province: and, in order to restrain the pachas, had suffered the divan to extend its power till the chiefs of the janizaries and azabs were left without control. The soldiers themselves, become citizens by the marriages they had contracted, were no longer the creatures of Constantinople: and a change introduced into their discipline still more increased these disorders. At first the seven military corps had one common treasury; and, though the society was rich, individuals not having any thing at their own disposal, could effect nothing. The chiefs finding their power diminished by this regulation, got it abolished, and obtained permission to possess distinct property, lands, and villages. And as these lands and villages depended on the Mameluke governors, it was necessary to conciliate them, to prevent their oppressions. From that moment the beys acquired an ascendancy over the soldiers, who till then had treated them with disdain: and this continually increased, as their government procured them considerable riches. These they employed in creating friends. They multiplied their slaves; and, after emancipating them, employed all their interest to advance them in the army. These upstarts, retaining for their patrons the same superstitious veneration common in the East, formed factions implicitly devoted to their pleasure.' Thus, about 1746, Ibrahim, one of the kiayas of the

janizaries (see *KIAYA*), rendered himself in reality master of Egypt; having managed matters so well, that of the twenty-four beys, or sangiacs, eight were of his household. His influence too was augmented by always leaving vacancies, in order to enjoy the emoluments himself, while the officers and soldiers of his corps were attached to his interest; and his power was completed by gaining over Rodoan, the most powerful of all the colonels, to his interest. Thus the pacha became altogether unable to oppose him, and the orders of the sultan were less respected than those of Ibrahim. On his death, in 1757, his family, i. e. his enfranchised slaves, continued to rule in a despotic manner. Waging war, however, among each other, Rodoan and several other chiefs were killed; but, in 1766, Ali Bey, who had been a principal actor in the disturbances, overcame his enemies, and for some time rendered himself absolute master of Egypt. Of this man there are various accounts. The following is given by M. Volney:—It is supposed that Ali was born among the Abazans, a people of Mount Caucasus; from whom, next to the Circassians, the slaves most valued by the Turks are obtained. Having been brought to a public sale at Cairo, Ali was bought by two Jew brothers, named Isaac and Youssef, who made a present of him to Ibrahim. At this time he is supposed to have been about thirteen or fourteen years old, and was employed by his patron in offices similar to those of the pages belonging to European princes. The usual education was also given him, viz. that of learning to manage a horse well; fire a carbine and pistol, and throw the djerid, a kind of dart used in the diversions of that country. He was also taught the exercise of the sabre, and a little reading and writing. In all these feats of activity he discovered such impetuosity, that he obtained the surname of Djendali, or the madman; and, as he grew up, discovered an ambition proportionable to the activity displayed in his youth. About the age of eighteen or twenty Ibrahim gave him his freedom; the badge of which among the Turks is letting the beard grow, for among that people it is thought proper only for women and slaves to want a beard. By his kind patron also he was promoted to the rank of kachef, or governor of a district, and at last elected one of the twenty-four beys. By the death of Ibrahim, in 1757, he had an opportunity of satisfying his ambition; being now engaged in every scheme for the promotion or disgrace of the chiefs, and having had a principal share in the ruin of Rodoan, Rodoan's place was quickly filled by another, who did not long enjoy it; and in 1762 Ali Bey, then styled Sheik el Beled, having got Abdelrahman, the possessor, exiled, procured himself to be elected in his room. However, he soon shared the fate of the rest, being condemned to retire to Gaza. This town, being under the dominion of a Turkish pacha, was by no means a safe retreat; for which reason, Ali having turned off to another place, kept himself concealed for some time, until in 1766 his friends at Cairo procured his recall. On this he appeared suddenly in that city; and killed in one night four

of the beys who were inimical to his designs, banished the rest, and assumed the whole power to himself. Still, however, his ambition was not satisfied: and he determined to throw off his dependence on the Porte altogether, and become sultan of Egypt. With this view he expelled the pacha, refused to pay the accustomed tribute, and in 1768 proceeded to coin money in his own name. The Porte, being at that time on the eve of a dangerous war with Russia, had not leisure to attend to the proceedings of Ali Bey; so that the latter had an opportunity of going forward with his enterprises very vigorously. His first expedition was against an Arabian prince named Hammam; against whom he sent his favorite Mohammed Bey, under pretence that the former had concealed a treasure entrusted with him by Ibrahim, and that he afforded protection to rebels. Having destroyed this unfortunate prince, he next began to put in execution a plan proposed to him by a young Venetian merchant, of rendering Gedda, the port of Mecca, an emporium for all the commerce of India; and even imagined he should be able to make the Europeans abandon the passage to the Indies by the Cape of Good Hope. With this view, he fitted out some vessels at Suez: and manning them with Mamelukes, commanded the bey Hassan to sail with them to Gedda, and seize upon it, while a body of cavalry under Mohammed Bey advanced against the town. Both these commissions were executed according to his wish, and Ali became quite intoxicated with his success. Nothing but ideas of conquest now occupied his mind, without considering the immense disproportion between his own force and that of the grand seignior. Circumstances were then indeed very favorable to his schemes. The sheik Daher was in rebellion against the Porte in Syria; and the pacha of Damascus had so exasperated the people by his extortions, that they were ready for a revolt. Having therefore made the necessary preparations, Ali Bey despatched, in 1770, about 500 Mamelukes to take possession of Gaza, and thus secure an entrance into Palestine. Osman the pacha of Damascus, however, no sooner heard of the invasion than he prepared for war, while the troops of Ali Bey held themselves in readiness to fly on the first attack. Sheik Daher hastened to their assistance, while Osman fled without even offering to make the least resistance; thus leaving the enemy masters of all Palestine. About the end of February, 1771, the grand army of Ali Bey arrived: which was supposed to consist of 60,000 men. M. Volney allows that there might be two thirds of that number, who were classed as follows: 5000 Mamelukes, constituting the whole effective part of the army; 15,000 Arabs from Barbary on foot, constituting the whole infantry of the army. Besides these, the servants of the Mamelukes, each of whom had two, would constitute a body of 10,000 men. A number of other servants would constitute a body of about 2000; and the rest of the number would be made up by sutlers and other usual attendants on armies. It was commanded by Mohammed Bey, the friend of Ali. 'But,' says M. Volney, 'as to order and discipline, these must not be mentioned.'

The armies of the Turks and Mamelukes are nothing but a confused multitude of horsemen without uniforms, on horses of all colors and sizes, without either keeping their ranks or observing any regular order.' This rabble took the road to Acre, leaving wherever they passed sufficient marks of their rapacity and want of discipline. At Acre a junction was formed with the troops of sheik Daher, consisting of 1500 Safadians, the name of sheik Daher's subjects, from Safad, a village of Galilee, originally under his jurisdiction. These were on horseback, and accompanied by 1200 Mutualis cavalry, under the command of sheik Nasif, and about 1000 Mogrebian infantry. Thus they proceeded towards Damascus, while Osman prepared to oppose them by another army equally numerous and ill regulated. 'The Asiatics,' says M. Volney, 'are unacquainted with the elements of war. Their armies are mere mobs, their marches, ravages, their campaigns inroads, and their battles bloody frays. The strongest or most adventurous party goes in quest of the other, which frequently flies without making any resistance. If they stand their ground they engage pell mell, discharge their carbines, break their spears, and hack each other with their sabres; for they have seldom any cannon, and when they have, they are but of little service. A panic frequently diffuses itself without cause; one party flies, the other shouts victory; the vanquished submit to the will of the conqueror, and the campaign often terminates without a battle. Such, great measure, were the military operations in Syria in 1771. The combined army of Ali Bey and sheik Daher marched to Damascus. The pachas waited for them; they approached, and, on the 6th of June, a decisive action took place: the Mamelukes and Safadians rushed on the Turks with such fury, that, terrified at their courage, they immediately took flight, and the pachas were not the last in endeavouring to make their escape. The allies became masters of the country, and took possession of the city without opposition, there being neither walls nor soldiers to defend it. The castle alone resisted. Its ruinous fortifications had not a single cannon, much less gunners; but it was surrounded by a muddy ditch, and behind the ruins were posted a few musqueteers; and these alone were sufficient to check this army of cavalry.—As the besieged, however, were already conquered by their fears, they capitulated the third day, and the place was to be surrendered next morning, when, at day-break, a most extraordinary revolution took place.' This was no less than the defection of Mohammed Bey himself, whom Osman had gained over in a conference during the night. At the moment, therefore, that the signal of surrender was expected, this treacherous general sounded a retreat, and turned towards Egypt with all his cavalry, flying with as great precipitation as if he had been pursued by a superior army. Mohammed continued his march with such celerity, that the report of his arrival in Egypt reached Cairo only six hours before him. Thus Ali Bey found himself at once deprived of all his expectations of conquest; and, what was worse, found a traitor whom he durst not punish at the head

of his forces. A sudden reverse of fortune now took place. Several vessels laden with corn for Sheik Daher were taken by a Russian privateer; and Mohammed Bey, whom he designed to have put to death, not only made his escape, but was so well attended, that he could not be attacked. His followers continuing daily to increase in number, Mohammed soon became sufficiently strong to march towards Cairo; and, in April 1772, having defeated the troops of Ali in a rencontre, entered the city sword in hand, while the latter had scarce time to make his escape with 800 Mamelukes. With difficulty he was enabled to get to Syria by the assistance of Sheik Daher, whom he immediately joined with the troops he had with him. The Turks under Osman were at that time besieging Sidon, but raised the siege at the approach of the allied army, consisting of about 7000 cavalry. Though the Turkish army was at least three times their number, the allies did not hesitate to attack them, and gained a complete victory. Their affairs now began to wear a more favorable aspect; but the military operations were retarded by the siege of Yafa, which had revolted, and though defended only by a garden wall, without any ditch, held out for eight months. In the beginning of 1773 it capitulated, and Ali Bey began to think of returning to Cairo. For this purpose Sheik Daher had promised him succours; and the Russians, with whom he had now contracted an alliance, made him a similar promise. Ali, however, ruined every thing by his own impatience. Deceived by an astrologer, who pretended that the auspicious moment when he was highly favored by the stars was just arrived, he set out without waiting for the arrival of his allies. He was also farther deceived by a stratagem of Mohammed, who had by force extorted from the friends of Ali Bey letters pressing his return to Cairo, where the people were weary of his ungrateful slave, and wanted only his presence in order to expel him. Ali Bey accordingly set out with his Mamelukes and 1500 Safadians given him by Daher; but no sooner entered the desert which separates Gaza from Egypt, than he was attacked by a body of 1000 chosen Mamelukes who were lying in wait for his arrival. They were commanded by a young Bey, named Mourad; who, being enamoured of the wife of Ali Bey, had obtained a promise of her from Mohammed, in case he could bring him her husband's head. As soon as Mourad perceived the dust by which the approach of Ali Bey's army was announced, he rushed upon him, attacked and took prisoner Ali Bey himself, after wounding him in the forehead with a sabre. Being conducted to Mohammed Bey, the latter pretended to treat him with extraordinary respect, and ordered a magnificent tent to be erected for him; but in three days he was found dead of his wounds, as was given out; though some affirm, with equal probability, that he was poisoned. After the death of Ali Bey, Mohammed took upon him the supreme dignity; but this change of masters proved of very little service to the Egyptians. At first he pretended to be only the defender of the rights of the sultan, remitted the usual tribute to Constantinople, and took the customary oath

of unlimited obedience; after which he solicited permission to make war upon Sheik Daher, the ally of Ali Bey. The reason of this request was a mere personal pique; and, as soon as it was granted, he made the most diligent preparations for war. Having procured an extraordinary train of artillery, he provided foreign gunners, and gave the command of them to an Englishman, named Robinson. He brought from Suez a cannon sixteen feet long, which had for a considerable time remained useless; and at length, in February 1776, he appeared in Syria with an army equal to that which he had formerly commanded under Ali Bey. Daher's forces, despairing of being able to cope with such a formidable armament, abandoned Gaza, of which Mohammed immediately took possession, and then marched towards Yafa. The history of this siege M. Volney gives as a specimen of the Asiatic manner of conducting operations of the kind. 'Yafa,' says he, 'the ancient Joppa, is situated on a part of the coast, the general level of which is very little above the sea. The city is built on an eminence, in the form of a sugar-loaf, in height about 130 feet perpendicular. The houses, distributed on the declivity, appear rising above each other, like the steps of an amphitheatre. On the summit is a small citadel, which commands the town; the bottom of the hill is surrounded by a wall without a rampart, of twelve or fourteen feet high, and two or three in thickness. The battlements on the top are the only tokens by which it is distinguished from a common garden wall. This wall, which has no ditch, is environed by gardens, where lemons, oranges, and citrons grow in this light soil to a most prodigious size. The city was defended by 500 or 600 Safadians and as many inhabitants, who, at the sight of the enemy, armed themselves with their sabres and muskets; they had likewise a few brass cannon, twenty-four pounders, without carriages; these they mounted as well as they could, on timbers prepared in a hurry: and, supplying the place of experience by hatred and courage, they replied to the summons of the enemy with menaces and cannon shot. Mohammed, finding he must have recourse to force, formed his camp before the town; but was so little acquainted with the business that he advanced within half cannon-shot. The bullets, which showered upon the tents, apprising him of his error, he retreated; and, by making a fresh experiment, was convinced he was still too near. At length he discovered the proper distance, and set up his tent, in which the most extravagant luxury was displayed: around it, without any order, were pitched those of the Mamelukes, while the Barbary Arabs formed huts with the trunks and branches of the orange and lemon trees, and the followers of the army arranged themselves as they could: a few guards were distributed here and there; and, without making a single entrenchment, they called themselves encamped. Batteries were now to be erected, and a spot of rising ground was made choice of to the south-east of the town, where, behind some garden walls, pieces of cannon were pointed, at 200 paces from the town, and the firing began, notwithstanding the musquetry of the enemy, who,

from the tops of the terraces, killed several of the gunners. It is evident that a wall only three feet thick, and without a rampart, must soon have a large breach in it; and the question was not how to mount, but how to get through it. The Mamelukes were for doing it on horseback: but they were told that this was impossible; and they consented, for the first time, to march on foot. It must have been a curious sight to see them, with their huge breeches of thick Venetian cloth, embarrassed with their tucked up beniches, their crooked sabres in hand, and pistols hanging to their sides, advancing and tumbling among the ruins of the wall. They imagined that they had conquered every difficulty when this obstacle was surmounted; but the besieged, who formed a better judgment, waited till they arrived at the empty space between the city and the wall; where they assailed them from the terraces and windows of the houses with such a shower of bullets, that the Mamelukes did not so much as think of setting them on fire, but retired under a persuasion that the breach was utterly impracticable, since it was impossible to enter it on horseback. Mourad Bey brought them several times back to the charge, but in vain. Six weeks passed in this manner; and Mohammed was distracted with rage, anxiety, and despair. The besieged, however, whose numbers were diminished by the repeated attacks, became weary of defending alone the cause of Daher. Some persons began to treat with the enemy; and it was proposed to abandon the place, on the Egyptians giving hostages. Conditions were agreed upon, and the treaty might be considered as concluded, when, in the midst of the security occasioned by this belief, some Mamelukes entered the town; numbers of others followed their example, and attempted to plunder. The inhabitants defended themselves, and the attack recommenced: the whole army then rushed into the town, which suffered all the horrors of war; women and children, young and old men, were all cut to pieces, and Mohammed, equally mean and barbarous, caused a pyramid formed of the heads of these unfortunate sufferers to be raised as a monument of his victory.' By this disaster the greatest terror and consternation were every where diffused. Sheik Daher himself fled, and Mohammed soon became master of Acre also. Here he behaved with his usual cruelty, and abandoned the city to be plundered by his soldiers. The French merchants claimed an exemption, and it was procured with the utmost difficulty; nor was even this likely to be of any consequence; for Mohammed, informed that the treasures of Ibrahim, Kiaya of Daher, had been deposited in that place, made an immediate demand of them, threatening every one of the merchants with death if the treasures were not instantly produced. A day was appointed for making the research; but, before this came, the tyrant himself died of a malignant fever after two days illness. His death was no sooner known than the army made a precipitate retreat. Sheik Daher continued his rebellion for some time, but was at last entirely defeated, and his head sent to Constantinople by Hassan Pacha the Turkish high admiral. The death of Mohammed was no

sooner known in Egypt, than Mourad Bey hastened to Cairo in order to dispute the sovereignty with Ibrahim Bey, who had been entrusted with the government on his departure from that place for Syria. Preparations for war were made on both sides; but at last both parties, finding that the contest must be attended with great difficulty, as well as very uncertain in the event, came to an accommodation, by which it was agreed that Ibrahim should retain the title of Sheik El Beled, and the power should be divided between them. But now the beys and others who had been promoted by Ali Bey, perceiving their own importance totally annihilated by this new faction, resolved to shake off the yoke, and therefore united in a league under the title of the House of Ali Bey. They conducted their matters with so much silence and dexterity, that both Mourad and Ibrahim were obliged to abandon Cairo. In a short time, however, they returned and defeated their enemies though three times their number; but, notwithstanding this success, it was not in their power totally to suppress the party. This indeed was owing entirely to their unskilfulness in the art of war, and their operations for some time were very trifling. At last, a new combination having been formed among the beys, five of them were sentenced to banishment in the Delta. They pretended to comply with this order, but took the road of the desert of the Pyramids, through which they were pursued for three days to no purpose. Arriving safe at Miniah, a village situated on the Nile, four leagues above Cairo, they took up their residence, and, being masters of the river, soon reduced Cairo to distress by intercepting its provisions. Thus a new expedition became necessary, and Ibrahim took the command of it upon himself. In October, 1783, he set out with an army of 3000 cavalry; the two armies soon came in sight of each other, but Ibrahim thought proper to terminate the affairs by negotiation. This gave such offence to Mourad, who suspected some plot against himself, that he left Cairo. A war betwixt the two rivals was now daily expected, and the armies continued for twenty-five days in sight of each other, only separated by the river. Negotiations took place; and the five exiled beys finding themselves abandoned by Mourad, took to flight, but were pursued and brought back to Cairo. Peace seemed now to be re-established; but, the jealousy of the two rivals producing new intrigues, Mourad was once more obliged to quit Cairo in 1784. Forming his camp, however, directly at the gates of the city, he appeared so terrible to Ibrahim, that the latter thought proper in his turn to retire to the desert, where he remained till March 1785. A new treaty then took place; by which the rivals agreed to share the power between them. From that time, we have no accounts of any remarkable transaction in Egypt till the French invaded that country in 1798; and of this, with the events that followed, we shall now take a brief survey.

Among all the powers which the conduct of the French republicans brought against them, Great Britain was the most formidable; the rulers of France, therefore, made her humiliation

leading object in all their designs; and they were most likely to effect this by the destruction of her commerce. The French then looked forward, through Egypt, to the subjugation of the East Indies; and, to execute this daring and desperate undertaking, Buonaparte was appointed commander in chief of the army of the East. In this station he accordingly embarked at Toulon with about 35,000 men, and after stopping at Malta, which he plundered, he pursued his voyage for the coast of Egypt, where he arrived on the 1st of July 1798. The army disembarked the same night, and on the 2nd they reached Alexandria, which was taken by assault on the evening of the 5th. From Alexandria the French marched for Cairo, in the course of which they had several skirmishes with the Mamelukes; but arrived on the 20th within six miles of Grand Cairo, which surrendered on the 23d of the same month. On the 25th the French general attacked one of the enemy's posts at Lambabe, in which about 300 of the enemy fell; but this was only a prelude to the battle of the Pyramids, which took place on the 26th, and from the issue of which the French appeared masters of Egypt. Of about 10,000 Mamelukes, 1000 were killed, 1000 drowned, and the rest fled, many of them wounded: 400 camels loaded with baggage, 300 horses richly accoutred, and fifty pieces of artillery, fell into the hands of the conquerors. But though the good fortune of Buonaparte seemed thus far to have followed him in Egypt, he soon experienced a reverse of an irreparable nature. This was no less than the destruction of his fleet: an event so disastrous to him, he appeared to have no suspicion of, and its effects, heightened by the disappointment he met with at Acre, were displayed in his future desperate conduct. After the surrender of Cairo, Buonaparte formed his army into three divisions, one of which, under Desaix, he destined for Upper Egypt, to pursue the flying Mamelukes; another he appointed for the defence of Cairo, while he marched himself, at the head of the third, in pursuit of Ibrahim Bey, who had taken his route towards Syria with a valuable caravan. In order, however, to oppose and prevent the execution of Buonaparte's designs in Egypt, the British government entered into an alliance with the Porte, and a plan was concerted betwixt them, the chief preparations for the accomplishment of which were made in Syria, under the superintendence of the pacha Djezzar. An army from Asia Minor was to make an attack upon the frontiers of Egypt towards Syria, while its operations were to be favored by making a powerful diversion towards the mouths of the Nile, as well as by different assaults to be made in Upper Egypt, with the remains of Mourad Bey's army. Sir Sidney Smith sailed from Portsmouth to direct the execution of this extensive plan, and to co-operate, as much as possible, towards its success, with the maritime force under his command. Care was taken, in the mean time, to block up the harbour of Alexandria with four ships of the line and five frigates, under the command of commodore Hood, who, without the assistance of a land force sufficient to attack Alexandria, found it impracticable to burn or destroy the French fleet

of transports. The report that the French vessels in the old port were burnt, he also found to be groundless; and he had made no use of the light vessels sent him by the combined fleet of Turks and Russians. Buonaparte, understanding what was going on, quickly formed the design of leaving Egypt, and of marching into Syria, for the purpose of destroying the preparations of the pacha Djezzar, and of disconcerting the plans of Sir Sidney Smith; but the result of this enterprise proved the reverse of the hero's expectations. Jaffa, the ancient Joppa, did not surrender till it had made an obstinate defence, and even then it was only to the superiority of European tactics. From Jaffa the hitherto triumphant general marched his army, in three divisions, against St. Jean d'Acre; but here he was obliged to stop, for the pacha, encouraged and supported by Sir Sidney Smith, baffled all his attempts upon the place, during a siege of about two months; and, after the loss of nearly the half of his army, he was forced to return to Egypt. Perhaps, however, the ultimate cause of Buonaparte's mortification at Acre, was the interception of his heavy artillery by the British, on their way from Damietta and Rosetta. The French troops reached Grand Cairo in twenty-six days after raising the siege of Acre; yet, in the course of this rapid march, they ravaged the whole country, burnt the harvests, destroyed the defences of the different ports, the magazines, and every thing that could be of avail to the Turks in approaching the frontiers of Egypt. In the mean time Sir Sidney Smith, with the greatest promptitude, had continued the execution of the remaining parts of the plan of operations against the French in Egypt, in which he was seconded by the increasing zeal of the Turks. Seid Mustapha Pacha had assembled, at the different ports in the island of Rhodes, the troops which were to attack Alexandria, under the conduct of European officers; and the combined fleet of Turkey and Britain were to sail for Egypt as soon as a convoy, to be sent by the captain pacha, then lying at anchor in the Dardanelles, should arrive at Rhodes. Buonaparte, on his part, was no less active: after subduing, in a great measure, a spirit of rebellion which had been industriously raised in the minds of the inhabitants in his absence, he turned his attention to the re-organisation of his army, which had suffered severely in the expedition to Syria; and so assiduous was he in this matter, that his troops were fit for action in about three weeks. But when in the neighbourhood of the Pyramids, intending to pursue Mourad Bey in his retreat to Fayoum, intelligence was brought him from Alexandria, that a Turkish fleet of 100 ships had anchored in the bay of Aboukir, from which 3000 troops had landed, and taken the fort of Aboukir by assault, and massacred the garrison of 500 men. He accordingly directed his officers to lead their forces towards the place of landing, and appointed the first rendezvous of the army to be at Ramanieh, on the left bank of the Nile. General Murat, with the advanced guard under him, took the route to Gizeh, and the moveable column under general Menou, together with the park of artillery and the staff, formed a junction at Ramanieh on the 20th of

July. The army afterwards assembled at the wells between Aboukir and Alexandria, at the latter of which places Buonaparte fixed his headquarters. The Turkish army was about 18,000 strong, but divided into two parts, and encamped on the opposite sides of a beautiful plain. When the French general came in sight of it, he immediately formed his columns for attack. General d'Estaing, with a body of infantry, carried the entrenched height of the enemy, which supported their right, at the point of the bayonet, while general Murat, with a body of cavalry, advancing rapidly into the centre of the Turkish army, prevented the junction of its different parts, and cut off their retreat; and, by these manœuvres, 2000 men were partly consigned to a watery grave, and partly killed by the republicans. The left division was next attacked, which made a more obstinate stand; but, by a variety of skilful movements, the whole were at last, though with considerable loss to the French, thrown into confusion, and obliged to fly; and the greatest part, thinking to reach their ships, perished in the sea. The fort of Aboukir was next summoned to surrender, but the Turks, having no idea of capitulating with arms in their hands, defended it with desperate fury; and, though general Menou besieged it in form, they did not yield till he had bombarded it for eight days, and reduced it almost to a heap of ruins. At last the pacha's son and 2000 men laid down their arms, and were made prisoners of war; and, in the fort, the French found 1800 men killed, and 300 wounded. This woeful reverse of fortune on the part of the Turks was beheld, it is said, by Sir Sidney Smith, while he had it not in his power to contribute in any manner, as at Acre, towards preventing it. After the surrender of the fort of Aboukir, Buonaparte returned to Alexandria, where he received intelligence of the dismal situation of French affairs in Europe, particularly in Italy and on the Rhine, and the convulsed state of the interior of France; upon which he resolved to leave Egypt and return home, doubtless full of the idea of attaining to that sovereignty which he afterwards reached. Admiral Gauthcaume was ordered to fit out two frigates with the utmost expedition, but was not informed of their destination. His future designs were known only to general Berthier, whom alone he made his confidential friend; though he brought with him generals Lasnes, Marmont, Murat, and Andreossi; as also Monge and Berthollet of the institute. Bessiers and his guides received sealed notes, not to be opened till a certain day and hour, and at a particular point of the sea shore; which were found to contain orders for immediate embarkation. Another packet, to be opened on the day after the sailing of the frigates, nominated general Kleber to the chief command, and Dessaix to that of Upper Egypt. From general Kleber's despatches, after the departure of Buonaparte, it appears that Mourad Bey, having passed down the Nile to El-Ganayur, was repulsed by a division of the army of Upper Egypt, commanded by general Morand. Having overtaken him in his flight, they surprised his camp at Samahout, killed a vast number of the Mamelukes, took 200 camels with spoils, 100 horses, and an immense

quantity of military implements: Mourad himself escaping with difficulty, and being obliged to wander through the inhospitable deserts of Upper Egypt in quest of an asylum, and the necessities of life. This man having been a steady and formidable opponent to the French, Desaix determined, if possible, to cut him off, and, for this purpose, he quickly organised two columns of infantry, mounted on dromedaries, taking the command of one himself, and giving the other to adjutant-general Boyer, who came up with Mourad in the desert of Sedinan on the 19th of October, after a forced march of three days. Here a desperate conflict ensued, in which the Mamelukes seemed determined to get possession of the dromedaries, but the republicans soon put them to flight and pursued them back to the deserts. A Turkish fleet of eighteen sail had come to anchor before Damietta on the 24th September, which, by the end of October, was increased to fifty-three sail, with Sir Sidney Smith on board the *Tyger* as naval commander. From this fleet, on the 1st November, about 4000 Turks were landed, who were quickly attacked by general Verdier at the head of 1000 men; and however unequal the contest would seem, the Turks, it is said, lost no fewer than 3000 men killed, 800 prisoners, including Ismael Bey the second in command, thirty-two stand of colors, and five pieces of cannon. This was succeeded by a number of battles of less note, in which the success of the French was various; and they appeared willing to evacuate Egypt upon certain conditions, which were signed at El-Arish by general Kleber and Sir Sidney Smith. These, however, were afterwards rejected, through a species of policy not easily accounted for, and fresh obstacles started against the evacuation proposed; which, in the opinion of some, was an object much to be desired by the remains of the army of the east, while the republicans refused that there was any occasion for such a measure, holding out that they had still 20,000 effective men in that quarter of the globe, sharing liberally in the affections of the inhabitants. Hostilities were accordingly renewed, and the gallant general Kleber, though now in unfavorable circumstances, after defeating the Turks with far inferior numbers, took Cairo by storm, and formed an alliance with Mourad Bey; but was afterwards treacherously assassinated by a janissary, while presenting the commander with a memorial for his perusal. Upon this, after some other generals, particularly Reynier, had declined the chief command, it was accepted of by Menou; which, as a variance had subsisted between him and Kleber, raised suspicions that he had hired the assassin; but the dying assertions of the murderer, who was impaled alive, his right hand burnt off, and his body left to be devoured by birds of prey, demonstrated these to be groundless. Three sheiks who were in the secret of the assassin's designs, but revealed nothing of the matter, were beheaded. Sir Sidney Smith sent lieutenant Wright to Cairo with proposals to general Menou respecting the evacuation of Egypt; and the general's answer was anxiously expected by the combined powers, as the grand vizier was resolved to march against the enemy

with 30,000 men, if he did not listen to the proposals. They were soon given to understand that he would hearken to no overtures of accommodation which they could make; for he had resolved to advance against Syria with the principal part of his army. This was an enterprise in which Buonaparte had failed, when opposed by Sir Sidney Smith: but Menou had lately been joined by a number of the Beys, with a view of securing their independence, having been alarmed with the idea that the sublime Porte was determined to subdue Egypt and destroy the Mamelukes: among others, the junction of Mourad Bey was of considerable importance to Menou, on this occasion. Alexandria, Damietta, and Rosetta, were strongly fortified by Menou, who also finished the lines begun by colonel Bromley at Aboukir, making several important additions; every place was put in such a state of defence, as appeared to defy any attack from the Turks. Great Britain, in the mean time, had determined on compelling the French troops to evacuate Egypt, that all apprehensions might be quieted respecting the East Indies from that quarter; and, with this view, an army was organised for the invasion of Egypt, the command of which was given to one of the most eminent and worthy officers of the brilliant age in which he lived, general Sir Ralph Abercromby. The ships with the troops anchored in the bay of Aboukir on the 2nd of March, but on account of the unfavorableness of the weather they did not begin to disembark till the morning of the 8th. In order to oppose the landing of the British forces, about 4000 of the French had marched from Alexandria, and taken their station on the heights of Aboukir; thus an action soon took place between the hostile armies, but after about two hours fighting the republicans retreated, and they were pursued to the walls of Alexandria. Passing over the skirmishing occurrences of the few following days, an action of the utmost moment took place on the 21st of March, when the French advanced with their whole force, amounting to 11,000 men, and attacked the British, about four miles from Alexandria, two hours before day-break. They commenced by a false attack on the left of the British army, but were still more desirous to have turned the right of their opponents, which they attempted in vain. Nor were they more successful in their attack upon the central division. The conflict, however, was obstinate and bloody; and though the French were completely defeated, with the loss of 3000 men killed and wounded (among whom were three generals; Roize, who was left dead on the field, and Lanusse and Rodet, who both died of their wounds soon after), this was not effected without considerable loss on the part of the British, who had soon to lament the death of their illustrious commander. The brave general Abercromby was mortally wounded early in the action, but continued delivering his orders with that coolness and perspicuity which ever distinguished him. His situation was not known till after the battle, when, having fainted with loss of blood, he was carried on board lord Keith's ship, where he died eight days after the

engagement, in which, like Epaminondas, and like Wolfe, he lost his life, after having led on his soldiers to a glorious victory.' Had it not been for the inferiority of the British cavalry (the wretched horses they were obliged to purchase at Marmorice Bay) to that of the enemy, whose retreat was also covered with cannon on the top of the hills, British valor would have this day completed the purpose for which it was displayed in this quarter. But general (since lord) Hutchinson, succeeding the gallant Abercromby as commander in chief of the British forces, was now to direct them to the expulsion or the excision of the French. The town and castle of Rosetta were taken by a division of the British army under colonel Spencer, aided by a body of the Turks; and early in May a strong detachment was sent against Cairo. On the 19th of the same month the French were attacked near Ramanich, by a body of the Turks assisted by the British when they were repulsed, and obliged to retire towards Cairo; and about the middle of June the city of Cairo was invested on all sides by the united forces of the British and the grand vizier. On the 22nd of June the garrison of Cairo sent a flag of truce to the British general, and, after a negotiation of several days, a convention was agreed to, by which the French troops at Cairo and its dependencies were to be conveyed in ships of the allied powers, and at their expense, together with their baggage, arms, ammunition, and effects, to the nearest French ports in the Mediterranean. Alexandria held out some time longer, and Menou had resolved on defending it to the last, but he was soon obliged to surrender, upon the conditions of the convention of Cairo, for himself and the army under his command; and thus the whole of Egypt was left in the possession of the allies. After the evacuation of Egypt, by the French, the English endeavoured to effect a reconciliation between the Mamelukes and the Turks, to restore the former government of the country: but the Turks treacherously assassinating a number of the beys, the remainder fled into Upper Egypt, and the Porte, being unable to subdue them, concluded a treaty with them, allowing them the possession of that part of the country. In consequence, however, of mutinies and intestine contentions among the Turkish troops, the Mamelukes soon returned into Lower Egypt, making the country a scene of anarchy and confusion, alternately ravaged by the contending parties. A small body of British troops, under the command of general Fraser, again landed on the coast of Egypt, on the 17th of March 1807, to whom the town and fortress of Alexandria surrendered on the 21st of the same month, though they were afterwards unfortunate; but as this enterprise took place in consequence of a rupture betwixt Britain and the Ottoman Porte, through the ascendancy of the French ambassador in the Turkish councils, it will fall more properly to be noticed under the article *TURKEY*.

At this period Mohammed Aly, the present pacha of Egypt, had recently been invested with that authority. He is a singular despot who, beginning his career in blood (for in the year

1811 he invited the Mamelukes to Cairo, and butchered them all in the citadel) has materially improved the resources of this fine country, and seems to be rapidly assimilating it to its ancient fruitfulness and prosperity. Cairo was sacked at this time by his troops, and every Mameluke in the provinces was put to death. It is said, in extenuation of this massacre, that he had received orders from Constantinople to exterminate this corps, who had at all times been troublesome, and who might take advantage of the absence of the pacha's army, a great part of which was required in Arabia for the subjugation of the Wahabees. He knew, too, that the beys were in correspondence with his enemies. Mohammed, however, could not but be gratified at the reception of such an order, the execution of which would rid him of doubtful friends and powerful enemies; and so little compunction did he feel on the occasion, that, we are told by M. Mengin, on being informed that he was reproached by all travellers in their narratives, for this treacherous and inhuman massacre, he replied that he would have a picture of it painted, together with one of the death of the duc d'Enghien, and leave posterity to judge which was the more barbarous.

Mohammed now turned his attention to the state of the war carrying on in Arabia against the Wahabees. His son, whom he left in command, had taken from them the city of Medina, the keys of which the pacha sent the Porte, with large presents of coffee, money, and jewels. He now also thought it time to pay his devotions at the shrine of Mecca. At Jeddah he was received with all kindness and hospitality by the shereer Ghaleb; in return for which, either through avarice, as some think, or, as others say, on discovery that the shereef was acting a double part, he secretly ordered his son Toussoun to seize and convey him to Cairo; while he plundered his palace of immense treasures, a part of which he applied to the support of the army, and, as usual, shared a part with his master, the Porte.

The pacha then entered upon one of his favorite projects, that of training his troops after the European system. This occasioned, in the first instance, a general conspiracy of the agas and chiefs against his authority, and the conspirators broke at once into the city, plundering the bazaars and spreading universal terror: the pacha with some difficulty quelled this revolt, and, remunerating the inhabitants of Cairo, suspended the execution of his scheme. His son, Ibrahim Pacha, having succeeded in completely subduing the Wahabees, to signalise the event he assembled the whole of the pilgrims from Egypt and Syria on Mount Arafat, where with great solemnity, and in conformity with a vow which he had made in case of success, he sacrificed 3000 sheep, and largely distributed alms in Mecca; he then departed for Cairo, and on his arrival received the honors of a triumph. On this occasion Mohammed also received rich presents from the grand signior, and compliments on his splendid victories.

The viceroy was now at liberty to turn his attention to the south, and to bring the whole

country on each side of the Nile, as far as Sennaar, under his subjection, and for this purpose he sent an army, under his youngest son Ismael. Of the activity and rapid progress of this young officer, his humanity and traits of generosity towards his prisoners and the conquered inhabitants, several instances are recorded. One single act of severity, however, proved fatal to him. He had ordered, when at Sennaar, one of the chiefs of that country to be hastinadoed, who seized the first favorable occasion to avenge himself. Ismael had gone to a village at some little distance from Sennaar, with a small guard of forty men; the chief, with a party, followed him thither, and, surprising his lodgings by night, stabbed him to the heart with a poniard, and most of his guards fell in the scuffle.

One of the objects of this expedition was that of recruiting his army with the blacks of Sennaar, Shendy, Kordofan, and the neighbouring countries, which was accomplished to the number of from 16,000 to 18,000 men. These unhappy beings were all of them, in the first place, vaccinated, and were then instructed in manual exercise and military evolutions, in the European mode, by some French officers. The hopes of the pacha, however, were greatly disappointed in these black troops. They were strong able-bodied men, and not averse from being taught; but when attacked by disease, which soon broke out in the camp, they died like sheep infected with the rot; such was the dreadful mortality that ensued, that, out of 18,000 of these unfortunate men, 3000 did not remain alive at the end of two years.

He now had recourse to a regular conscription of the Arabs or Fellahs, of whom he seized about 30,000 indiscriminately, and had them conveyed to Upper Egypt under a military guard. These, with the remains of the black slaves, a few Berbers, and the Mameluke officers, compose the pacha's present army. Twelve Europeans, chiefly Italians, were employed as instructors; at their head is placed colonel Léve, formerly aid-de-camp to Marshall Ney. A new conscription took place in 1814, of 15,000 more, it being the intention of Mohammed Aly to keep up an army of 40,000 men, one battalion of which is to be stationed at Alexandria, to be trained as marines for his navy, which is to consist of forty vessels of different rates, the seamen being entirely Arabs. His adoption of European tactics has been thought by some travellers to be preparatory to throwing off his allegiance to the Porte, to whom it is supposed he has given irreparable offence by his former protection of the Greeks: he has lately, however, made the amende honorable, we presume, by his expedition against the Greeks; and his presents to the Porte have been splendid and constant.

We again advert to the statistical and other peculiarities of this interesting country, with a view to furnishing the reader with the latest information of travellers on these points.

The river Nile, when swelled by the rains which fall in Abyssinia, begins to rise in Egypt about the month of May; but the increase is inconsiderable till towards the end of June, when

it is proclaimed by a public crier through the streets of Cairo. About this time it has usually risen five or six cubits; and, when it has risen to sixteen, great rejoicings are made, and people cry out Waffah Allah, i. e. God has given abundance. This commonly takes place about the end of July, or before the 20th of August; and the sooner it takes place, so much the greater are the hopes of a good crop. Sometimes, though rarely, the necessary increase does not take place till later. In 1705 it did not swell to sixteen cubits till the 19th of September, the consequence of which was, that the country was depopulated by famine and pestilence. We may easily imagine, that the Nile cannot overflow the whole country of itself, in such a manner as to render it fertile. There are, therefore, innumerable canals cut from it across the country, by which the water is conveyed to distant places, and almost every town and village has one of these canals. In those parts of the country which the inundation does not reach, and where more water is required than it can furnish, as for watering of gardens, &c., they have recourse to artificial means for raising it from the river. Formerly they made use of Archimedes's screw, but now, in place of it, they have the Persian wheel. This is a large wheel turned by oxen, having a rope hung with several buckets which fill as it goes round, and empty into a cistern at the top. Where the banks of the river are high, they frequently make a basin in the side of them, near which they fix an upright pole, and another with an axle across the top of that, at one end of which they hang a great stone, and at the other a leathern bucket; this bucket, being drawn down into the river by two men, is raised by the descent of the stone, and emptied into a cistern placed at a proper height. This kind of machine is used chiefly in the upper parts of the country, where the raising of water is more difficult than in places near the sea. When any of their gardens or plantations want water, it is conveyed from the cisterns into little trenches, and from thence conducted all round the beds in various rills, which the gardener easily stops by raising the mould against them with his foot, and diverts the current another way as he sees occasion. The rise of the inundation is measured by an instrument adapted for the purpose, called mikeas, which we translate nilometer. It is a round tower near Cairo, with an apartment, in the middle of which is a cistern neatly lined with marble. The bottom of this cistern reaches to that of the river, and there is a large opening by which the water has free access to the inside. The rise of the water is indicated by an octagonal column of blue and white marble, on which are marked twenty cubits of twenty-two inches each. The two lowermost have no subdivisions, but each of the rest is divided into twenty-four parts, called digits; the whole height of the pillar being thirty-six feet eight inches. When the river has attained its proper height, all the canals are opened, and the whole country laid under water. During the time of the inundation a certain vertical motion of the waters takes place; but, notwithstanding this, the Nile is so easily managed, that many fields

lower than the surface of its waters are preserved from injury merely by a dam of moistened earth, not more than eight or ten inches in thickness. This method is used particularly in the Delta when it is threatened with a flood. As the Nile does not always rise to a height sufficient for the purposes of agriculture, the former sovereigns of Egypt were at vast pains to cut proper canals to supply the deficiency. Those which convey the water to Cairo, into the province of Fayoom, and to Alexandria, have always been best taken care of by the government.

The lands inundated by the Nile, as we have observed, are exceedingly fertile; and though they have successively from year to year, without intermission, borne one and frequently two crops, and without any rational system of invigoration by manure or otherwise, for more than 3000 years, they still continue to do the same without any perceptible impoverishment, and without any further tillage than the adventitious top-dressing of black slimy mould, by the overflowing of the river. But the productiveness of the soil, where the inundation does not reach, has been greatly over-rated. The crops of wheat in particular are scanty, not above five or six for one; but for maize and dourra, or millet, the soil appears to be peculiarly adapted; and these two species of grain, with rice, lentils, and various kinds of pulse, constituting the principal food of nine-tenths of the inhabitants, allowed the government, who usurped the monopoly, to export the greater part of the wheat produced. Since the peace of Europe, however, this branch of commerce has nearly ceased, in consequence of the increased cultivation of that grain in other countries. At one period not less than 800 or 900 European vessels annually sailed from Alexandria, for Marseilles, Genoa, Leghorn, Trieste, Malta, and Constantinople, freighted with articles of raw produce in exchange for hard money or for the manufactures of those respective countries; while two or three cargoes were all that could be got together for England. But, in the year 1821, an experiment was made by an English merchant, of a cargo of linseed for crushing; when it was found that, notwithstanding the freight (on account of the greater distance) doubled that which is paid from Russia, it would answer as a return for British exports, if relieved from the heavy quarantine duty, to which Baltic seed is not subject; this duty was accordingly mitigated by the lords of the treasury, and, in consequence, the exportation direct from Egypt to England increased last year to 25,000 quarters, and gave employment to more than twenty British ships. An article of the very first importance to the commerce and manufactures of England has recently been raised in Egypt, and to such an extent as to have surpassed all expectation. We allude to cotton wool, not of the usual coarse kind hitherto grown in Egypt, but of a very superior quality, raised from Brasil seed. The first essay was made by order of the pacha, in the year 1822, when the crop yielded about 25,000 bags, of two cwt. each. A few bags of this cotton, sent to Liverpool on

trial, were sold at the rate of from 11*d.* to 13*d.* per pound. Some thousand bales have, in the interval, been sent to France, Italy, and the South of Germany. In 1823 the crop was so abundant that, after supplying the demands of the countries bordering on the Mediterranean, it is calculated that at least 50,000 bags may be exported to England in the course of the present year; and the pacha is still extending the culture of this useful plant, on tracts of country long neglected, by clearing out the ancient canals and digging others, which communicate with the Nile; so that the crop of 1824 was expected to double that of the preceding, and in future years will, in all probability, equal the whole of what is now imported from America, to which it is by no means inferior. This new source of supply acquires additional importance from the consideration, that it will be brought to England in British shipping, and will lead to a material increase of our export trade to Egypt.

Mohammed has recently engaged himself in opening the ancient canals and digging new ones. Among these the canal of Malmoudiah is particularly deserving of notice, and connects the harbour of Alexandria with the Nile, at Fouah; by which the whole produce of Egypt can be brought without danger or interruption to the port of shipment. In the winter of 1817, when a scarcity of grain prevailed all over Europe, ships flocked to Egypt where there was abundance; but owing to the bar at the mouth of the Nile, near Rosetta, and the tempestuous weather along the coast, none of it could be conveyed in time to the vessels that were waiting at Alexandria, to the number of 300 sail, some of which ultimately departed with half cargoes, and others went away in ballast; thus the losses became incalculable, and the disputes endless. It was now that the advantages of a navigable canal were seen by the pacha, who accordingly set about the stupendous undertaking. All the laboring classes of Lower Egypt were put in requisition, and a month's pay advanced them to provide biscuit and provisions. To each village and district was marked out the work allotted to it. The Arabs were marched down in thousands and tens of thousands, under their respective chiefs, along the line of the intended canal; and, however exaggerated it may appear, we have the best authority for stating that the number employed at one time exceeded 250,000 men. In about six weeks the whole excavation was completed, and the people returned home to their respective occupations; but in the autumn a few thousands were called upon to face parts with masonry, and make the whole navigable for vessels of considerable burden. This work is about forty-eight miles in length, ninety feet in breadth, and from fifteen to eighteen feet in depth. It was opened with great pomp on the 7th of December 1819.

Until lately the arts and all kinds of learning were at a very low ebb among the Egyptians. Even the most simple of the mechanical professions are still in a state of infancy. The work of their cabinet-makers, gunsmiths, and locksmiths, is clumsy; and their manufactures of gunpowder and sugar, though much improved are

still indifferent. The only thing in which they can be said to have arrived at any degree of perfection, is the manufacture of silk stuffs; though even these are far less highly finished than those of Europe, and likewise bear a much higher price. One extraordinary art indeed is still extant among the Egyptians, and appears to have existed in that country from the most remote antiquity; a power of enchanting the most deadly serpents in such a manner, that they allow themselves to be handled, nay even hurt and wounded severely, without offering to bite the person who injures them. Those who have this art are named *PSYLLI*, or serpent charmers. But the pacha has introduced colleges and academies for the instruction of youth in foreign languages and mathematics; afforded toleration to all the European and other religious sects; and encouraged the practice of vaccination and the surgery and pharmacy of Europe.

Mr. Bruce gives a long account of the sources of the vast quantities of marble, met with in the remains of ancient buildings in this country; and which supplied in ancient times, we know, the materials of many of the public buildings of Italy. These he discovered during his journey from Kenne to Cosseir on the Red Sea, before he went to Abyssinia. At Hamra the Porphyry Mountains and quarries begin, the stone of which is at first soft and brittle; but the quantity is immense, as a whole day was taken up in passing by them. These Porphyry Mountains begin in the latitude of nearly 24° , and continue along the coast of the Red Sea to about $22^{\circ} 30'$, when they are succeeded by the marble mountains; these again by others of alabaster, and these last by basaltic mountains. From the marble mountains our author selected twelve kinds, of different colors, which he brought along with him. Some of the mountains appeared to be composed entirely of red and others of green marble, and by their different colors afforded an extraordinary spectacle. Not far from the Porphyry Mountains the cold was so great, that his camels died on his return from Abyssinia, though the thermometer stood no lower than 42° . Near Cosseir he discovered the quarries whence the ancients obtained those immense quantities of marble, with which they constructed so many wonderful works. The first place, where the marks of their operations were very perceptible, was a mountain much higher than any they had yet passed, and where the stone was so hard that it did not yield to the stroke of a hammer. In this quarry he observed that some channels for conveying water terminated; which, according to him, shows that water was one of the means by which these hard stones were cut. In four days, during which our author travelled among these mountains, he says, that he had 'passed more granite, porphyry, marble, and jasper, than would build Rome, Athens, Corinth, Syracuse, Memphis, Alexandria, and half a dozen such cities.' It appeared to him that the passages between the mountains and what he calls defiles, were not natural but artificial openings; where even whole mountains had been cut out, in order to preserve a gentle slope towards the river. This descent

Mr. Bruce supposes not to be above one foot in fifty; so that the carriages must have gone very easily, and rather required something to retard their velocity than any force to pull them forward. Concerning the mountains in general, he observes, that the porphyry is very beautiful to the eye, and is discovered by a fine purple sand without any gloss. An unvariegated marble of a green color is generally met with in the same mountain; and where the two meet, the marble becomes soft for a few inches, but the porphyry retains its hardness. The granite has a dirty brown appearance, being covered with a sand; but, on removing this, it appears of a gray color with black spots, with a reddish cast all over it. The granite mountains lie nearer to the Red Sea, and seem to have afforded the materials for Pompey's pillar. The redness above mentioned seems to go off on exposure to the air; but re-appears on working or polishing the stone farther. The red marble is next to the granite, though not met with in the same mountain. There is also a red kind with white veins, and vast quantities of the common green serpentine. Some samples of that beautiful marble named Isabella, were likewise observed; one of them of that yellowish cast called quaker color, the other of the bluish kind named dove color. The most valuable kind is that named verde antico, which is found next to the Nile in the mountains of serpentine. It is covered by a kind of blue fleaky stone, somewhat lighter than a slate, more beautiful than most kinds of marble, and when polished having the appearance of a volcanic lava. In these quarries the verde antico had been uncovered in patches of about twenty feet square. There were small pieces of African marble scattered about in several places, but no rocks or mountains of it; so that our author conjectures it to lie in the heart of some other kind. The whole is situated on a ridge with a descent to the east and west, by which means it might easily be conveyed either to the Nile or Red Sea; while the hard gravel and level ground would readily allow the heaviest carriages to be moved with very little force. In the Red Sea in lat. $25^{\circ} 3'$, at a small distance from the south-west coast, there is an island called the Mountain of Emeralds; but none of these precious stones are to be met with there. Here, as well as on the continent, there were found many pieces of a green pellucid substance; but veined, and much softer than rock crystal, though somewhat harder than glass. A few yards up the mountain he found three pits, which are supposed to have been the mines whence the ancients obtained the emeralds; but, though many pieces of the green substance above mentioned were met with about these pits, no signs of the true emerald could be perceived. The substance, however, he conjectures to have been the *smaragdus* of the Romans. In the mountains of Cosseir, as well as in some places of the deserts of Nubia, our author found some rocks exactly resembling petrified wood. The only metal said by the ancients to be produced in Egypt is copper. On the road to Suez are found great numbers of Egyptian flints and pebbles, though the bottom is a hard, calcareous,

and sonorous stone. Volney tells us that the stones above-mentioned, which resemble petrified wood, are to be met with here. They are in the form, he says, of small logs cut slanting at the ends, and might easily be taken for petrifications, though he thought them real minerals.

Besides camels, horses, asses, mules, sheep, black cattle, and other domestic *quadrupeds*, there are many wild animals in Egypt; particularly tigers, hyenas, antelopes, crocodiles, apes with heads resembling those of dogs, hippopotamuses, ichneumons, chameleons, yellow lizards, and a species of rats resembling ferrets, remarkably useful for destroying the crocodiles' eggs. Among the feathered tribe, there are ostriches, eagles, hawks, pelicans, and water fowls of various kinds, among which last the most remarkable is the ibis, a bird of the duck kind, which was deified by the ancient Egyptians, on account of its usefulness in destroying serpents, and noxious insects. These are numerous, and among the different species of serpents the cerastes, or horned viper, abounds, whose bite proves mortal, except to those who have the secret of charming it.

F. Sicard mentions two salt lakes situated in the desert west of the Delta, three or four leagues in length, and about a quarter of a league in breadth, with a solid and stony bottom. For nine months in the year they are without water; but in winter there oozes out of the earth a reddish violet-colored water, which fills the lakes to the height of five or six feet. This being evaporated, by the return of the heat, there remains a bed of salt two feet thick and very hard, which is broken in pieces with iron bars: and from these lakes no less than 30,000 quintals of salt are procured every year.

Besides the ordinary *winds* before mentioned, Egypt is infested, as we have also intimated, with the destructive blasts common to all warm countries which have deserts in their neighbourhood. These have been distinguished by various names, such as poisonous winds, hot winds of the desert, Samiel, the wind of Damascus, Kamsin, and Simoom. In Egypt they are denominated 'winds of fifty days, because they most commonly prevail during the fifty days preceding and following the equinox, though, should they blow constantly during one-half of that time, a universal destruction would be the consequence. Of these travellers have given various descriptions. M. Volney says that the violence of their heat may be compared to that of a large oven at the moment of drawing out the bread. They always blow from the south, and are undoubtedly owing to the motion of the atmosphere over such vast tracts of hot sand, where it cannot be supplied with a sufficient quantity of moisture. When they begin to blow, the sky loses its usual serenity, and assumes a dark, heavy, and alarming aspect, the sun laying aside his usual splendor, and becoming of a violet color. This terrific appearance seems not to be occasioned by any real haze or cloud in the atmosphere at that time, but solely by the vast quantity of fine sand carried along by those winds, and which is so excessively subtle that it penetrates every where. The motion of this wind is always rapid, but its

heat is not intolerable till after it has continued for some time. Its pernicious qualities are evidently occasioned by its excessive avidity of moisture. Thus it dries and shrivels up the skin; and, by affecting the lungs in a similar manner, soon produces suffocation and death. The danger is greatest to those of a plethoric habit, or who have been exhausted by fatigue; and putrefaction soon takes place in the bodies of such as are destroyed by it. Its extreme dryness is such, that water sprinkled on the floor evaporates in a few minutes; all the plants are withered and stripped of their leaves; and a fever is instantly produced in the human species by the suppression of perspiration. It usually lasts three days, but is altogether insupportable if it continue beyond that time. The danger is greatest when the wind blows in squalls, and to travellers who happen to be exposed to its fury without any shelter. The best method in this case is to stop the nose and mouth with a handkerchief. Camels, by a natural instinct, bury their noses in the sand, and keep them there till the squall is over. The inhabitants, who have an opportunity of retiring to their houses, instantly shut themselves up in them, or go into pits made in the earth, till the destructive blast be over. The description of a blast of this kind which overtook Mr. Bruce in the desert of Nubia is still more terrible. See SIMOOM.

The population of Egypt is composed of Franks, or Europeans, Armenians, Greeks, Syrians, Christians, Jews, Turks, Arabians, and Copts, who are supposed, on very probable grounds, to be the descendants of the ancient Egyptians. The Franks are mostly from the shores bordering on the Mediterranean, and engaged in commerce and in the pacha's new manufactures; they do not exceed 1000, half of whom are in Alexandria, and the other half in Cairo. In spite of all the partiality and protection of the pacha, the Turks lose no opportunity of insulting and abusing these 'Christian dogs.' But our expeditions to this country seem to have resulted in two provisions, in favor of Europeans, that are remarkable enough:—1. At the peace of Amiens, Sir John Stuart demanded, and succeeded in obtaining, permission for Europeans to enter the western harbour of Alexandria, from which they had been jealously excluded, and permitted only to enter the eastern harbour, of which the water is shallow, the bottom rocky, and the anchorage dangerous: the one was formerly called the harbour of the Faithful, and the other that of Infidels. 2. No European or Christian was formerly permitted to ride on horseback in any part of Egypt, the horse being reserved for Mahomedans, while the ass was deemed the proper animal for Christians. This indignity was also abolished by the exertions of Sir John Stuart, who stipulated that all Europeans, without distinction, should be allowed to ride on horseback, which they still do.

There are about 2000 Armenians, who reside principally in the capital, where they exercise every kind of trade, and are much concerned in money transactions with the government. The Greek Christians of Syria may be reckoned at 3000 in Cairo, and 1000 in the other cities of

Egypt: they were formerly the wholesale merchants who supplied the land proprietors and others with various kinds of articles, and were in general wealthy; but the monopoly of the viceroy has very considerably impoverished them. There are about 5000 descendants of the ancient Greek colonists, who form quite a distinct race from the modern Greeks: these people have lost their ancient language, and speak a kind of Arabic; many of them are mariners, but in general they pursue the inferior and handicraft trades. According to the latest computations, there are about 4000 Jews in Egypt, 3000 of whom inhabit a part of Cairo, called after them 'the Jews' quarter, of which the streets are so narrow as to be almost impassable; the houses are dark, crowded together, filthy, and so infectious that, when the plague breaks out, the first enquiry is, If it has appeared in the Jews' quarter?

M. Mengin, the author of *L'Histoire de l'Egypte, sous le Gouvernement de Mohammed Aly*, reckons, in Cairo, eight persons to each house, and in the provinces four. The account then stands thus:

	Houses.	Inhabit.
In Cairo	25,000	200,000
In the provincial towns of Alexandria, Rosetta, Damietta, Old Cairo, and Boulak	14,532	58,128
In fourteen provinces, containing 3475 villages	564,168	2,256,272
	603,700	2,514,400

Cairo being the only city of Egypt which contains any great accumulation of inhabitants, built by Gaubar, a general in the service of the first khalif of the race of the Fatemites of Egypt, in the year 358 of the hegira (968 of the Christian era), it was surrounded with walls by Saladin. For the last 300 years its splendor has declined considerably; and the palaces of Mohammed Aly are mean and ill contrived. But here are 240 principal streets, forty-six public places, eleven bazaars, 140 schools, 300 public cisterns, and 400 mosques.

The Copts are by far the most numerous class of Christians in Egypt, amounting at least to 160,000, of whom about 10,000 inhabit the two most populous quarters of Cairo. In towns they practise different trades, but the greater part of them labor on the lands, among the Fellahs. Under the government of the Mamelukes the Copts were employed in taking an account of, and collecting, the revenues of the villages; and many of them still hold situations of this kind, and as writers about the court. They are austere and forbidding in their manners, generally silent, and wearing an air of melancholy: but are said to be tyrannical when in authority.

The oriental race of Fellahs compose the chief part of the population of Egypt, a mixture, perhaps, of ancient Egyptians, Arabians, and Syrians; they approach nearest to the Copts, in general appearance and manners, but they are rigid Mussulmen, and strictly observe the rites and ceremonies laid down by their sheiks or

priests. They labor hard on the soil, and live in the most abstemious manner on dourra, dwell in cottages of unbaked bricks, are clothed in coarse woollen cloth, and sleep on mats: those in the towns exercise handicraft trades, and keep shops in the bazaars, which they only quit to attend the mosques. Like all orientals, they are fond of frequenting coffee-houses, and listening to the tales of pretended magicians, or the rude music of strolling singers. In meekness and apathy they cannot be exceeded.

'The tented Arab,' says an able article on Egypt in the *Quarterly Review*, 'hovering with his flocks along the borders of the fertile valley of the Nile, is the same in character, manners, and customs, as he every where else is, and apparently has been, in all times since the days of the patriarchs, regarding with disdain and proud independence all other classes of mankind, but more particularly those of his own nation, who, in his eyes, have degraded themselves by taking up their abodes in fixed habitations, and whom he calls in contempt *haty*, or Arabs of the walls. Those who turn cultivators are equally despised, and considered in the light of *Fellahs*, with whom an alliance by marriage would be regarded as dishonorable. The Arab women have fine features and complexions; they are much fairer than the Egyptian women, and far more correct in their conduct. In cases of infidelity, the injured party takes the law into his own hands, and the culprit is generally punished with death.'

The Egyptian women, like other oriental females, are the mere slaves of their husbands' or their owners' caprices; and thus their degraded condition is one of the greatest obstacles to the civilisation of Egypt, and one of the last that will probably be removed, connected as it is with the precepts of the Mahomedan law. M. Mengin, however, states the women of late, whether married, or slaves from Georgia, Circassia, and Mongrelia, are allowed frequently to quit the harem, and that accompanied by a confidante, under pretext of going to the bath, or of making visits, they indulge with impunity in illicit amours.

'A *cady*, or judge, sent from the Porte annually, settles all lawsuits and criminal prosecutions: under him are the sheiks and others, learned in the law. A civil process is stated to cost about 4 per cent. of the value in dispute, of which the *cady* takes four-fifths for himself, and gives one-fifth to the other lawyers. All minor disputes and complaints are brought before the *Kiaya-bey*. His officers are the Agha of the janissaries, who is charged with maintaining good order, and especially among the soldiers; the *ouali*, or agha of the police, who looks after the thieves and prostitutes, on both of whom he levies contributions for the support of himself and his myrmidons. The *moteceb* regulates the weights and measures; the *bache-aghah* has the direction of the patrols, and the spies who frequent the coffee-houses, bazaars, and other public places; and, in addition to these, there is a head-man in every quarter of the city for settling disputes and preserving peace. This is said to be so effectually done, that the streets of Cairo are as safe as those of London, except on occa-

sions when the military break loose or want of pay, or to avenge themselves of some grievance.

Of the information upon Egypt, afforded to us by the intelligent Dr. Clarke, the following is a summary:—In his passage from Acre to Aboukir, he witnessed a phenomenon, formerly noticed, but also by some writers strenuously disputed. 'As we were sitting down to dinner, the voice of a sailor employed in heaving the lead, was suddenly heard calling 'half four!' The captain, starting up, reached the deck in an instant; and almost as quickly putting the ship in stays, she went about. Every seaman on board thought she would be stranded. As she came about, all the surface of the water exhibited a thick black mud: this extended so widely, that the appearance resembled an island. At the same time no land was really visible, not even from the mast-head, nor was there any notice of such a shallow in any chart on board. The fact is, as we learned afterwards, that a stratum of mud, extending for many leagues off the mouths of the Nile, exists in a moveable deposit near the coast of Egypt, and, when recently shifted by currents, it sometimes reaches quite to the surface, so as to alarm mariners with sudden shallows, where the charts of the Mediterranean promise a considerable depth of water. These, however, are not, in the slightest degree, dangerous. Vessels no sooner touch them than they become dispersed; and a frigate may ride secure, where the soundings would induce an inexperienced pilot to believe her nearly aground.'—Vol. iii. p. 13.

He left Rosetta on the morning of August 10th, and proceeded up the Nile to Cairo, then occupied by the English and their Turkish allies. 'A vessel leaving Rosetta, is driven by the wind,' he says, 'with extraordinary velocity against the whole force of the torrent to Cairo, or into any part of Upper Egypt. For the purpose of her return, with even greater rapidity, it is only necessary to take down the mast and sails, and leave her to be carried against the wind by the powerful current of the river. It is thus possible to perform the whole voyage from Rosetta to Bulâc, the quay of Cairo, and back again, with certainty, in about seventy hours, a distance equal to 400 miles.'—p. 32.

Of the population, fertility, and beautiful groves of Lower Egypt, our traveller speaks with his usual eloquence.

Throughout the Delta irrigation is carried to a vast extent, but it is effected, for the most part, by artificial means; and an exaggerated idea of the effects of the Nile is conveyed by the beautiful description of Gray. Extensive canals on each side of the river conduct its waters to the utmost extent of their level, but the fields are many of them supplied by water-wheels, or the still simpler process of lading. The soil thus treated produces three crops in the year—clover, corn, and rice, of which the last is sown while the field is actually under water, a practice which, as Dr. Clarke observes, is alluded to by Solomon (Eccles. ii. 1). The eastern sycamore attains an enormous size, and its boughs are so bent by the prevalent winds as to make them resemble a peacock's tail. The fruit resembles

in shape the common fig, but is smaller, dry and insipid. The thermometer stood at 90° in the shade, and the inhabitants of the country were walking about or engaged in the avocations of husbandry, in a state of perfect nakedness, and displaying a complexion of the darkest tawny. They arrived at Bulac at midnight, and were aroused the next morning with intelligence that the pyramids were in sight. What follows is in Dr. Clarke's best style.

'Never will the impression made by their appearance be obliterated. By reflecting the sun's rays, they appeared as white as snow, and of such surprising magnitude, that nothing we had previously conceived in our imagination had prepared us for the spectacle we beheld. The sight instantly convinced us that no power of description, no delineation can convey ideas adequate to the effect produced in viewing these stupendous monuments. The formality of their structure is lost in their prodigious magnitude: the mind, elevated by wonder, feels at once the force of an axiom, which, however disputed, experience confirms,—that in vastness, whatever be its nature, there dwells sublimity. Another proof of their indescribable power is, that no one ever approached them under other emotions than those of terror; which is another principal source of the sublime. In certain instances of irritable feeling, this impression of awe and fear has been so great, as to cause pain rather than pleasure; of which we shall have to record a very striking instance in the sequel. Hence, perhaps, have originated descriptions of the pyramids, which represent them as deformed and gloomy masses, without taste or beauty. Persons who have derived no satisfaction from the contemplation of them, may not have been conscious that the uneasiness they experienced was a result of their own sensibility. Others have acknowledged ideas widely different, excited by every wonderful circumstance of character and situation; ideas of duration, almost endless; of power, inconceivable; of majesty, supreme; of solitude, most awful; of grandeur, of desolation, and of repose.'—Vol. ii. pp. 44—16.

Dr. Clarke's description of Cairo is short, but very curious and interesting. He was sufficiently disgusted with it as the dirtiest metropolis in the world; but the picturesque crowd in its streets, and on its canals, and the foliage of its gardens, no less than the splendid panorama seen from the heights of the citadel, had sufficient beauty and novelty to repay this inconvenience. Here, as in South America, the lizard is the harmless inhabitant of all the gardens, and is seen hanging on the walls and ceilings of the best apartments. Swarms of flies filled every dish and every drinking vessel, and the climate, though extolled as delightful by the British officers who had arrived from India, appeared to Dr. Clarke only tolerable to those who could reconcile themselves to the listless and sordid inactivity of the natives and settled Franks. Dr. Clarke recognised in the funeral cries of Egypt the same mournful notes, and the repetition of the same syllables which are used, on similar occasions, by the Russians and the Irish. In his observations on the mummy-pits, he is led to

animadvert on the falsehood of the common opinion, that the mummies were placed upright in these cemeteries, and supposes that the words of Herodotus, which have been generally quoted to this effect, relate only to those particular mummies which were kept in the houses of their descendants. The horses of our author's Arab guides were the finest he had seen in the whole course of his travels; and the Arab grooms were regarded by the English officers as superior to those even of their own country. These horses do not lie down at night, but sleep standing, with one foot fastened to the piquet.

Dr. Clarke supposes, from the decay of the obelisks at Alexandria, and from similar appearances on other ancient buildings, that granite, namely, from the decomposition of its felspar by exposure to the atmosphere, is less calculated for works of duration than pure homogeneous marble, or even than common limestone. Of the two obelisks known by the name of Cleopatra's Needles, one only is now standing. A subscription was raised by several officers of our army and navy to remove to Great Britain its fallen companion, which, as it now lies on the sand, measures seven feet square at the base, and sixty-six feet in length. Lord Cavan presided in this undertaking, which was worthy of the ancient Romans, and would, probably, have been attended with complete success, had not, for some unexplained reason, the sailors of our fleet been forbidden to assist in the labor. Dr. Clarke gives some probable reasons why the emperor named in the inscription on the base of Pompey's Pillar is not, as is generally supposed, Dioclesian but Hadrian, and attempts also to prove that this magnificent monument was really erected to the unfortunate general whose name tradition has assigned to it. The Arabs, it seems, call it the ruins of 'Julius Caesar's palace.' Our author is among the first who has done sufficient justice to the regularity of the plan of the catacombs of Alexandria; the chaste and awful simplicity of their ornaments, and the long and gloomy arcades of this subterranean city of death. Twelve large halls, besides many smaller apartments, surrounded with places adapted to receive bodies in a recumbent posture, are disposed in a form not very dissimilar from the ancient symbol of the trident, and conclude with a circular sanctuary covered with a simple dome, which is hewn, like all the rest, in the solid rock. In this part of the excavation an ornament appears, which colonel Squire took for a crescent, but which Dr. Clarke more probably apprehended to be the winged globe, which, according to Macrobius, was the Egyptian symbol of Serapis, the lord of the dead. With this visit to Alexandria, Dr. Clarke's Egyptian travels concluded. See ALEXANDRIA.

The splendid antiquities and ancient literature of Egypt have been abundantly illustrated by recent travellers and writers. The labors of the French Institute at Cairo are entitled, perhaps, to our first notice, for their stupendous and magnificent *Déscription de l'Égypte*. We may next mention Mr. William Hamilton's *Ægyptiaca*, 4to. Lond. 1809, originating with the first British expedition. In October, 1801, captain Leake

and lieutenant Hayes were appointed by general Hutchinson, to make a survey of Egypt, and of the country beyond it, if it should be found practicable; and Mr. Hamilton joined these gentlemen in their expedition. Partly, however, on account of the disturbed state of the country, they were unable to proceed further south than a few hours' journey beyond Syene, to a village called Debôd, opposite to which they observed the ruins of Barembre, the Parembolæ of the ancients; here also they found a Greek dedication of a temple to Isis, by Ptolemy Philometor and his queen. But they collected a variety of inscriptions from other parts of Egypt, to which they added drawings and descriptions of the architectural remains to which they belonged. At Alexandria Mr. Hamilton was engaged, in company with some other gentlemen, by examining the inscription on Pompey's pillar, in different positions of the sun, to ascertain the name Dioclesian, as that of the emperor to whom it was dedicated; and to find some traces of the name of Pompeius, a prefect of Egypt under that emperor.

Mr. Legh visited Egypt in 1812, and extended his observations as far as Itrim, within about three days' journey of the second cataract of the Nile. Accompanied by the Rev. Mr. Smelt, he engaged as an interpreter, on leaving Cairo for Upper Egypt, an American, of the name of Barthow, who had resided many years in the country. They sailed on the 13th January, and their first landing was at the ruined village of Benihassen, where they visited the excavations which Norden ascribes to 'holy hermits, who made their abodes there.' The principal chamber is sixty feet in length, and forty in height; to the south of it are seventeen smaller chambers, and probably the like number to the north. Mr. Legh says, they found it difficult to follow Mr. Hamilton's descriptions of the paintings which cover the walls of the chambers. At Ashmounien, the site of the ancient Hermopolis, they partook of the enthusiasm with which Denon speaks of its splendid ruins; but Mr. Legh observes, that his delineation of them denotes the haste with which he travelled, for that the winged globe, represented by him on the frieze, does not exist in the original. Indeed, he found that Denon is very little to be depended on, where he does not copy from preceding travellers, or from the actual fragments carried away by the French. By his own account, he has drawn and described objects seen only in galloping past them; and, at the best, laboring under the horror of a hostile visit from the Arabs or Mamelukes. At Siout, which has succeeded to Girgeh, as the capital of Upper Egypt, they fell in with Burckhardt, travelling as Shekh Ibrahim, on his way to the Great Oasis, where a tribe of Bedouins had lately established themselves. Ibrahim Bey, the eldest son of the pacha, here received them with considerable civility. Reaching Gaw-el-Kebir, the ancient Antæopolis, on the 28th, they found the portico of the temple still standing, in the midst of a thick grove of dates, and consisting of three rows, each of six columns; they are eight feet in diameter, and, with their entablature, sixty-two feet high. Mr.

Legh thinks this venerable and gigantic ruin the most picturesque in Egypt; the columns, architraves, and every part of the building, are covered with hieroglyphics. At the farthest extremity of the temple is an immense block of granite, of a pyramidal form, twelve feet high, and nine feet square at the base, in which is cut a niche, seven feet high, four feet wide, and three feet deep.

Our travellers were forcibly struck with the luxuriant fertility of the soil along the banks of the Nile, as contrasted with the wretched state of poverty and misery of the inhabitants. 'The fields, enriched by the Nile, teem with plenty; the date-trees here are loaded with fruit; cattle of every kind, poultry, and milk, abound in every village; but the wretched Arab is compelled to live on a few lentils, and a small portion of bread and water, while he sees his fields plundered and his cattle driven away, to gratify the insatiable wants of a mercenary soldier, and the inordinate claims of a rapacious governor. After having paid the various contributions, and answered the numerous demands made upon him, not a twentieth of the produce of his labor falls to his own share; and without the prospect of enjoying the fruits of his toil, the Fellah, naturally indolent himself, allows his fields to remain uncultivated, conscious that his industry would be but an additional temptation to the extortion of tyranny.' p. 42.

Between Cafr Saide, supposed to be the site of Chenoboscia, and Diospolis Parva, the modern How, they observed, for the first time, some crocodiles basking on the sand-banks in the river, the largest apparently about twenty-five feet long. Mr. Legh thinks Girgeh the limit below which they do not descend; and they appear to be most numerous between this place and the cataracts. The superstitious natives, we are told, attribute the circumstance of crocodiles not being observed in the lower parts of the Nile, to the talismanic influence of the Mikias, or Nilometer, at Cairo.

A fair wind wafted the travellers past Dendera, Koptos, and Kous, and on the 7th February they landed on the plain of Thebes, the city of a hundred gates, the theme and admiration of ancient poets and historians, and the wonder of every traveller in every age. The ruins extend from each bank of the Nile to the sides of the enclosing mountains. The objects which most powerfully attract the attention on the eastern side, are the magnificent temple of Karnac, and the remains of the temple of Luxor; the latter of which, Mr. Legh says, mark the southern extremity of the walls of the city on that side of the river. On the opposite, or western bank, are the Memnonium, the two colossal statues, and the remains of Médinet-Abou. The Necropolis, or celebrated caverns, known as the sepulchres of the ancient kings of Thebes, are excavations in the mountains, covered with sculptures and paintings, still in the highest degree of preservation. Of these, Mr. Legh gives no description, which indeed, without engravings, would have been of little use. For the most ample, laborious, and accurate details of these ancient ruins, says the Quarterly Reviewer,

we must still consult the learned and indefatigable Pococke.

The time passed by Mr. Legh at Essouan was employed in visiting the islands of Elephantina, Philæ, and the cataracts. 'Elephantina,' he says, 'is celebrated for its beauty, and certainly contains within itself every thing to make it one of the most enchanting spots in the world; woods, gardens, canals, mills, rivers, and rocks, combine to make it picturesque.' Eight temples, or sanctuaries, are crowded together on the island of Philæ, though its whole length does not exceed 1000 feet, nor its breadth 400. Mr. Legh thinks, from the present state of these temples, that the system of building among the ancient Egyptians, was first to construct great masses, and afterwards to labor for ages in finishing the details of the decorations, beginning with the sculpture of the hieroglyphics, and then passing to the stucco and painting. He tells us also, that the granite quarries, at the foot of the mountains, still bear the marks of the chisel and the wedge; 'and that the unfinished obelisks, columns, and sarcophagi, which are to be seen in great profusion, show the unwearied labor and mighty schemes of the ancient inhabitants.'

The cataracts of the Nile have been represented by former writers in exaggerated colors. This barrier, however, placed by nature between Nubia and Egypt, is in the highest degree magnificent.

'Passing upwards from Egypt, you leave the delicious gardens of the island of Elephantina, which divides the Nile into nearly two equal streams; and, on the left, the romantic and ruined town of Essouan strongly reminded us of the old gothic castles in England. Beyond, the two chains of primitive mountains, lying on each side the Nile, cross the bed of the river, and form innumerable rocky points or islands to impede its course. The wild disorder of the granite rocks, which present every variety of grotesque shape, the absence of all cultivation, the murmur of the water, and the savage and desolate character of the whole scene, form a picture which exceeds all power of description.' p. 54.

The boundary of the French expedition in Egypt was marked on a granite rock a little above the cataracts; and our travellers were earnestly exhorted by the Arab shekh at Essouan, not to think of proceeding further. But, as the Mamelukes were at a considerable distance, and the Barâbras at peace with the pachia of Egypt, they proceeded, and found a population of a character totally distinct from that of Egypt, its low sandy banks, its Copts, Arabs, Turks, and Jews. The natives are Barâbras, or Berebers, or Berberins, the same who inhabit Mount Atlas and the interior parts of Barbary, to which they have given their name; a frugal, harmless, and honest people, subsisting chiefly on dates, millet, and a few leguminous plants; and rigid Mahomedans. For the first eighteen miles, the mountains are described as hemming in the Nile, leaving but few small patches that could possibly be cultivated, and these were generally plarated with dates. But we must here leave our travellers, referring the reader to Mr. Legh's Narrative for their further route. Returning

down the Nile, they again visited the neighbourhood of Thebes, and landed at Manfalout, to examine some mummy-pits in the desert, near the village of Amabdi, of which they had heard an extraordinary account from a Greek, of the name of Demetrius. He told them, that in pursuing some fugitives, they were suddenly observed to disappear. On coming to the place, they found a pit, which he and some others descended; at the bottom were fragments of mummies of crocodiles scattered about, but no fugitives to be seen. This story raised the curiosity of our travellers, and they determined to visit those subterranean chambers, in which the sacred crocodiles had been interred, and which the odious was not permitted to see.

The party was composed of Mr. Legh, Mr. Smelt, the American interpreter, an Abyssinian merchant of the name of Fadlallah, and three of their boat's crew, Barabras, whom they had brought from the Cataracts. Having wandered about four hours in search of Amabdi, they at length observed four Arabs cutting wood. These people showed an unwillingness to give them any information—talked of danger—and were heard to mutter that—‘if one must die all must die’ :—this, however, did not deter the party from proceeding. The story of this adventure is so well told, and so interesting, that, though rather long, we give it in Mr. Legh's own words.

‘We were bent on going, and the Arabs at last undertook to be our guides for a reward of twenty-five piastres. After an hour's march in the desert, we arrived at the spot, which we found to be a pit or circular hole of ten feet in diameter and about eighteen feet deep. We descended without difficulty, and the Arabs began to strip, and proposed to us to do the same: we partly followed their example, but kept on our trousers and shirts. I had by me a brace of pocket pistols, which I concealed in my trousers, to be prepared against any treacherous attempt of our guides. It was now decided that three of the four Arabs should go with us, while the other remained on the outside of the cavern. The Abyssinian merchant declined going any farther. The sailors remained also on the outside to take care of our clothes. We formed therefore a party of six: each was to be preceded by a guide—our torches were lighted—one of the Arabs led the way,—and I followed him.

‘We crept for seven or eight yards through an opening at the bottom of the pit, which was partly choked up with the drifted sand of the desert, and found ourselves in a large chamber about fifteen feet high.

‘This was probably the place into which the Greek, Demetrius, had penetrated, and here we observed what he had described, the fragments of the mummies of crocodiles. We saw also great numbers of bats flying about, and hanging from the roof of the chamber. Whilst holding up my torch to examine the vault, I accidentally scorched one of them. I mention this trivial circumstance, because afterwards it gave occasion to a most ridiculous, though to us a very important, discussion. So far the story of the Greek was true, and it remained only to explore the galleries where the Arabs had formerly taken refuge, and where, without doubt, were deposited

the mummies we were searching for. We had all of us torches, and our guides insisted upon our placing ourselves in such a way, that an Arab was before each of us. Though there appeared something mysterious in this order of march, we did not dispute with them, but proceeded. We now entered a low gallery, in which we continued for more than an hour, stooping or creeping as was necessary, and following its windings, till at last it opened into a large chamber, which, after some time, we recognised as the one we had first entered, and from which we had set out. Our conductors, however, denied that it was the same, but on our persisting in the assertion, agreed at last that it was, and confessed they had missed their way the first time, but if we would make another attempt they would undertake to conduct us to the mummies. Our curiosity was still unsatisfied; we had been wandering for more than an hour in low subterranean passages, and felt considerably fatigued by the irksomeness of the posture in which we had been obliged to move, and the heat of our torches in those narrow and low galleries. But the Arabs spoke so confidently of succeeding in this second trial, that we were induced once more to attend them. We found the opening of the chamber which we now approached guarded by a trench of unknown depth, and wide enough to require a good leap. The first Arab jumped the ditch and we all followed him. The passage we entered was extremely small, and so low in some places as to oblige us to crawl flat on the ground, and almost always on our hands and knees. The intricacies of its windings resembled a labyrinth, and it terminated at length in a chamber much smaller than that which we had left, but, like it, contained nothing to satisfy our curiosity. Our search had hitherto been fruitless, but the mummies might not be far distant; another effort, and we might still be successful.

‘The Arab whom I followed and who led the way, now entered another gallery, and we all continued to move in the same manner as before, each preceded by a guide. We had not gone far before the heat became excessive; for my own part, I found my breathing extremely difficult, my head began to ache most violently, and I had a most distressing sensation of fullness about the heart.

‘We felt we had gone too far, and yet were almost deprived of the power of returning. At this moment the torch of the first Arab went out; I was close to him and saw him fall on his side—he uttered a groan—his legs were strongly convulsed, and I heard a rattling noise in his throat—he was dead. The Arab behind me, seeing the torch of his companion extinguished, and conceiving he had stumbled, past me, advanced to his assistance, and stooped. I observed him appear faint, totter, and fall in a moment—he also was dead. The third Arab came forward, and made an effort to approach the bodies, but stopped short. We looked at each other in silent horror. The danger increased every instant; our torches burnt faintly; our breathing became more difficult; our knees tottered under us, and we felt our strength nearly gone.

‘There was no time to be lost—the American, Barthow, cried to us ‘take courage,’ and we

began to move back as fast as we could. We heard the remaining Arab shouting after us, calling us Caffres, imploring our assistance, and upbraiding us with deserting him. But we were obliged to leave him to his fate, expecting every moment to share it with him. The windings of the passages through which we had come increased the difficulty of our escape; we might take a wrong turn, and never reach the great chamber we had first entered. Even supposing we took the shortest road, it was but too probable our strength would fail us before we arrived. We had each of us separately and unknown to one another observed attentively the different shapes of the stones which projected into the galleries we had passed, so that each had an imperfect clue to the labyrinth we had now to retrace. We compared notes, and only on one occasion had a dispute, the American differed from my friend and myself; in this dilemma we were determined by the majority, and fortunately were right. Exhausted with fatigue and terror, we reached the edge of the deep trench which remained to be crossed before we got into the great chamber. Mustering all my strength, I leaped, and was followed by the American. Smelt stood on the brink, ready to drop with fatigue. He called to us 'for God's sake to help him over the fosse, or at least to stop, if only for five minutes, to allow him time to recover his strength.' It was impossible—to stay was death, and we could not resist the desire to push on and reach the open air. We encouraged him to summon all his force, and he cleared the trench. When we reached the open air it was one o'clock, and the heat of the sun about 160°. Our sailors, who were waiting for us, had luckily a bardak full of water, which they sprinkled upon us, but, though a little refreshed, it was not possible to climb the sides of the pit; they unfolded their turbans, and slinging them round our bodies, drew us to the top.'

The Arab who remained at the entrance anxiously enquired for his hababebas, or friends; he was told they were employed in bringing out the mummies; the travellers then mounted their asses, and rode forward towards the boats with all speed, but were pursued; and being brought back to Manafalout, found great difficulty in escaping the vengeance of its inhabitants.

The accomplished, but unfortunate, Mr. Burckhardt left England on the 2d of March, 1809, for Malta, whence he set out for Aleppo, which he reached on the 6th of July. At this place and Damascus, he spent the principal part of the next three years; during which he made a variety of excursions into the Hauran and the Lesge, visited the ruins of Palmyra and Balbec, and perfected himself in the knowledge of the religion, manners, and language of the Mahomedan Arabs. On the 18th of June, 1812, he set out from Damascus for Cairo, avoiding the usual route of the sea coast and desert between El Arish and the borders of Egypt, and directing his course, in the disguise of the poorest of the Bedouins, from the Holy Land, east of the Jordan, by Szalt, into Arabia Petrea, and across the great desert El Ty; he reached Cairo on the 4th September, with the intention of availing

himself of the first opportunity of penetrating into Africa, which the departure of a Fezzan or a Darfur caravan might afford him. Finding, however, that this was not likely soon to take place, he determined to pass the intermediate time in exploring Egypt, and the country above the Cataracts, and was thus enabled to perform two very arduous and interesting journeys into the ancient Ethiopia; one of them along the banks of the Nile from Assouan to Dar El Mahass on the frontiers of Dongola, in the months of February and March 1813, during which he discovered many remains of ancient Egyptian and Nubian architecture, with Greek inscriptions, such as are found in the temples of Philæ:—the other between March and July in the following year, through Nubia to Souakim and Djedda. The details of this journey, contained in his *Travels*, are said to be the best notices ever received in Europe of the actual state of society, trade, manufactures, and government in what was the cradle of all the knowledge of the ancient Egyptians.

Captain Light's *Travels* were published in 1818, and are chiefly valuable for the ill-executed but tolerably accurate prints of Egyptian antiquities which they contain. He had previously contributed to Mr. Walpole's *Memoirs*, relating to European and Asiatic Turkey, several curious decorations in the remains of the churches of Nubia. These *Memoirs* contain also some papers of the late Mr. Davison, who was British consul at Algiers, and accompanied Mr. Wortley Montague to Egypt in 1763. In the great pyramid, Mr. Davison discovered a room, before unknown, immediately over the chamber which contains the sarcophagus; and descended the three successive wells, to the depth of 155 feet. He also well describes the catacombs of Alexandria. This volume likewise comprises an account of the customs and manners of modern Egypt by Dr. Hume. Nor should we forget the obligations which every writer on the geography of Egypt must in future owe colonel Leake's elegant two-chart map of that country, comprehending also a sketch of Nubia, as far as the southern cataract; the limit of all the existing antiquities.

The 'Memnon' or head of a colossal statue found at Thebes, now in the British Museum, was brought from that place to Alexandria at the joint expense of poor Burckhardt, and Mr. Salt, our consul in Egypt. It is considered the finest specimen of ancient Egyptian sculpture which has yet been discovered, and is formed of a single block of granite about ten tons in weight. Under the direction of M. Belzoni, it was moved by the sheer labor of the Arab peasantry two miles, and, without the aid of any kind of machinery, embarked on the Nile. The French, unable to remove it, attempted to blow off with gunpowder the large mass of hair behind, forming that bushy coiffure so common on Egyptian statues, and part of the Bust; fortunately the face has sustained no injury.

'By the indefatigable labor of (the late) M. Belzoni and Mr. Salt, the British Museum,' says the *Quarterly Reviewer*, 'is likely to become the richest depository in the world of Egyptian antiquities. They uncovered the front of the great sphynx, when numerous pieces of antiquity, as

unexpected as extraordinary, were developed, pieces which, for many centuries, had not been exposed to human eyes. Among other things, a beautiful monolithic temple of very considerable dimensions was discovered between the legs of the sphynx, having within it a sculptured lion and a small sphynx. In one of the paws of the great sphynx was another temple, with a sculptured lion standing on an altar. In front of the great sphynx were the remains of buildings, apparently temples, and several granite slabs with inscriptions cut into them, some entire and others broken. One of these is by Claudius Cæsar, recording his visits to the pyramids, and another by Antoninus Pius; both of which, with the little lions, are now in the British Museum. Several paint-pots were also found fronting the sphynx, with paint of different colors in them. At Thebes, M. Belzoni made many new and curious discoveries, and found many valuable relics which had escaped the ravages of the invading Persians and the modern Arabs: he has also uncovered six tombs of the kings of Egypt, which for centuries had not been entered, or, indeed, known. That of Apis he represents as uncommonly magnificent and interesting. 'It is certainly,' he says, 'the most curious and astonishing thing in Egypt, and impresses one with

the highest idea of the workmanship of the ancient inhabitants. The interior, from one extremity to the other, is 190 feet, containing a great number of apartments and galleries. The walls are every where covered with hieroglyphics and bas-reliefs, in fresco colors, which are brighter than any color we have, and as fresh as if they had been only just laid on. But the finest antique in this place is in the principal chamber. It is a sarcophagus, formed of a single piece of alabaster, nine feet seven inches long, three feet nine inches wide, the interior and the exterior being equally covered with hieroglyphics and figures, hollowed with a chisel. This sarcophagus sounds like a silver bell, and is as transparent as ice; no doubt, when I shall have it transported to England, as I hope to do successfully, it will be esteemed as one of the most precious treasures of which any European museum can boast.'

The most important, however, of M. Belzoni's labors in Egypt was the opening of the second pyramid of Ghiza, known by the name of Cephrenes. But, for the particulars of this interesting operation and its results, see PYRAMIDS OF EGYPT; and, for some recent discoveries in regard to THEBES, the article of that title.

EHRENBREITSTEIN, a once celebrated fortress of Germany, in the Lower Electorate, considered as the key of the Rhine and the Moselle, is situated near Coblenz, on the opposite side of the Rhine. It included three fortresses, the chief of which was thus named, and the other two Thal and Vallendar. The value and strength of Ehrenbreitstein have been often mentioned by travellers, but were never so fully proved, as by the resistance it made to the French, during a siege and blockade of two years, in 1795 and 1796. In 1797 it was restored to Prussia; but the works were previously blown up. Though it is closely connected with the country behind the dreary district of Weteravia, it has the appearance towards the Rhine of being nearly insular, and perfectly pyramidal. The abruptness of its elevation above Coblenz, is so little diminished by the breadth of the river, that the rock may almost be said to threaten the city like a precipice; the streets being as open to inspection from the fortress, as those of a model on a table. The only entrance into the castle from the Rhine, is by a road cut in the solid rock, under four gateways. So long ago as the fifteenth century, three years were spent in digging a well through the solid rock, to the depth of 280 feet, as is mentioned in an inscription within the castle. The possession of this castle was confirmed to the elector of Treves, in 1660, by the treaty of Westphalia; but as it was considered one of the keys of Germany, towards France, the governor always took the oaths to the emperor and the empire, as well as the elector. The French plenipotentiaries at Rastadt demanded the cession of the fortress to the republic, which was obstinately refused by the deputies of the empire. At last it was mutually agreed that its fortifica-

tions should be demolished, but this was protested against by the Austrian deputy. From that period the French troops laid siege to it, notwithstanding the armistice concluded in 1797, and closely blockaded it till the 24th of January 1799, when it surrendered. At the bottom lies the small town of Thal-Ehrenbreitstein, which contains 3500 inhabitants; and carries on a brisk trade with Coblenz, by a bridge of boats across the Rhine.

EHRET (George Dionysius), F.R.S. an eminent botanical painter, son of a gardener of the prince of Baden Durlach, was born in 1710. Visiting Paris, he was employed in the garden of plants under the celebrated Jussieu, and then came to England. He went in 1736 to Holland, and made drawings for Clifford of Amsterdam. Under the direction of Linnæus, who gave him lessons in botany, he formed the figures of plants for the Hortus Cliffortianus, published in 1737, and returning to England, in 1740, finally settled here. He was patronised by the duchess of Portland, Drs. Sloane, Mead, and Fothergill, Ralph Willet, Esq., and other persons of taste. He died in 1770.

EHRETTA, in botany, a genus of the monogynia order, and pentandria class of plants; natural order forty-first, asperifolia: FRUIT is a bilocular berry: SEEDS solitary and bilocular; the stigma emarginated.

EHRIHARTA, in botany, a genus of the monogynia order, and hexandria class of plants: CAL. is a two-valved, abbreviated, and one-flowered glume: COR. a double glume, each two-valved; the exterior one compressed, and scy-meter shaped, transversely wrinkled, and gashed at the base. There are six stamina, three on each side the pistil in a parallel line. The stigma is simple, compressed, four-tufted, and

torn at the top. Species nine, natives of the West Indies, and South America.

EJACULATE, *v. a.* } Lat. *ejaculator*, from *e*
EJACULATION, *n. s.* } forth, and *jaculator* to
EJACULATORY, *adj.* } hurl or throw, as a dart.

To dart out or shoot forth: applied metaphorically, to words or to acts of the mind. Ejaculation is used both for the act of darting or throwing out, and words (hence prayers) or things ejaculated: ejaculatory is throwing, or having the power of throwing out: hence, uttered shortly or suddenly, and sudden or hasty.

There seemeth to be acknowledged, in the act of envy, an *ejaculation* or irradiation of the eye.

Bacon's Essays.

In your dressing let there be *ejaculations* fitted to the several actions of dressing; as at washing your hands, pray to God to cleanse your soul from sin.

Taylor's Guide to Devotion.

The continuance of this posture might incline to ease and drowsiness; they used it rather upon some short *ejaculatory* prayers, than in their larger devotions.

Duppa's Devotion.

We are not to value ourselves upon the merit of *ejaculatory* repentances, that take us by fits and starts.

L'Estrange.

Being rooted so little way in the skin, nothing near so deeply as the quills of fowls, they are the more easily *ejaculated*.

Grew's Muscum.

The mighty magnet from the centre darts

This strong, though subtle force, through all the parts:

Its active rays *ejaculated* thence,

Irradiate all the wide circumference. *Blackmore.*

He whose *ejaculatory* uses of God's name are not prayers for some one, will find them curses to himself.

Thomas.

EICHSELD, a province of Prussia (in part ceded to that power by Hanover, in 1818), and part of the present principality of Calenberg. It is divided into the Upper and Lower Eichsfeld, and contains 90,000 inhabitants. The other and larger part, not belonging to Hanover, was a part of the electorate of Mentz.

EICHSTADT, a town and bishop's see of Bavaria, in the circle of the Upper Danube, situated in a valley on the Alt. The king of Bavaria conferred the title of prince of Eichstadt on Eugene Beauharnois, his son-in-law, formerly viceroy of Italy. A convent in this town is much visited by zealous Catholics as containing a supposed relic of St. Wilibald. Population 6000. Thirty-two miles N. N. E. of Augsburg.

EICK (John Van), a celebrated Flemish painter, commonly called John of Bruges, from his birth place, flourished in the fifteenth century, and was the first who discovered the method of painting in oil. Being a chemist, he found in the course of his experiments, that, by grinding colors with linseed or nut oil, he could form them into a solid body which would resist water, and not need the varnish used in painting in water colors or in fresco. He presented the first picture painted in this manner to Alphonsus I. king of Naples, who was much pleased with it.

EIDER DUCK. See ANAS.

EIGG, an island of the Hebrides, six miles in length and from one to three in breadth, containing a superficial area of about eleven square miles. Kelp and wool are yielded here, together

with a few horses. The clergyman has several other small islands under his charge, and, in visiting Cannay, has to perform a voyage of twenty-four miles. There is also a resident Roman Catholic clergyman. Distant from the shore of Scotland eight miles.

EJECT, *v. a.* } Fr. *jetter*, from Lat. *ejicio*,
EJECTION, *n. s.* } *ejectum*; i. e. *e* out, and
jacio to hurl. To throw out; expel: hence to cast away; discharge.

To have *ejected* whatsoever the church doth take account of, be it never so harmless in itself, and of never so ancient continuance, without any other crime to charge it with, than only that it hath been the hap thereof to be used by the church of Rome, and not to be commanded in the word of God, could not have been defended.

Hooker.

We are peremptory to dispatch

This viperous traitor; to *eject* him hence,
Were but our danger; and to keep him here,
Our certain death; therefore it is decreed
He dies to night.

Shakespeare. Coriolanus.

Infernal lightning sallies from his throat!

Ejected sparks upon the billows float!

Sandys.

It was the force of conquest; force with force

Is well *ejected*, when the conquered can.

Milton.

The French king was again *ejected* when our king submitted to the church.

Dryden.

Tears may spoil the eyes, but not wash away the affliction; sighs may exhaust the man, but not *eject* the burthen.

South.

The heart, as said, from its contracted cave,
On the left side *ejects* the bounding wave.

Blackmore.

Will any man say, that if the words whoring and drinking were by parliament *ejected* out of the English tongue, we should all awake next morning chaste and temperate.

Swift.

These stories are founded on the *ejection* of the fallen angels from heaven.

Broome.

EJECTION, in Scottish law, is the turning out the possessor of any heritable subject by force; and is either legal or illegal.

1. EJECTION, ILLEGAL, is one person's violently turning another out of possession, without lawful authority.

2. EJECTION, LEGAL, is where a person having no title to possess, is turned out by the authority of law.

EJECTMENT, in English law, a writ or action which lies for the lessee for years, on his being ejected or put out of his land before the expiration of his term, either by the lessor or a stranger. It may also be brought by the lessor against the lessee, for rent in arrears, or holding over his term, &c. Ejectment of late is become an action in the place of many real actions, as writs of right, formedons, &c., which are very difficult, as well as tedious and expensive; and this is now the common action for trial of titles and recovering of lands, &c., illegally held from the right owner: yet where entry is taken away by descents, fines, recoveries, disseisins, &c. an ejectment shall not be brought; whereby we find that all titles cannot be tried by this action. The method of proceeding in the action of ejectment is to draw up a declaration, and feign therein a lease for three, five, or seven years, to him that would try the title; and also feign a casual ejector or defendant; and then deliver the declaration to the ejector, who serves a copy of it on the tenant in

possession, and gives notice at the bottom for him to appear and defend his title; or that he, the feigned defendant, will suffer judgment by default, whereby the true tenant will be turned out of possession; to this declaration the tenant is to appear at the beginning of next term by his attorney, and consent to a rule to be made defendant, instead of the casual ejector, and take upon him the defence, in which he must confess lease, judgment, entry, and ouster, and at the trial stand upon the title only: but in case the tenant in possession does not appear, and enter into the said rule in time, after the declaration served, then, on affidavit being made of the service of the declaration, with the notice to appear as aforesaid, the court will order judgment to be entered against the casual ejector by default; and thereupon the tenant in possession, by writ *habere facias possessionem*, is turned out. On the trial in ejectment, the plaintiff's title is to be set forth from the person last seised in fee, under whom the lessor claims down to the plaintiff, proving the deeds, &c., and the plaintiff shall recover only according to the right which he has at the time of bringing his action. And here, another who has title to the land, may be defendant in the action with the tenant in possession; for the possession of the lands is primarily in question, and to be recovered, which concerns the tenant, and the title thereto is tried collaterally, which may concern some other.

Ejectment ought to be brought for a thing that is certain; and if it be of a manor, the manor of A, with the appurtenances; if of a rectory, the rectory of B, &c. And so many messuages, cottages, acres of arable land, meadow, &c., with the appurtenances in the parish of, &c. For land must be distinguished, how much of one sort, and how much of another, &c. Cro. Eliz. 339. 3 Leon. 13. Ejectment lies of a church, as of an house called the parish church of, &c. And a church is a messuage, by which name it may be recovered: and the declaration is to be served on the parson who performs divine service. 11 Rep. 25. 1 Salk. 256. A rector may recover in ejectment against his lessee, on the ground of the lease of the rectory being avoided on account of his own non-residence, by force of the 13 Eliz. c. 20, and the lease to the defendant, describing him as doctor in divinity, produced by him at the trial in support of his title, is *prima facie* evidence of his being such as he is therein described to be, so as to avoid the lease under stat. 21 Hen. 8. c. 13. § 3. It lies *de uno messuagio sive burgagio*; but not *de uno messuagio sive tenemento*, unless it have a *vocat A. &c.* to make it good, because of the uncertainty of the word *tenement*. 1 Sid. 295. But for a messuage and tenement hath been allowed. 1 Term Rep. 11. So indeed for a messuage or tenement. 3 Wils. 23. 3 Mod. 328. 1 Sid. 295. but see *contra*, 1 East's Rep. 441, 2. It will lie for a moiety, or third part of a manor or messuage, &c. And for a chamber or room of a house well set forth. 11 Rep. 55. 59. 3 Leon. 210. It lieth *de domo*, which hath convenient certainty for the sheriff to deliver possession, &c. Cro. Jac. 654. It lies of a cottage or curtilage; of a coal-mine, &c. but not

of a common, piscary, &c. Cro. Jac. 150. For underwood it lies, though a *præcipe* doth not. 2 Roll. Rep. 482, 483. But for *uno clauso*, or *una pecia terræ*, &c. without certainty of the acres, and their nature, it doth not lie. 11 Rep. 55. 4 Mod. 1. It lieth of a close, containing three acres of pasture, &c. Also of so many acres of land covered with water; though not *de aquæ cursu*. Cro. Jac. 435. 1 Brownl. 242. It also lies for a prebendal stall, after collation to it. 1 Wils. 14.

EIGHT, adj.	} Sax. eahta, æhta; Belg. agt; Scottish and Teut. acht; Goth. ahta, attha, and ath; Dan. atte; Fr. huit; Lat. octo; Gr. okro.
EIGHTEEN, EIGHTEENTH, EIGHTFOLD, EIGHTHLY, adv.	
EIGHTIETH, adj.	} A word of number; twice four. Eighth is the ordinal of eight: eightfold is eight times the number or quantity; eighthly is in the eighth place; eighteen, eight and ten; eightscore, eight twenties; eighty, eight ten times told.
EIGHTSCORE, EIGHTY.	

And it was don aftr these wordis almceast *eighte* dayes: and he took Petre and James and Jon, and he stiede into an hil to prey. *Wiclif. Luke ix.*

And it was doon in the *eightithe* day thei camen to circumside the child, and thei clepiden him *Zacarye* by the name of his fadir. *Id. Luk i.*

And as the *cyghtene* on which the tower in Siloa fel down and slough hem, gessen ye for thei weren dettouris more than alle men that dwellen in Jerusa-lem? *Id. Luk. xiii.*

In the *eighteenth* year of Jeroboam died Abijam. *1 Kings.*

Another yet?—A seventh! I'll see no more; And yet the *eighth* appears. *Shakspeare. Macbeth.*

He can't take two from twenty, for his heart, And leave *eighteen*. *Id. Cymbeline.*

What! keep a week away? seven days and nights? *Eightscore* eight hours? and lovers absent hours, More tedious than the dial *eightscore* times? Oh weary reckoning! *Id. Othello.*

Eighty odd years of sorrow have I seen, And each hour's joy wrecked with a week of teen. *Shakspeare.*

In the *eighth* month should be the reign of Saturn. *Bacon.*

Fighthly, living creatures have voluntary motion, which plants have not. *Bacon's Natural History.*

This island contains *eightscore* and *eight* miles in circuit. *Sandys's Journey.*

Among all other climacterick three are most remarkable; that is, seven times seven, or forty-nine; nine times nine or *eighty* one; and seven times nine, or the year sixty-three, which is conceived to carry with it the most considerable fatality.

Browne's Vulgar Errors.

If men naturally lived but twenty years, we should be satisfied if they died about *eighteen*; and yet *eighteen* years now are as long as *eighteen* years would be then. *Taylor.*

A pedant values phrases, and elects them by the sound, and the *eight* parts of speech are his servants. *Overbury.*

Some balances are so exact as to be sensibly turned with the *eightieth* part of a grain.

Wilkins's Math. Magic.

I stay reluctant seven continued years,
And water her ambrosial couch with tears;

The *eighth* she voluntarily moves to part,
Or urged by Jove, or her own changeful heart.

Pope.

I thus passed 'about *eighteen* months in London,
working almost without intermission at my trade,
avoiding all expense.

Franklin.

Oft, where his feathered foe had reared her nest,
And laid her eggs and household gods to rest,
Burning for blood in terrible array,
The *eighteen*-inch militia burst their way;
All went to wreck; the infant foemen fell,
When scarce his chirping bill had broke the shell.

Beattie.

EIGNE, *adj.* Fr. *aisne*. In law, denotes
the eldest or first born. Here it signifies un-
alienable, as being entailed.

It happeneth not seldom, that, to avoid the yearly
oath, for averment of the continuance of some estate
for life, which is *eigne*, and not subject to forfeiture
for the alienation that cometh after it, the party will
offer to sue for a pardon uncompelled before the time;
in all which, some mitigation of the uttermost value
may well and worthily be offered.

Bacon.

EIMBECK, an old town of Hanover, on the
Ilme, with 5000 inhabitants. It belonged to the
Hanseat confederacy, and has some manufact-
ures, but is not thriving. Great part of its for-
tifications were demolished by the French in
1761. Forty-eight miles S.S.W. of Brunswick.

EIMEO, or **MOVEA**, one of the Society
Islands in the South Pacific, about ten miles in
length by five in breadth. The harbour of Taloo
on the north coast is the best; and here the
water is so clear, that the branching of beautiful
coral is visible at great depths. The island is
hilly and rocky, with valleys interposed. Twelve
miles west of Otaheite.

EINURA, or **YENNOOR**, a town in the district
of South Canara, Hindostan, containing eight
temples belonging to the Jain, and one to the
Siva Brahmans. The former have an annual
allowance of fourteen and the latter ten pagodas.
There is an immense colossal image here of
one of the gods of the Jains, which stands in
the open air. It is formed of one solid piece of
granite. The hills and neighbourhood about this
place are considered unproductive.

EI'SEI, *n. s.* Sax. *eoril*. Vinegar; ver-
juice; any acid. An old word.

Cast in thy mind

How thou resemblest Christ, as with sowre poison
If thou paine thy taste; remember therewithall,
How Christ for thee tasted *eisel* and gall.

Sir T. More.

EISENACH, a principality of Germany in
Thuringia, and circle of Upper Saxony, situated
on the confines of Hesse. It is mountainous,
and scarcely produces corn enough for the in-
habitants. Some indifferent wine is made: but
it has mines of copper, iron, vitriol, and alum,
with some salt springs. It gave a vote to the
duke of Saxe Weimar, in the diets and assem-
blies of the circle. Population 62,000. Its rivers
are the Warra, Slade, Unstrut, and Fulda.

EISENACH, the capital of the above province,
is situated on a rising ground near the junc-
tion of the Hesse and Horsa. It has a castle in
the market-place as old as the eleventh century,
and formerly the residence of the princes of Eise-

nach. The streets are neat and well built. Popu-
lation 5000. On a high mountain in the immedi-
ate neighbourhood stands the castle of Wartburg
remarkable as the prison of Luther in 1521
when the elector of Saxony judged his temporary
confinement expedient. Eisenach has a few coarse
woollen manufactures. It experienced, on the
1st of September, 1810, a severe calamity, three
powder waggons having exploded in the streets,
and destroyed many houses. Twenty-six miles
W.S.W. of Erfurt, and forty east of Weimar.
Long. 10° 20' 15" E., lat. 50° 58' 55" N.

EISENARTZ, a town of Upper Styria, con-
taining 1350 inhabitants. It is 2190 feet above
the level of the sea, at the foot of a hill which
contains one of the richest iron mines known.
This was discovered in 712, and still produces
50,000 tons of ore yearly, giving employment to
2500 miners and smelters. Ten miles north of
Leoben.

EISENBERG, a town of Germany, in the
principality of Altenburg. It has a castle and a
few manufactures; being situated on an eminence
near the Saale. Twenty miles west of Alten-
burg, and thirty south-west of Leipsic. Popula-
tion 3300.

EISENBURG, a county of Lower Hungary, on
the borders of Austria and Styria, adjoining the
counties of Oldenburg, Sala, and Wesprim. It
is exceedingly fertile and populous, containing
near 300,000 inhabitants. Its rivers are the
Roab, Rabnitz, Guns, Sala, and Mur. Great
part of it is covered with wood; other parts are
appropriated to pasture and the culture of the
vine. The population is a mixture of Hunga-
rians, Germans, Croaicians, and Jews.

EISLEBEN, the capital of the county of
Mansfeld, Prussia, is chiefly remarkable as the
birth place of Luther. The house in which the
reformer was born and died being burnt down
in 1594, it was rebuilt at the expense of the
town, and is now used as a public school. Here
are four churches, all Lutheran, and about 5400
inhabitants. It is divided into the Old and New
Town, and the suburbs; large vacancies having
been made between the buildings, in consequence
of the frequent fires that have ravaged this place.
The adjacent mines of Mansfeld afford employ-
ment to many of the inhabitants, two miles south-
east of Mansfeld, and twelve west of Halle.

EITIER, *pron. & conj.* Sax. *egther*; Scot.
aithau; Goth. *aithwar*, or *aithau*, i. e. *eitt twar*,
or *thera*, one of them. One of two, used im-
properly for each; any of an indeterminate num-
ber. Used distributively as a conjunction corres-
ponding with or.

And Jhesus sayed to hem, Y axe you if it is leve-
ful to do wel in the sabate or yuel; for to make saaf,
ethir to leesse.

Wiclif. Luk. vi.

We doubt whether the Lord in different circum-
stances, did frame his people unto any utter dissimili-
tude, *either* with Egyptians or any other nation.

Hooker.

Lepidus flatters both,
Of both is flattered; but he neither loves,
Nor *either* cares for him.

Shakespeare. Antony and Cleopatra.

Henry VIII. Francis I. and Charles V. were so
provident, that scarce a palm of ground could be gotten

by *either* of the three, but that the other two would set the balance of Europe upright again. *Bacon.*

We never heard of any ship that had been seen to arrive upon any shore of Europe; no nor of *either* the East or West Indies. *Id. New Atlantis.*

Our infirmity will not suffer any long intention, *either* of body or mind. *Bp. Hall. Contemplations.*

Goring made a fast friendship with Digby, *either* of them believing he could deceive the other. *Clarendon.*

In the process of natural beings, there seem to be some creatures placed, as it were, on the confines of several provinces, and participating something of *either*. *Hale.*

Seven times the sun has *either* tropick viewed,
The Winter banished and the Spring renewed. *Dryden.*

I do not ask whether bodies do so exist, that the motion of one body cannot really be without the motion of another: to determine this *either* way, is to beg the question for or against a vacuum. *Locke.*

So like in arms these champions were,
As they had been a very pair;
So that a man would almost swear,
That *either* had been *either*. *Drayton's Nymph.*

What perils shall we find,
If *either* place, or time, or other course,
Cause us to alter the' order now assigned. *Daniel.*

Either your brethren have miserably deceived us, or power confers virtue. *Swift to Pope.*

The food of the cod is *either* small fish, worms, crustaceous animals, such as crabs, large whelks, &c. and their digestion is so powerful, as to dissolve the greatest part of the shells they swallow. *Pennant.*

EJULATION, *n. s.* Lat. *ejulatio*. Outcry; lamentation; moaning; wailing.

Instead of hytns and praises, he breaks out into *ejulations* and effeminate wailings. *Government of the Tongue.*

With dismal groans
And *ejulation*, in the pangs of death,
Some call for aid. *Philips.*

EKATERINADARA, a town in the government of Caucasus, Kuban Tartary, the capital of the Tchernomorskie, or Cossacks of the Black Sea. The late empress Catherine, after whom it is called, removed a great body of Cossacks from the banks of the Dnieper to the eastern shores of the sea of Azoph, for the purpose of repelling the incursions of the Tartars, and granted them, in 1791, a territory of about 1000 square miles, including the isle of Taman. In the succeeding year they founded their capital, which resembles an extensive village in a forest. Each cottage has an area in front, with an avenue of the finest oaks. The inhabitants choose their own chief, and preserve the European manners.

EKATERINEBURG, or **CATHERINEBURG**, a town of Asiatic Russia, in the province of Isett, on the left bank of the river of that name, and on the eastern side of the Uralian chain. It is surrounded by an earthen rampart, with a chevaux de frize. Here are five churches, and several well built stone houses. The neighbouring mountains afford vast variety of minerals, and great works are carried on in Ekaterineburg, by the Russian government, as iron foundries, forges, &c., which manufacture cannon and anchors. An immense copper coinage also pro-

duces 12,530 pieces daily. The workhouses are of brick, covered with thin iron plates. This is the seat of the supreme college for the administration of the mines and foundries of Siberia, Casan, Perm, and Orenburg, and takes cognisance of 114 foundries. There is besides a chamber for superintending the gold mines. Provisions are cheap and plentiful. Houses 2000.

EKATERINOGRAD, a town and fortress of Asiatic Russia, in the government of Caucasus, situated on the Malka, or Balk, a little above its junction with the Terek. It was founded in the year 1776, and remained the capital of the province of Caucasus, before being constituted a government in 1785. It is the strongest place on the Caucasian line of posts. Twenty-four miles north-west of Mozdok.

EKATERINOSLAV, or **CATHERINOSLAF**, a town and government of European Russia, constituted by the empress Catherine in 1784. When Paul I. incorporated it with the Crimæa he gave the whole the name of New Russia, and changed the name of this town to Nowo-Rossizsk. The present emperor, however, restored the division of Catharine, distributing New Russia into the three governments of Cherson, Taurida, and Ekaterinoslav. The last, though reduced in some measure from its original size, is still considerable, extending from 33° 40' to 39° 20' E. long., and from 47° to 49° N. lat., between the governments of Poltawa, Charkov, Voronetz, the Donski Cossacks, Taurida, and Cherson, and containing about 35,000 square miles, the surface consisting for the most part of dry steppes, little susceptible of culture, except on the banks of the Dnieper, Don, Donetz, Samara, and the other rivers. The climate is mild. The chief productions are hemp, corn, millet melons, and fruits. Here are all the common domestic animals, and an unusual quantity of bees. It is divided into eight counties. The inhabitants are computed at 560,000; the majority deriving their subsistence from the breeding of cattle. The most intelligent and thriving part are of foreign descent, viz. Greeks, Germans, or Moldavians.

EKE, *v. a. & conj.* Goth. *auktan*; Sax. *eacan*; Icel. *auka*, to increase. Spenser frequently writes this word eek. To protract; lengthen; increase; supply deficiency. Hence, as a conjunction, it signifies also, likewise; beside; but is obsolete.

Yet holt thine anker, and thou maicst arive
There bountie bereth the key of my substaunce,
And *eke* thou haste thy beste frende alive. *Chaucer.*

And *eke* full ofte a littell skare,
Vpon a bank, her men be ware,
Let in the streme, whiche with greet peine,
If any man it shall restraine. *Gower.*
I dempt there much to have *eked* my store,
But such *eking* hath made my heart sore. *Spenser.*
And *eke* huge mountaines from their native seat,
She would command themselves to beare away. *Id. Faerie Queene.*

If any strength we have, it is to ill;
But all the good is God's, both power and *eke* will. *Id.*

The little strength that I have, I would it were with you.

—And wine to *eke* out her's.

Shakspeare. As You Like It.

I speak too long; but 't is to piece the time,
To *eke* it, and to draw it out in length,
To stay you from election.

Id. Merchant of Venice.

Now, if 'tis chiefly in the heart,
That courage does itself exert,
'Twill be prodigious hard to prove,
That this is *eke* the throne of love. *Prior.*

Your ornaments hung all,
On some patched doghole *eked* with ends of wall.

Pope.

EKRON, a city and government of the Philistines. It fell by lot to the tribe of Judah, in the first division made by Joshua (xv. 45.) but was afterwards given to the tribe of Dan, (xix. 43.) It was situated near the Mediterranean, between Ashdod and Jamnia. Ekron was a powerful city, and it does not appear that the Jews were ever sole peaceable possessors of it: the Ekronites were the first who said that it was necessary to send back the ark of the God of Israel, in order to be delivered from those calamities which the presence of it brought upon their country. 1 Sam. v. 10. The idol Baalzebub was principally adored at Ekron. 2 Kings i. 2. &c.

ELABORATE, *v. a. & adj.* } Spanish and

ELABORATELY, *adv.* } Port. *elaborar* ;

ELABORATENESS, *n. s.* } Ital. and Lat.

ELABORATION. } *elaborare*, from

e, out, and *laboro*, to labor. To produce or improve by labor: as an adjective, highly or laboriously finished or performed.

Formalities of extraordinary zeal and piety are never more studied and elaborate than when politicians most agitate desperate designs. *King Charles.*

' At least, on her bestowed
Too much of ornament, of outward shew
Elaborate, of inward less exact. *Milton.*

Man is thy theme, his virtue or his rage
Drawn to the life in each elaborate page. *Waller.*

To what purpose is there such an apparatus of vessels for the *elaboration* of the sperm and eggs; such a tedious process of generation and nutrition? *Ray.*

Politick conceptions, so *elaborately* formed and wrought, and grown at length ripe for delivery, do yet prove abortive. *South.*

Some coloured powders which painters use, may have their colours a little changed, by being very *elaborately* and finely ground. *Newton's Opticks.*

I will venture once to incur the censure of some persons for being *elaborately* trifling. *Bentley.*

Consider the difference between *elaborate* discourses upon important occasions, delivered to parliaments, and a plain sermon intended for the common people. *Swift.*

It is there *elaborately* shewn, that patents are good. *Id.*

They in full joy *elaborate* a sigh. *Young.*

In the theatre, the first intuitive glance, without any *elaborate* process of reasoning, would show, that this method of political computation would justify every extent of crime. *Burke.*

As the glands which produce the prolific dust of the anthers, the honey, wax, and frequently some odoriferous essential oil, are generally attached to the corol, and always fall off and perish with it, it is evident that the blood is *elaborated* or oxygenated in this pulmonary system for the purpose of these important secretions. *Darwin.*

ELÆAGNUS, the oleaster, or wild olive, a genus of the monogynia order, and tetrandria class of plants; natural order sixteenth, calycifloræ: cor. none: cal. campanulated, quadrid, superior: FRUIT a plum below the campanulated calyx. This genus must not be confounded with the oleaster or wild olive of Gerard, Parkinson, and Ray which is only a particular species of olive, called by Tournefort and Casper Bauhine, *olea sylvestris*. See OLEA. There are ten species.

1. *E. inermis*, without thorns, is the kind commonly preserved in the gardens of this country. The leaves are more than three inches long, and half an inch broad, and have a shining appearance like satin. The flowers come out at the foot-stalks of the leaves, sometimes singly, at other times two, and sometimes three, at the same place. The outside of the empalement is silvery and studded; the inside of a pale yellow. It has a very strong scent. The flowers appear in July, and are sometimes succeeded by fruit.

2. *E. latifolia*, with oval leaves, is a native of Ceylon, and some other parts of India. In this country it rises with a woolly stem to eight or nine feet, dividing into many crooked branches, garnished with oval and silvery leaves, which have several irregular spots of a dark color on the surface. They are placed alternately on the branches, and continue all the year.

3. *E. spinosa*, the eastern broad-leaved olive with a large fruit, is a native of the Levant and some parts of Germany. The leaves are about two inches long, and one and a half broad in the middle. They are placed alternate, and are of a silver color: at the foot-stalk of every leaf there comes out a pretty long sharp thorn, which are alternately longer: the flowers are small, the inside of the empalement is yellow, and they have a strong scent when fully open.

The first and last species may be propagated by laying down the young shoots in autumn. They will take root in one year; when they may be cut off from the old trees, and either transplanted into a nursery for two or three years, or into places where they are to remain. The proper time is in the beginning of March, or early in autumn. They should be screened from high winds; for they grow very freely, and are apt to be split by the wind, if too much exposed. The *latifolia* is too tender to endure the open air of this country; and therefore must be kept in a warm stove, except during a short time in the warmest part of summer. From the flower of these plants an aromatic and cordial water has been drawn, which is said to have been successfully used in putrid and pestilential fevers.

ELÆOCARPUS, in botany, a genus of the monogynia order, and polyandria class of plants: cor. pentapetalous and lacerated: cal. pentaphyllous: FRUIT a plum with a wrinkled kernel. Species five, natives of India and New Zealand.

ELÆOMELI, in ancient medicine, a sweet oil, as thick as honey, said to flow from a tree in Syria, and to have been useful in bilious complaints.

ELÆOTHESIUM, in antiquity, the anointing room, or place where those who were to

wrestle or had bathed, anointed themselves. See GYMNASIUM.

ELAH, the son of Baasha, the fourth king of Israel after the separation of the ten tribes from Judah. He was murdered while in a state of intoxication, by Zimri, when he had reigned only two years, A. M. 3014, and A. A. C. 934.

ELAH, in ancient geography, a valley of Israel, famous for the defeat and death of Goliath, the Philistine, by David.

ELAM, in ancient geography, a country frequently mentioned in Scripture, lying south-east of Shinar. In the time of Daniel, (viii. 2.) Susiana seems to have been part of it; and, before the captivity, it does not appear that the Jews called Persia by any other name. Elymæ and Elymais are often mentioned by the ancients. Ptolemy, though he makes Elymais a province of Media, places Elymæ in Susiana, near the sea coast. Stephanus takes it to be a part of Assyria; but Pliny and Josephus more properly of Persia, whose inhabitants, the latter tells us, sprang from the Elamites. The best commentators agree, that the Elamites, who were the ancestors of the Persians, were descended from Elam, the son of Shem. It is likewise allowed, that the inspired writers constantly intend Persia, when they speak of Elam and the kingdom of Elam.

ELANCE, *v. a.* Fr. *elancer*. To throw out; to dart; to cast as a dart.

While thy unerring hand elanced
Another, and another dart, the people
Joyfully repeated !

Prior.

Harsh words, that once elanced, must ever fly
Irrevocable. *Id.*

ELAPHEBOLIA, from *ελαφος*, a deer; in Grecian antiquity, a festival in honor of Diana the huntress. In the celebration a cake was made in the form of a deer, and offered to the goddess. It owed its institution to the following circumstance:—When the Phocians had been severely beaten by the Thessalians, they resolved, by the persuasion of one Deiphantus, to raise a pile of combustible materials, and burn their wives, children, and effects, rather than submit to the enemy. This resolution was unanimously approved by the women, who decreed Deiphantus a crown for his magnanimity. When every thing was prepared, before they fired the pile, they engaged their enemies, and fought with such desperate fury, that they totally routed them, and obtained a complete victory. In commemoration of this unexpected success, this festival was instituted to Diana, and kept with great solemnity.

ELAPHEBOLIUM, in Grecian antiquity, the ninth month of the Athenian year, answering to the latter part of February and beginning of March. It consisted of thirty days, and took its name from the elaphebolia which was celebrated in it.

ELA'PSE, *v. n.* Lat. *elapsus*. To pass away; to glide away; to run out without notice.

There is a docile season, a learning time in youth,
Which, suffered to *elapse*, and no foundation laid, sel-
dom returns. *Clarissa.*

For when an old wood perished, and produced a
morass, many centuries would *elapse* before another
wood could grow and perish again upon the same
ground, which would thus produce a new stratum of

morass over the other, differing indeed principally in
its age, and perhaps as the timber might be different
in the proportions of its component parts.

Darwin.

Though years

Elapse, and others share as dark a doom,
They but augment the deep and sweeping thoughts
Which overpower all others, and conduct
The world at last to freedom !

Byron.

ELASMIS, in natural history, a genus of talcs, composed of small plates in form of spangles, and either single, and not farther fissile, or, if complex, only fissile to a certain degree, and that in somewhat thick laminae. Of these talcs there are several varieties, some with large and others with small spangles, which differ also in color and other peculiarities.

ELASTIC, *adj.* Fr. *elastique*, from Gr.

ELASTICAL, } *ελαστικός*, of the verb *ελαω*;
ELASTICITY, *n. s.* } Heb. *אָדָה*, to impel or cast
off. Springy; energetic. The force whereby
bodies restore themselves to a position from which
they have been displaced.

By what *elastic* engines did she rear
The starry roof and roll the orbs in air.

Blackmore.

If the body is compact, and bends or yields inward
to pressure, without any sliding of its parts, it is hard
and *elastic*, returning to its figure with a force rising
from the mutual attraction of its parts.

Newton's Opticks.

The most common diversities of human constitu-
tions arise from the solids, as to their different de-
grees of strength and tension; in some being too lax
and weak, in others too *elastic* and strong.

Arbuthnot on Aliments.

A lute-string will bear an hundred weight without
rupture; but at the same time cannot exert its *elastici-
ty*: take away fifty, and immediately it raiseth the
weight. *Id.*

A fermentation must be excited in some assignable
place, which may expand itself by its *elastic* power,
and break through, where it meets with the weakest
resistance. *Bentley.*

Me emptiness and dulness could inspire,
And were my *elasticity* and fire. *Pope.*

His form robust and of *elastic* tone,
Proportioned well, half muscle and half bone,
Supplies with warm activity and force
A mind well lodged, and masculine of course.

Cowper.

We can have no idea of a natural power, which
could project a sun out of chaos, except by comparing
it to the explosions or earthquakes owing to the sudden
evolution of aqueous or of other more *elastic* vapours;
of the power of which, under immeasurable degrees of
heat and compression, we are yet ignorant. *Darwin.*

ELASTIC GUM, or ELASTIC RESIN. See GUM,
ELASTIC.

ELASTIC VAPORS are such as may, by any ex-
ternal mechanical force, be compressed into a
smaller space than they originally occupied;
restoring themselves, when the pressure is taken
off, to their former state, with a force exactly
proportioned to that with which they were at
first compressed. Of this kind are all the aerial
fluids, without exception, and all kinds of fumes
raised by heat, whether from solid or fluid bodies.
Of these some retain their elasticity only when
a considerable degree of heat is applied to them,
or to the substances which produce them; while

others remain elastic in every degree of cold, either natural or artificial, that has been observed. Of the former kind are the vapors of water, spirit of wine, mercury, sal ammoniac, and all kinds of sublimable salts; of the latter, those of spirit of salt, mixtures of vitriolic acid and iron, nitrous acid, and various metals; and, in short, the different species of aerial fluids indiscriminately. The elastic force with which any one of these fluids is endowed, has not yet been calculated, being ultimately greater than any obstacle we can put in its way. Thus, if we compress the atmospherical air, we shall find that, for some little time, it will easily yield to the force we apply; but every succeeding moment the resistance will become stronger, and a greater and greater force must be applied in order to compress it farther. As the compression goes on, the vessel containing the air becomes smaller, but no power whatever has yet been able to destroy the elasticity of the continued fluid in any degree; for, upon removing the pressure, it is always found to occupy the very same space that it did before. The case is the same with aqueous steam, to which a sufficient heat is applied to keep it from condensing into water. This will yield to a certain degree; but every moment the resistance becomes greater, until at last it will overcome any obstacles whatever. An example of the power of this kind of steam we have every day in the steam engine; and the vapors of other matters, both solid and fluid, have frequently manifested themselves to be endowed with an equal force. Thus the force of the vapors of spirit of wine has occasioned terrible accidents when the worm has been stopped, and the head of the still absurdly tied down to prevent an explosion; the vapors of mercury have burst an iron box; and those of sal ammoniac, volatile salts, nitrous acid, marine acid, phosphorus, &c., have all been known to burst the chemical vessels which confined them, in such a manner as to endanger those who stood near them. In short, from innumerable observations, it may be laid down as an undoubted fact, that there is no substance whatever capable of being reduced into a state of vapor, but what in that state is endowed with an elastic force ultimately superior to any obstacle we can throw in its way. It has been a desideratum among philosophers to give a satisfactory reason for this astonishing power of elasticity in vapor, which is seemingly so little capable of accomplishing any great purpose when in an unconfined state. As air is that fluid in which, from the many experiments made upon it by the air-pump and otherwise, the elastic property has most frequently been observed, the researches of philosophers were at first principally directed towards it. The causes they assigned, however, were very inadequate; being founded upon an hypothesis concerning the form of the particles of the atmosphere itself, which they supposed to be either rolled up like the springs of watches, or that they consist of a kind of elastic flakes. This was followed by another hypothesis concerning their substance, which was imagined to be perfectly elastic, and so strong that it could not be broken by any mechanical power whatever;

and thus they thought the phenomenon of the elasticity of the air might be explained. But an insuperable difficulty still attended their scheme, notwithstanding both these suppositions; for it was observed, that the elastic power of the air was augmented, not only in proportion to the quantity of pressure it was made to endure, but in proportion to the degree of heat applied to it at the time. Sir Isaac Newton was aware of this difficulty; and justly concluded that the phenomena of the air's elasticity could not be solved on any other supposition, than that of a repulsive power diffused all around each of its particles, which became stronger as they approached, and weaker as they removed from each other. Hence, the common phenomena of the air-pump and condensing-engine received a satisfactory explanation; but still it remained to account for the power shown in the present case by heat, as it could not be denied that this element had a very great share in augmenting the elasticity of the atmosphere, and seemed to be the only cause of elasticity in other vapors. It does not appear that Sir Isaac entered into this question, but contented himself with attributing to heat the property of increasing repulsion, and ascribing this to another unexplored property called rarefaction. Thus matters stood till the great discovery made by Dr. Black, that some bodies have the power of absorbing in an unknown manner the element in question, and parting with it afterwards, so that it flows out of the body which had absorbed it, with the very same properties that it had before absorption. Hence, many phenomena of heat, vapor, and evaporation, were explained in a manner much more satisfactory than had ever been attempted, or even expected before. One of these was that remarkable property of metals becoming hot by hammering; during which operation, in the doctor's opinion, the element of heat is squeezed out from between the particles of the metal, as water is from the pores of a sponge by pressing it between the fingers. Of the same nature is the phenomenon above-mentioned, that air when violently compressed becomes hot, by reason of the quantity of more subtle element squeezed out from among the particles. In this manner it appears, that heat and the repulsive power of Sir Isaac Newton are the very same; that by diminishing the heat of any quantity of air, its elasticity is effectually diminished, and it will of itself shrink into a smaller space as effectually as by mechanical pressure. In one case we have what may be called ocular demonstration of the truth of this doctrine, viz. that by throwing the focus of a strong burning lens upon a small quantity of charcoal in vacuo, the whole will be converted into inflammable air, having even a greater power of elasticity than common air in an equal degree of heat. Here there is nothing else but heat or light to produce the elastic power, or cause the particles of charcoal, which before attracted, now to repel each other. In another case we have evidence equally strong, that the element of heat by itself, without the presence of that of light, is capable of producing the same effect. Thus when a phial of ether is put into the receiver of an air-pump, and sur-

rounded by a small vessel of water, the ether boils violently, and is dissipated in vapor, while the water freezes, and is cooled to a great degree. The dissipation of this vapor shows that it has an elastic force; and the absorption of the heat from the water shows, that this element not only produces the elasticity, but actually enters into the substance of the vapor itself; so that we have not the least reason to conclude that there is any other repulsive power by which the particles are kept at a distance from one another, than the substance of the heat itself. In what manner it acts, we cannot pretend exactly to explain, without making hypotheses concerning the form of the minute particles of matter, which must always be very uncertain. All known phenomena, however, concur in rendering the theory now laid down extremely probable. The elasticity of the steam of water is exactly proportioned to the degree of heat which flows into it from without; and, if this be kept up to a sufficient degree, there is no mechanical pressure which can reduce it into the state of water. This, however, may very easily be done by abstracting a certain portion of the latent heat it contains: when the elastic vapor will become a dense and heavy fluid. The same thing may be done in various ways with the permanently elastic fluids. Thus the purest dephlogisticated air, when made to part with its latent heat, by burning with iron, is converted into a gravitating substance of an unknown nature, which adheres strongly to the metal. If the decomposition is performed by inflammable air, both together unite into a heavy, aqueous, or acid fluid; if by mixture with nitrous air, still the heat is discernible, though less violent than in the two former cases. The decomposition indeed is slower, but equally complete, and the dephlogisticated air becomes part of the nitrous acid, from which it may be again expelled by proper means: but of these means heat must always be one; for thus only the elasticity can be restored, and the air be recovered in its proper state. The same thing takes place in fixed air, and all other permanently elastic fluids capable of being absorbed by others. The conclusion therefore, which we can only draw from what data we have, concerning the composition of elastic vapors, is, that all of them are formed of a terrestrial substance, united with the element of heat in such a manner, that part of the latter may be squeezed out from among the terrestrial particles; but in such a manner, that, as soon as the pressure is taken off, the surrounding fluid rushes in, and expands them to their original bulk: and this expansion or tendency to it will be increased in proportion to the degree of heat, just as the expansion of a sponge would be exceedingly augmented, if we could contrive to convey a stream of water into the heart of it, and make the liquid flow out with violence through every pore in the circumference. In this case, it is evident that the water would act as a power of repulsion among the particles of the sponge, as well as the fire does among the particles of the water, charcoal, or whatever other substance is employed. Thus far we may reason from analogy, but in all probability the internal and essential texture of these vapors will for ever remain unknown. It has been ima-

gined by some, that the artificial elastic fluids have not the same mechanical property with common air, viz. that of occupying a space inversely proportional to the weights with which they are pressed: but this is found to be a mistake. All of them likewise have been found to be non-conductors of electricity, though probably not all in the same degree. See AIR and ELECTRICITY.

ELASTICITY. The cause or principle of elasticity, or springiness, is variously assigned. The Cartesians account for it from the *materia subtilis* making an effort to pass through pores that are too narrow for it. Other philosophers, in lieu of the subtle matter, substitute ether, or a fine ethereal medium that pervades all bodies. Others, setting aside the precarious notion of a *materia subtilis*, account for elasticity from the great law of attraction, or the cause of the cohesion of the parts of solid and firm bodies. Thus, say they, when a hard body is struck or bent, so that the component parts are moved a little from each other, but not quite disjointed or broken off, or separated so far as to be out of the power of that attracting force whereby they cohere; they must certainly, on the cessation of the external violence, spring back to their former natural state. Elasticity has also been resolved into the pressure of the atmosphere: for a violent tension, or compression, though not so great as to separate the constituent particles of bodies far enough to let in any foreign matter, must yet occasion many little vacuola between the separated surfaces; so that upon the removal of the force they will close again by the pressure of the aerial fluid upon the external parts. See ATMOSPHERE. Lastly, others attribute the elasticity of all hard bodies to the power of resiliation in the air included within them: and so make the elastic force of the air the principle of elasticity in all other bodies. These are clearly the mere conjectures of philosophy.

M. Libes, the author of the *Nouveau Dictionnaire de Physique*, has in that work given a new explication of the phenomena of elasticity, which depends upon the following principles:—

1. The signs of elasticity suppose a compression effected, that is, an alteration in the figure of bodies produced by the mutual approach of the molecule: whence it results, that bodies, whose molecule yield with a very great facility to the slightest pressure, so as to roll one over another without changing their figure, cannot give sensible signs of elasticity. Such in general are liquids. 2. When an elastic body is compressed, some of its integrant molecule are brought nearer to one another, while others undergo a farther separation nearly equal to the approach of the former. 3. At the habitual degree of heat and pressure which we experience, all bodies have a volume determined by the ratio of equality, which exists between the attractive force of their particles, and the repulsive force communicated by the caloric combined with those particles.

These being granted, the re-establishment of solid bodies, after the compression, appears to be the result of the combined action of the caloric and of attraction. For in the molecule brought nearer by the compression, the repulsive force augments, and the attractive force likewise aug-

ments; but the augmentation of the former force exceeds that of the latter. For, at the epoch of the formation of the body, such as it existed previous to the compression, the repulsive force communicated to its molecu^læ by the caloric, was sufficient to give the degree of separation that was peculiar to the body: it was, therefore, superior to the attractive force until the moment when the molecu^læ had become so far separated as was consistent with the natural state of the body. Whence it results, that if the particles are brought nearer together by compression, that is, if they are contracted with the caloric into a smaller space, the ratio of equality which subsisted between the attraction and the repulsion before the compression, must be destroyed in favor of the repulsion; and consequently, on the cessation of the compression, this surplus of repulsive force will act so as to separate again the molecu^læ brought nearer by the compression, until the equilibrium is re-established between the attraction and the repulsion: and this equilibrium can only be re-established, when the molecules have recovered the degree of separation which they had previous to the compression. For similar reasons the attraction will predominate over the repulsion in those particles which have suffered a farther separation than is due to the natural state: it must, therefore, act to draw the particles nearer, and re-establish the equilibrium of those forces: and this equilibrium cannot be re-established until the molecules have recovered the relative distance which they had before the compression.

This theory M. Libes applies to an elastic sphere, as an ivory ball when falling upon a plane, to a plate of steel, whose extremities are brought towards each other by bending, and to the known effects of tempered metals, &c. In explaining the elasticity of æriform fluids, M. Libes calls in to his aid a new force. For, in this kind of substances, the repulsion having prevailed over the attraction, their particles are retained in their mutual position by the pressure of the atmosphere. But this force, it may be observed, being constant, makes no change in the results just stated; except that, if the pressure be taken away, the particles of the gas will be separated from one another, until their relative distance attains a point determined by the equality between the attraction of the earth and the repulsion of those particles. Now, since all bodies contain caloric, it may be asked how it happens that all bodies are not elastic, if caloric be the principle of elasticity?

To this M. Libes replies by the following remarks:—1st. Since there is not in nature any body, either perfectly hard, or perfectly soft, there is none but what possesses some degree of elasticity. 2dly. Perceptible signs of elasticity suppose the compression effected: it is not there-

fore surprising, that bodies in which we cannot produce compression should not give any sign of elasticity. 3dly. Although caloric be the principle of elasticity, it does not follow that all bodies which contain caloric must exhibit this property. 1. Too much or too little caloric may equally weaken the elastic force. The different forms which distinguish the integrant molecu^læ of different bodies; the different arrangement assumed by those molecu^læ, according to circumstances, may be sometimes more or less favorable, at others more or less prejudicial to elasticity. 2. Soft bodies, such as butter, humid clay, &c., experience in their soft state a commencement of solution by water, which must alter the repulsive force of their molecu^læ, and consequently hurt the elasticity. This is so true, that these bodies, freed from their aqueous parts, without changing their temperature, yield sensible signs of elasticity.

M. Libes, instead of attempting to explain, as some would expect, why caloric is elastic, says it is not necessary to suppose it so. For it may communicate this property to other bodies without being so itself. This position he illustrates as follows: when dry bread is immersed in water, that bread becomes swoln, its particles being farther separated from one another: water, therefore, by penetrating the pores of the bread, communicates to its particles a repulsive force; yet it would be ridiculous to conclude from hence, that the molecu^læ of water mutually repel one another. In like manner, when we subject a body to the action of heat, its integrant molecules are separated from one another, and acquire a repulsive force by their combination with caloric: but this phenomenon, like the preceding, depends probably upon the concourse of several attractive forces, such as that of the molecu^læ of the caloric, that of the particles of the body for one another, and, lastly, the reciprocal attraction of the particles of the caloric and those of the body penetrated by that fluid: whence it results that the elasticity of bodies by no means presupposes that of the caloric which has given rise to it. Indeed, M. Libes does not regard as completely demonstrated the existence of the fluid called caloric; he assumes the hypothesis as a matter of convenience, which enables us to abridge the language of philosophical discussions, and to found upon our reasonings an analytical calculus. He next, therefore, proceeds to state his theory analytically; and deduces from his formulæ the following results among others. 1. That when we compress elastic fluids, the repulsive force becomes more powerful than the attractive, and consequently when the compression ceases, the molecu^læ ought to return towards their first position. 2. That liquids and æriform fluids have the exclusive privilege of assuming a larger volume when the pressure of the atmosphere is taken away. *Dict. de Phys. Retrospect*, No. 8.
